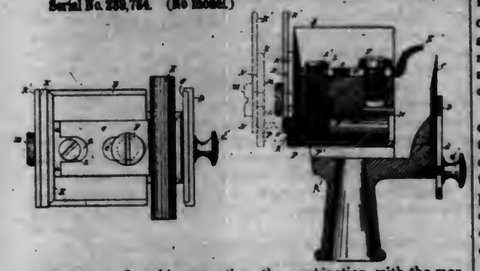
4. The combination, with the main frame and the seed-boxes secured thereon, of the shaft M, arranged in rear of the seed-boxes, the sprocket-wheel on said shaft, mechanism for rotating the said shaft, the divided cross-bar, the rearwardly-projecting arms attached to said cross-bar and adjustably secured to the seed-boxes, the shaft carried by said cross-bar, the sprocket-pinion on said shaft geared to the sprocket-wheel on the shaft M, the operating-wheel on the said shaft, the seed-slide, and mechanism actuated by the operating-wheel to reciprocate the seed-slide, as set forth.

5. The combination of the divided bar F, the arched bar I, connecting the members of the same, the seed-slide, the lever *a*, pivoted at its upper end on the bar I, the pitman *b*, connecting said lever with the seed-slide, the angle-levers W, pivoted on the bar F, the rod Y, connecting said levers W, the rod Z, connecting said levers to the lever *a*, the operating-wheel arranged between the ends of the levers W and adapted to operate the same, and mechanism for rotating said operating-wheel, as set forth.

6. The combination, with the corn-planter having the spiked operating-wheels, of the chains connected to and wound upon the said wheels and having their free ends secured at the starting end of the field, so as to unwind gradually from the wheels as the machine progresses and secure an even start, substantially as set forth.

403,517. ELECTRO-MAGNET AND ARMATURE. FREDERICK W. COLE, Newton, Mass., assignor of one-half to Moses G. Crane, same place. Filed May 24, 1888. Serial No. 274,260. (No model.)



Claim.—1. The combination, with an electro-magnet having a pole-piece with converging surfaces, of an armature composed of two

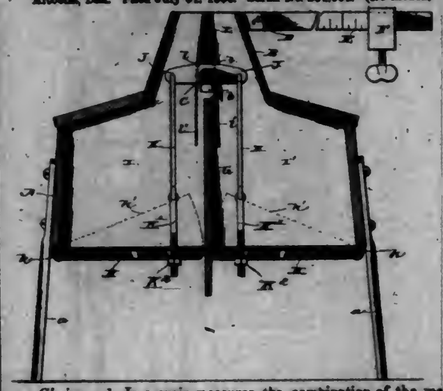
portions, one of which is arranged and moves substantially parallel with one of the surfaces of the pole-piece, and the other of which portions approaches and recedes from the other surface of said pole-piece, substantially as described.

2. A horseshoe electro-magnet having two similar pole-pieces, each provided with pivot-lugs at one side, combined with an armature pivotally connected with said lugs having two portions, one substantially radial to the pivot-axis and the other substantially concentric with said pivotal axis, substantially as and for the purpose described.

403,518. HINGE-MORTISER. WILLIAM COOPER, ALONZO MILLIKEN, and GEORGE W. DUNCP, Minneapolis, Minn., assignors to the Northwestern Tool and Implement Company, same place. Filed Nov. 2, 1888. Serial No. 289,764. (No model.)

Claim.—1. In a hinge-mortiser, the combination, with the mortising-chisel, of a transversely-adjustable gage provided with an extensible face-plate, whereby the same gage is adapted to gage in opposite directions from two different levels, one above and the other below the cutting-edge of the chisel, substantially as described.

2. In a hinge-mortiser, the combination, with the mortising-chisel, of a transversely-adjustable gage provided with a face-plate in two sections, one fixed and the other movable thereon to form an extension in the same plane for measuring in opposite directions from levels above and below the edges of the knives, substantially as described.



3. In a hinge-mortiser, the combination, with the mortising-chisel, of a transversely-adjustable gage provided with a face-plate in two sections, one fixed and terminating above the edge of the chisel, the other pivoted to the fixed sections and reversible thereon to form an extension in the same plane for measuring from a level below the edge of the chisel, substantially as described.

4. In a hinge-mortiser, the combination, with the mortising-chisel, of a transversely-adjustable gage provided with a face-plate in two sections, one fixed and the other movable thereon, to form an extension thereof in the same plane, and a locking device for locking the movable to the fixed sections, substantially as described.

5. In a hinge-mortiser, the combination, with the mortise-chisel, of a transversely-adjustable gage provided with a face-plate having two sections, one fixed and terminating above the level of the knives, and the other pivoted to the fixed section and reversible thereon to form an extension in the same plane to a level below said knives, and having depressions in its inner surface at diametrically-opposite points, and a spring-actuated catch mounted in the gage-shaft, adapted to engage said depressions and lock the movable to the fixed plate in the two different positions, substantially as described.

6. In a hinge-mortiser, the combination, with the head or stock, of a three-sided rectangular mortising-chisel secured thereto, a chip-removing knife secured to said stock opposite and slightly removed from the mouth of said chisel, a transversely-adjustable chip-gage mounted in the top of said stock or head between the knives of said chisel, an outside horizontally-adjustable gage having its stem mounted in said stock, provided with a face-plate in two sections, one fixed and the other movable thereon, to form an extension thereof, and an adjustable stop mounted on the face of the chip-knife for limiting the thrust thereof, substantially as described.

403,519. GRAIN-WEIGHING APPARATUS. JAMES R. CREIGHTON, Altoona, Dak. Filed July 31, 1888. Serial No. 281,901. (No model.)

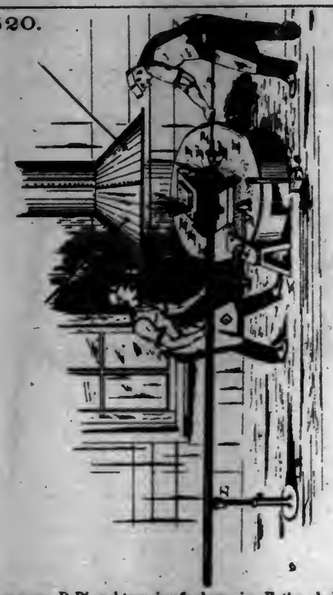
Claim.—1. In a grain-measurer, the combination of the main casing having the vertical central partition, G, forming the compartments I I', the shaft C, journaled in the frame above the partition and having the arms J, the swinging doors H H' at the lower ends of the compartments, the rods K, connected to and depending from the arms J, the link-bolts K', loosely connected to the lower ends of the rods K and extending through the doors, and the adjusting-nuts K², screwed to the lower ends of the link-bolts and bearing under the doors, substantially as described.

2. In a grain-measurer, the combination of the main frame or casing divided into two similar vertical compartments by the partition G, the hinged and swinging doors forming the bottoms of said compartments, the shaft C, journaled in vertical slots in the sides of the casing and provided with arms J J, standing over the said compartments, the rods K, connecting said arms and doors, the swinging door L, provided with the kerf-slots *l* and having its corners journaled on the shaft C, and the curtains *l' l'*, depending from the door L on each side of the partition G, substantially as specified.

3. In a grain-measurer, the combination, with the opposite vertical compartments, I I', and the hinged doors forming the floors of said compartments, of the shaft C, journaled in vertical slots in the extension B of the casing, the lever D, journaled in said extension, the link-rods *d*, connecting the arms of the bifurcation of said lever with the ends of the shaft C outside of the casing, the weight F on the graduated arm of said lever, the studs M on said shaft, and the wheels N, against which said studs normally rest, substantially as specified.

4. The combination, with the main casing having the compartments I I', the hinged doors H H', the shaft C, provided with the studs M, beveled on each side transversely at their points, and the wheels N on the side of the extension B, of the lever having the graduated arm E, the link-rods *d*, the sliding weight F, the arms J J of the shaft C, and the link-rods K, substantially as specified.

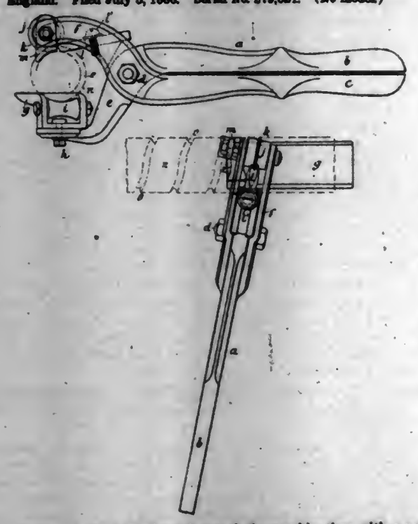
403,520. DEVICE FOR WELDING THE ENDS OF BOILER-FLUES. JAMES CUMMINS, Buffalo, N. Y. Filed Mar. 28, 1888. Serial No. 305,146. (No model.)



Claim.—1. The hereinbefore-described attachment for furnaces for welding the ends of boiler-flues, consisting of the block A, having longitudinal passage B C and transverse passages D D', and a feed-passage, E, the said block being adapted for use with the hearth and tuyere, as and for the purpose set forth.

2. The herein-described devices for welding the ends of boiler-flues, consisting of the following-named parts jointly: the hearth H and tuyere I, the furnace A, standard L, beak-horn M, push-rod P, swage N, and sledge-hammer O, as and for the object stated.

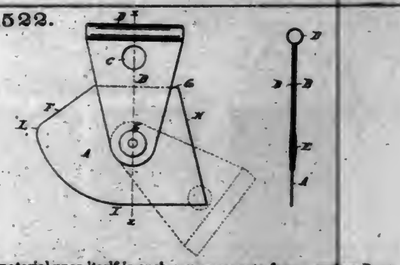
3. As an improved article of manufacture, a furnace-block, substantially as described, having longitudinal passage B enlarged at C,



403,520.

transverse passage D D', and tapering feed-opening E, the whole being formed substantially as described and stated.

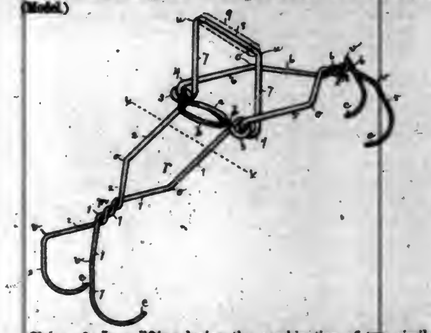
403,521. TOOL FOR SPIRAL TURNING. ELIAS CUTLAN, London, England. Filed July 5, 1888. Serial No. 279,021. (No model.)



Claim.—1. In a spiral-turning tool, the combination, with a pair of pivoted handles and arms, of a guide adjustable relatively to the longitudinal axis of the tool and arranged upon one of the arms to run on the work or upon a bar or rod parallel to the work, and a blade, *k*, carried upon the other arm for causing the traverse of the tool relatively to the work, for the purpose specified.

2. In combination with a pair of pivoted handles and arms and with the cutter *l*, a leading-guide, *j k*, made adjustable in its supporting-arm *f* by means of pin *q*, and a series of holes, *p*, adapted to receive said pin, whereby the tool may cut spirals on pieces of different diameters.

403,522. SCRAPER OR CLEANER. GEORGE H. DU BOIS, Flushing, N. Y. Filed July 20, 1888. Serial No. 280,136. (No model.)



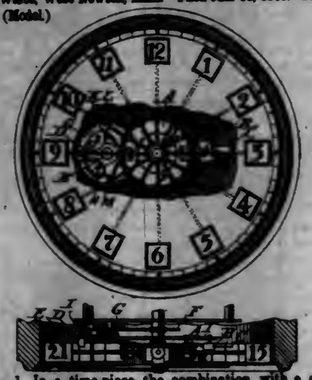
Claim.—A scraper or cleaner composed of blade A, provided with irregular edges G H I F and point L, and an adjustable handle, B, attached near the center thereof, said handle being formed by bending the material upon itself in such a manner as to form a spring, D, at its top, which causes the two sides thereof to fit snugly to the sides of the blade, for the purpose substantially as shown and described.

403,523. PAINT. SYLVESTER C. DUNHAM, Willow Springs, Nebr., assignor of one-half to George W. Lambert, same place. Filed Oct. 23, 1888. Serial No. 288,897. (No specimens.)

Claim.—The compound to be used as a dressing or paint for roofs, consisting of the admixture, with coal-tar, sulphur, brown oxide of iron, and air-slaked lime, of salt, in substantially the proportions specified.

403,524. LIFTING DEVICE. CYRENIUS ELLIS and ELLIS R. ESHBAH, New Martinsburg, Ohio. Filed May 28, 1888. Serial No. 275,408. (Model.)

Claim.—1. In a lifting device, the combination of two similar parts or halves, each formed of a single piece of wire or metal rod bent at its middle, as described, and having a loop or coil in each branch constituting a hinge part, and having its branches extending away from the hinge parts more or less parallel and then connected together at a suitable point, as by twisting the parts upon each other, and the branches terminating in a hook device, substantially as set forth.



2. In a lifting device, the combination of two similar parts or halves, each formed of a single piece of wire or metal rod bent at its middle, as described, and having a loop or coil in each branch constituting a hinge part, and having its branches extending from the hinge parts approximately parallel to each other and then united at a suitable point by one or more twists, and the extremities of the branches then diverging and each being provided with a hook end, substantially as set forth.

3. In a lifting device, the combination of two parts, each having loops or coils constituting hinge parts whereby the two parts are connected, and each having its branches extended, bent, and twisted, connected as described, and provided with terminal hooks, and one part having a supporting-loop projecting from the central portion of the device, substantially as set forth.

4. In a lifting device, the combination of two parts, each having loops constituting hinge parts for hinging the parts together and each having projecting branches united at suitable points by bends or twists and provided with independent terminal hooks, and one part having a supporting-loop and the other part having a loop or coil as means for opening and working the device, substantially as set forth.

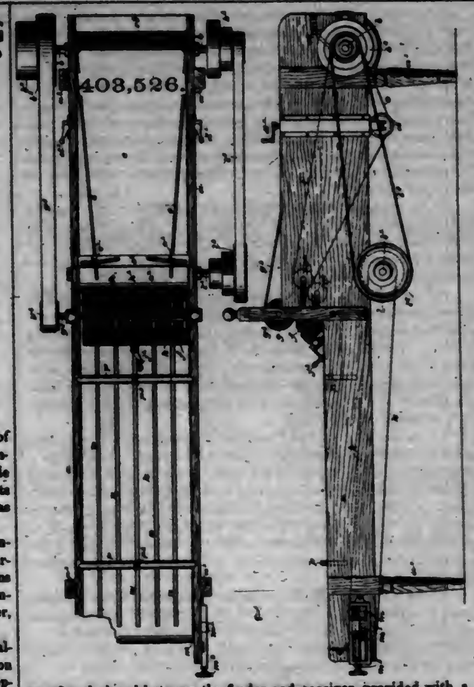
5. The lifting device consisting of the combination of two similar parts formed of wire or metal rods and hinged together by loops or coils formed in their bodies, and each part having projecting branches connected and braced at points more or less remote from the hinges and then diverging and terminating in separate hooks, and one part having a supporting-loop and a handle placed thereon and the other part having a thumb projection formed of a loop or coil, which, with the handle, serves as means for opening and working the device, substantially as set forth.

403,525. TIME-PIECE DIAL. MARTIN V. B. BRIMMER, Boston, Mass., assignor of two-thirds to John Swann, New York, N. Y., and Henry R. Watts, West Newton, Mass. Filed Jan. 16, 1888. Serial No. 261,078. (Model.)

Claim.—1. In a time-piece, the combination, with a series of rotary spindles, each having a pinion thereon, of a rotative gear intermeshing with the series of pinions and carrying relatively-movable weights, together with mechanical devices for adjusting the weights to cause the gear to rock, and thus shift the spindles, substantially as described.

2. In a time-piece, the combination, with a series of rotary spindles, each having a pinion thereon, of a loosely-mounted gear intermeshing with the pinions and having oppositely-projecting extensions or arms, suitable weights carried upon said extensions, and mechanism for moving said weights, so that one may overbalance the other, and thus rock the gear and shift the spindles, as set forth.

3. In a time-piece, a series of rotary spindles carrying the numeral-indicating devices and each provided with a pinion, in combination with a loosely-mounted gear engaging the pinions and supporting oppositely-located weights, and mechanism for adjusting the weights to rock the gear and shift the spindles, consisting of a cam, a link-connection between it and one of the weights, and a gearing-connection between the cam and the time-piece movement, all substantially as set forth.



4. In a time-piece, the combination, with a series of spindles, a loosely-mounted gear engaging the spindles, so as to shift them when it is rocked and having oppositely-projecting arms, weights carried upon said arms, a rotating cam operated by connection with the time-piece mechanism and acting upon projections or pins on one of the weighted arms, while it connects with and causes the weight upon the other arm to slide thereon, all the parts operating to accomplish a rocking of the gear at stated intervals, substantially as described.

5. In a time-piece, a series of rotary devices carrying the numeral-indicators, a loosely-mounted wheel geared or connected to the spindles so as to shift them all in unison when it is rocked, said wheel having relatively-adjustable weighted extensions, and mechanism for moving the weights, so that one may overbalance the other and rock the gear, substantially as specified.

6. In a time-piece, the combination of the spindles having pinions *a*, the gear-wheel A, meshing with the pinions and having arms C and E, said arm C carrying sliding weight B, and said arm E carrying stationary weight D and having pins L and M, the cam H, secured on a gear which drives it, and the connecting-rod I between cam H and the weight B, substantially as described.

7. In a time-piece, the combination of a series of spindles having pinions *a*, a loosely-mounted gear-wheel, A, engaging the pinions, the weighted arms C and E, the cam H, and mechanical devices whereby the cam is enabled to cause the gear to rock at intervals, and thus shift the spindles, so that numerals from 1 to 12 and 12 to 24 will be exposed alternately, as described.

403,526. CRACKER-STACKING MACHINE. AUGUSTUS F. FITZGERALD, Brooklyn, assignor to the Van Duzer & Holmes Biscuit Company, New York, N. Y. Filed Oct. 25, 1888. Serial No. 289,103. (No model.)

Claim.—1. A cracker-stacking machine consisting of a feeder, a receiver placed below the feeder, a device independent of the feeder and receiver moving transversely of the machine and provided with fingers for separating the crackers, for arranging the crackers in a straight line or lines upon the receiver, and means for operating this separating device, substantially as shown and described.

2. A cracker-stacking machine consisting of a feeder, a receiver arranged below the feeder, a laterally-reciprocating frame independent of and placed between the feeder and receiver, provided with a channel or channels down which the crackers fall from the feeder to the receiver, and means for operating the reciprocating frame, substantially as shown and described.

3. A cracker-stacking machine consisting of a feeder, a receiver arranged below the feeder, a laterally-reciprocating frame independent of and placed between the feeder and receiver, provided with a channel or channels down which the crackers fall from the feeder to the receiver, means for operating the reciprocating frame, and a deflector which inverts the crackers as they fall to the receiver, substantially as shown and described.

4. A cracker-stacking machine consisting of a traveling apron which feeds the crackers, a second traveling apron arranged below the first, means for operating the aprons, a laterally-reciprocating frame placed between the two aprons, means for operating the reciprocating frame, vertical partitions in the reciprocating frame, longitudinal guide-bars over the lower apron, and pivoted links joining the lower ends of the partitions and the ends of the guide-bars adjacent thereto, substantially as shown and described.

5. A cracker-stacking machine consisting of a traveling apron which feeds the crackers, a second traveling apron arranged below the first, means for operating the aprons, a laterally-reciprocating frame, means for operating the reciprocating frame, vertical partitions in the reciprocating frame, longitudinal guide-bars over the second apron, pivoted links joining the lower ends of the partitions and ends of the guide-bars adjacent thereto, and an adjustable deflecting-plate in the reciprocating frame and extending across the same under the partitions, substantially as shown and described.

6. A cracker-stacking machine consisting of a traveling apron which feeds the crackers, means for operating the apron, a laterally-reciprocating frame independent of and placed below the apron, provided with partitions forming a channel or channels down which the crackers fall, means for operating the reciprocating frame, and guides above the apron to direct all the crackers into the channels in the reciprocating frame, substantially as shown and described.

7. A cracker-stacking machine consisting of a traveling apron which feeds the crackers, guides placed above the apron, a stripper bearing against the apron, a laterally-reciprocating frame provided with partitions extending over the stripper and forming channels down which the crackers slide from the receiving-apron, a second traveling apron arranged below the first or feeding-apron, guide-bars over the second apron, links connecting the lower ends of the partitions in the reciprocating frame with the ends of the guide-bars adjacent thereto, and means for operating the aprons and reciprocating frame, substantially as shown and described.

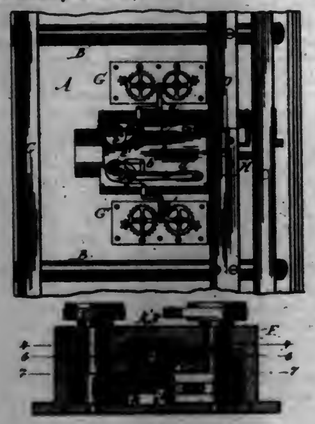
8. A cracker-stacking machine consisting of a traveling apron which feeds the crackers, guides placed above the apron, a stripper bearing against the apron, a laterally-reciprocating frame provided with partitions extending over the stripper and forming channels down which the crackers slide from the feeding-apron, and a deflector which inverts the crackers as they fall, a second traveling apron arranged below the first or receiving apron, guide-bars over the second apron, links connecting the lower ends of the partitions in the reciprocating frame with the ends of the guide-bars adjacent thereto, and means for operating the aprons and reciprocating frame, substantially as shown and described.

9. In a cracker-stacking machine, in combination, the traveling apron *c*, means for operating the apron, the guards c^3, extending transversely across the apron, and the adjustable guide-bars *e e*, extending longitudinally over the apron *c*, substantially as shown and described.

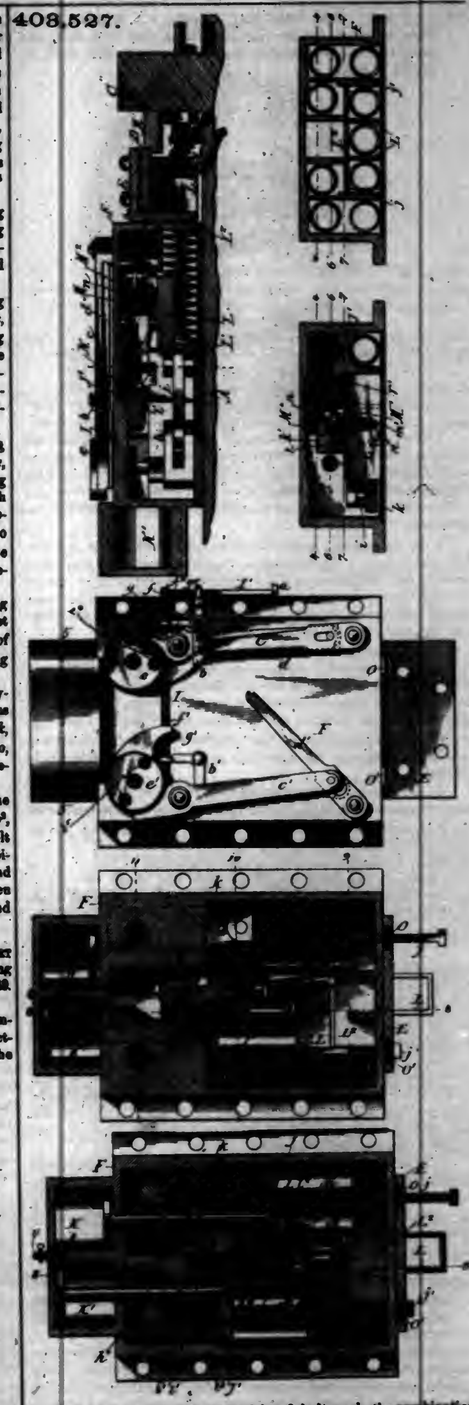
10. In a cracker-stacking machine, in combination, the traveling apron *c*, means for operating the apron, the adjustable guide-bars *e e*, extending longitudinally over the apron *c*, the laterally-reciprocating frame *f*, provided with partitions *h h*, adjustably clamped to the frame *f*, and means for operating the reciprocating frame, the guide-bars being arranged to guide crackers placed on the apron into channels formed by the partitions of the reciprocating frame *f*, substantially as shown and described.

11. In a cracker-stacking machine, in combination, the traveling apron *c*, means for operating the apron, the adjustable guide-bars *e e*, extending longitudinally over the apron *c*, the stripper c^3, bearing against the apron *c*, the laterally-reciprocating frame *f*, provided with partitions *h h*, adjustably clamped to the frame *f*, and means for operating the reciprocating frame, the guide-bars being arranged to guide crackers placed on the apron into the channels formed by the partitions of the reciprocating frame, substantially as shown and described.

12. In a cracker-stacking machine, in combination, the traveling apron *c*, means for operating the apron, the stripper c^3, bearing against the apron *c*, and the frame *f*, provided with a deflector consisting of the inclined side *i* and plate i', adjustably connected to and projecting from the side *i*, substantially as shown and described.



13. In a cracker-stacking machine, in combination, the laterally-reciprocating frame *f*, means for operating the frame *f*, the partitions *h h* in the same provided with extensions h^2 h^2, the traveling apron *k*, means for operating the apron *k*, the guide-bars *n n*, and the links *o o*, joining guide-bars *n* to extensions h^2, substantially as shown and described.



14. In a cracker-stacking machine, an adjusting device for the guide-bars, consisting of the main piece p', slotted clamping-piece p^3, bridge-piece p^2, secured to the clamping-piece p^3, and clamping bolt and nut p^4 p^2, joining the main piece p' and bridge-piece p^2, in combination with the guide-bars *n*, resting upon the traveling apron *k* and provided with headed bolts *n'*, the heads *n'* being clamped between the main piece p' and clamping-piece p^3, substantially as shown and described.

408,527. DEVICE FOR OPERATING SAFE BOLT-WORK.

ROBERT W. FOWLER, Chicago, Ill., assignor to The Yale & Towne Manufacturing Company, Stamford, Conn. Filed May 7, 1888. Serial No. 273,042. (Model.)

Claim.—1. In an apparatus for operating safe bolt-work, the combination, with the bolt-work, of two independent automatic retracting-powers adapted independently or simultaneously to retract the bolt-work, substantially as set forth.

2. In an apparatus for operating safe bolt-work, the combination, with the bolt-work, of two independent automatic retracting-powers adapted independently or simultaneously to retract the bolt-work and a time mechanism for tripping or releasing the retracting-powers, substantially as set forth.

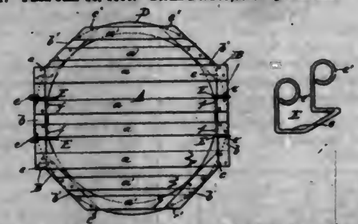
3. In an apparatus for operating safe bolt-work, the combination, with the bolt-work, of two independent automatic retracting-powers adapted independently or simultaneously to retract the bolt-work, in combination with a casting-power, substantially as set forth.

4. As an improvement in devices for automatically operating the bolts of a safe or vault door, two automatic retracting-powers, in combination with two time mechanisms, each arranged to operate one of the retracting-powers independently of the other, substantially as set forth.

5. In an apparatus for operating safe bolt-work, the combination, with the bolt-work, of two automatic retracting-powers applied to the bolt-work to retract it, a casting-power applied to the bolt-work to cast it, and a lug secured to the case of the retracting-springs, adapted to trip and release the fastening of the casting-power whenever the retracting-power is released, substantially as set forth.

6. As an improvement in devices for automatically operating the bolts of a safe or vault door, two automatically-acting retracting-powers, which may be separately released to retract the bolts, in combination with a system of interlocking compound levers and detents arranged to hold the retracting-powers in check until released at a predetermined time by the power provided for that purpose.

7. The combination of detents for holding the automatic retracting-powers for operating safe bolt-work in check until each predetermined time as they are to be released, and an interlocking connection between the detents and time mechanism that will have to be released by the time mechanism before the time mechanism moves the detents to release the power that is provided to automatically retract the bolts of a safe or vault door.



8. As an improvement in devices for automatically operating the bolts of a safe or vault door, two automatically-acting retracting-powers, in combination with a casting-power and mechanism that will enable the setting of either retracting-power to set the casting-power that is provided to cast the bolts.

9. As an improvement in devices for automatically operating the bolt-work of a safe or vault door, two automatic retracting-powers, in combination with a casting-power and pawl *l*, case J, dog *n*, and case L, to enable the casting and one retracting-power, when released, to be again set without releasing the other retracting-power, substantially as set forth.

10. In a device for the automatic operation of safe bolt-work, the combination of two cushions and two automatic retracting-powers with a cock or equivalent connection between them to adjust the resistance of the cushion to the work either power has to perform, substantially as set forth.

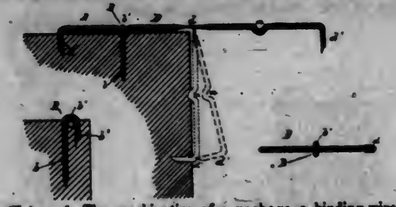
408,528. BASKET-COVER.

GEORGE C. GARDRANER, Watervliet, N. Y. Filed Jan. 10, 1888. Serial No. 295,967. (No model.)

Claim.—1. In covers for fruit or vegetable baskets, the combination, with the oppositely-located angular rim-bearing pieces B B, constructed of pieces, as above described, of the long slats *a a*, secured by their ends to bars *b b* of the said rim-bearing pieces, and the outer and shorter slats, *a' a'*, secured by their ends to bars *b' b'*, all substantially as described, for the purposes set forth.

2. The combination, with the cover A, composed of the two oppositely-located rim-bearing pieces B B, constructed of parts *b b' b'* and slats *a a'*, as described, of the fastening-pieces E, having holding-limbs *c*, for engagement with the lower side of rim-piece of the basket, and portion *c'*, for engagement with the cover at its upper side, substantially as and for the purposes set forth.

408,529. EXPANSIBLE MANDREL.



FRANCIS J. GAY, Providence, R. I., assignor to The Brown & Sharpe Manufacturing Company, same place. Filed Feb. 14, 1888. Serial No. 263,853. (No model.)

Claim.—In a universal holder, the combination, with a shank and expansible bushing connected thereto and a tapering plug for expanding the same, of two collars mounted upon the shank of said holder, the one so carried on the shank as to revolve upon the same against a shoulder on the shank, and the other connected with said plug so as to be incapable of revolution upon said shank, but so that it can slide thereon, the contacting faces of said collars being provided with inclined planes coacting with each other, whereby the revolution of the loose collar will give a longitudinal movement to the other collar and to the tapering plug connected therewith, substantially as described.

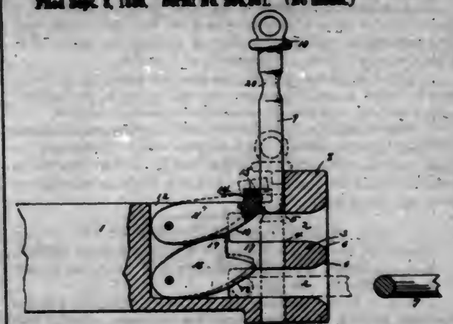
408,530. METALLIC STRAP FOR BOXES.

BURTON H. GUNN, Covington, Ky. Filed May 12, 1888. Serial No. 274,249. (Model.)

Claim.—1. The combination of a package, a binding-wire provided with notches or corrugations *a*, the said corrugations being embedded in the material of the package, and staples crossed in said corrugations, substantially as and for the purposes specified.

2. A binding-strap provided with corrugations *a* and points *d'*, the two elements lying in the same plane, substantially as and for the purposes specified.

3. A binding-strap provided with corrugations *a* and points *d'*, the two elements lying in the same plane, in combination with a package, substantially as and for the purposes specified.



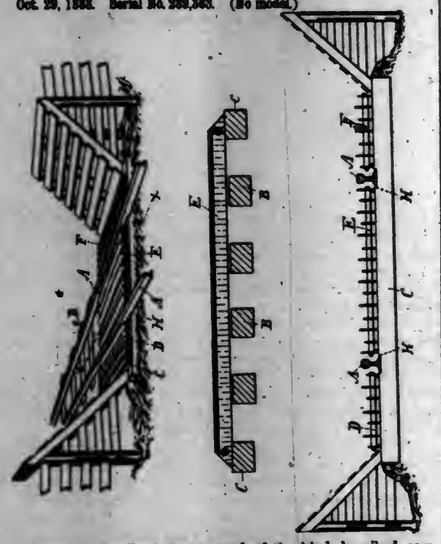
4. A binding-strap provided with corrugations *a* and points *d'*, the two elements lying in the same plane, in combination with a package and staples driven into the package across the corrugations, substantially as and for the purposes specified.

5. The combination of a package and a corner-strap of wire provided with pointed ends *d'* and corrugations *a*, the pointed ends and corrugations being embedded in the package, and staples crossed in the corrugations, substantially as and for the purposes specified.

6. A corner-strap of wire provided with pointed ends *d'* and corrugations *a*, lying in the same plane, and a central flattened space, *d*, substantially as and for the purposes specified.

408,531. CAR-COUPLING.

ALEXANDER H. GRANT, Hobart, N. Y. Filed Sept. 8, 1888. Serial No. 284,961. (No model.)



Claim.—1. In a car-coupling, a draw-head formed with horizontal link-recesses located above one another, a pivoted vertically-movable dog having its outer curved end projecting into the coupling-pin hole and across the rear of upper link-recess, and a second pivoted vertically-movable dog located beneath and bearing against the upper dog and having a curved end projecting across the rear of lower link-recess, substantially as shown and described.

2. A car-coupling consisting of draw-head 1, having horizontal link-recesses 2, slot 12, with vertically-movable dog 11 pivoted therein, and having curved portion 13 on its under side projecting across the rear of upper link-recess 2, with curved outer end projecting into pin-hole 5, and having concave slotted head 15, and the vertically-movable dog 16, pivoted in slot 17 beneath dog 11, and having curved portion 18 on its under side projecting across the end of lower link-recess 2, and the shouldered curved portion 19 on its upper side bearing against the under side of dog 11, substantially as shown and described.

3. A car-coupling consisting of draw-head 1, formed with the front elevated portion, 8, and with coupling-pin hole 5 at its rear, and having horizontal link-recesses 2, slot 12, with vertically-movable dog 11 pivoted therein, and having curved under portion, 13, projecting across the upper recess 2, with curved outer end projecting into pin-hole 5, and having concave slotted head 15 and the vertically-movable dog 16, pivoted in slot 17 beneath dog 11, and having under curved portion, 18, projecting across the end of lower link-recess 2, and the shouldered curved portion 19 on its upper side bearing against the under side of dog 11, in combination with the coupling-pin 9, having annular slot 20 adjacent to its flange 10, substantially as shown and described.

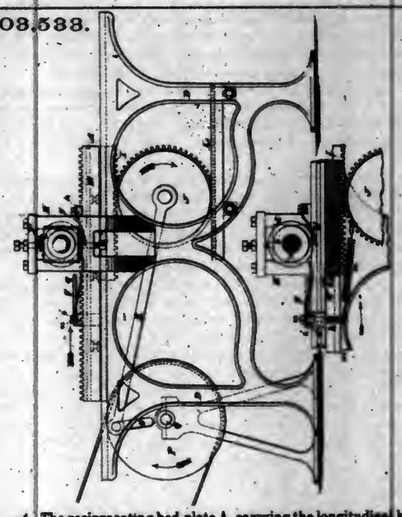
408,532. CATTLE-GUARD. JAMES T. HALL, St. Louis, Mich. Filed Oct. 29, 1888. Serial No. 289,363. (No model.)

Claim.—1. A railway cattle-guard of the kind described, composed of flexible bars set upon edge in the form of a grating and free to vibrate laterally, substantially as described.

2. A railway cattle-guard of the kind described, composed of flexible bars set up on edge lengthwise of the track and connected at their ends only in sections in the form of gratings and supported by raised ties under the ends, substantially as described.

3. The combination, with the ties extended as described, of sloping side fences having their posts secured directly to the extended ends of said ties, substantially as and for the purpose specified.

4. The combination, with the rails and ties, of the guard, between said rails, the extended ties supporting the ends of said guard, the sloping side fences secured to the ends of said extended ties, and a section of guard between the rail and the side fences, substantially as shown and described.



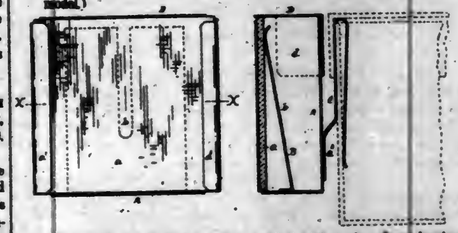
408,533. MACHINE FOR SLITTING SHEETS OF TIN. WILLIAM HIPPERLING, New York, N. Y., assignor to Stephen A. Gunn, Plainfield, N. J., and Richard A. Donaldson, Brooklyn, N. Y. Filed Jan. 5, 1889. Serial No. 295,489. (No model.)

Claim.— 1. The reciprocating bed-plate A, provided with the transverse grooves S, combined with the angle-bars crossing said grooves and carrying the longitudinal knives V, the adjusting-bolts W, for said bars, the rotating knives *d*, spring-fingers *g*, and mechanism, substantially as described, for imparting to the bed-plate a reciprocating movement and to the knives *d* a rotary movement, substantially as set forth.

2. The reciprocating bed-plate A, having transverse grooves S and carrying the angle-bars T, knives V, and rack-bars E, combined with the transverse shaft G, circular knives *d*, gear-wheels F, engaging said rack-bars, spring-fingers for stripping the widths of tin from the knives, and mechanism, substantially as described, for imparting to the bed-plate a reciprocating movement between the sides of the machine.

3. The reciprocating bed-plate carrying the longitudinal knives and rack-bars E, combined with the transverse shaft carrying circular knives and engaging said rack-bars, the rack-bars I L, gear-wheel J, connecting-rod K, and wheel P, the latter being upon the driving-shaft, substantially as and for the purpose set forth.

408,533.



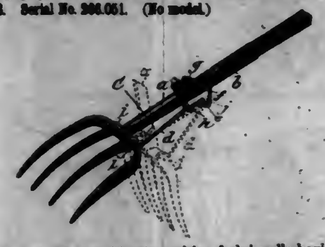
4. The reciprocating bed-plate A, carrying the longitudinal knives V, combined with the circular knives *d*, the transverse bar *i*, spring-fingers *g*, secured to said bar, standards *j*, bolts *k*, slots *m*, springs *n*, and mechanism, substantially as described, for imparting a reciprocating movement to the bed-plate, substantially as and for the purpose set forth.

408,534. VETERINARY INSTRUMENT. GEORGE W. HOLAND, Shelbyville, Ill., assignor to William W. Thornton, same place. Filed Mar. 16, 1889. Serial No. 303,503. (No model.)

Claim.—The combination of the hinged side bars, the bit-rods connecting the free ends thereof, and the notched bars pivoted to one of the bit-rods and engaging the other, substantially as described.

408,535. SAMPLE-HOLDER AND BOX-PULL. WILLIAM W. JOHNSON, Palmyra, Nebr. Filed Sept. 12, 1888. Serial No. 285,272. (No model.)

Claim.—1. An inclosing-case provided with a glass front having in combination therewith an interior upwardly-projecting tongue, constructed to hold a sample and a clasp to engage a box, substantially as described.



2. The combination, with the inclosing-case provided with a glass front and means for attachment to a box, of a spring-tongue secured at one end to the interior of said case and having its opposite end inclining toward said glass front, substantially as set forth.

3. An inclosing-case provided with a glass front having in combination therewith an upwardly-extended slotted tongue constructed to hold a sample and press it against the glass front, a clasp to engage a box without interfering with the box-cover, and a cap removably connected with the case, substantially as described.

4. The combination of the inclosing-case and a clasp united thereto toward the base and separated from the case at the top to

engage over the edge of a box without interfering with the box-cover, substantially as set forth.

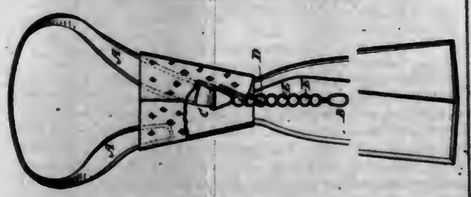
408,536. FORK. OTTO KRAMER, Unionville, Mich. Filed Mar. 3, 1888. Serial No. 266,051. (No model.)

Claim.—1. The combination, with a fork-handle having a slot at its lower end, of a loop secured to said handle and having an offset, and a fork having its tine pivoted in the slot of the handle, and a slide-brace secured at one end to the fork and its opposite end bearing in the loop, substantially as specified.

2. The combination, with a handle having a slotted ferrule at one end, of a fork having its shank pivoted in the slot, a loop secured to the fork-head, with one end adapted to receive a set-nut and also having an offset, a set-nut adapted to hold the fork to the handle in a straight position, and the slide-brace secured at one end to the fork and having its opposite end bearing in the loop, so that the fork may be held in an angular position with respect to the handle, substantially as specified.

408,537. TOP ROLL FOR SPINNING-MACHINES. EDWARD LAFLOR, Willimantic, Conn., assignor of one-half to Theodore R. Stowell, Providence, R. I. Filed Dec. 15, 1888. Serial No. 293,099. (No model.)

Brief.—The object of the invention is to enable the two rolls of a pair to act independently one of the other and to diminish wear upon the rolls and their supporting devices

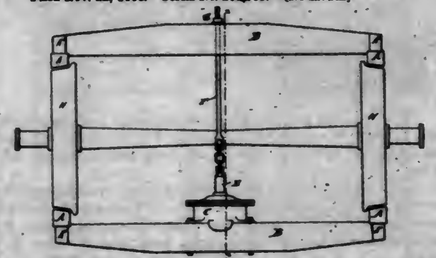


Claim.—1. The improved top roll herein described, having a shaft which is mounted in bearings, so as to be capable of vertical movement therein, but incapable of rotation, the shells B, pivotally mounted on said shaft and capable of limited vertical oscillation, and the rotatable shells C, mounted on the oscillating shells B and provided with suitable drawing-surfaces, substantially as specified.

2. The combination of the cap-bars D, having vertical slots, the shaft A, having the square-faced ends *a* and the saddle-bearing *d*, the shells B, the pins A, and the shells C, substantially as specified.

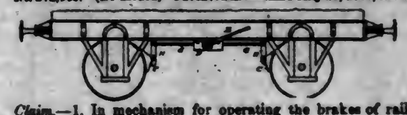
3. The combination of the vertically-slotted cap-bars D, the shaft A, having the square-faced ends *a*, the shoulders *b b'* *c c'*, and the saddle-bearing *d*, the shells B, the pins A, and the shells C, substantially as specified.

4. The combination of a vertically-movable non-rotatable shaft, bearings for said shaft, vertically-movable non-rotatable shells mounted on said shaft and capable of vertical oscillation thereon, and tubular draw-rolls mounted rotatably on said shells, substantially as specified.



408,538. NECKSCARF. ADOLPH LANDER, New York, N. Y., assignor, by mesne assignments, to Sophie Lander, same place. Filed June 9, 1888. Serial No. 276,565. (No model.)

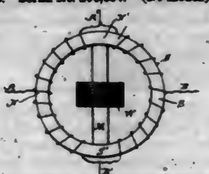
Claim.—1. A necktie having a detaining-pin, D, and provided with a neckband secured at one end to the necktie, and having at the outer extremity of its free end an attached metallic tip, B, provided with a series of orifices, E, arranged in line along the length of the tip, and through which the detaining-pin passes at a point beyond the neckband to hold the neckband in its adjusted position and secure the necktie to the neck of the wearer, substantially as described.



2. The combination, with a necktie having a detaining-pin, D, and a neckband, C, secured at one end to the necktie, of a tip secured to the outer extremity of the neckband, and consisting of a single piece of serpented wire bent between its ends to form two members, and having the serpented portions of one member crossing the serpented portions of the other member to form the line of separated orifices E, through which the detaining-pin passes at a point beyond the neckband to hold the latter in its adjusted position, substantially as described.

408,539. POWER-BRAKE. LOUIS P. LAWRENCE, Passaic, N. J., assignor to the Lawrence Railway Brake Company, New York, N. Y. Filed Nov. 22, 1888. Serial No. 291,595. (No model.)

Claim.—The combination, with two brake-beams carrying shoes which are adjacent to the rims of wheels, said beams being mounted to move toward each other when pressing the shoes against the rims of the wheels, of a brake-cylinder secured to the inner surface of one brake-beam, a piston in said cylinder mounted to move toward the inner edge of the brake-beam to which its cylinder is secured while operating, and a rod connected with said piston and with the other brake-beam, substantially as set forth.



408,540. BRAKE FOR RAILWAY-WAGONS. WILLIAM S. LAYCOCK, Sheffield, County of York, England. Filed Apr. 26, 1888. Serial No. 272,165. (No model.) Patented in England May 25, 1887, No. 7,562.

Claim.—1. In mechanism for operating the brakes of railway rolling-stock, the combination, substantially as hereinbefore specified, of a transverse horizontal operating-shaft having at each end means for turning the same by hand, brake-shoes opposed to each other in customary manner, and screw-and-lever connections, substantially as shown, between said shaft and the brake-shoes, for the purposes set forth.

2. The combination of the transverse screw-threaded shaft A, its levers B and fixed collars, the brake-shoes C, internally-screw-threaded bearing D, bell-crank levers F, and connecting-rods G, substantially as hereinbefore specified, for the purpose set forth.

408,541. ELECTRICAL CONVERTER. HERMANN LEMP, Lynn, Mass., assignor to the Thomson Electric Welding Company, of Maine. Filed Feb. 4, 1889. Serial No. 298,857. (No model.)

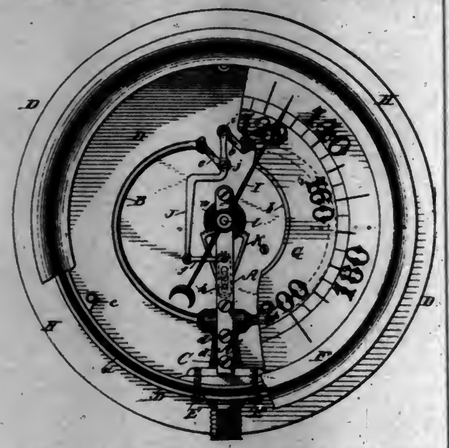
Claim.—1. In an induction-coil or converter, the combination, substantially as described, of an alternating current primarily wound on an endless core, a magnetic bridge joining the sides of said core and carrying the secondary, and an electric switch connected with the primary coils for varying the position of the poles of the primary with relation to the ends of the bridge.

2. In an induction-coil or converter, the combination, with a circular or endless iron core or carrier having one set of coils wound upon it, of an iron bridge or connecting-piece joining opposite sides of said carrier and wound with a second set of coils constituting the primary or secondary, as the case may be.

3. In an induction-coil or converter, the combination, with an endless core or carrier wound with primary coils in series, of a stationary magnetic bridge-piece, and an adjustable commutator having blocks or plates connected in regular order to the circuit of the primary coils, and commutator-brushes for passing current through

said primary in two branches or circuits, as and for the purpose described.

4. A variable-current induction-coil or converter having a primary circuit formed through a commutator and coils constructed after the manner of a Gramme armature, in combination with a secondary wound on an iron bridge-piece connecting opposite sides of the iron core for the primary, as and for the purpose described.



408,542. BRUSH. CHARLES LOCHER, Paris, France. Filed Jan. 3, 1889. Serial No. 295,272. (No model.) Patented in France Nov. 2, 1888, No. 190,831.

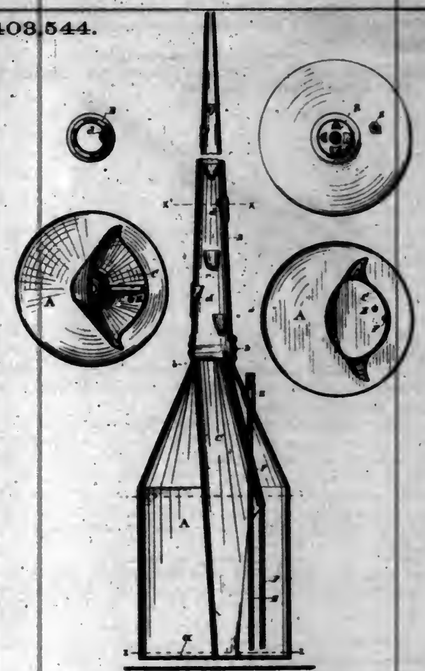
Claim.—1. As a new article of manufacture, a brush having its stock provided with tuft-receiving holes and with ventilating-openings communicating with the tuft-receiving holes, substantially as described.

2. As a new article of manufacture, a brush having its stock provided with tuft-receiving holes and with ventilating-openings communicating with the tuft-receiving holes, said openings being of smaller diameter than the tuft-receiving holes, substantially as described.

408,543. VACUUM OR PRESSURE GAGE. MARTIN LINCOLN, Bridgeport, Conn. Filed Jan. 19, 1888. Serial No. 261,290. (No model.)

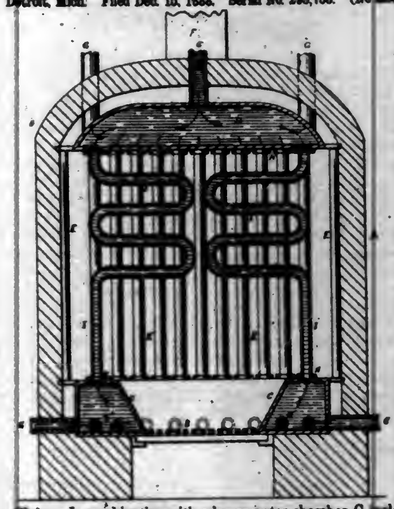
Claim.—In a vacuum or pressure gage, the combination of the index pinion-shaft, the pivoted toothed segment, and the pivoted lever connecting the free ends of the tubes, said pivotal bearings being supported independent of the casing, the respective axes of such parts being adjusted in a vertical plane, and the stroke of the segment adjusted to assume a balance position when the index indicates a desired pressure indication, as set forth.

408,544. OIL-CAN. FRANKLIN MARANVILLE, Clinton, Ohio. Filed Mar. 21, 1888. Serial No. 304,210. (No model.)



Claim.—1. An oil-can having the component parts consisting of an oil-chamber, A, a conductor, C, extending from the bottom to the top of said chamber, arranged in open connection with the tube B, in combination with an air-pipe, arranged in relation with the said chamber in the manner substantially as described, and for the purpose set forth.

2. In combination with the oil-chamber, a tube, B, provided with one or more cups in the interior thereof, and an air-tube extending into said chamber, with a conductor arranged therein for conveying oil therefrom to the said tube, in the manner and for the purpose substantially as described.

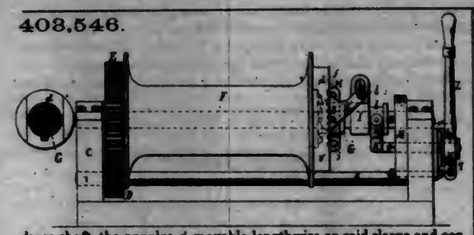


3. In an oil-can, a conductor extending from bottom to top of the oil-chamber, in combination with the tube B, constructed substantially as shown, and for the purpose set forth.

4. In combination with an oil-can, the tube thereof provided with cups, being at their upper side in communication with the interior of said tube and can, formed and arranged substantially as shown, and for the purposes described.

408,544.

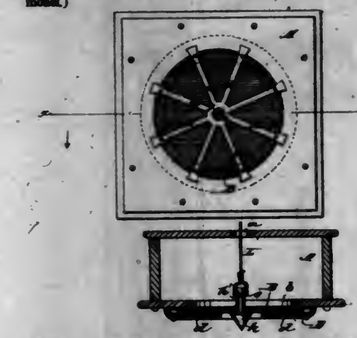
408,545. CIRCULATING-WATER HEATER. JAMES HEATH, Detroit, Mich. Filed Dec. 15, 1888. Serial No. 293,753. (No model.)



Claim.—In combination with a lower water-chamber, C, inclosing the fire-grate, an upper water-chamber, D, supported thereon by tubes or rods E K, a double series of identical and homogeneous tubes, I, also connecting said chambers, arranged on opposite sides of the fire-box with corresponding parts thereof in parallel, vertical, and horizontal planes with intervening spaces, and return circulation-tubes G, said heating-chambers and tubes being connected in such manner as to permit the exposure of their entire surfaces above the base to the action of the heat, substantially as and for the purpose set forth.

408,546. HOISTING APPARATUS. FRANCIS MCMAHON, Somerville, assignor of one-half to John W. McMahon, West Roxbury, Mass. Filed Feb. 2, 1888. Serial No. 263,486. (No model.)

Claim.—1. In a hoisting apparatus, the drum provided with the chamber *a*, and the annulus *c*, fixed to said drum, the sleeve G, provided with a flange arranged in the chamber *a* and splined to the



408,546.

drum-shaft, the annulus *d*, movable lengthwise on said sleeve and connected thereto by a spline, the clasp H, applied to the said sleeve and having pivots *g*, the levers *k*, fulcrumed on said pivots and at their outer ends arranged in the slot of slide I, the said slide splined to the drum-shaft, and the forked slide K, supported in the frame and having rolls *n* in the prongs of its fork to work in the groove *l* of the slide I and operated by a screw and nut, the latter worked by an arm, L, clamped to it, said mechanism being for clutching the drum of the apparatus to the drum-shaft, all being arranged and supported essentially as shown and set forth.

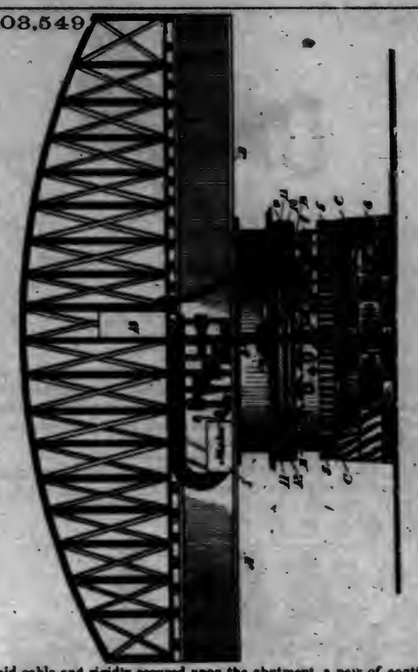
2. The combination of the drum-shaft adapted to be revolved by suitable mechanism, the drum chambered, as shown, the flanged sleeve G, connected to the drum by the annulus *c* fixed thereto, the annulus *d*, splined to the said sleeve, and the levers A, fulcrumed to the sleeve G and connected at their outer ends to the slot in the slide I, the latter operated longitudinally on the drum-shaft by a slide connected to a handle, L, essentially as shown, and for the purpose set forth.

408,547. MECHANICAL TELEPHONE. WILLIAM W. HUBBELL, New York, N. Y., assignor to the American Private Line Telephone Company, same place. Filed Oct. 1, 1887. Serial No. 251,304. (No model.)

Claim.—1. In a mechanical telephone, the combination, with the diaphragm B, of radial plates *d*, held in front of the diaphragm and secured at their ends to the casing and held under constant tension by the line-wire, substantially as described.

2. The combination, with the diaphragm B and the radial plates *d*, and central apertured plate, *f*, held in front of the diaphragm, and the plates *d*, secured at their ends to the casing, of the button A, formed with a reduced shank, *k*, pressed at *c* and adapted to pass through the center of the plate *f* and diaphragm and to be connected to the line-wire, so that the latter will exert a constant tension upon the plates *d f*, substantially as described.

408,548. COMPOUND FOR PIPING, BOWLS, &c. BENTH. H. CLARKE and CHARLES GARSIDE, Victoria, British Columbia, Canada. Filed Oct. 5, 1888. Serial No. 287,202. (No specimens.)



Claim.—1. The herein-described composition of matter, consisting of sand, forty-three per cent.; sulphur, thirty-three per cent.; pitch, one per cent., and an earth, such as ground burnt clay, twenty-three per cent., mixed together under the action of superheated steam, substantially as specified.

2. The herein-described composition of matter, consisting of sand, sulphur, pitch, and an earth, such as ground burnt clay, mixed together under the action of superheated steam, substantially as specified.

408,549. MEANS FOR OPERATING DRAW-BRIDGE SPANS BY ELECTRICITY. JOHN M. OSFORD, Bridgeport, Conn. Filed Mar. 2, 1889. Serial No. 301,745. (No model.)

Claim.—1. The combination, in an apparatus for electrically actuating draw-bridge spans, with a cable containing the circuit-wires and extended beneath the channel, of a pair of brushes connected to

408,549.

said cable and rigidly secured upon the abutment, a pair of continuous copper conductors secured upon and movable with the draw-span and engaged by said brushes, a motor connected to said conductors and geared to the driving-pinion, and suitable mechanism, as a rheostat and switches, interposed between the conductors on the span and the motor, whereby the speed and direction of rotation of the motor may be governed, substantially as set forth.

2. The combination, in an apparatus for electrically operating draw-bridge spans, with the abutment upon which said span is mounted and adapted to turn, of the shore-circuit extended beneath the channel and terminating in a pair of brushes affixed to the abutment, a pair of continuous metallic strips mounted upon and insulated from the draw-span base and engaged by said brushes, a motor secured in and moving with the draw-span, gearing arranged between the motor and the bridge-driving pinion-shaft, connections extending from the metallic strips to the motor, and suitable instruments for the control of said circuits located at a point accessible from the bridge-floor and interposed into the circuit between the motor and the metallic strips, substantially as specified.

408,550. STEM FOR CIGAR AND CIGARETTE HOLDERS OR PIPES. IRVING PAINE, Hornellsville, N. Y. Filed May 9, 1888. Serial No. 273,348. (No model.)

Claim.—1. A stem for a cigar-holder or pipe, having a longitudinal bore and cut away on its under side and provided with ways, in combination with a removable hollow sleeve longitudinally slotted and adapted to slide upon the ways and form an independent chamber below the plane of the bore, and an aperture connecting this chamber and bore, substantially as specified.

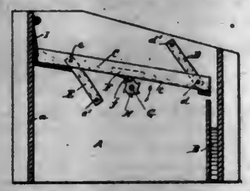
2. The stem 1, having the longitudinal bore 2, shoulder 3, recess 4, aperture 9, and opposite ways 5, in combination with the sleeve 6, threaded, as at 11, and slotted, as at 7, and mounted on the ways, and with the holder 13, having stem 12, substantially as specified.

408,551. TILTING COLTER-HOLDER. WILLIAM H. PERRIN, Smith's Falls, Ontario, Canada, assignor of one-half to Benjamin Osborne, same place. Filed Oct. 11, 1888. Serial No. 287,817. (No model.)

Claim.—The combination, with the plow-beam, of the colter arranged adjacent to one side of the beam and having a longitudinal series of transverse openings, the clip-plate passing around the beam and the colter and having the top *c*, resting on top of the beam, the bottom *c'*, bearing against the bottom of the beam in a vertical plane in rear of the vertical plane of the top *c*, and the downwardly and

408,551.

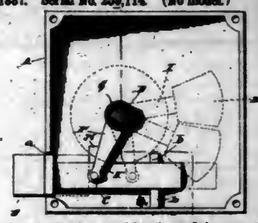
rearwardly inclined sides c^3 c^4, connecting the top and bottom, the side c^2 having a perforation and bearing against the side of the colter, and the side c^4 bearing against the side of the beam, and the set-screw mounted in the perforation in the side c^2, and passing through one of the openings in the colter, as set forth.



408,552. METHOD OF ORNAMENTING GLASS. LÉON PERTUS, Green Point, assignor to the Ravenswood Art Glass Works, New York, N. Y. Filed Feb. 7, 1889. Serial No. 299,001. (No model.)

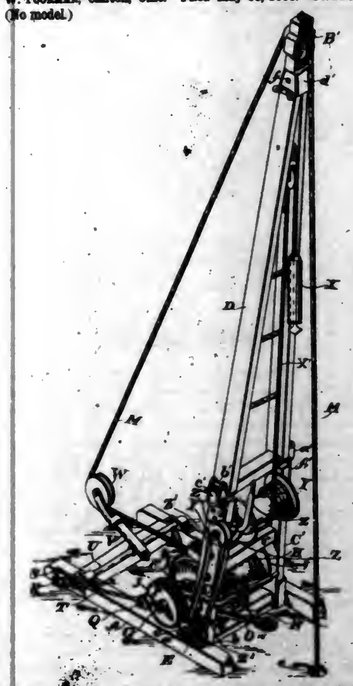
Claim.—1. The method herein described of ornamenting vitreous articles, which consists in covering portions of the article with a protective layer, then revolving the article, and while revolving causing portions of the same to pass at intervals through an acid etching-bath to etch the unprotected portions, and continuously brushing off the eaten portions of the article while it is revolving through the bath, substantially as set forth.

2. The method herein described for ornamenting vitreous articles, which consists in covering portions of the article with a protecting layer and leaving other portions unprotected, then rotating the article, and while rotating subjecting the unprotected portions at intervals to the action of an etching-bath, and continuously removing the eaten portions while the article is revolving through the bath, substantially as set forth.



408,553. SCREEN. WILLIAM J. PHILLIPS and CHARLES HUMPHRYS, Wauseon, Ohio. Filed July 17, 1888. Serial No. 280,189. (No model.)

Claim.—1. In a sieve, the combination, with the stationary frame provided with a back piece for the screen to strike against, of the rearwardly-inclined arms pivoted to the ends of the sieve and to the said frame, the inclined sieve, the plates provided with sloping projections *f* and secured to the sieve midway between the screen pivot-pins, and the revolving ratchet-wheels journaled under the said plates and operating upon their sloping projections, and permitting the screen to fall downwardly and rearwardly against the said back piece, substantially as set forth.



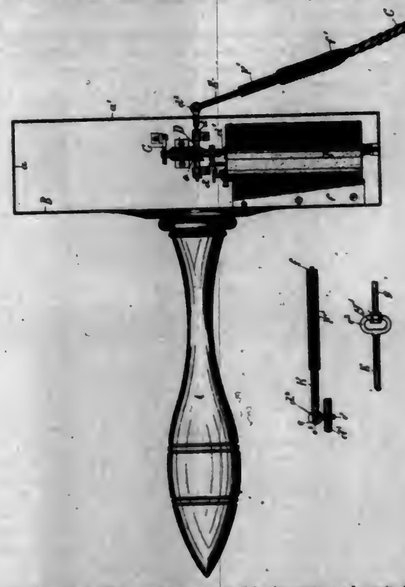
2. In a sieve, the combination, with the stationary frame having sides A and back *a*, of the inclined sieve, the inclined arms D, pivoted to the front end of the sieve and to the sides A above the sieve, the inclined arms E, pivoted to the rear end of the sieve and to the said sides below the sieve, the spring secured to the back *a* and pressing the sieve against it, the plates provided with sloping projections *f* and secured to the sieve between the pivot-pins, and the revolving ratchet-wheels journaled under the said plates for lifting and releasing the sieve, thereby causing it to strike against the said back piece at the extremity of its rearward and downward motion, substantially as set forth.

408,554. LATCH. FRANK L. PIERCE, Clay Centre, Kans. Filed Dec. 27, 1887. Serial No. 259,114. (No model.)

Claim.—In a lock, the combination of the case S, provided with an opening, *a*, the guide-studs *b b*, and the stop N, the bolt B, operating between the guide-studs and projecting through the opening *a*, the squared knob-shaft mounted in registering bearings in the sides of the case, the sleeve G, arranged on the said shaft within the case and provided with a lever or arm, F, having a loop, K, engaging a spindle, C, on the bolt, the said lever or arm being adapted to engage the stop N to limit the outward movement of the bolt, and the weighted arms L, connected to the knob-shaft, substantially as specified.

408,555. ROCK AND EARTH DRILLING MACHINE. SAMUEL W. POORMAN, Canton, Ohio. Filed May 18, 1888. Serial No. 274,234. (No model.)

Claim.—1. The combination, with the supporting-frame A, of a driving-pinion, E, shaft G, wheel J, loosely mounted thereon, said wheel having on its inner face clutch-lugs and on its outer face a series of internal rack-teeth, *k*, plate P, having on its inner face a pawl, *x*, and on its outer face a crank-pin, Q, connecting-rod T, crank-pin R, lever S, rock-shaft U, arm V, sheave W, and rope M, whereby the drill may be raised or dropped alternately, substantially as described, and for the purpose set forth.



2. The combination, with the supporting-frame A, having standards C and C', of a driving-pinion, E, shaft G, wheel J, loosely mounted thereon, hangers F, having journal-boxes *e* pivotally secured therein, a spool, H, brake-wheel *j*, lever O, clutch K, and lever L, whereby the raising of the rope and drill may be under the control of the operating-power and the descent of the same controlled by the foot of the operator on the lever O, substantially as described.

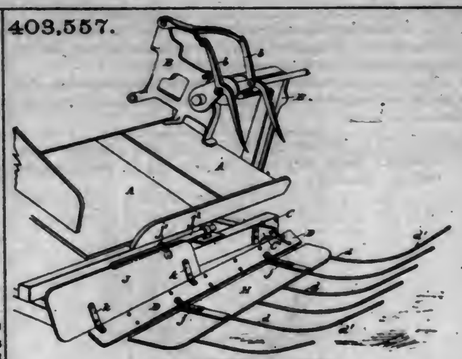
3. The combination of the driving-pinion E, shaft G, wheel J, loosely mounted thereon and provided with rack-teeth *k*, a ratchet-plate, P, mounted on said shaft G and provided with a pawl, *x*, which engages the rack-teeth *k*, the rock-shaft U, the connecting-rod T, connecting said rock-shaft with said ratchet-plate, a vibrating arm, V, secured to the said rock-shaft, a sheave, W, journaled in said arm, rope M, spool H, upon which the rope is wound, worm-wheel *g*, and worm *q*, whereby the drill may be lowered or raised during the operation of the drilling, substantially as set forth.

4. The combination of the driving-pinion E, wheel J, geared therewith, clutch *k*, and spool H, mounted upon the shaft of the wheel J, rope M, wound upon said spool, brake-wheel *j*, secured to said spool, the lever O, for operating the brake-wheel *j*, and the lever N, for operating the clutch, whereby the drill may be raised and lowered, substantially as set forth.

5. In a rock and earth drilling machine, the combination of the driving-pinion E, a gear-wheel, J, having peripheral cogs and a series of internal rack-teeth, a ratchet-plate loosely mounted thereon, a pawl to engage the rack-teeth, a rock-shaft, U, provided with an arm, S, a rod, T, for connecting said rock-shaft and ratchet-plate, and an arm, V, secured to said rock-shaft and provided with a sheave, substantially as set forth.

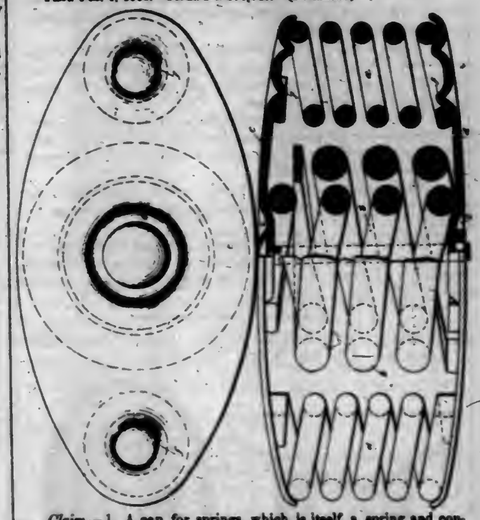
408,556. MUSICAL SKIPPING-ROPE. LEWIS RITCHIE, Portland Place, County of Middlesex, England. Filed Oct. 6, 1888. Serial No. 287,405. (No model.) Patented in England Dec. 5, 1887, No. 16,711.

Claim.—1. The combination of skipping-rope end made fast to one member of a swivel, a swivel one member of which is so made fast to a skipping-rope end and the other connected by a knuckle-joint to the end of the first-motion shaft of a musical box, said knuckle-joint being produced in the adjacent ends of the said swivel member and the first-motion shaft, as set forth.



2. The combination of a musical box the first-motion shaft of which is continued through the side of the box, where it is connected by means of a knuckle-joint to a rod about which a tube to which a skipping-rope end is made fast is free to rotate, the said rod and tube together forming a swivel connecting the said skipping-rope end and the first-motion shaft, as set forth.

408,557. BUNDLE-CARRIER. JOHN M. ROSEBROCK, Hoosick Falls, N. Y. Filed May 9, 1888. Serial No. 273,263. (No model.)

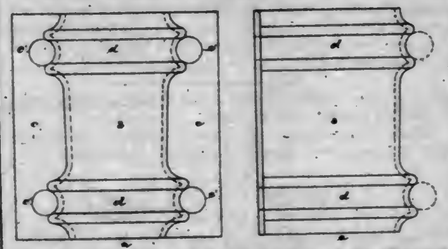


Claim.—1. The combination, with the downwardly-folding carrier-rods, of a hinged board resting upon the carrier-rods, substantially as and for the purpose specified.

2. The combination, with the downwardly-folding carrier-rods and the hinged supporting-board in which the rods are pivoted, of the board or shield J, hinged to the supporting-board, substantially as and for the purpose described.

408,557.

408,558. CAR-SPRING. CHARLES T. SCHOEN, Philadelphia, Pa. Filed Feb. 6, 1888. Serial No. 298,843. (No model.)

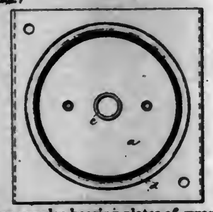


Claim.—1. A cap for springs, which is itself a spring and constructed curved, convex, or elliptical in longitudinal section, substantially as described.

2. A cap for springs, which is itself a spring and convex, curved, or elliptical in shape, substantially as described.

3. A spring composed of a suitable number of spiral springs, and caps which are themselves springs, arranged at opposite ends of the spiral springs and made curved, convex, or elliptical in shape, substantially as described.

408,559. STAKE-POCKET FOR CARS. CHARLES T. SCHOEN, Philadelphia, Pa. Filed Mar. 5, 1888. Serial No. 301,906. (No model.)



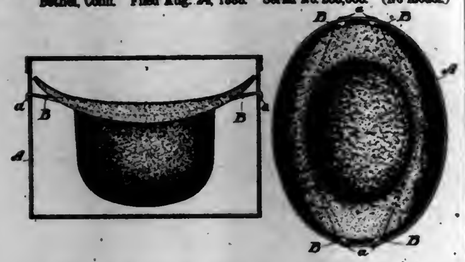
Claim.—1. A stake-pocket for cars constructed of wrought metal and having its bolt-receiving portions formed of the substance of the body elevated or projected beyond the plane of the body, whereby said stake-pocket is rendered interchangeable with ordinary cast-iron stake-pockets with respect to the U-bolts and holes therefor, substantially as described.

2. A wrought-metal stake-pocket for cars, having bolt-receiving portions elevated or projected beyond the plane of the body, and further provided with spuds, substantially as described.

3. A wrought-metal stake-pocket for cars, composed of the body *a*, bolt-receiving portions *d*, flanges *c*, with bolt-holes, and spuds *e*, substantially as described.

408,560. CENTER BEARING-PLATE FOR RAILWAY-CARS. CHARLES T. SCHOCH, Philadelphia, Pa. Filed Mar. 15, 1889. Serial No. 303,421. (No model.)

Claim.—1. Center annular bearing-plates of wrought metal, constructed with concentric ribs, combined with interposed bearing-pieces, substantially as described.

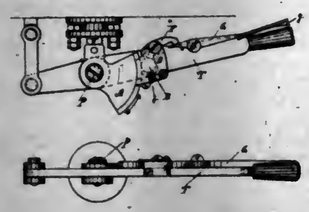


2. Center bearing-plates of wrought metal, constructed with concentric ribs and flanged central openings, combined with annular bearing-pieces interposed between the ribs, and also around the center openings, substantially as described.

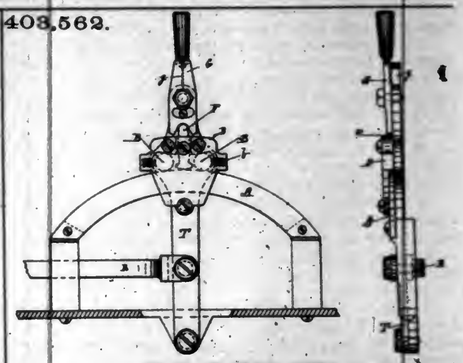
3. Wrought-metal center bearing-plates constructed with concentric intermeshing ribs or projections, combined with an annular bearing-piece placed between said ribs and held from lateral displacement by them, substantially as described.

4. Center bearing-plates of wrought metal, constructed with stiffening-ribs and an interposed bearing-ring, substantially as described.

5. Center bearing-plate constructed of wrought metal with central flanged openings, and a bearing-ring surrounding such flanged openings and adapted to the shape of the plates adjacent to such openings, substantially as described.



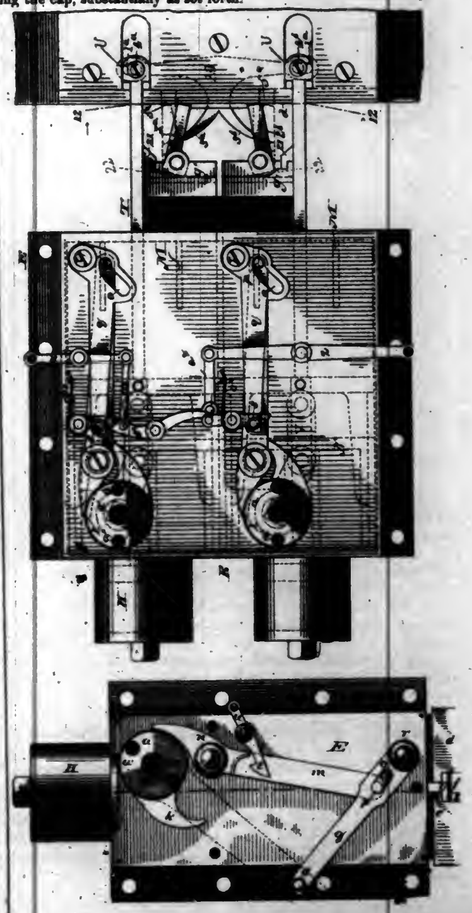
408,561. HAT-PACKING SUPPORT. MYRON C. SCHOONMAKER, Bethel, Conn. Filed Aug. 24, 1888. Serial No. 283,660. (No model.)



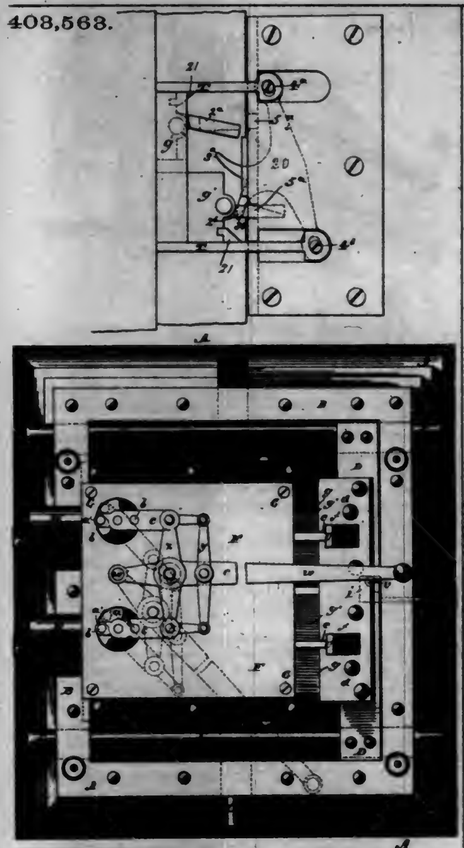
Claim.—A hat-packing support consisting of two parallel and elastic bands extending in the same horizontal plane diametrically across the interior of the bandbox, said bands being separated by a space considerably less than the diameter of the base of the hat crown, and normally secured at their extremities to the said box, whereby, when the hat-crown is inserted and depressed between said bands, the latter will automatically yield and by their resiliency exert a firm grip on said crown and hold the hat in suspension within the box, substantially as shown, and for the purposes set forth.

408,562. LEVER-CLUTCH. ALLISON M. STICKNEY, Medford, Mass. Filed Feb. 9, 1889. Serial No. 299,305. (No model.)

Claim.—In combination, the clutch A B, holder D, and levers F and G, all arranged and operating substantially as described.



408,562.



408,563. BOLT-WORK MECHANISM. EMORY STOCKWELL, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed July 2, 1888. Serial No. 278,775. (Model.)

Claim.—1. In an automatic double bolt-operating device, the combination of a series of locking and unlocking mechanisms and a series of fastening mechanisms adapted to release both locking mechanisms by the action of either one or more time mechanisms, substantially as set forth.

2. In combination with a case containing bolt-throwing mechanism, a cap for protecting the locking-levers and provided with an aperture, so that the setting-wrench may be applied without removing the cap, substantially as set forth.

408,563.

3. A double automatic bolt-operating device composed of duplicate single automatic bolt-operating devices, combined with mechanism for simultaneously setting them and with mechanism for simultaneously releasing them, substantially as set forth.

4. The combination of a double mechanism for throwing bolt-work and a double wrench for simultaneously setting both parts of the double mechanism, substantially as set forth.

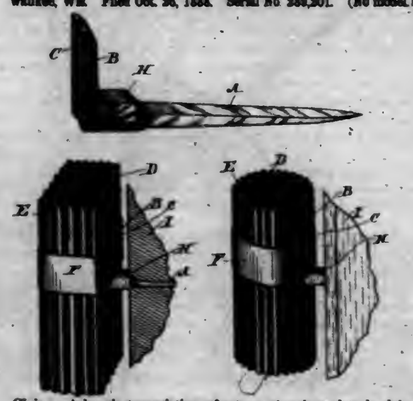
5. In combination with a double automatic mechanism for throwing bolts, a double wrench constructed with parallel pivoted arms, so that neither of said arms can operate its proper locking or toggle shaft unless both mechanisms are unlocked, substantially as set forth.

6. In a double bolt-operating mechanism, the double wrench, in combination with two locking-shafts and a fixed pivot which serves as a guide and support around which the wrench rotates in setting the mechanisms, substantially as set forth.

7. In a double wrench for setting a double bolt-operating mechanism, a hand-lever, *w*, connected to two single arms or wrenches by means of the cross-arm *x*, substantially as set forth.

8. In a double bolt-throwing device, two pivoted push-dogs which normally rest against some portion of the bolt-work and either of which, upon the failure of its side of the bolt-throwing mechanism to work, may be pushed out of connection with the bolt-work, so as to offer no obstruction to its retraction, substantially as set forth.

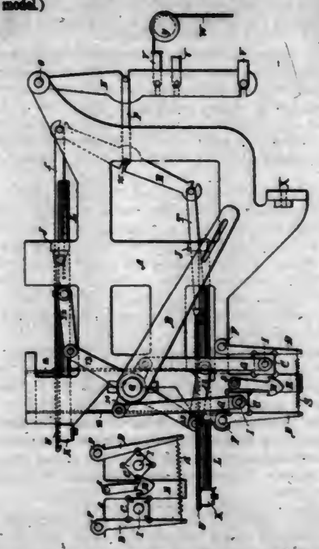
9. In a double automatic bolt-throwing device, two independent draw-bars, each provided with a bracket or support for holding the push-blocks in proper position, substantially as set forth.



10. In a double bolt-operating mechanism, the combination of two independent draw-bars, and a yoke pivotally connecting them and provided with projecting arms resting against slotted push-dogs, whereby if one of said mechanisms fails to act the arm of the yoke will push aside and pass through the push-dog, thus disconnecting and rendering harmless that mechanism which has failed to work, substantially as set forth.

11. In a double automatic bolt-operating mechanism, the combination of a double pivotal arm and two retaining-hooks which are both moved by said arm through the operation of a time lock or locks and both mechanisms released thereby, substantially as set forth.

12. In a double wrench for setting a double bolt-operating mechanism, a hand-lever, *w*, connected to two single arms by means of the parallel pivoted cross-arm *x* and *y*, which maintain the arms parallel to each other, substantially as set forth.

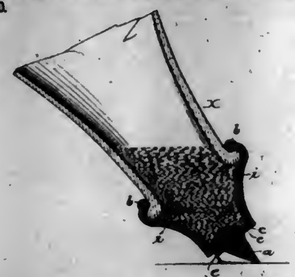


13. The combination, with the double mechanism for throwing bolt-work, of the pivoted lever *z*, the link z^3, the centrally-pivoted lever b^3, and the latches *t*, substantially as set forth.

408,564. PIPE-SUPPORTING DEVICE. HUGH J. SULLIVAN, Milwaukee, Wis. Filed Oct. 26, 1888. Serial No. 289,301. (No model.)

Claim.—A bracket consisting of a tang, A, adapted to be driven into the side of a building, an enlarged shank, H, and a head, B, having a vertical channel, C, in its face, in combination with a corrugated metal water-pipe and a band, F, fitting closely but movably about the pipe and the head of the bracket, the channel in the face of the bracket being constructed and adapted to receive therein and fit closely upon an outwardly-projecting corrugation of the pipe, substantially as described.

408,565. DOUBLE-LIFT OPEN-SHED DOBBIES. WILLIAM P. UHLINGER, Philadelphia, Pa. Filed Sept. 26, 1887. Serial No. 250,889. (No model.)

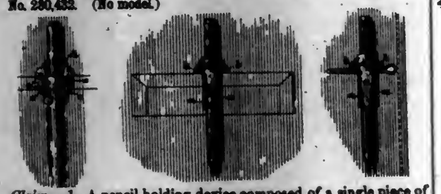


Claim.—1. In combination, hooks, means, substantially as described, to operate said hooks, lever R, links connecting said hooks and lever R, harness-actuating lever N, and link P, connecting said lever R and lever N.

2. In combination, the card-cylinders of a Jacquard machine, the arms D D, attached to the frame, and the spring S, connecting said arms, substantially as and for the purpose described.

3. In combination, the card-cylinders of a Jacquard machine, the arms D D, attached to the frame, and the spring S, connecting said arms and hook H, all constructed and operating substantially as and for the purpose described.

408,566. RESERVOIR-BRUSH. WALTER H. UNDERWOOD, Yonkers, N. Y. Filed Aug. 20, 1888. Serial No. 284,169. (No model.) Patented in England Feb. 28, 1888, No. 311, and in France July 30, 1888, No. 179,070.



Claim.—1. A nozzle provided with a flattened slit end of flexible material and with a terminal blade of greater rigidity projecting outward adjacent to the slit, substantially as described.

2. The within-described nozzle, having a body portion adapted for attachment to a reservoir and closed by a top, *c*, a solid blade extending from said top, and slits *e e*, at an angle to each other in the top at the base of the blade, substantially as described.

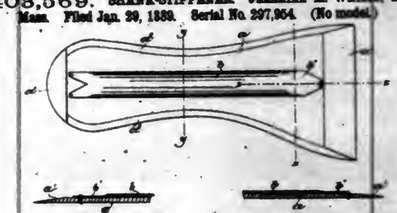
3. A nozzle composed of a hollow nipple of flexible material having distributing-slits *e*, and air-inlet slits *i*, substantially as and for the purpose set forth.

408,567. PENCIL-HOLDER. SECURNEY WALES, Terre Haute, Ind., assignor to Charles B. Fox, Boston, Mass. Filed July 19, 1888. Serial No. 280,432. (No model.)

Claim.—1. A pencil-holding device composed of a single piece of metal provided with a suitable pencil-holding socket, *d*, having a plurality of downwardly-projecting fingers, *a*, and also provided with two downwardly-projecting fingers, *b b*, each provided with a series of teeth upon one edge thereof, said fingers *a* and *b* being so arranged relative to each other that said holder may be secured to the garment by inserting a portion thereof between two of the fingers *a* and the fingers *b b*.

2. A pencil-holding device composed of a single piece of metal provided with a suitable pencil-holding socket, *d*, having a plurality of downwardly-extending fingers, *a a*, and also provided with two downwardly-projecting fingers, *b b*, the lower end of each of which is arranged to overlap the edge of one of said fingers *a a*, whereby said fingers *a a* and *b b* are adapted to secure said holder to a garment by engaging with opposite sides of a portion thereof with said garment in position to press against and hold in position a pencil when it has been inserted in said socket.

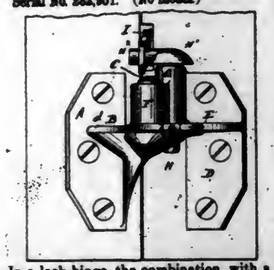
3. A pencil-holding device composed of a single piece of metal provided with a suitable pencil-holding socket having a plurality of fingers, *a a*, extending downward therefrom, and also provided with two downwardly-projecting fingers, each having a series of teeth formed thereon, and arranged with its lower end overlapping one of the fingers *a*, whereby said holder may be secured to a garment by inserting a portion thereof between two of the fingers *a a* and the fingers *b b* in position to press upon and hold in position a pencil inserted in said socket.



408,568. VAPOR-STOVE. JACOB R. WALLACE, Chicago, Ill., assignor to George M. Clark & Company, same place. Filed Apr. 30, 1888. Serial No. 273,243. (No model.)

Claim.—1. In a vapor-stove, the combination of a generating-burner having a partially-closable regulating-valve located in its vapor-passage from the generator of said burner with one or more non-generating burners, each fed from the generator by a separate vapor-passage and each having its own regulating valve or valves, substantially as set forth.

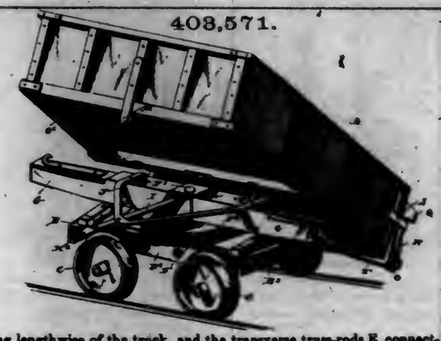
2. In a vapor-stove, the combination of a generating-burner having a partially-closable valve for regulating its own vapor supply, one or more non-generating burners supplied by a channel separate from that leading to the generating-burner, and a shut-off valve located in the passage from the generator, through which all the vapor flows and connecting with the passages feeding the several burners, substantially as specified.



3. In a generating-burner having a generator located at the side of and above its base-plate and a deflector-tube located under said base-plate, the combination of such generator base-plate and deflector-tube, said plate being provided with a slot or passage, L, giving direct access by the flame from the tube to the generator, substantially as specified.

408,569. SHANK-STIFFENER. JEREMIAH M. WATSON, Boston, Mass. Filed Jan. 29, 1889. Serial No. 297,954. (No model.)

Claim.—The shank-stiffener herein described, comprising the piece of material *a*, and the metallic plate grooved or concaved from one to the other of its longitudinal edges and secured to said piece *a*, and provided with fastenings at its ends by which it is secured directly to said piece, the ends of the metallic plate being flattened to prevent the formation of shoulders thereat, substantially as described.



408,570. LOCK-HINGE. JOSEF WOLF, Newark, N. J. Filed Aug. 17, 1888. Serial No. 282,951. (No model.)

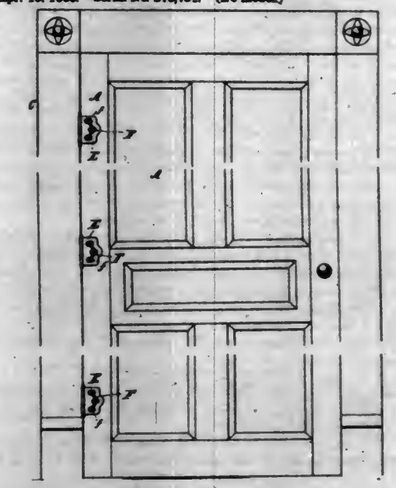
Claim.—In a lock-hinge, the combination, with a hinge-plate, of a bracket thereon provided with a pintle, two opposite notches, and angular shoulders on its upper face, a hinge-plate provided with a socket for the hinge-pintle, an additional socket and two straight edges to rest against the angular shoulders of the other bracket, a sliding bolt in the additional socket, and a lever for raising said bolt, substantially as described.

408,571. DUMPING-CAR. JAMES W. ALFERD, Wall, Pa. Filed Mar. 30, 1888. Serial No. 308,957. (No model.)

Claim.—1. The combination, with the truck-body and the central transverse timber thereof, of the plate E^3, having arms extending lengthwise of the truck, and the transverse truss-rods E, connecting the side timbers of the truck-body and bearing on said arms, substantially as shown and described.

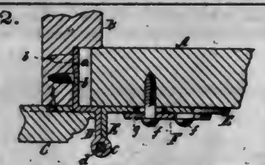
2. The combination, with the truss-body and the central transverse timber thereof, of the plate E^3 on said transverse timber and formed with a hole to receive the king-bolt, and with arms extending lengthwise of the truck and formed with hooked ends, and the transverse truss-rods E, connecting the side timbers of the truck-body, bearing on said arms and engaging said hooked ends, substantially as and for the purpose described.

3. The combination, with the timber G, of the strip H, secured to said timber and bent to form a horizontal portion at the top and bottom of said timber, and with inclined portions connecting said horizontal portions, substantially as shown and described.



4. The combination, with the timber G, of the strip H, secured to said timber and bent to form a horizontal portion at the top and bottom of said timber, with inclined portions connecting said horizontal portions, and with one end extended, as at H^3, to engage a spring-catch upon the body of the car, substantially as and for the purpose described.

5. The combination, with the timber G, of the strip H, secured to said timber and bent to form a horizontal portion at the top and bottom of said timber, with inclined portions connecting said horizontal portions, with one end extended, as at H^3, to engage a spring-catch upon the body of the car, and the brace-strips I and J, substantially as shown and described.



6. The combination, with the car-body and the timber G, of the truck and the locking-latch *e*, pivoted to said truck and formed with parallel arms adapted to embrace said timber upon opposite sides, substantially as shown and described.

7. The combination, with the car-body, of the strip O, secured to the end of the side timber and covering the end thereof, the vertical strip P, resting upon the strip O, the vertical rod R, the strip S, embracing said strip P, and the angle-iron T, arranged at right angles to the strip O, substantially as shown and described, and for the purpose specified.

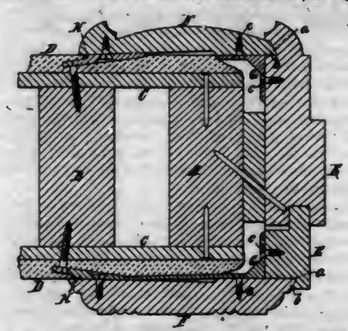
408,572. DOOR-HANGING. WILLIAM J. BODA, Dayton, Ohio. Filed Apr. 16, 1888. Serial No. 270,731. (No model.)

408,572.

Claim.—1. The combination, with the hinging-jamb provided with a recess, of the door having its edge fitted into said recess, and adjustable hinges securing the door to said jamb, whereby the door may be adjusted in and out of said recess and close joints effected with both the hinging and latching jambs under all conditions of adjustment permitted by the hinge, substantially as described.

2. The combination, with a hinging-jamb provided with a recess whose outer wall is formed by the overlapping pilaster-facing, of the door having its edge fitted into said recess, and adjustable hinges securing the door to said jamb, substantially as and for the purpose described.

3. The combination, with the jamb and the door hinged thereto, of the pilaster-facing overlapping the hinging edge of the door to form a closed joint between the same and the jamb, substantially as and for the purpose described.



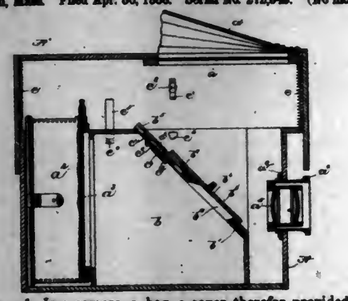
4. The combination, with the jamb and the door adjustably hinged thereto, of the pilaster-facing overlapping the hinging edge of the door to form a closed joint between the same and the jamb under different lateral adjustments of the door, substantially as and for the purpose described.

5. The combination of the jamb B, provided with the recess *a*, the door A, having its edge fitted into said recess, and the adjustable hinges, each composed of two leaves, D and E, the latter of which is provided with slots *e*, and a superimposed clamping-plate, F, substantially as and for the purpose described.

6. The combination of the jamb B, provided with the recess *a*, the pilaster-facing C, extended to form the outer wall of said recess, the door A, having its edge fitted into said recess, and the adjustable hinges securing said door to the jamb, substantially as and for the purpose described.

7. The combination of the jamb B, provided with a recess, *a*, the door A, having its edge fitted into said recess, and the adjustable hinges, each composed of two leaves, D and E, the former of which is bent to fit into the recess *a* and be secured to the jamb, and the latter of which is provided with slots *e*, and a superimposed clamping-plate, F, having screw-openings coincident with said slots and secured to the door, substantially as and for the purpose described.

408,573. FINISHING OF HOUSE INTERIORS. WILLIAM J. BODA, Dayton, Ohio. Filed Dec. 10, 1888. Serial No. 293,069. (No model.)

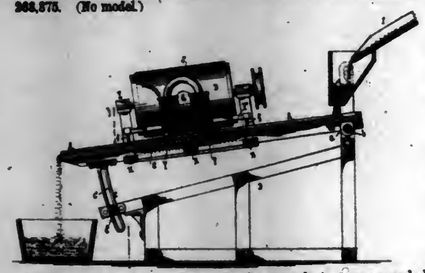


Claim.—1. As a new article of manufacture, a completed frame for doors or windows, consisting of the jamb and facings, said jamb having the facings interlocked thereto and secured by interior fastening devices, substantially as described.

2. As a new article of manufacture, a completed frame for doors and windows, consisting of the jamb and facings, said jamb projecting outside of the line of the wall and having the facings interlocked thereto and secured by interior fastening devices, substantially as described.

3. The combination, with the jamb E and facing F, interlocked with each other, of the angle-irons G, for securing said jamb and facing together, substantially as described.

4. The combination, with the interlocked jamb E and facing F, of the integral angle-irons G and lugs H, for uniting said jamb and facing and securing them to the wall, substantially as described.

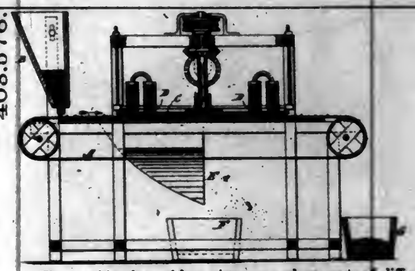


408,574. PHOTOGRAPHIC CAMERA. CHARLES E. BURLINGAME, Boston, Mass. Filed Apr. 30, 1888. Serial No. 272,349. (No model.)

Claim.—1. In a camera, a box, a cover therefor provided with a tell-tale, a sensitive surface, a lens, and a dark chamber interposed between said sensitive surface and lens and provided with an opening substantially in line with the said lens, combined with a mirror, a disk or support attached thereto, means to move said disk, a stop on said disk, and a locking device to engage said stop and operated from outside the box, substantially as described.

2. In a camera, a box, a cover therefor provided with a tell-tale, a sensitive surface, a lens, and a dark chamber interposed between said sensitive surface and lens and provided with an opening substantially in line with the said lens, combined with a mirror, a disk or support attached thereto, means to move said disk, a stop on said disk, a locking device to engage said stop and operated from outside the box, and a movable stop adapted to be moved into position to be engaged by the locking device, as and for the purpose specified.

408,575. MACHINE FOR SEPARATING IRON FROM ORES. GORDON CONKLING, Glens Falls, N. Y. Filed Mar. 29, 1888. Serial No. 268,875. (No model.)



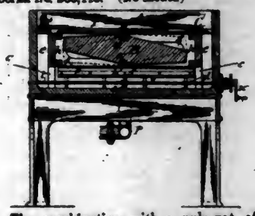
Claim.—1. The combination, with the trough A, transverse belt C, and means for moving the latter, of the magnetized plates F, extending or running in the direction of the length and travel of the belt to attract particles to the belt, substantially as described.

2. The combination, with the trough A, transverse belt C, and means for moving the latter, of the traverses F', extending across the belt, and the magnetized plates F, suspended from the traverses and extending or running in the direction of the length and travel of the belt, substantially as described.

3. The combination, with the trough A, the endless belt C, and the magnetized plate or plates F, of suitable means, substantially such as herein described, for adjusting the inclination of the trough.

4. The combination, with the trough A, the endless belt C, and the magnetized plate or plates F, of the frame H, which is attached to the trough and supports the endless belt, and the magnetized plate or plates, and means, substantially such as described, for adjusting the inclination of the trough, substantially as set forth.

408,576. MAGNETIC SEPARATOR. GORDON CONKLING, Glens Falls, N. Y. Filed Aug. 23, 1888. Serial No. 283,532. (No model.)



Claim.—1. The combination, with a conveyer for supporting the mass to be treated, of a magnet, a disk revolving independent of the conveyer and magnet at a point between said conveyer and magnet, and means for revolving the disk, substantially as described.

2. The combination, with a conveyer for supporting the mass to be treated, of a stationary magnet, a disk revolving between the conveyer and the stationary magnet, and means for revolving the disk, substantially as described.

3. The combination, with a conveyer for supporting the mass to be treated, of a magnet located above the conveyer, a disk revolving above the conveyer and under the magnet, and means for revolving the disk, substantially as described.

4. The combination, with a conveyer and magnets of different intensities relatively to the mass under treatment, of a revolving disk between the magnets and said mass, substantially as described.

408,577. PAPER-PULP SCREEN. PATRICK H. CRAGIN, Penn Yan N. Y., assignor to the Seneca Screen Company, same place. Filed Aug. 18, 1888. Serial No. 283,113. (No model.)

Claim.—1. The combination, with a pulp-vat, of a screen-box seated in said vat with a pulp-space between their sides and bottoms and provided with screen-plates at the top and bottom of said box, and an agitator in the screen-box, substantially as set forth.

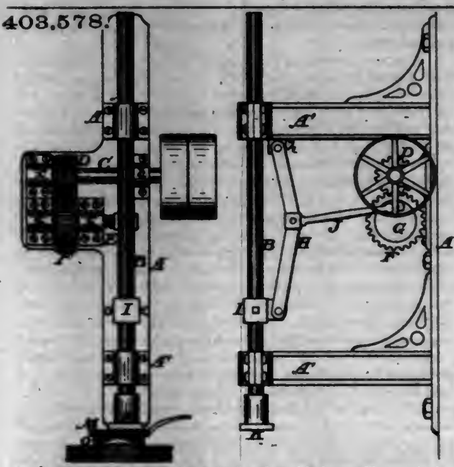
2. The combination, with the pulp-vat, of a screen-box seated in said vat with pulp-passages between their sides and bottoms, and provided with ports through its ends and with screen-plates at its top and bottom, an agitator in the screen-box, and pulp-ducts leading from the ports of the screen-box, as set forth.

3. In combination with the pulp-vat, a screen-box seated in said vat with pulp-passages between their sides and bottoms and provided with ports through its ends, with screen-plates at its top and bottom and with recesses along the sides and ends of its interior, an agitator in said screen-box, and pulp-ducts leading from the ports of the screen-box, as set forth and shown.

4. In combination with a pulp-vat and a screen-box seated therein with a pulp-space between their bottoms and screen-plates on the bottom of said box, scrapers or wipers under the bottom screen-plates, substantially as and for the purpose set forth.

5. In combination with a pulp-vat and a screen-box seated therein with a pulp-space between their bottoms and screen-plates on the bottom and top of said box, an agitator in the screen-box, and scrapers under the bottom screen-plates, substantially as described and shown.

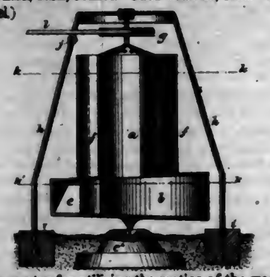
6. In combination with the pulp-vat and the screen-box seated therein with a pulp-space between their bottoms and screen-plates on the bottom of the said box, a horizontally-movable frame between the bottom of the vat and bottom of the screen-box, wipers or scrapers carried on said frame and in contact with the under side of the bottom screen-plates, a rack on the same frame, a shaft extended through the vat, and a pinion on said shaft meshing with the aforesaid rack, substantially as described and shown.



7. In combination with the pulp-vat, a screen-box seated therein with a pulp-space between their bottoms, and screen-plates on the top and bottom of said box, the rocking bar B, pivoted longitudinally in the center of said screen-box and having its top and bottom surfaces sloping from lines central of said surfaces and parallel with the axis of the bar, substantially as described and shown.

8. In combination with the pulp-vat, a screen-box seated therein with a pulp-space between their bottoms, and screen-plates on the top and bottom of said box, the rocking bar B, pivoted longitudinally in the center of said screen-box and provided midway the width of its top and bottom surfaces with the longitudinal grooves *a a*, and the ribs *b b*, secured to the screen-box and extending from the screen-plates into the aforesaid grooves, substantially as described and shown.

408,578. MACHINE FOR SETTING VAULT-LIGHT PACKING-RINGS. HARRY A. CROSBY, Cleveland, Ohio. Filed Apr. 17, 1888. Serial No. 270,968. (No model.)

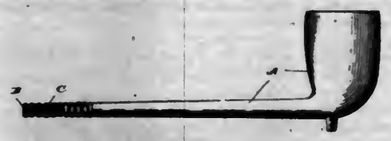


Claim.—A machine for setting vault-light packing-rings, comprising the ring-plate O, the vertically-movable shaft B, set in boxes

408,578.

on the bracket-frame A, the linked or knuckle levers H, attached at top end to frame A and the lower end attached to an adjustable sleeve, I, on the shaft and connected by pitman J to the crank-disk G on shaft E, and the gear F, and pinion D, all constructed to operate substantially as described.

408,579. APPARATUS FOR UTILIZING THE POWER OF WAVES. EMILE J. DELAURIER, Paris, France. Filed June 23, 1886. Serial No. 206,063. (Model.)



Claim.—An apparatus for utilizing the motion of the waves, consisting in the combination of a central swiveled chamber, *a*, with a tube, *b*, that is in direct communication with chamber *a*, the tube *b* having valves *d e*, and of curved blades *f*, disposed around said chamber *a*, as hereinbefore described, and for the purpose specified.

408,580. CLASP-PLATE. AUSTIN R. DICKINSON, Syracuse, N. Y. Filed Feb. 23, 1889. Serial No. 300,831. (No model.)

Claim.—As an improved article of manufacture, a transversely-slotted clasp-plate formed of a metal blank with solid longitudinal rolled marginal portions of greater thickness of metal than the longitudinal central portion, as set forth.

408,581. TOBACCO-PIPE. JOHN W. DOWLING, New York, N. Y. Filed Feb. 5, 1889. Serial No. 298,999. (No model.)

Claim.—As a new article of manufacture, the pipe having its stem provided with the series of circumferential swells or beads B and the soft yielding rubber tip slipped over the said stem, whereby similarly-shaped circumferential swells or beads are imparted to the tip and the latter is retained firmly on the stem, substantially as described.

408,582. DEVICE FOR STARTING CARS. EDWARD PALEN, Cleveland, Ohio. Filed Aug. 6, 1888. Serial No. 282,105. (No model.)

Claim.—1. In a device for starting cars and for analogous uses, the disks O, mounted on the hub of the ratchet-wheel, so as to offer a slight frictional resistance, as described, and the pawl flexibly connected to said disks, whereby the pawl is thrown into or out of engagement with the teeth of the ratchet-wheel by the movement of the axle.

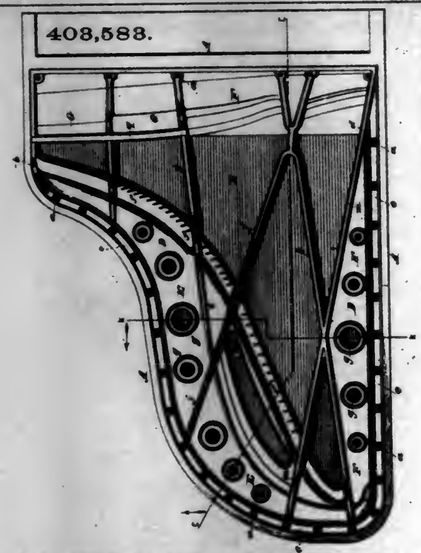
2. In a device for starting cars and for analogous uses, the wheels or disks O, movably mounted on the hub or sleeve F, said disks being provided with eccentric slots to receive the pins for holding the pawl, as set forth.

3. In a device for starting cars and for analogous uses, the wheels or disks O, provided with eccentric slots and mounted on the hub F and in the frame M, as described, and the pawl provided with the pin *c*, for engagement with the slots *b* in said disks, as set forth.

4. In a device for starting cars and for analogous uses, the ratchet-wheel rigidly secured to the axle, the disks or wheels O, mounted loosely on the hub of the ratchet-wheel, and the pawl connected to the disks, so as to be thrown in or out of engagement with the teeth of the ratchet-wheel, as set forth.

5. In a device for starting cars and for analogous uses, the ratchet sleeve or hub F, having the offsets, said offsets being adapted to receive the bars I, forming the lever-frame M, and the wheels or disks for operating the pawl carried by said frame, as set forth.

6. In a device for starting cars, the swinging frame provided with the pawl for engagement with the ratchet-wheel, in combination with the rod for holding the pawl out of engagement with the ratchet, as set forth.

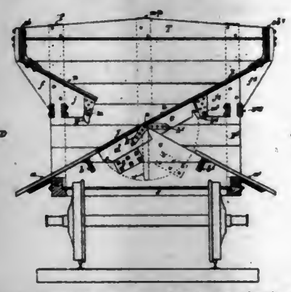


7. The bar A, mounted on friction-rollers B, and provided with pin E, in combination with the stops S and T and spring C, as set forth.

408,588. PIANO-PLATE. PAUL GERHARD, New York, N. Y. Filed Oct. 9, 1888. Serial No. 287,675. (No model.)

Claim.—1. The piano-plate or string-frame D, having continuous arched web E extending along two sides and one end of the plate D, and provided with the depressed supporting-flange *e* throughout its extent, so that the plate D is supported on opposite sides by said flange *e*, as specified.

2. In a piano-plate or string-frame, the continuous arched web E, extending along two sides and one end of the plate, the upper side of the web being on the same level, said web being in form of an arch whose ends are both supported by the flange *e*, substantially as described.



408,583.

3. In a piano-plate or string-frame, the continuous arched web E, extending along three sides of the plate, combined with the tuning-pin plate F, and with braces passing from said plate F to and along the side, top, and bottom of said web and projecting below the bottom thereof, substantially as described.

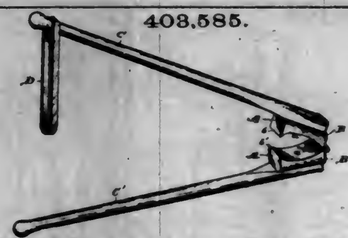
4. In a piano-plate or string-frame, the raised web E, having braces passing along and extending from the upper and also from the lower sides of said web and integral therewith, substantially as described.

408,584. DUMPING-CAR. JOHN M. GOODWIN, Sharpsville, Pa. Filed Oct. 26, 1888. Serial No. 289,186. (No model.)

Claim.—1. In a non-careening dumping-car having valves extending lengthwise of the car, which, when suitably held along one edge by appropriate detents, retain the load of the car, and when freed from such detents release such load, the valve-detent gear aforesaid, consisting of several detents acting in support of such valve as direct struts, suitably distributed parallel with, adjacent to, and below such edge of such valve, individually pivoted each on an appropriate journal-pin or suitably-formed abutment cast on or secured to a fixed member of the car and oscillating in a vertical plane, and an associated rocker shaft or rod operated by a lever applied at one end (or levers, one at each end) thereof and carrying opposite each such detent a rocker-arm connected with such opposed detent by a bar or link constructed, disposed, and operating substantially as and for the purposes set forth.

2. In a non-careening dumping-car having cargo-discharging valves extending lengthwise of the car and discharging its load through the dropping or letting down of such valves, or some of them, the valve-replacing gear consisting of a rocker shaft or rod extending lengthwise of the car, and at one or each end thereof beyond the cargo-box of the car, suitably mounted in appropriate bearings situated below the hinge-bearings of the valves aforesaid and having at one or each of its ends an actuating arm or lever, vibrating arms fixed on such shaft, and brackets or butts fixed upon the inferior face of each such valve, one opposed to each such vibrating arm, constructed, disposed, and operating substantially as and for the purposes set forth.

3. In a non-careening dumping-car combining in its construction fixed inclined floors, as *n* and *k*, the inboard edge of each thereof carried by brackets, as *j'*, and valves, each made up of cleats, as *c*, and floors, as *r* and *u*, each such cleat having its outboard end suitably fashioned for adjustment with a corresponding detent, as *y*, in the operation whereof, in order to carry a cargo, each such valve is, by detents suitably disposed, unyieldingly supported and held in association with the fixed inclined floor thereto correspondent, as on the side U of the car in Fig. 2, and for the purpose of discharging cargo each such valve is to be dropped by a uniform release of the outboard edge of the valve effected by a simultaneous withdrawal of the several members of the detent-gear supporting the same, the combination of the valves aforesaid, the detent-gear, whereof the tripping members, alternately supporting and releasing a valve, are individually pivoted each on a journal-pin or abutment fixed in or formed upon one of the floor-carrying brackets, as *j'*, and act in support of the valve as direct struts or posts, and the floor-carrying brackets, as *j'*, each provided with a journal-pin, as j^3, or other suitable abutment for support of a tripping member of the detent-gear, operating in association substantially as described, and for the particular purposes specified.

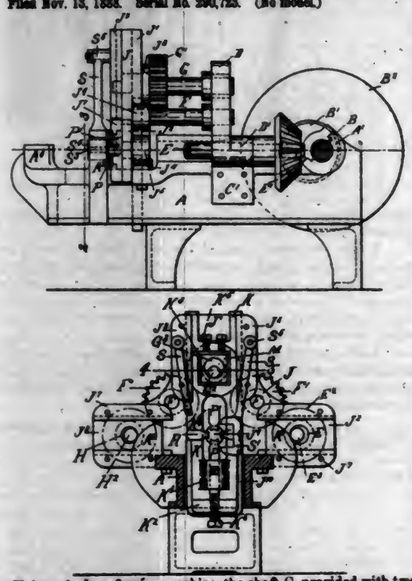


4. In a non-careening side-discharging dumping-car combining in its construction fixed inclined floors, as *a* and *n* and *a'* and *k*, extending lengthwise of the car and respectively along the sides of the same, the uppermost two of such floors, as *n* and *k*, serving primarily each as a cargo-carrying floor, but in the operation of dumping forming a section of a cargo-chute, and valves intermediate between each oppositely-fixed floors, wherein, by appropriate disposition of said valves, respectively, and association of one of them with that upper fixed floor with which it directly co-operates, and accompanying association of the other valve with the lower fixed floor, with which it directly co-operates, a continuous inclined plane is formed, extending from the uppermost edge of the upper fixed floor on either side of the car downward and entirely across the car to the lower edge of the opposite lower fixed floor, or by association of each valve with the lower inclined floor, with which it directly co-operates, two continuous inclined planes are formed, respectively extending from a common apex along the longitudinal middle line of the car downward and outward, each to the lower edge of that lower floor which forms part of that plane, as a means for retaining for carriage in such car material deposited upon an inclined plane formed as aforesaid and extending all across the car or upon either or both of the two oppositely-directed inclined planes declining outward, simultaneously formed as aforesaid, one upon each side of the middle line of the car, and for releasing such material in order that it may be dumped by operation of the said inclined floors upon which it lies, the supplementary side-boards hereinbefore described and herewith shown, each fitted with suspending-hooks and locking-bolts, whereby it is adjustable, externally, to either side of the car and along and upon the surface of an inclined lower floor of the car and removable at will by disengagement of its suspending-hooks from the staples, (as *g'* in the drawings,) carrying the same, constructed, applied, secured, released, carried, and operating substantially as and for the purposes set forth.

5. In a non-careening side-discharging dumping-car combining in its construction fixed inclined floors and valves arranged with relation to each other and operating substantially as hereinbefore described and as shown in Fig. 2, wherein, by appropriate disposition of said valves, respectively, as described, a continuous inclined plane is formed extending from either side of the car, as desired, all across the car, and operating as a chute for discharge of the entire load of the car upon that side thereof toward which such plane declines, the combination of the supplementary adjustable and removable side-board constructed and applied to such car, as described and as shown on the side U of Fig. 2, and the discharging floor or chute formed in such car by disposing and fixing the valves of the car so that they, with either of the lower fixed floors and the opposite upper fixed floor of the car, constitute a continuous inclined plane extending all across the car, as aforesaid, substantially as described, and for attainment of the supplemental result desired, as set forth.

408,585. BOOT-JACK. GEORGE H. HACKETT, South Royalton, Vt. Filed Oct. 11, 1888. Serial No. 287,832. (No model.)

408,585.



Claim.—1. The boot-jack herein described, consisting of the hinged jaws and the handles, substantially as shown and described.

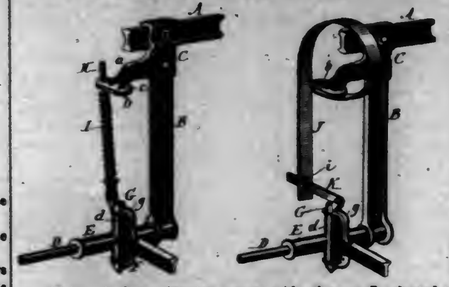
2. The hinged jaws having biting-lips, in combination with the handles, as and for the purpose set forth.

3. A boot-jack consisting, essentially, of the handles and the jaws fixed to the handles and adjustably hinged together, substantially as described.

4. A boot-jack consisting, essentially, of a pair of handles, the jaws fixed to the handles and having the perforated arms, and a split pin passing through said arms to detachably and adjustably hinge the jaws together, substantially as described.

403,586. FORGING-MACHINE. JAMES A. HAMER, Reading, Pa. Filed Nov. 13, 1888. Serial No. 290,723. (No model.)

Claim.—1. In a forging-machine, the shaft G, provided with two eccentrics having their centers on opposite sides of the shaft-center, said eccentrics being connected with separate hammers which are guided radially upon a frame, substantially as set forth.



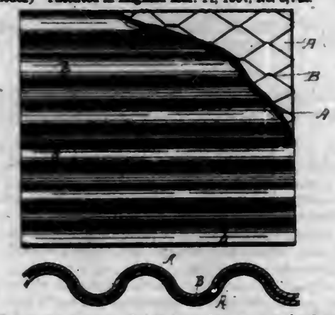
2. In a forging-machine, the parallel shafts E, G, and H, connected substantially as described, and provided with eccentrics connected with separate hammers which are guided radially upon a frame, two of said hammers being reciprocated in opposite directions by one of said shafts, substantially as set forth.

3. In a forging-machine, the combination of the horizontal bed-plate provided with anvil-block A^4, and the vertical frame secured thereto, a main shaft, B, with eccentric B', connected with a horizontal hammer, W, and engaging shafts E, G, and H, with eccentric ends connected with radial hammers R R, P, and P', and dies S^4, all arranged and operated substantially as set forth.

4. In a forging-machine having radial hammers guided in a vertical frame, substantially as described, the bottom hammer, P, secured to a sliding slotted plate, K, reciprocated in guides above the central forging-point, substantially as and for the purpose set forth.

5. In a forging-machine, the combination of the bed-plate A, main shaft B, parallel shafts E, G, and H, with eccentric ends, yoke D, vertical frame J, radial hammers R R, P, and P', horizontal hammer W, and swinging dies, all arranged and operated substantially as set forth.

408,587. CULTIVATOR. FREDERICK A. HEAD, Rock Island, Ill. Filed Jan. 24, 1889. Serial No. 297,401. (No model.)



Claim.—1. In a cultivator, a removable piece, as G, adapted to be connected either with a rod, as H, or with a bar, as K, substantially as and for the purpose specified.

2. In a cultivator, an arm or bracket, as *a*, adapted to be secured to the arched axle, and a casting, as G, adapted to be connected with the joint which couples the shovel-beam to the axle, whereby either one of two forms of springs I and J can be used at pleasure in the same cultivator, substantially as and for the purpose specified.

3. In a cultivator, a socketed piece, C, provided with an arm or bracket, *a*, in combination with the parts A B of an arched axle, substantially as and for the purpose specified.

403,588. FELT ROOFING. GEORGE A. HERDMAN, London, County of Middlesex, England. Filed Sept. 27, 1887. Serial No. 250,352. (No model.) Patented in England Mar. 11, 1887, No. 3,742.

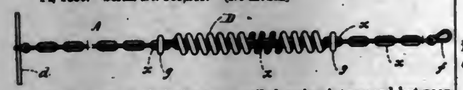
Claim.—A corrugated felt material composed of two or more sheets of felt and an intermediate interstitial web of metal united and corrugated, as set forth.

403,589. LATHE-CHUCK. FREEMAN HIGGINS, Manchester, N. H. Filed Jan. 12, 1889. Serial No. 296,131. (No model.)

Claim.—The combination, with the jaws, screws to operate them, and pinions on said screws, of the rack-bar in mesh with said pinions, and the hand-wheel secured to said rack-bar, whereby the said jaws may be operated simultaneously, substantially as described.

403,590. KITCHEN-CABINET. LU HOUSTON, Shockey, Kans. Filed July 19, 1888. Serial No. 280,365. (No model.)

Claim.—1. In a kitchen-cabinet, the combination, with the portion B, the extension B', the hinged doors D, and supporting-brackets *d*, of the bread-board F, the drawer G, secured to one of the front corners of the said board, and the hinged door *g* on the front of the portion B, and registering with the drawer G, substantially as specified.



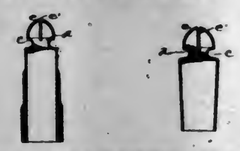
2. A kitchen-cabinet comprising the portion B, divided into bins and having doors hinged to its sides adapted to close the bins, and brackets to support the hinged doors when the latter are open, and provided with a sliding bread-board and a drawer attached thereto and slightly in advance of the same, said portion B having a door constructed in its front face, designed to open and allow the drawer to protrude and permit the bread-board to be fully drawn out, and the

408,590.

extension B', provided with drawers in its lower part, and divided into compartments which are closed by hinged doors, substantially as described.

408,591. CHAIN. JAMES INGRAM, Lawrence, Mass. Filed Mar. 14, 1888. Serial No. 303,215. (No model.)

Claim.—1. A chain having a coiled spring interposed between two of its links, substantially as and for the purpose set forth.



2. A chain of the character described, provided with a bar at one end, a catch at the opposite end, and a coiled spring interposed in its body, substantially as described.

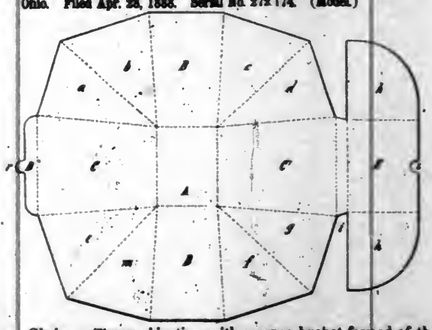
3. A chain having a portion of its links grouped, and a coiled spring disposed around said portion, with its ends secured to said chain, substantially as described.

4. A chain of the character described, provided with a bar and catch and having a portion of its links grouped, a coiled spring being disposed around said portion, with its ends secured to a link at each end of said grouped portion, substantially as described.

5. The chain A, provided with the bar *d* and catch *f*, in combination with the spring D, secured around said chain, the links *x* thereof being grouped within said spring, substantially as and for the purpose set forth.

408,592. BURNER TIP OR PILLAR. WALTER M. JACKSON, New York, N. Y. Filed Nov. 1, 1888. Serial No. 289,753. (No model.)

Claim.—As a new article of manufacture, a gas-burner tip or pillar having a conoidal head, an internal shelf, and a gas-exit slot dividing the head into two parts and extending down into the inclined shelf, substantially as set forth.



408,593. SECONDARY BATTERY. AUGUSTUS JAMIESON, Elizabeth, N. J. Filed Sept. 27, 1888. Serial No. 286,522. (No model.)

Claim.—1. The method of generating electric currents, which consists in forming a coating of sulphate of lead upon the surface of lead electrodes by immersion in sulphuric acid, converting the sulphate on one half the electrodes into sulphide of lead by immersion in a reducing agent—such as sulphide of sodium—converting the sulphate on the other half of the electrodes into plumbic peroxide by immersion in an oxidizing agent—such as hypochlorite of soda—replacing the electrodes in pairs in the sulphuric acid to form a battery, and connecting them up in an electric circuit.

2. The method of charging secondary batteries, which consists in converting the plumbic sulphate on one set of electrodes into plumbic peroxide by treatment with an oxidizing agent—such as hypochlorite of soda—and in converting the sulphate of lead on the other set of electrodes into sulphide of lead by treatment with a reducing agent, such as sulphide of sodium.

3. The method of forming plumbic peroxide upon a surface of lead, which consists in first converting some of the lead into the plumbic sulphate and then converting the sulphate into plumbic peroxide by treatment with hypochlorite of soda.

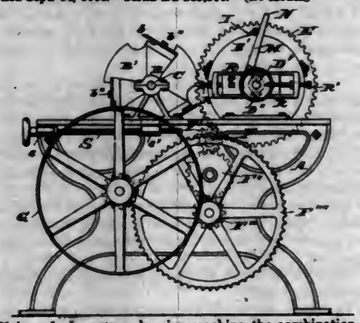
408,594. FOLDED PAPER BUCKET. HENRY S. JAPES, Dayton, Ohio. Filed Apr. 28, 1888. Serial No. 272,174. (Model.)

Claim.—The combination, with a paper bucket formed of the parts A, *a b*, B, *c d*, C, *g f*, B', *m e*, C D, *i* A, E, and A, and folded with the parts *a b* and *e m* upon the side C, the parts *c d* and *g f* upon the side C', the part E braced by the parts A and A to form a lid hinged by the part *i*, so as to be below the upper edge of the bucket and latched by the flap D of the bail O, fastened in opposite sides of the bucket and securing the same, substantially as and for the purpose set forth.

408,595. DECOY. WILLIAM H. JESSER, Clinton, Iowa. Filed Mar. 19, 1888. Serial No. 303,900. (No model.)

Claim.—1. A decoy-body hollowed out and having a lid, in combination with a removable head, substantially as described.

408,595.



2. A decoy-body hollowed out and a pivoted lid for the same, in combination with a removable head, substantially as described.

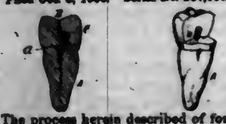
3. A decoy-body hollowed out, and a lid pivoted upon a pin on the forward end of the same and having a diagonal edge, in combination with a removable head screwed onto the pivot of said lid, substantially as described.

4. A decoy-body having a collar, D', screwed into its forward end, in combination with a bolt screwing into said collar, and a removable head into which said bolt is fixed, substantially as described.

5. A decoy-body of the class described, said body being hollowed out, a collar screwed into the forward end of the same, and a lid pivoted upon said bolt, in combination with a bolt screwing into said collar, and a removable head screwing over said bolt, substantially as described.

408,596. STAVE-DRESSING MACHINE. FRANK H. KANE, River side, assignor to the Cincinnati Cooperage Company, Cincinnati, Ohio. Filed Sept. 14, 1888. Serial No. 285,306. (No model.)

Claim.—1. In a stave-dressing machine, the combination of a revolving cutter-head, a stave-feeding reel carrying dogs provided with bifurcated tangs adapted to automatically clutch the staves and having the periphery of its heads suitably cogged, pinions engaging therewith, and power-driven gear mechanism, substantially as and for the purpose specified.



2. The combination, in a stave-dressing machine, of a revolving cutter-head provided with adjustable and detachable knives, a stave-carrying reel carrying thereon dogs provided with a series of bifurcated tangs adapted to clutch the staves, in the manner and for the purpose described.

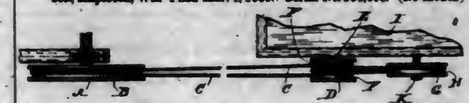
3. The combination, in a stave-dressing machine, of two revolving cutter-heads adjustable with reference to each other, and a stave-carrying reel embracing one of the cutter-heads and adapted to deliver the staves between the two cutter-heads to be dressed, adjustable dogs on said reel provided with bifurcated tangs and adapted to clutch the staves, and the hereinbefore-described means for adjusting the same, in the manner and for the purpose specified.

4. The combination, in a stave-dressing machine, of a revolving cutter-head having knives mounted thereon, and a stave-carrying reel carrying thereon adjustable dogs provided with a series of bifurcated tangs adapted to clutch the staves, in the manner and for the purpose described.

5. The combination, in a stave-dressing machine, of a revolving cutter-head, a stave-carrying reel carrying thereon adjustable dogs provided with a series of bifurcated tangs, and anti-friction rollers moving in cam-grooves, connected with and adapted to actuate said dogs, in the manner and for the purpose described.

408,597. ARTIFICIAL TOOTH-CROWN. CHARLES H. LAND, Detroit, Mich. Filed Oct. 3, 1888. Serial No. 287,066. (No model.)

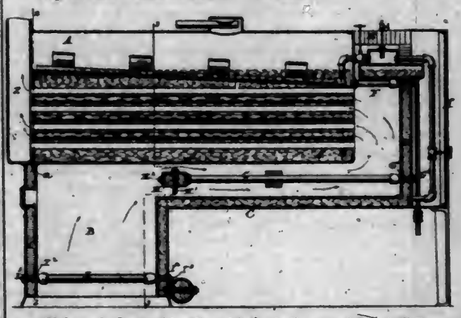
Claim.—1. The process herein described of forming an artificial crown or partial crown conformed to the lost portion of a tooth, consisting of securing an anchoring-post in the tooth, fitting thereupon and upon the adjacent tooth portions a thin plate of metal to form a matrix or supporting-base, then fusing upon said matrix or base an artificial crown or partial crown, substantially as described.



2. The process of forming an artificial crown or partial crown conformed to the lost portion of a tooth, herein set forth, consisting of securing an anchoring-post in the tooth, fitting thereupon and upon the adjacent portion of the tooth a thin plate of metal to form a matrix or supporting-base provided with a tube to engage the post, then molding upon said matrix or base a crown or partial crown of plastic porcelain body, and fusing said body, substantially as described.

3. The process of forming an artificial crown or partial crown conformed to the lost portion of a tooth, herein set forth, consisting of securing an anchoring-post in the tooth, fitting thereupon and upon the adjacent portion of the tooth a thin plate of metal to form a matrix or supporting-base provided with a tube to engage said post, then molding upon said matrix or base a crown or partial crown of plastic porcelain paste, and fusing said body, provided with an anterior veneer thereupon, substantially as described.

4. The process of forming an artificial crown or partial crown conformed to the lost portion of a tooth, herein set forth, consisting of securing an anchoring-post in the tooth, fitting thereupon and upon the adjacent portions of the tooth a thin plate of metal to form a matrix or supporting-base provided with a tube to engage said post, engaging a veneer with said tube by means of pins in the veneer, and molding thereupon an intermediate body of porcelain paste and fusing said body with the veneer and said matrix or base, substantially as described.

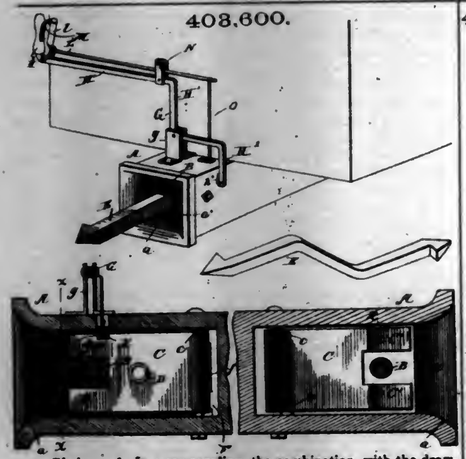


5. The herein-described process of forming a matrix or supporting-base for an artificial tooth-crown or partial crown, consisting of securing an anchoring-post in the tooth, fitting upon the tooth adjacent to said post a thin perforated metal plate, *b'*, then uniting upon said plate a tube, *b*, to engage said post, substantially as described.

408,598. DEVICE FOR TRANSMITTING POWER. ADOLPH LARSON, Mapleton, Wis. Filed Mar. 1, 1888. Serial No. 301,695. (No model.)

Claim.—The combination of a driving-wheel, A, having a groove in its periphery, a driven pulley, D, and an idle-pulley, G, the two pulleys D and G being supported on a thrashing-machine, I, at a considerable distance from the driving-wheel A, in combination with a cable-belt, C, carried entirely around the wheel A, around the idle-pulley G, and each strand of the cable being carried entirely around the pulley D in a groove in its periphery, the pulley D being located intermediate the pulley G and wheel A, substantially as described.

408,599. BOILER. FREDERICK LUDWIG, Glencoe, Minn. Filed Aug. 30, 1888. Serial No. 284,127. (No model.)



Claim.—1. In combination with the boiler A and the shell C, provided with the upturned end D, a box, H, placed between the boiler and shell and connected with the latter by means of hollow bolts H' and pipes G, connected at opposite ends with the parts D and H.

2. In combination with the boiler A and the shell C, provided with an upturned end, D, a box, H, connected with the shell by hollow bolts H', pipes G, connected with the box H and end D, and plugs G^2 and H^2, having removable plugs and arranged in line with the pipes.

408,600. CAR-COUPLING. HENRY P. MONDAY, Stoutland, Mo., assignor of one-half to Benjamin F. Tipton, same place. Filed Feb. 13 1889. Serial No. 299,740. (No model.)

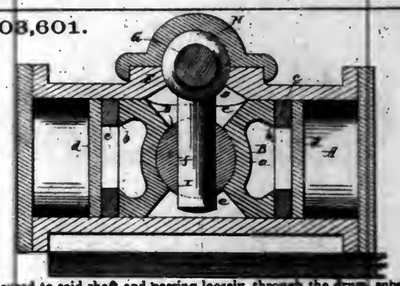
403,600.

Claim.—1. In a car-coupling, the combination, with the draw-head provided at its mouth with the inwardly-extending lip *a'*, of the swinging jaw pivoted in the throat of the draw-head and adapted to swing at its free end in rear of the said lip, the spring to normally hold the free end of the jaw away from the said lip, and the operating-lever connected to the jaw to enable the latter to be drawn laterally against the pressure of the said spring substantially as specified.

2. In a car-coupling, the combination, with the draw-head having a transverse horizontal pin adjacent to its mouth, of the swinging jaw pivoted in the throat of the draw-head and provided at its free end with two members, C C, which are arranged, respectively, above and below the said transverse pin and have engaging shoulders *c' c'* to engage corresponding shoulders on the link, the spring connected to the said jaw, and the operating-lever connected to the jaw to enable the latter to be operated against the pressure of the spring, substantially as specified.

3. In a car-coupling, the combination, with the draw-head provided with a horizontal pin, B, near its free end, and having a stop-rib, F, provided with shoulders *f f*, of the jaw pivoted in the throat of the draw-head and provided with the shouldered members C C, the operating-lever connected to the free end of the jaw, and the link provided with shoulders to engage the shoulders of the jaw and having tapered ends to bear against the stop-rib and engage the shoulders thereof, substantially as specified.

4. In a car-coupling, the combination, with the draw-head and the swinging spring-actuated jaw pivoted in the throat thereof, of the operating-lever pivoted to the draw-head and engaging the jaw to lock it in position, and the latch-lever mounted on the operating-lever and connected to the latch, where the latch may be manipulated by the hand which grasps the operating-lever, substantially as specified.



5. In a car-coupling, the combination, with the draw-head, the swinging spring-actuated jaw arranged therein, and the latch mounted in the throat of the draw-head and engaging the jaw, of the operating-lever provided with a long arm, H, and a depending arm, H^3, which is connected to the free end of the jaw, and the latch mounted on the operating-lever and connected to the latch, the handles of the said lever being arranged adjacent to each other and normally held separated by an interposed spring, substantially as specified.

6. In a car-coupling, the combination, with the draw-head, the swinging spring-actuated jaw arranged therein, and the latch K arranged in the throat of the drawhead and engaging a notch, *k*, in the jaw, to hold the latter in the engaging position, of the operating-lever G, pivoted to a bracket on the upper side of the draw-head and comprising the long arm H, which extends to the side of the car and is provided at its free end with a vertical handle, H^3, the angular portion H', and the depending arm H^3, which is connected at its lower end to the free end of the jaw by the link *h*, the latch-lever pivoted to the long arm of the operating-lever, extending through a guide-loop thereon and provided with a vertical handle which is arranged adjacent to the handle of the operating-lever, the connecting-rod between the free end of the latch-lever and the free end of the latch, and the leaf-spring arranged between the handles of the said levers, whereby they are normally held separated, substantially as specified.

403,601. STEAM-ENGINE. JAMES MCALLISTER, Chippewa Lake, Mich. Filed Jan. 26, 1889. Serial No. 297,502. (No model.)

Claim.—1. The combination, with a piston and a shaft mounted in proximity to the same, of a drum mounted in said piston, and a pin

403,601.

secured to said shaft and passing loosely through the drum, substantially as set forth.

2. The combination, with a piston having a recess with diverging walls and a shaft mounted in proximity to said piston, of a drum mounted in said piston, and a pin secured to the shaft and passing loosely through said drum, substantially as set forth.

3. The combination, with a piston and a shaft mounted in proximity thereto, of a drum mounted in said piston, a ring keyed to the shaft, and a pin projecting from said ring and passing loosely through the drum, substantially as set forth.

4. In a steam-engine, the combination, with a cylinder having an opening with diverging walls and a piston having a recess with diverging and curved walls, of a drum mounted in said piston, a shaft in proximity to the opening in the cylinder, and a pin secured to the shaft and passing through said opening and through an opening in the drum, substantially as set forth.

5. In a steam-engine, the combination, with a cylinder having an opening, and a piston in said cylinder having a recess with curved walls to produce bearing-faces, of a drum having a central perforation mounted in the piston and adapted to oscillate on said bearing-faces, a shaft mounted in proximity to the opening in the cylinder, and a pin secured to said shaft and passing through the openings in the cylinder and drum, substantially as set forth.

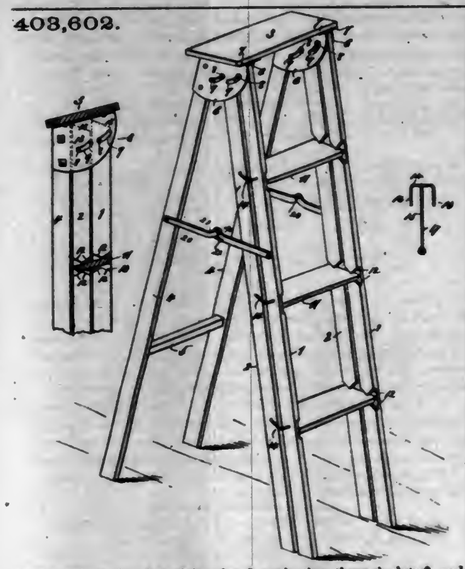
6. The combination, with a cylinder having an opening therein and a shaft mounted in proximity to said opening, of a piston in said cylinder, packing-rings secured to said piston and heads secured to said rings, and a drum mounted in said piston and having a perforation, and a pin secured to the shaft and passing through the drum, substantially as set forth.

7. In a steam-engine, the combination, with a cylinder and piston therein, of a drum mounted in said piston, a shaft carrying a crank-arm mounted in proximity to an opening in said cylinder, and a pin secured to said shaft and passing through an opening in the drum, substantially as set forth.

8. In a steam-engine, the combination, with a cylinder and a piston therein, of a drum mounted in said piston, a shaft mounted in proximity to an opening in said cylinder, a pin secured to said shaft and passing through an opening in the drum, a crank-arm at one end of said shaft, a second shaft carrying a crank-arm, and a pitman connecting said crank-arms, substantially as set forth.

9. In a steam-engine, the combination, with a cylinder, a shaft mounted in bearings cast integral with said cylinder, and a piston, of a drum mounted in said piston, and a pin secured to the shaft and passing through an opening in the cylinder and through said drum, substantially as set forth.

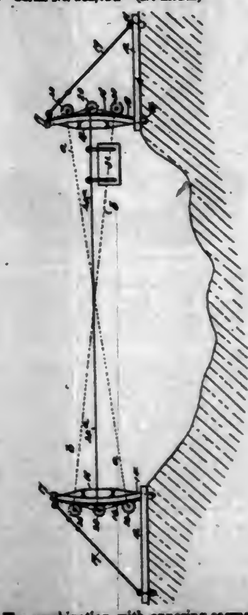
403,602. STEP-LADDER. JOHN A. NEILL, East Portland, Oreg. Filed Oct. 26, 1888. Serial No. 289,178. (No model.)



Claim.—1. A folding step-ladder constructed with uprights having recesses in their inner surface, with reverse double inclined V-shaped shoulders, and steps having their ends located in the recesses between the reverse double inclined V-shaped shoulders and pivoted to the uprights, substantially as shown and described.

2. A folding step-ladder constructed with a top with depending brackets, bracing-legs secured to the top, uprights having a sliding connection at their upper end with the top brackets, and recesses in their inner surface with reverse double inclined V-shaped shoulders, and steps having their ends located in the recesses between the reverse double inclined V-shaped shoulders and pivoted to the uprights, substantially as shown and described.

3. A folding step-ladder constructed with the bracing-legs 4, the top 3, the brackets 6, each having curved slots 9 and rocking steps 11, pivoted to the uprights 1 and 2, with supports for the steps on the uprights 1 and 2, secured to legs 4, and by means of flanges 7 to top 3, the uprights 1 and 2, connected at their upper ends to brackets 6 by pins 8, projecting through slots 9, substantially as shown and described.

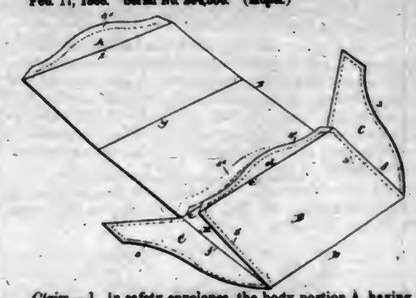


4. A folding step-ladder constructed with the bracing-legs 4, the top 3, the brackets 6, with curved slots 9, secured to legs 4, and by means of flanges 7 to top 3, the uprights 1 and 2, connected at their

403,602.

upper ends to brackets 6 by pins 8, projecting through slots 9, and having slots 10 in their inner face, with reverse double inclined V-shaped shoulders 12, and steps 11, having their ends located in slots 10 between the V-shaped shoulders 12 and pivoted to uprights 1 2 by the T-shaped castings 15, having the cross bent portion 16, connecting the uprights 1 2 on a side, the inturned ends 16, projecting through uprights 1 2 and into the end of steps 11, and the main portion 17, extending beneath the steps and having an eye, 19, secured to the step by a bolt, 18, substantially as shown and described.

408,603. CONVEYER. CHARLES H. NEWCOMER, Omaha, Nebr. Filed Aug. 14, 1888. Serial No. 282,734. (No model.)



Claim.—1. The combination, with opposing segmental standards and a rack secured to the outer convex surface of each of the same, of a carriage meshing with the rack of said standards, a chain secured to and wound upon the axle of each of said carriages, a cable connecting the chains, and means, substantially as shown and described, for simultaneously moving the carriages in opposite directions, as set forth.

2. The combination, with opposing segmental standards arranged in pairs, having their bases in the same horizontal plane, and said standards being arcs of a circle whose center is midway between the opposing pairs, and a rack secured to the outer convex face of each of the standards, of a carriage meshing with the rack of each pair of standards, a chain secured to, coiled upon the axles, and connecting the carriages, and means, substantially as shown and described, for simultaneously moving the two carriages in opposite directions, as set forth.

3. The combination, with opposing segmental standards arranged in pairs, a rack secured to the outer convex surface of each of the same, a carriage meshing with the rack of each pair of standards, and a cable connecting the carriages, of a crank-shaft journaled in one pair of standards, a sprocket-wheel upon said shaft, and a chain belt, passing around said sprocket-wheel secured to opposite sides of one carriage at opposite ends, substantially as shown and described.

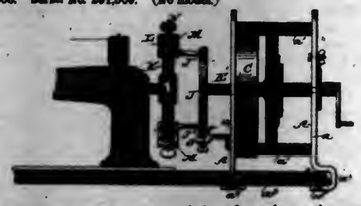
4. The combination, with opposing segmental vertical standards, each having a racked outer convex face, the center of the segments being midway between the pairs, of a carriage meshing with the rack of each of said standards, consisting of toothed wheels united by an axle, a chain secured to the carriage-axle, coiled around the same, a cable connecting said chain, and means, substantially as described, for raising and lowering one carriage, as set forth.

408,604. ENVELOPE. JOHN O. DONNELL, Lowville, N. Y. Filed Feb. 17, 1888. Serial No. 264,356. (Model.)

Claim.—1. In safety-envelopes, the body portion A, having folding sealing side wings, C C, a folding wing, B, sealed to the body portion, said side wings, C C, sealed upon the wing B, an elongated folding wing adapted to wrap once or more around the main portion of the envelope, and having sealing or adhesive material a^3, arranged to seal over the upper ends of the side wings, C C, and provided with a folding and sealing outer end portion, A, substantially as and for the purpose described.

2. A safety-envelope with an extending wing arranged to be folded once or more times about the main or body portion of the envelope, said wing provided with a supplemental gummed surface, a^3, adapted to be sealed to the body portion over the upper open end of the same, and a folding and sealing outer end, A, arranged to seal on the said wing portion over the aforesaid sealed portion a^3, substantially as and for the purpose described.

408,605. MANUFACTURE OF COLLARS FOR JUG-TOPS. ARCHIBALD W. PAULL, Wheeling, W. Va. Filed Nov. 19, 1888. Serial No. 291,233. (No model.)



Claim.—1. An improvement in the manufacture of collars for jug-tops, which consists in forming a sheet-metal cup, drawing a second cup of less diameter within the cup first formed, folding back the base of the first cup upon itself to form a drip-trough, and removing the metal at the end of the second cup, substantially as and for the purposes described.

2. An improvement in the manufacture of collars for jug-tops, which consists in forming a sheet-metal cup, drawing a second cup of less diameter within the cup first formed, folding back the base of the first cup upon itself to form a drip-trough, removing the metal at the

end of the second cup, and cutting away or perforating the metal of the second cup at or near its junction with the metal of the first cup, substantially as and for the purposes described.

403,606. MOTOR. ARNIE W. PEARCE, Greenwood, S. C., assignor of one-half to Laura Henrietta Johnson, same place. Filed Nov. 21, 1888. Serial No. 291,509. (No model.)

Claim.—1. A spring-motor consisting of a casing, spring-actuated gearing mounted therein, one of the gear-shafts projected at each side of the casing, provided at one end with a disk, J, having arms adapted to detachably connect the motor with the drive-wheel of the machine to be driven, a ratchet-wheel at its opposite end, and an adjustable pawl for engaging the same, substantially as shown and described.

2. The combination, with the casing A, the shaft E, the intermediate gearing for operating it, and the ratchet-wheel *b'*, mounted thereon, of the adjustable pawl F, the spring G, and the diagonally-adjustable nut I, operating upon the spring G, substantially as and for the purposes specified.

3. The combination, with the shaft E, the intermediate gearing for operating it, and the ratchet-and-pawl mechanism connected therewith and operated as specified, of the disk J, secured upon the inner projecting end of said shaft, provided with projecting arms J' J', having boxes L at their outer ends, said boxes provided with adjustable elastic bearing-blocks, whereby said arms are detachably secured to the rim of the drive-wheel, substantially as and for the purpose hereinbefore described.

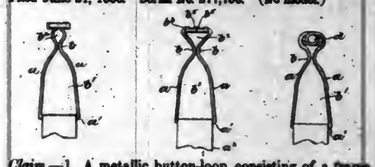
403,607. SAFETY-PIN. EMILE PICKHARDT, Islington, Mass., and DANIEL A. CARPENTER, New York, N. Y. Filed May 14, 1888. Serial No. 273,784. (No model.)

Claim.—1. In a safety-pin, the combination of the sharpened limb 1, unsharpened limb 2, coil 3, and a shield formed from a flat blank having the faces 5 5 united at the edge 7 and the open edge 9, said shield being attached to the limb 2, a portion of which is located immediately at the opening in the edge 9 of the shield and serves as a guide whereby the point of the pin is directed through that opening from either side, substantially as and for the purpose described.

2. In a safety-pin, the shield thereof drawn from a flat blank having faces 5 5 united across the end 6 and along the edge 7 and open at the two other edges, 8 and 9, said shield being secured to the pin's unsharpened limb, which constitutes a guide whereby the point is directed through the opening in the edge 9 from either side, substantially as and for the purpose described.

3. In a safety-pin, the combination of the sharpened limb 1, unsharpened limb 2, with the hook 4 at the end thereof, the coil 3, and a shield formed from a flat blank attached to the hook 4, said shield having the faces 5 5 united at the edge 7, and the open edge 9, through which the point of the pin is directed from either side by a portion of the limb 2, substantially as and for the purpose described.

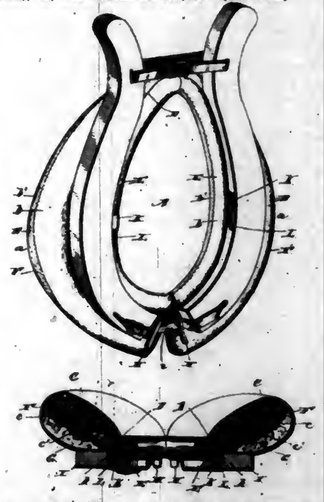
403,608. SAFETY-PIN. EMILE PICKHARDT, Islington, Mass., and DANIEL A. CARPENTER, New York, N. Y. Filed Feb. 13, 1889. Serial No. 299,580. (No model.)



Claim.—1. The combination of the sharpened limb, coil, unsharpened limb, and shield, the shield having the faces 5 5 and the open edge 9, through which the point of the pin passes on either side, and the unsharpened limb having the offset formed by the section 10 and bend 11, substantially as and for the purpose described.

2. The combination of the sharpened limb, coil, unsharpened limb, and shield, the shield having the faces 5 5 united along the edges 6 and 7, and the open edges 8 and 9, and the unsharpened limb having the offset formed by the section 10 and bend 11, substantially as and for the purpose described.

3. The combination of the sharpened limb, coil, unsharpened limb, and shield, the shield having the faces 5 5 and the open edge 9, and the unsharpened limb being flattened and having the offset formed by the section 10 and bend 11, substantially as and for the purpose described.



403,609. BUTTON-LOOP. EMILE PICKHARDT, Islington, Mass. Filed June 21, 1888. Serial No. 277,758. (No model.)

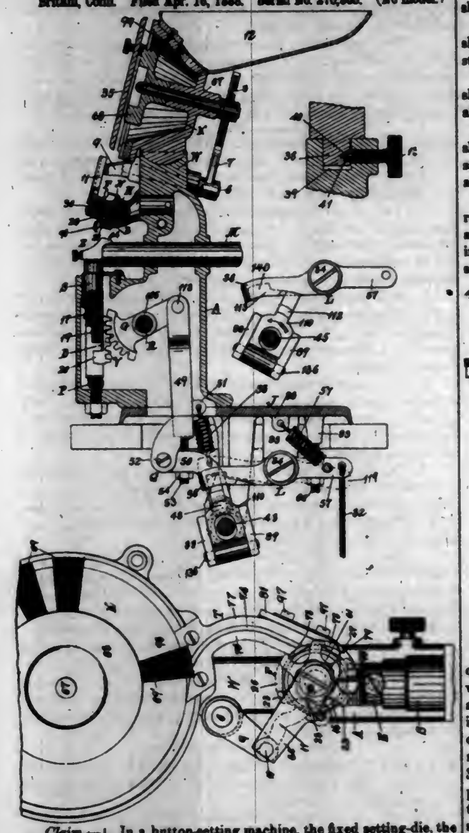
Claim.—1. A metallic button-loop consisting of a frame having two arms, *a'*, united by a cross-bar at one end and expansible at their opposite ends, the said arms being bent to form a contracted throat and leave between the contracted throat and the cross-bar a button-receiving eye, and on the opposite side of the said throat a button-holding eye capable of being enlarged, substantially as described.

2. A metallic button-loop consisting of a frame having two arms, *a'*, united by a cross-bar at one end and expansible at their opposite ends, and a connecting device, substantially as described, to unite said expansible ends, the said arms being bent to form a contracted throat and leave on opposite sides thereof a button-receiving and a button-holding eye, substantially as described.

403,610. HORSE-COLLAR. JAMES E. PURDY, New York, N. Y. Filed Aug. 16, 1888. Serial No. 282,846. (No model.)

Claim.—1. In a horse-collar, the sides *a a*, comprising the inclosing sacks or casings B B, the flexible pads arranged in the said sacks or casings, and the rows of stitching D through the sacks or casings and the pads and dividing the neck-rolls from the body-rolls, substantially as specified.

2. In a horse-collar, the sides *a a*, comprising the sacks or casings B B, having their open upper ends stitched together, the flexible pads C C, arranged in the sacks or casings in contact with the rear sides of the same, the rows of stitching D, and the filling G, between the pads and front sides of the sacks or casings, substantially as specified.



3. In a horse-collar, the sides *a a*, comprising sacks or casings B B, which are stitched together at their upper ends and are composed, respectively, of the front and rear sections, *b b'*, the flexible pads arranged in the sacks or casings, and the rows of stitching extending through the sacks or casings and the pads and thereby forming the neck and body rolls E F, substantially as specified.

4. The horse-collar herein shown and described, having the sides *a a*, connected together at their upper ends and loose at their lower ends, and provided adjacent to their lower ends with the hooks H H, which are adapted to engage the hame strings or latches, substantially as specified.

5. The horse-collar herein described and shown, having sides *a a*, provided at suitable points with loops K K, to engage keepers on the hames, substantially as specified.

6. The horse-collar A, provided with the sides *a a*, having free ends, the hooks H H, arranged near the lower ends of the sides, and the spring-loops K K, arranged at intermediate points of the sides and connected to the collar by the loops *k k*, in combination with the hames provided with the keepers L L, adapted to be engaged by the said spring-loops, and the hame strings or latches connecting the lower ends of the hames and engaging the said hooks H, substantially as and for the purpose specified.

403,611. BUTTON-SETTING MACHINE. FRANCIS H. RICHARDS, Hartford, assignor to the American Button Fastener Company, New Britain, Conn. Filed Apr. 16, 1888. Serial No. 270,863. (No model.)

Claim.—1. In a button-setting machine, the fixed setting-die, the presser-slide, the driver, the driving-crank having a fixed throw or stroke, and mechanism, substantially as described, connecting said crank and driver, said connecting mechanism having therein a spring arranged to yield on the fastener meeting obstructions, all substantially as described.

2. In a button-setting machine, the combination of the fixed setting-die, the driver, the revolving driving-crank, and mechanism, substantially as described, connecting said crank and driver, said connecting mechanism having therein a spring arranged to yield, as set forth, and having an adjustable stop regulating the normal relative positions of the crank and driver, all substantially as described.

3. In a button-setting machine, the combination of the head H the feed-wheel F, having flange N and having the re-entrant rim 32 and the die B, set on said head and standing within said wheel and rim, substantially as described.

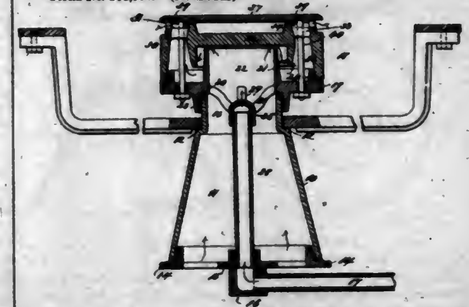
4. The combination, with the feed-wheel F and the setting die, of the stud 30, and the feed-arm having a hub turning on said stud and within said feed-wheel, the hub extending within said wheel to said die to serve as a stop, all substantially as described.

5. The combination of head H, having shoulder 31, the die B, engaging said shoulder, stud 30, wheel F, and arm 64, substantially as set forth.

6. The combination, with the feed-wheel and die, of the arm 64, fitted to turn said wheel relative to said die, and the oscillating arm 9, said arm 64 having a cam-shaped groove, whereby the movement thereof by said arm 9 is timed to conform to the movement of the driver and presser-slide, all substantially as described.

7. The combination, in a machine of the class specified, of the feed-wheel actuated by arm 64, shaft 6, having arm 9, actuating arm 64, the hopper having a chute leading to said wheel, and having a rotary reciprocating brush delivering buttons to said chute, and gears 7 and 8, said hopper being removably attached to the machine, and the whole organized and coacting substantially as set forth, all substantially as described.

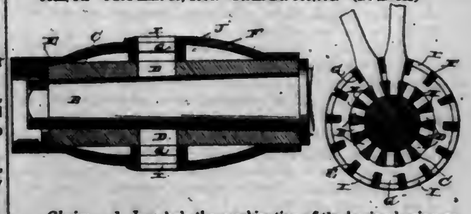
8. In a button-setting machine, the combination, with the presser-slide, of the indicator Y, as set forth.



9. In a button-setting machine, the combination, with presser-slide, of the indicator Y, formed in two parts pivoted together, substantially as set forth.

10. In a button-setting machine, the combination, with the presser-slide, of the indicator 120, lever 122, and a cam operating said lever, all substantially as set forth.

11. In a button-setting machine, the combination, with the presser-slide, of indicator-arm 120, having stop 133, lever 122, a cam whereby said lever is moved back, and a spring to throw the same forward, all substantially as described.

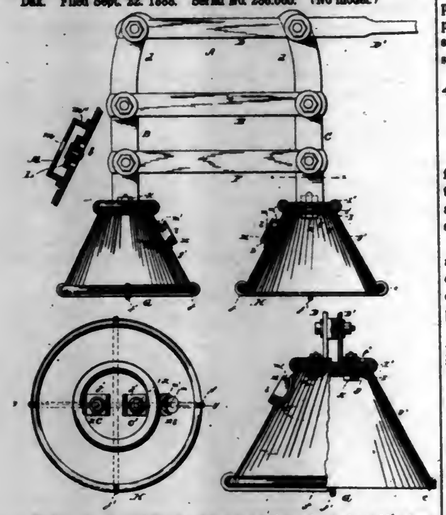


12. The combination, with the presser-slide and driver, of the rock-shaft operatively connected to actuate said driver and having arm 72, the indicator pivoted substantially as described, said arm and indicator having one of them a cam and the other resting against said cam, all substantially as described.

403,612. GAS BURNER AND HEATER. DANIEL S. ROBILLIARD and CHARLES G. DAVIES, Quebec, Quebec, Canada. Filed July 31, 1888. Serial No. 281,537. (No model.)

Claim.—The combination, with a base-plate, 19, having a central opening surrounded by an upwardly-extending collar, 21, and provided near the outer edge with an annular vertical flange, 24, lugs or arms 25, projected radially from the inner wall of the base-plate opening, an interiorly-threaded cap, 26, supported centrally within the opening of the base-plate by said arms 25, and having in the top an aperture, 27, and a gas-supply pipe screwed in the said cap, of a ring, 30, supported upon the base-plate 19, outside of the flange 24, a cap-plate attached to the said ring by horizontal arms and supported thereby a slight distance above the collar of the base-plate 19, the said cap-plate 32 being provided with downwardly and upwardly extending peripheral flanges, the inner walls of which are spaced from the outer wall of the base-collar 21, teeth formed upon the upper edge of the ring 30, and a crown-piece, 37, resting upon the upper flanged cap-plate and extending over and beyond the said teeth, substantially as shown and described, whereby a commingling-chamber, 22, is formed, having an outlet in the circuitous chambers 35 and 36, and a cooling-space provided between the cap-plate and the crown-piece, as and for the purpose specified.

403,618. HUB FOR VEHICLE-WHEELS. JAMES D. ROTH, Nazareth, Pa. Filed Mar. 13, 1888. Serial No. 303,091. (No model.)



Claim.—1. In a hub, the combination of the boxing having an annular series of longitudinal recesses, and the shells fitted on the box-

ing and having their ends overlapping, and provided with annular series of openings adapted to coincide and register with the recess in the boxing, as set forth.

2. The improved hub herein described and shown, comprising the boxing provided with an annular series of longitudinal recesses, the shell E, fitted on the boxing and provided at its end with an annular series of openings adapted to register with the recesses in the boxing and larger than said recesses, and the shell F, fitted on the boxing and having its end fitting over the end of the shell E, and provided with an annular series of openings coinciding with the openings in the shell E, the said shell F being provided with an internal annular shoulder adapted to contact with the end of the shell E, as set forth.

403,614. WASHING-MACHINE. Alford A. Rounds, Yankton Dak. Filed Sept. 22, 1888. Serial No. 286,065. (No model.)

Claim.—1. A washing-machine consisting of a series of horizontal parallel bars, E F, and a handle-bar, D, a pair of vertical bars, B C, rigidly secured to the ends of said horizontal bars and having their lower ends extended below the horizontal bar F, the lower extremities of each pair of vertical bars B C being bent to form the feet *j j*, and the inverted cups G H, bolted to the feet of said vertical bars, all arranged and combined, substantially as and for the purpose specified.

2. A washing-machine consisting of a series of horizontal bars, E F, and a handle-bar, D, a pair of vertical bars, B C, rigidly secured to the ends of said horizontal bars and having their lower ends extended below the horizontal bar F, the lower extremities of each pair of vertical bars B C being bent to form the feet *j j*, and the inverted cups G H, each cup having two packing-disks, I I', which are provided with flaring annular rims that overlap the joint between the head and shell of the cup on both the interior and exterior surfaces of said cup, and bolts which pass through the feet *j j*, the packing-disks, and the head of the cup, substantially as described.

403,615. PROCESS OF LEACHING ORES WITH HYPOSULPHITE SOLUTIONS. Edward H. Russell, New Haven, Conn., assignor to the Russell Process Company, same place. Filed Dec. 29, 1887. Serial No. 259,338. (No specimens.)

Claim.—1. The method of preparing ores and metallurgical products for the use thereon of a hyposulphite leaching solution, which consists in introducing into the ore or product a compound adapted to precipitate copper out of a copper solution, and then treating the ore or product with a solution of a copper compound, substantially as and for the purpose specified.

2. The method of preparing ores and metallurgical products for the use thereon of a hyposulphite leaching solution, which consists in introducing into the ore or product a carbonate, and then introducing into it a copper salt or compound, substantially as and for the purpose set forth.

3. The method of preparing ores and metallurgical products for the use thereon of a hyposulphite leaching solution, which consists in introducing into the ore or product carbonate of soda, and then introducing into the mass sulphate of copper or blue-stone, substantially as and for the purpose specified.

4. The method of preparing ores and metallurgical products for the use thereon of a hyposulphite leaching solution, which consists in introducing into the ore or product a compound adapted to precipitate copper from a sulphate-of-copper solution and treating the mass with such a solution, substantially as and for the purpose described.

5. The process of extracting metal from ores and metallurgical products, which consists in introducing a carbonate into the ore or product, then introducing a salt of copper, and finally treating the mass with a hyposulphite solution, substantially as and for the purpose specified.

6. The process of extracting metal from ores and metallurgical products, which consists in introducing into the ore or product carbonate of soda, then treating the mass with a solution of sulphate of copper, and then treating it with a hyposulphite solution, substantially as and for the purpose described.

7. The process of extracting metals from ores and metallurgical products, which consists in introducing into the ore a compound to precipitate copper from a copper solution, then treating the mass with such a solution, and finally treating the ore or product with a hyposulphite solution, substantially as and for the purpose specified.

403,616. PROCESS OF LEACHING ORES WITH HYPOSULPHITE SOLUTIONS. Edward H. Russell, New Haven, Conn., assignor to the Russell Process Company, same place. Filed Mar. 3, 1888. Renewed Apr. 17, 1889. Serial No. 307,633. (No specimens.)

Claim.—1. As an improvement in the art of extracting metals from ores and metallurgical products by means of a leaching solution, the method of diminishing the power of the solution to dissolve lead and its compounds, which consists in introducing into the solution sulphate of lime, substantially as described.

2. As an improvement in the art of extracting metals from ores and metallurgical products, the method of extracting the metals, which consists in treating the ore or product with a hyposulphite solution containing a sulphate of lime or calcium, substantially as and for the purpose described.

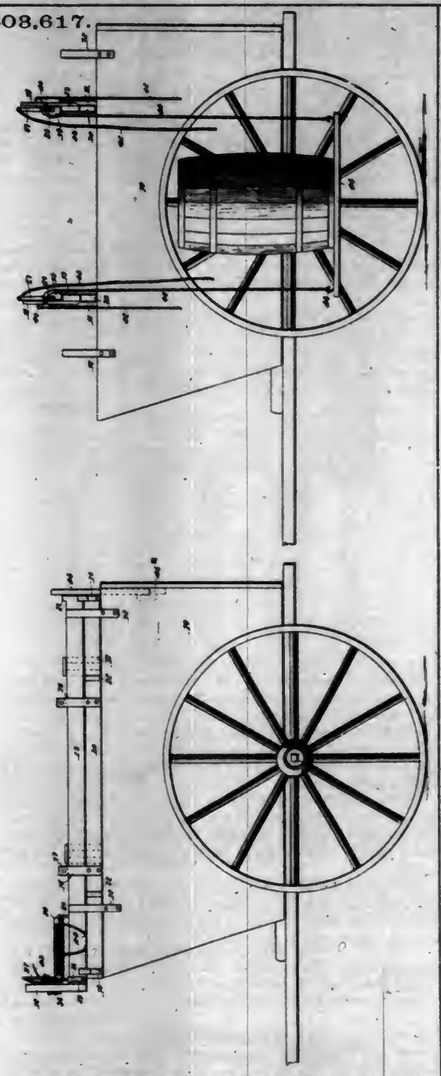
3. The process of obtaining metals from ores and metallurgical products, which consists in treating the ore or product with a leaching solution into which sulphate of lime has been introduced and separating or precipitating the metals from the solution, substantially as and for the purpose described.

4. The process of obtaining metals from ores and metallurgical products, which consists in treating the ore or product with a hyposulphite leaching solution into which sulphate of lime has been introduced, and afterward separating the metals from the solution, substantially as and for the purpose described.

5. The process of obtaining metals from ores and metallurgical products, which consists in introducing sulphate of lime into a hyposulphite solution, treating the ore or product with the resultant solution, and then precipitating the lead from the solution, so as to leave the precious metals, substantially as and for the purpose described.

6. The process of obtaining metals from ores and metallurgical products, which consists in introducing sulphate of lime into a hyposulphite solution and using the resultant solution on the ore or product, then precipitating the lead by means of a carbonate, and finally precipitating the precious metals by means of a sulphide or sulphides, substantially as described.

403,617. HOISTING ATTACHMENT FOR ASH AND GARBAGE CARTS. John F. Schultz, New York, N. Y. Filed Feb. 5, 1889. Serial No. 298,712. (No model.)



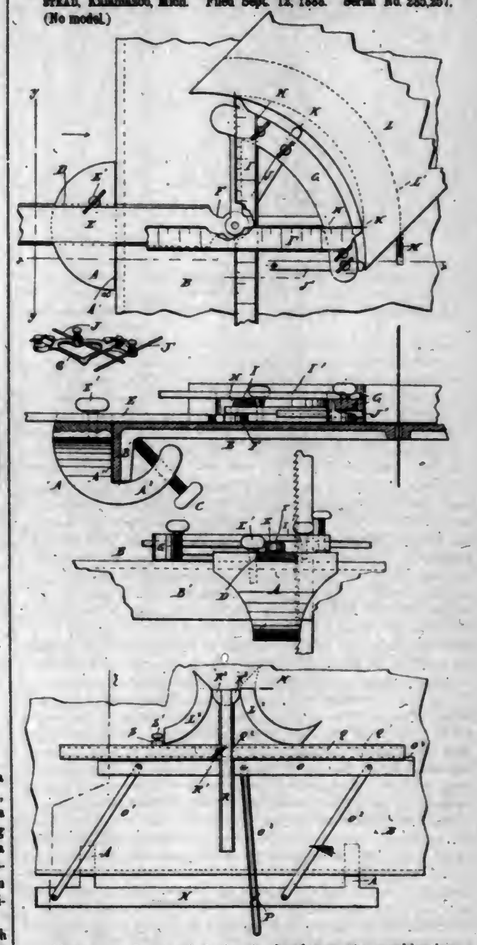
Claim.—1. In a hoisting attachment for vehicles, a frame consisting of a stationary bar and a parallel bar sliding thereon, a drum mounted upon the sliding bar of the frame, a platform, a rope connecting the drum and platform, and means, substantially as shown and described, for manipulating the drum, as and for the purpose specified.

2. In a hoisting attachment for vehicles, a frame consisting of a stationary bar and a parallel bar sliding thereon, a drum detachably mounted upon the sliding bar of the frame, a platform, a rope connecting the platform and drum, a ratchet-wheel secured to the drum, and a lever carrying a dog capable of actuating the drum, substantially as specified.

3. In a hoisting attachment for vehicles, the combination, with a frame consisting of a stationary bar and a parallel bar sliding thereon, of a drum detachably mounted upon the sliding bar of the frame, a ratchet-wheel secured to the drum, a lever carrying a weighted dog capable of actuating the drum, and a trip-lever capable of elevating the drum and tripping the dog, substantially as shown and described.

4. In a hoisting attachment for vehicles, the combination, with a frame consisting of a stationary bar and a parallel bar sliding thereon, of a drum detachably mounted upon the sliding bar of the frame, a ratchet-wheel secured to the drum, a lever carrying a weighted dog capable of actuating the drum, a trip-lever capable of elevating the drum and tripping the dog, a rope secured to the drum, and a platform detachably attached to the said rope, all combined for operation substantially as shown and described.

403,617.



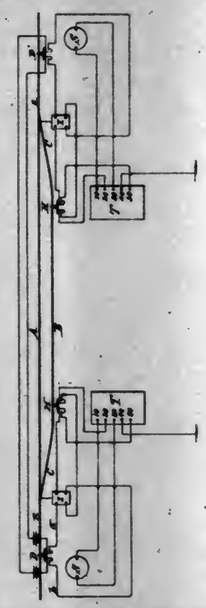
5. In a hoisting attachment for vehicles, the combination, with a frame consisting of a stationary bar and a parallel bar sliding thereon, of a drum detachably mounted upon the sliding bar of the frame, a ratchet-wheel secured to the drum, a spring-actuated lever carrying a weighted dog capable of normal contact with the ratchet-wheel, a pawl engaging with the said ratchet-wheel, a trip-lever capable of elevating the drum and dog, a rope secured to the drum, and a platform attached to said rope, all combined for operation substantially as specified.

6. In a hoisting attachment for vehicles, the combination, with the body of a vehicle provided with slotted vertical standards upon one face of the sides and solid vertical standards upon the opposite face of said sides, of a frame capable of being fitted in the slotted standards and between the slotted and solid standards, consisting of a stationary lower bar, an upper parallel bar held to slide thereon, and a hoisting mechanism attached to one outer end of the upper sliding bar, substantially as and for the purpose specified.

7. In a hoisting attachment for vehicles, the combination, with the body of a vehicle provided with slotted vertical standards upon one face of the sides and solid vertical standards upon the opposite face of the said sides, of a frame capable of being fitted in the slotted standards and between the slotted and solid standards, consisting of a stationary lower bar provided wih guides at the ends, stops intermediate of the ends, and vertical guide-standards arranged in pairs carrying friction-rollers, and an upper bar held to slide upon the lower bar below the friction-rollers, provided at one end with a stop and at the opposite end with a hoisting mechanism, all combined for operation substantially as shown and described.

8. A hoisting mechanism for vehicles, consisting of a revoluble drum provided with an attached ratchet-wheel, a spring-actuated lever held to turn upon the said drum, a pin secured transversely of the lever, a dog pivoted upon the said pin, having one weighted end capable of engagement with the ratchet-wheel, and a lip projected from the opposite end, a trip-lever adapted for contact with the pin on the drum-lever and capable of elevating the drum and dog, and a rope attached to the outer end of the drum-lever and the trip-lever, substantially as shown and described.

403,618. WORK-FEEDER FOR BAND-SAWS. Abram B. Springstead, Kalamazoo, Mich. Filed Sept. 12, 1888. Serial No. 285,257. (No model.)



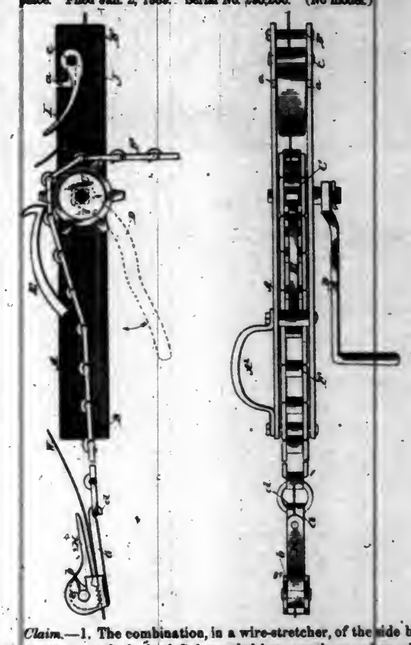
Claim.—1. In a work-feeder for band-saws, the combination, with the base-clamp, of a horizontal bar which slides in the grooved upper portion of said clamp, a frame or work-carrier, G, which is pivoted to and swings horizontally on the outer end of said bar, and horizontal arms which slide in said work-carrier and are provided with spurs for engaging the stuff to be sawed, all substantially as shown and described, to operate as specified.

2. In a work-feeder for band-saws, the combination, with the saw-table, of a detachable clamp, A, a transverse bar, E, adjustable on the clamp over the table, a carrier-frame, G, fastened to the bar E, and radially-adjustable arms on the said carrier-frame having stops on their outer ends, substantially as described.

3. In a work-feeder for band-saws, the combination, with the saw-table, of a clamp, A, a transverse bar, E, adjustable on the clamp A, a segmental frame, G, pivoted to the bar E and provided with radial dovetail slots and holes, and radially-adjustable stop-arms J J' and scaled measuring-arms I I', adjustable in said holes and slots, substantially as described.

403,619. SWITCH-INSTRUMENT FOR RAILROAD-SIGNALS.

GEORGE C. STEENBERGH, Syracuse, N. Y. Filed July 14, 1888. Serial No. 279,943. (No model.)



Claim.—1. The combination, with a block of railway main track and siding connected with said block, two electric circuits, circuit-breakers at each end of the block connected with said circuits and actuated separately by the cars passing over the block of road, registering mechanism in the circuits actuated in opposite directions, respectively, by the circuit-breakers at opposite ends of the block, and signals actuated by the registering mechanism, of two circuit-breakers separate and independent of the circuit-breakers at the ends of the block and connected, respectively, with the two circuits and actuated separately, one by the movement of the switch-rod in opening the switch of the siding and the other by the movement of the switch-rod in closing said switch, substantially as described and shown.

2. The combination, with a block of railway main track and siding connected with said block, two electric circuits, circuit-breakers at each end of the block connected with said circuits and actuated separately by the cars passing over the block of road, registering mechanism in the circuits actuated in opposite directions, respectively, by the circuit-breakers at opposite ends of the block, and signals actuated by the registering mechanism, of two circuit-breakers separate and independent of the circuit-breakers at the ends of the block and connected, respectively, with the two circuits and actuated separately, one by the movement of the switch-rod in opening the switch of the siding and the other by the movement of the switch-rod in closing said switch, and circuit-breakers connected with the same circuits and arranged at the side of the track-rail of the aforesaid siding to be actuated by the cars entering and leaving said siding, substantially as described and shown.

3. In combination with the shifting-rail of a railroad-switch and a rod connected to said rail, two electric circuits, two circuit-breaking bars, each in one of the aforesaid circuits and arranged side by side, a double guide-cam secured stationarily between the said circuit-breaking bars and having its ends beveled in opposite directions from each other, a reciprocating rod, a bell-crank connecting said rod at one end with the switch-rod, and an insulated double wedge secured to the opposite end of the reciprocating rod and adapted to pass between the circuit-breaking bars alternately at opposite sides of the stationary guide-cam during the motion of the aforesaid reciprocating rod in opposite directions, substantially as described and shown.

403,620. WIRE-STRETCHER.

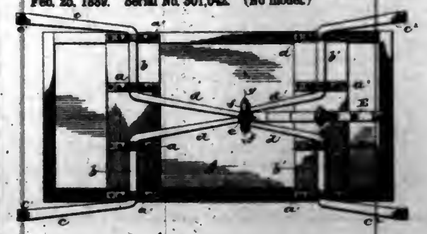
FREDERICK STILES, Burnet, Tex., assignor of two-thirds to R. L. Harrell and H. A. Burns, both of same place. Filed Jan. 2, 1889. Serial No. 295,266. (No model.)

Claim.—1. The combination, in a wire-stretcher, of the side bars, A A, having a toothed wheel, C, journaled between them and provided with a crank, a set of cross bars or bolts connecting the two side bars, a pawl, E, hung upon one of the cross-bars and having its toothed end arranged to abut against the teeth of the wheel, and a chain, F, passing over the toothed wheel and underneath the pawl, substantially as shown and described.

2. The combination, with the frame-bars A, having right-angular slots *a*, of the gripping cam-lever I, having trunnions *c*, fitting in said slots, and the cross-bar J, connecting the frame-bars and forming a bearing beneath the cam-lever to grip the wire against, as shown and described.

3. The combination of frame-bars A A, with connecting-bolts B B', cross-plate J, and slots *a*, the gripping cam-lever I, cog-wheel C, with attached crank, detent E, chain F, and wire-holder G H, attached to the chain, substantially as shown and described.

403,621. COUPLING-POLE FOR LUMBER-WAGONS.



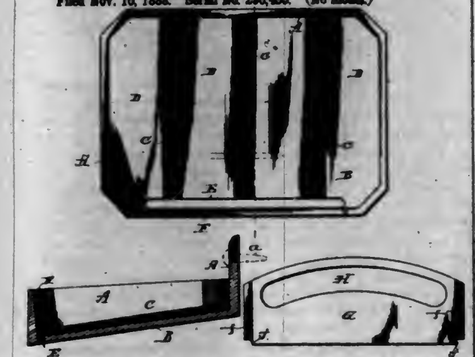
BENJAMIN R. STOCKDILL and WILLIAM A. WORLEY, Carl Junction, Mo. Filed Mar. 8, 1889. Serial No. 302,512. (No model.)

Claim.—The metallic plate B, formed with flat ends to fasten to the coupling-pole, and an intermediate raised or convexed part, *b*, with the longitudinal slot *b'* and journal or pivot holes b^2 b^3, in combination with an axially-perforated friction-roll turning upon a fixed pivot, as shown and described.

403,622. VEHICLE-SPRING.

HENRY C. SWAN, Oshkosh, Wis. Filed Feb. 25, 1889. Serial No. 301,042. (No model.)

Claim.—1. The combination, with a vehicle-body and rock-shafts connected thereto and provided with arms loosely connected at their inner ends, of a spring loosely connected at one end to said arms and bearing at its other end against said body, and a spring-supporting device at a point between its ends, substantially as set forth.



2. The combination, with a vehicle and rock-shafts mounted thereon having arms pivotally connected together, of a flexion-spring pivotally connected to the arms of the rock-shafts, and a clevis-bolt for adjustably connecting the flexion-spring with the vehicle, substantially as set forth.

3. The combination, with a vehicle and rock-shafts mounted thereon having arms pivotally connected thereto, of a flexion-spring pivotally connected to said arms, and a clevis-bolt having a yoke at one end to receive the flexion-spring, a screw-threaded upper end to pass through the vehicle-bottom, and a nut on said bolt, whereby the tension of the flexion-spring may be regulated, substantially as set forth.

4. The combination, with a vehicle-body and a set of rock-shafts loosely connected thereto, of a flexion-spring secured to the body by means of an adjusting-bolt, the free inner end of said spring being connected to the inwardly-extending arms of the rock-shafts in a manner to permit the free vertical movement of the body, substantially as set forth.

403,623. SOAP-HOLDER.

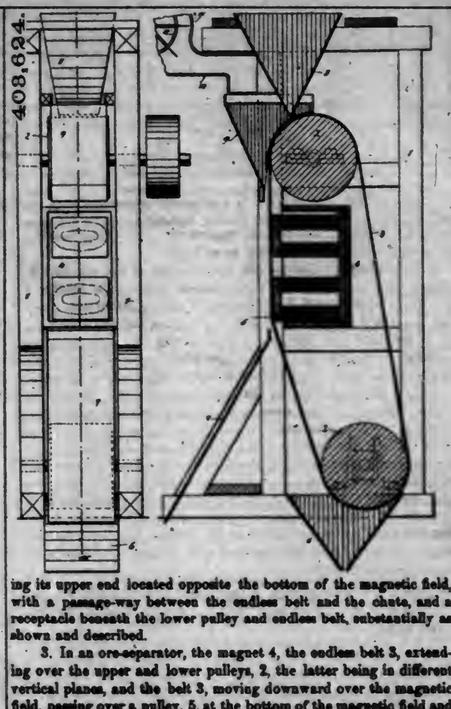
LE GRAND TERRY, Horseheads, N. Y. Filed Nov. 10, 1888. Serial No. 290,455. (No model.)

Claim.—1. A soap-holder having a sloping bottom with ribs and depressions therein and a rim around the bottom, said rim having a removable portion, substantially as set forth.

2. The combination, with a sloping bottom having ribs and depressions therein and a slot in its lowest edge, of a rim around the edge of the bottom and a removable front piece adapted to form one side of the slot, substantially as set forth.

3. The combination, with a sloping bottom having ribs and depressions therein and a slot at the lower edge into which said depressions lead, of a rim terminating opposite the ends of the slot in beveled seats and a removable front piece adapted to be held against said seats, substantially as set forth.

4. The combination, with a sloping bottom having ribs and depressions and a slot at its lower edge, into which said depressions lead, of a rim terminating at the ends of the slot in grooves, shoulders at the ends of said grooves, and a removable front piece adapted to slide in the grooves, substantially as set forth.



403,624. MAGNETIC ORE-SEPARATOR.

WILLIAM B. THOMAS, Catasauqua, Pa. Filed Mar. 30, 1888. Serial No. 305,373. (No model.)

Claim.—1. An ore-separator consisting of an endless belt mounted on upper and lower pulleys, a supply-chute having its lower open end located above the upper pulley and endless belt, a directing-chute closed at the top and open at its lower end opposite the upper pulley and endless belt, a magnet having its field located adjacent to and behind the vertically-descending portion of the endless belt, a chute having its upper end located adjacent to the bottom of the field of the magnet and in front of the endless belt, with a passage-way between the chute and belt, a hopper located beneath the lower pulley and the endless belt, a suction air-tube connected to the closed top of the directing-chute, and an exhaust-fan located in a chamber opening into the suction-tube, substantially as shown and described.

2. In an ore-separator, a magnet, an endless belt passing over upper and lower pulleys and vertically downward over the field of the magnet, a receiving-chute having its lower open end located above the upper roller and endless belt, a directing-chute having its lower open portion opposite the upper pulley and endless belt, a chute having its upper end located opposite the bottom of the magnetic field, with a passage-way between the endless belt and the chute, and a receptacle beneath the lower pulley and endless belt, substantially as shown and described.

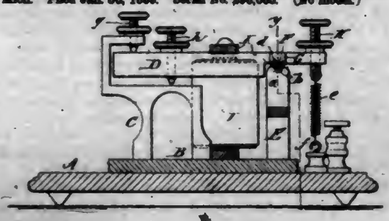
403,624.

3. In an ore-separator, the magnet 4, the endless belt 3, extending over the upper and lower pulleys, 2, the latter being in different vertical planes, and the belt 3, moving downward over the magnetic field, passing over a pulley, 5, at the bottom of the magnetic field and extending rearward at an angle over the lower pulley 2, the receiving-hopper 8, opening onto the belt 3, above the upper pulley 2, the directing-chute 9, open at its lower end opposite the belt 3, passing over the upper pulley 2, and the chute 7, having its upper end located opposite the belt 3, beneath the pulley 5, with a passage-way between the belt 3 and said chute 7, substantially as shown and described.

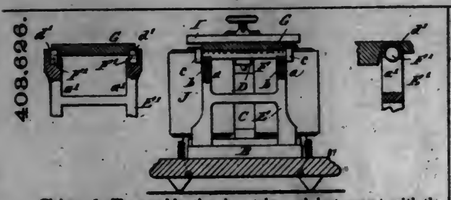
4. An ore-separator consisting of a vertical endless belt, a magnet having its field located behind the vertically-descending portion of the endless belt, a receiving-chute opening onto the endless belt above its upper roller, a directing-chute with closed top open at its lower portion opposite the endless belt and its upper roller, a chute having its upper end located opposite to the endless belt below the field of the magnet, with a passage-way between the belt and chute and an air-exhaust tube, and mechanism connected with the upper end of the directing-chute, substantially as shown and described.

403,625. SCRAPER.

SAMUEL THOMPSON, Englewood, Ill. Filed July 10, 1888. Serial No. 279,554. (No model.)



Claim.—1. In a scraper, the combination, with the reservoir A, provided with perforations *a*, of the clamping-plate C and the screws *b*, substantially as specified.

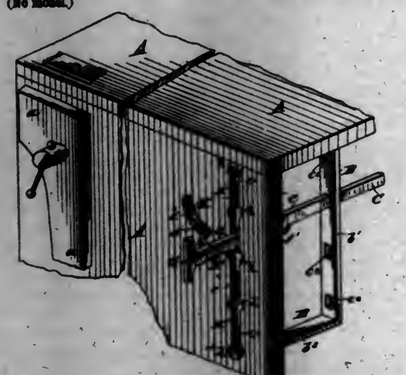


2. The combination, with the reservoir A, provided with perforations *a*, of the clamping-plate C, the screws *b*, and the strip D, substantially as specified.

403,626. TELEGRAPH-SOUNDER.

FRANK I. VAN EPPS, Hudson, Mich. Filed Jan. 30, 1889. Serial No. 298,063. (No model.)

408,626.



Claim.—1. The combination, in a telegraph-instrument, with the armature-lever and the standard, having registering curved recesses on their lower and upper surfaces, respectively, of a rolling bearing-piece in said recesses, substantially as set forth.

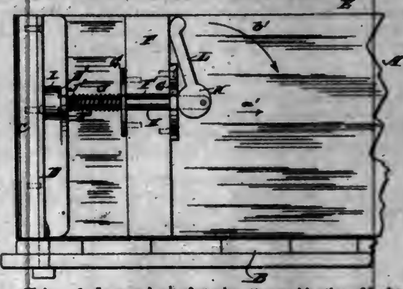
2. In a telegraph-sounder, the combination of the standard E, provided with arms *a*, having approximately semicircular notches *b* in the upper ends thereof, the rolling rod F, resting and turning freely in the notches *b* and provided with the heads *c*, and the armature-lever D, provided with the cross-arm G, having the approximately semicircular groove *d* receiving the upper side of said rod to allow the arm to rock on the rod and the rod to roll, substantially as specified.

3. In a telegraph-sounder, the combination of the standard E, provided with one or more arms, *a*, having approximately semicircular notches *b* in the upper ends thereof, the rolling rod F, resting and turning freely in the notches *b* and provided with the heads *c*, the armature-lever D, provided with the cross-arm G, having the approximately semicircular groove *d* receiving the upper side of the rolling rod to allow the arm to rock on the rod and the rod to roll, the ends of the arm G being flush with the outer sides of the standard and resting between the upper halves of the heads *c*, and the retractile spring *e*, adapted to hold the armature-lever D down upon the rod F, substantially as specified.

408,627. ADJUSTABLE WORK-REST FOR BENCHES. ALEXANDER WATSON, Brookline, Mass. Filed Dec. 20, 1888. Serial No. 294,153. (No model.)

Claim.—1. The combination, in a work-rest for benches, of a bar fitted to the bench for lateral adjustment and provided with a rack, a detent on the bench to which the rack is adapted, and a latch hung to the bench and provided with a lug adapted to lock the bar, substantially as herein set forth.

2. The combination, in a work-rest for benches, of a bar fitted to the bench for lateral and vertical adjustment and provided with a rack, a detent on the bench to which the rack is adapted, and a latch hung to the bench and provided with a series of lugs adapted to lock the bar, however it may be adjusted, substantially as herein set forth.



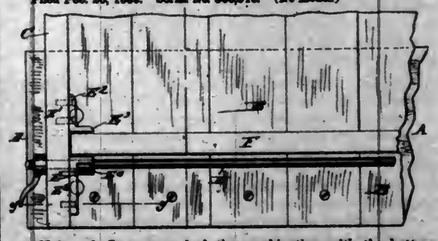
3. The combination, in a work-rest for benches, of a bar fitted to the bench for lateral adjustment and provided with a rack, a detent on the bench to which the rack is adapted, and a latch hung to the bench and having a lug adapted to lock the bar, said latch provided with a pin projecting into a slot of the bench to allow its operation from the outer face of the bench, substantially as herein set forth.

4. The combination, in a work-rest for benches, of a bar fitted to the bench for lateral and vertical adjustment and provided with a rack, a detent on the bench to which the rack is adapted, and a latch hung to the bench and provided with a series of lugs adapted to lock the bar, however it may be adjusted, said latch provided with a pin projecting through a slot of the bench to allow its operation from the outer face of the bench, substantially as herein set forth.

5. The combination, with a work-bench provided with a face slot or recess, H, and a curved slot, K, of a work-rest bar, C, fitted for lateral and vertical adjustment in the bench, a latch, D, hung to the bench and provided with a lug or lugs, *d*, adapted to overlie and lock the bar C, and having a pin, J, entering the slot K, and a keeper, E, for the latch, substantially as herein set forth.

6. The combination, with a work-bench having slots *c*¹ H K, of a frame, B, held thereto and provided with slots *c c*¹ and a detent, *f*, a bar, C, having a head, G, and rack F, and fitted to the bench and frame, a latch, D, hung to the frame B and having lugs *d d*², an arm, *d*³, and a pin, J, and a keeper, E, for the latch, all arranged for operation substantially as herein set forth.

408,628. END-GATE FOR WAGONS. WILLIAM R. WATT, Somerville, Tenn. Filed Feb. 20, 1888. Serial No. 300,517. (No model.)



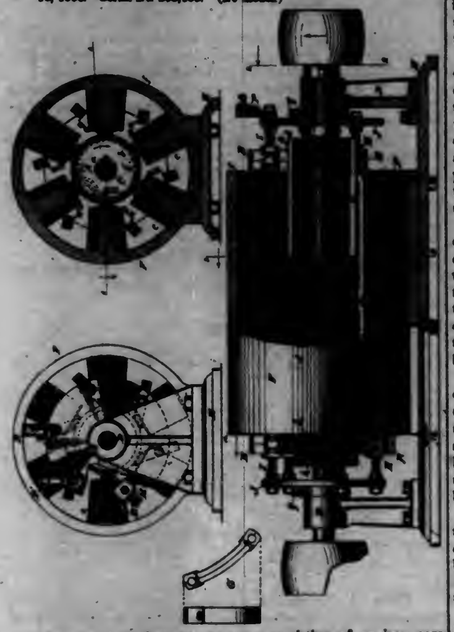
Claim.—1. In an end-gate fastening, the combination of L-shaped cleats secured on the sides of the wagon-bed, one of the said cleats being provided with an opening in its transversely-extending part, an end-gate fitting between the said cleats, and a shaft mounted to turn and slide on the end-gate and provided with a head adapted to enter the opening in the cleat, substantially as described.

2. In an end-gate fastening, the combination of L-shaped cleats secured on the sides of the wagon-bed, one of the said cleats being provided with an opening and a bearing in its transversely-extending part, an end-gate fitting between the said cleats, and a shaft mounted to turn and slide on the end-gate and provided with a head adapted to enter the opening in the cleat, substantially as described.

3. In an end-gate fastening, the combination, with L-shaped cleats secured on the sides of the wagon-bed, of an end-gate fitted between the said cleats, a shaft mounted to turn and to slide on the said end-gate, a fixed head secured on one end of the said shaft and adapted to engage an opening in one of the said cleats, and a cam-lever secured on the said shaft and serving to turn the said shaft and to cause it to slide laterally, substantially as shown and described.

4. In an end-gate fastening, the combination, with L-shaped cleats secured on the sides of the wagon-bed, of an end-gate fitted between the said cleats, a shaft mounted to turn and to slide on the said end-gate, a fixed head secured on one end of the said shaft and adapted to engage an opening in one of the said cleats, a cam-lever secured on the said shaft and serving to turn the said shaft and to cause it to slide laterally, and a spring held on the said shaft and operating in conjunction with the said lever, substantially as shown and described.

408,629. WAGON-BED. WILLIAM R. WATT, Somerville, Tenn. Filed Feb. 20, 1888. Serial No. 300,516. (No model.)



Claim.—1. In a wagon-bed, the combination, with the bottom, of sides adapted to rest on the said bottom, L-shaped metallic cleats secured to the insides of the said sides and forming a guideway for the end-gate, bolts formed on the lower ends of the said cleats to pass through corresponding apertures in the said bottom, and nuts screwing on the under sides of the said bolts, substantially as shown and described.

2. In a wagon-bed, L-shaped metallic cleats adapted to be secured to the sides of the wagon-bed to form a guideway for the end-gate, each cleat being provided on its lower end with a bolt adapted to pass through an aperture in the bed-bottom, and a nut adapted to screw on the said bolt, substantially as shown and described.

3. In a wagon-bed, the combination, with the wagon-bed bottom, and a transverse beam extending across the under side of the said wagon-bed bottom, of sides adapted to rest on the said wagon-bed bottom, L-shaped metallic cleats secured to the insides of the said sides to form a guideway for the end-gate, bolts formed on the lower enlarged ends of the said cleats and passing through corresponding apertures in the said bed-bottom and its transverse beam, and nuts screwing on the said bolts against the said transverse beam, substantially as shown and described.

408,630. DYNAMO-ELECTRIC MACHINE. THOMAS L. WILLSON, Brooklyn, N. Y., assignor to John C. McGuire, same place. Filed Dec. 10, 1888. Serial No. 293,132. (No model.)

Claim.—1. A dynamo-armature consisting of an iron core mounted to rotate on an axis, with a layer of independent and normally open-circuited conducting-bars insulated from each other extending longitudinally over the core and fastened thereto, so as to rotate therewith.

2. A dynamo-armature consisting of a cylindrical iron core mounted on a revolving shaft, and a layer of independent and normally open-circuited conducting-bars insulated from each other extending longitudinally over the cylindrical core and fastened thereto, so as to rotate therewith.

3. A dynamo-armature consisting of an iron core mounted to rotate on an axis, with a single layer of independent and normally open-circuited segmental conducting-bars applied over said core and fastened thereto, extending longitudinally thereof, insulated therefrom by an interposed insulating-envelope, and insulated from each other by being alternated with insulating-leaves.

4. A dynamo-armature consisting of a cylindrical iron core mounted on a revolving shaft, and a layer of independent and normally open-circuited conducting-bars insulated from each other applied around the exterior of the cylindrical core, fastened thereto to rotate therewith, extending longitudinally thereof, and projecting at the end beyond the end of the core.

5. The combination, with a field-magnet formed with converging poles of alternately-contrary polarities facing a central axis, of an armature consisting of a cylindrical iron core mounted to rotate on said axis, and a single layer of longitudinal conducting-bars insulated from each other fastened to said core, and extending at one end (or both) beyond the ends of the poles to form a commutating-surface, and a series of commutator-brushes equal in number to the field-poles arranged to bear on said commutating-surface in positions coincident with the respective fields of force.

6. The combination, with a field-magnet formed with converging poles of alternately-contrary polarities facing a central axis, of an armature consisting of a cylindrical iron core mounted to rotate on said axis, and a single layer of longitudinal conducting-bars insulated from each other, fastened to said core, and extending at both ends beyond the ends of the poles to form commutating-surfaces, and two series of commutator-brushes, one series arranged at each end to bear on said commutating-surfaces, and each series equal in number to the field-poles and arranged coincidently with the successive fields of force.

7. The combination of a field-magnet having converging poles of alternately-contrary polarities, an armature consisting of a cylindrical layer of longitudinal conducting-bars mounted to revolve within the field-poles, two series of collecting-brushes, each equal in number to the field-magnet poles, arranged to bear against said bars in coincidence with the fields of force, and electrical connections with the respective brushes, whereby they are all coupled together between the positive and negative terminals of the machine.

8. The combination of a field-magnet having converging poles of alternately-contrary polarities, an armature consisting of a cylindrical layer of longitudinal conducting-bars mounted to revolve within the field-poles, two series of collecting-brushes, each equal in number to the field-magnet poles, arranged to bear against said bars in coincidence with the fields of force, and electrical connections between alternately-successive pairs of brushes in each series, the connected pairs in one series alternating with those of the other series, whereby the generated current is caused to flow back and forth through the armature and to traverse the several brushes serially.

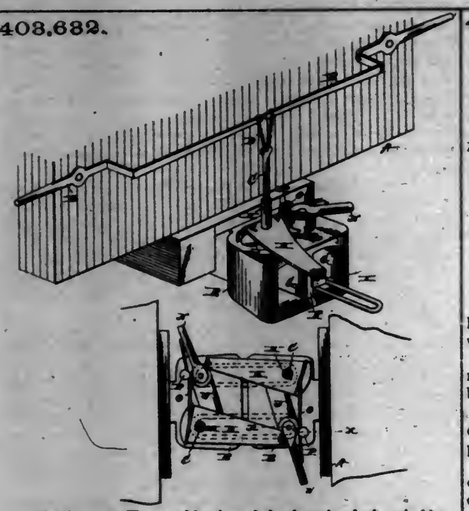
9. The combination of a field-magnet having converging poles of alternately-contrary polarities, an armature consisting of a cylindrical layer of longitudinal conducting-bars mounted to revolve within the field-poles, a series of collecting-brushes, equal in number to the field-poles, arranged to bear against the said bars in coincidence with the fields of force, holders for the respective brushes, and segmental coupling-bars constructed for engagement at their opposite ends with the respective holders and adapted to form electrical connections between them.

10. The combination of a field-magnet having converging poles of alternately-contrary polarities, an armature consisting of a cylindrical layer of longitudinal conducting-bars mounted to revolve within the field of force, a series of collecting-brushes arranged to bear against said bars in coincidence with the respective fields of force, holders for the respective brushes, and a yoke or disk mounted on a rotative bearing carrying said brush-holders and adjustable on its bearing to vary the lead of the brushes.

11. In a dynamo of the described type, the combination, with the armature having its end projecting to form a commutating-surface, of collecting-brushes bearing on said surface, a holder for each of said brushes formed with a projecting stud, and a segmental coupling-bar adapted to electrically connect two of said holders, and constructed at its ends to be clamped upon the studs thereof.

12. In a dynamo, the combination, with a brush-holder consisting of a rigid open frame, of a commutator-brush passing freely through said frame, two clamping-plates within said frame embracing the brush between them, and adjusting-screws reacting against the frame for pressing said plates against the brush and adjusting their inclination relatively to the holder.

13. In a dynamo, the combination, with a brush-holder consisting of an open frame formed with a rocker-bearing within it, of a commutator-brush passing freely through said frame, two clamping-plates within said frame embracing the brush between them, and one of said plates resting on said rocker-bearing, a screw engaging said latter plate for adjusting it on said bearing to different inclinations relatively to the holder, and a screw for pressing the opposite plate toward the rocking plate to clamp the brush between them.



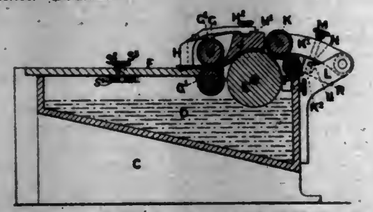
14. A dynamo-armature consisting of an iron core mounted to rotate on an axis and formed with longitudinal grooves, with a layer of independent and normally open-circuited conducting-bars insulated from each other extending longitudinally over the core, and with certain of the bars at intervals made wider than the others and projecting into said grooves in the core, with an insulating-layer interposed between the core and said bars.

408,631. PLASTIC COMPOUND FOR USE IN VARIOUS ARTS. ARTHUR T. WOODWARD, Boston, Mass. Filed Jan. 22, 1887. Serial No. 225,168. (No specimens.)

Claim.—The plastic compound herein described, the same being composed of pulverized silica or silicate, mineral or vegetable resin or pitch intimately mixed therewith, mineral or vegetable wax, linseed or other drying oil, and an oxide of zinc or tin, substantially as described, for the purposes specified.

408,632. CAR-COUPLING. CHARLES A. WOOLSEY and WILLIAM W. WOOLSEY, Ohio, Tex. Filed Dec. 15, 1888. Serial No. 293,897. (No model.)

403,632.

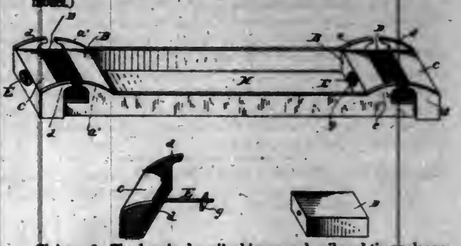


Claim.—1. The combination of the draw-head, the trip-block pivoted on the upper side of the same, the trigger secured to the upper side of the draw-head, and the spring bearing on the trip-block, as set forth.

2. The combination of the draw-heads having two compartments, the coupling-link held permanently in one of said compartments, the trip-blocks on the upper sides of the draw-heads and supporting the coupling-pins, the triggers guiding the coupling-pins and adapted to operate the trip-block, and the spring bearing on the trip-block, as set forth.

3. The improved coupling herein described and shown, comprising the draw-head having a central vertical partition, the weighted pin arranged in one of said partitions, the link secured by said pin, the trip-block pivoted on the upper side of the draw-head and having arms projecting therefrom in opposite directions, a spring bearing on one of said arms, a trigger secured to the draw-head projecting over the other of said arms and provided with a sleeve on its upper side and having its front end bent downward, and a coupling-pin supported in said sleeve, as set forth.

403,633. MACHINE FOR GUMMING PAPER. JOHN J. ALLEN, Halifax, County of York, England. Filed Sept. 18, 1888. Serial No. 285,736. (No model.)

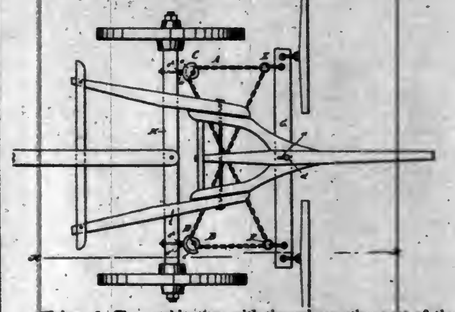


Claim.—1. The combination of a trough for holding gum, a gumming-roller revolving therein, the strickle and adjustable cover plate with groove for guides, the feeding-rollers in front of the gumming-roller, the top feed-roller being self-adjustable, the regulating-guides, the tension-roller adjustable as to its height by means of the pivoted lever and screws, the taking-off fingers, and finishing-roller, for the purposes substantially as shown and described.

2. The combination of a trough for holding gum, a gumming-roller revolving in said trough, the adjustable cover-plate F, provided with slots S^2 and having its outer corners provided with angles S, the strickle-plate F', attached to said cover-plate, the machine-frame C, having angles S', corresponding with the angles of the cover-plate, the studs S^2, the slotted bracket U', attached to the machine-frame, and the spindle T, tapped into the cover-plate, said spindle being provided with a milled head, T^2, and having a collar, T', working in the slotted bracket, substantially as described.

3. The combination of a trough for holding gum, a gumming-roller revolving in said trough, a self-adjustable feed-roller located above the gumming-roller, an adjustable tension-roller, a pivoted arm upon which said tension-roller is mounted, means for adjusting said pivoted arm, and a finishing-roller, substantially as described.

403,634. COMBINATION RAILROAD CROSS-TIE. WILLIAM H. BAGBY, Waco, Tex. Filed Dec. 26, 1888. Serial No. 294,611. (No model.)



Claim.—1. The herein-described improved railroad tie or sleeper having removable end caps inclosing the ends thereof and provided with overhanging ears or short arms, substantially as set forth.

2. The herein-described improved railroad tie or sleeper having removable end caps inclosing the ends of said tie or sleeper, and the blocks secured by said caps, substantially as set forth.

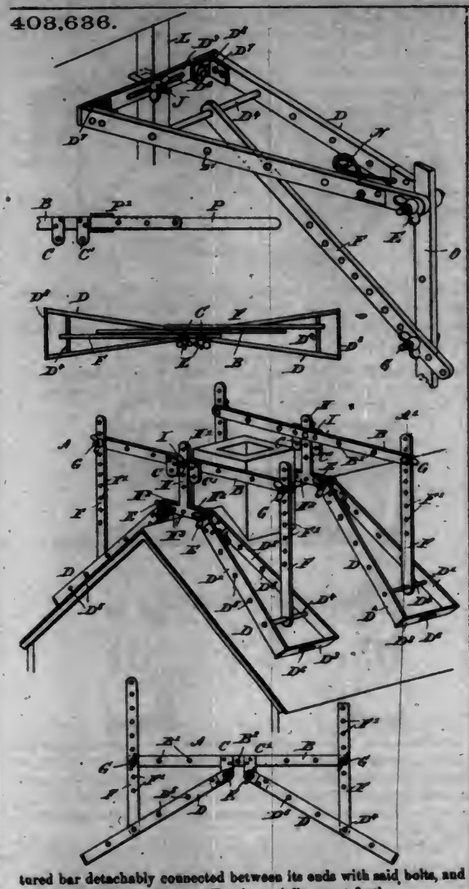
3. The herein-described improved metallic railroad-tie having overhanging ears or short arms, and the removable end caps, also provided with ears or short arms, substantially as set forth.

4. The herein-described improved metallic railroad-tie having overlapping ears or short arms, the apertured partitions, the end caps, also having ears or short arms, the apertured blocks, and the nutted bolts, substantially as set forth.

403,635. DRAFT-EQUALIZER. JOHN BEVERS, Marine Mills, Minn. Filed Feb. 26, 1888. Serial No. 301,190. (No model.)

Claim.—1. The combination, with the axle or other part of the vehicle provided with pulleys located in line with the draft, or thereabout, of the whiffletree provided with rings or staples near its ends, and chains passing from each end of the whiffletree to and around the opposite pulley, thence to the adjacent end of the whiffletree, substantially as described.

2. The whiffletree A, provided near its ends with the rings E F, and the axle-tree provided with the pulleys C D, in combination with the two chains A B, the former attached at one end to the ring E, passed through pulley C, thence to the ring F, to which it is attached, the chain B, attached at one end to the ring F, passed around the pulley D, thence to ring E, to which it is attached, substantially as described.



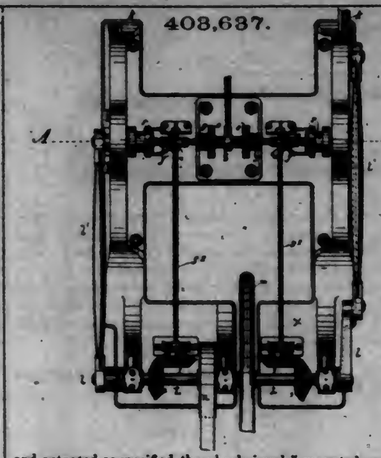
403,636. SCAFFOLDING. ADOLPH BITTERLY, Ottawa, Ill. Filed Oct. 2, 1888. Serial No. 286,969. (No model.)

Claim.—1. In a scaffold, a triangular leg comprising side bars, D' D^3, a cross-bar, D^3, connecting the bars at one end, a rod, D^4, connecting the side bars between their ends, and a removable clamping-bolt connecting the side bars at their opposite ends, and a bar, F, mounted at one end on the cross-rod D^4 to swing in the plane of the leg and provided with a series of transverse apertures, F', and an intermediate transversely-apertured bar bolted to the bar F and connected with the clamping-bolt, substantially as set forth.

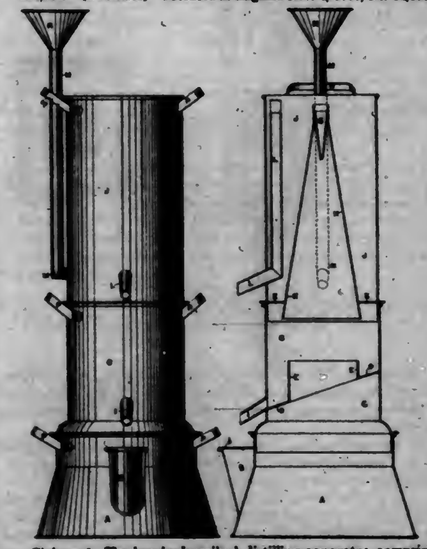
2. In a scaffold, a triangular leg comprising side bars, D' D^3, a longitudinally-slotted cross-bar, D^3, connecting said side bars at one end, a bolt connecting the opposite ends of the side bars, an intermediate cross-rod, D^4, a hook-bolt, J, passed through said slot, an apertured bar mounted at one end on said cross-rod, and an apertured bar detachably connected with the bar F and the said bolt, substantially as set forth.

3. A scaffold consisting in two triangular legs or frames having removable bolts at their adjacent narrow ends, a cross-rod between their ends, apertured bars F, mounted on said cross-rods, and an apertured bar detachably connected between its ends with said bolts, and at its ends bolted to the bars F, substantially as set forth.

403,636.



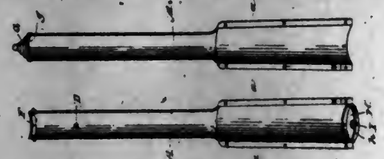
4. A scaffold consisting in the two triangular legs or frames having cross-rods between their ends and removable bolts at their adjacent narrow ends, apertured bars F, mounted at one end on said rods D^4, and the apertured cross-bar B, detachably connected between its ends by a T-shaped apertured bar, H, with said bolts, the vertical arm of said bar H being bolted to the bar B and the transverse arm to the legs, substantially as set forth.



5. The herein-described scaffold, consisting in the legs or frames D, having bolts E at their adjacent ends, cross-rods D^4, the apertured bars F, and the removable T-shaped apertured bar H, through the transverse arm of which said bolts pass, and the apertured bar B, having depending apertured lugs C C', between which the vertical arm of the bar H passes, and a bolt detachably connecting said vertical arm with the bar B, substantially as set forth.

403,637. TRANSMISSION APPARATUS. THEODOR BOSSE, Mühlhausen, Germany. Filed May 12, 1888. Serial No. 273,741. (No model.)

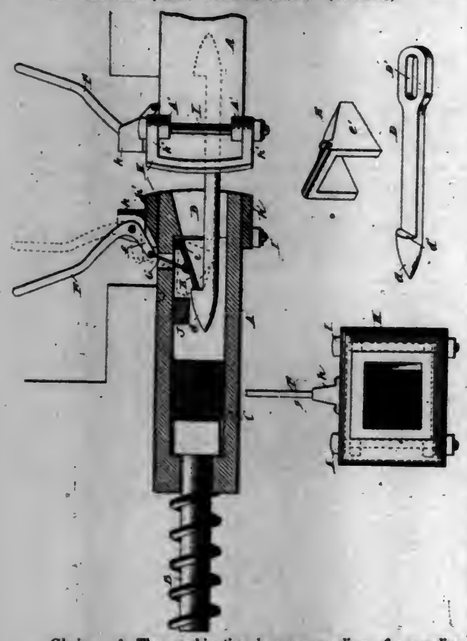
Claim.—The combination, with suitable supporting-frame, a, main shaft L, mounted in suitable bearings in said frame, the fly-wheel m, the pulley n, and the wrist-cranks l, mounted upon said shaft, and the rod l', connecting said crank with the sliding rack K of the shafts e, f, and f', journaled in bearings in said frame, the wheels c and d, mounted upon said shafts and meshing, as specified, the sliding racks K, meshing with the wheels i and i', sliding in a groove in said frame and actuated as specified, the wheels i and i', mounted upon the shafts f f and provided with crown-ratchets, the wheels s, mounted upon said shaft L, the shafts s^2, journaled upon said frame, the wheels s', mounted upon said shafts s^2 and meshing with the wheels s, the eccentrics t, also mounted upon said shafts s^2 and working in the yokes v, said yokes v attached to the oscillating levers u, said oscillating levers u, the straps u', the collars r, mounted upon the shafts f and f' and constructed with pawl p, as specified, all substantially as and for the purpose set forth.



403,638. DISTILLING APPARATUS. PHILIP H. BRAGDEN, Wincanton, County of Somerset, England. Filed May 16, 1887. Serial No. 238,384. (No model.) Patented in England Nov. 4, 1886, No. 14,190.

Claim.—1. The herein-described distilling apparatus, comprising the three superimposed sections supported upon each other, the upper and lower sections being designed to retain water, the inclined diaphragm located in the intermediate section and having an upwardly-projecting hollow curb, and the cone open at its ends and located in the upper one of said sections and having its lower end wider than said curb above which it opens, substantially as set forth.

2. The herein-described distilling apparatus, comprising the three superimposed sections, the upper and lower ones of which are provided with water-supply openings, the cone secured in the upper one of said sections and having a smaller cone in its upper end, the water-outlet pipe in said upper section having its inner opening beneath the upper end of said cone, the inclined diaphragm having a curb projecting therefrom, and the outlet-pipe of the central section, substantially as set forth.



408,639. HYDRANT-CASING. PATRICK P. BRADLEY, Harrisburg, Pa. Filed Feb. 11, 1889. Serial No. 299,392. (No model.)

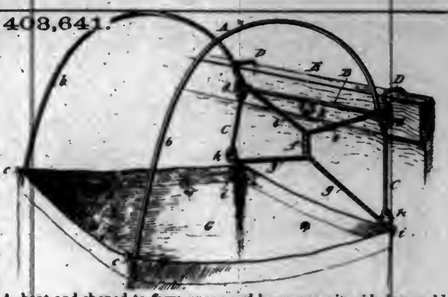
Claim.—1. In a hydrant-casing formed in halves, the combination, with the cylindrical or regular upper part and the base-section tapering from the bottom upward, of the extended flanges on the base-section for uniting the halves, substantially as described.

2. In a hydrant-casing formed in halves, the combination, with the base-section having the extended flanges, of the top formed integral therewith of substantially circular form, with the lapping extensions or flanges, substantially as and for the purpose set forth.

408,640. CAR-COUPLING. ROBERT L. BEETS, New Washington, Pa. Filed Mar. 6, 1889. Serial No. 302,055. (No model.)

Claim.—1. The combination, in a car-coupling, of a coupling-gate and a detachable frame adapted to be placed over a draw-head and carrying an operating-lever for lifting said gate, substantially as described.

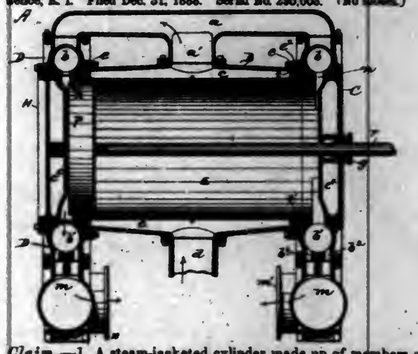
2. The combination, with the draw-head, of a rubber buffer fitted therein, a coupling-gate also within the draw-head, a coupling-hook, and a lifting-lever for said gate, substantially as described.



3. In a car-coupling, the following elements in combination, viz: a draw-head, A, provided with rubber buffer C therein, the coupling-gate E, formed with side flanges, *e'*, and pivoted within the draw-head by pivot-pin *e*, a detachable frame, H, formed with flanges *h'* and bracket *h*, the lever F, pivoted in said bracket and connected with gate E by a link, G, and the bolts I, securing the frame H to the draw-head by passing through the flanges *h'* and lugs A', substantially as described.

408,641. BAG-HOLDER. FRANK A. BROWN, Angelica, N. Y. Filed Apr. 23, 1888. Serial No. 272,130. (No model.)

Claim.—1. In a bag-holder, the wires A, bent to form two outwardly and downwardly projecting side arms, *b b*, terminating in hooks *c c* and further twisted and bent in the rear, forming loops *d d*, and continued to form a back composed of upper and lower extensions, *e e* and *g g*, united in the center at *f* and terminating below in opposite side loops, *h h*, and hooks *i i*, essentially as described.

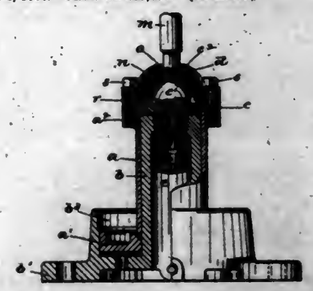


2. In a wire-frame bag-holder, the combination, with the wires

408,641.

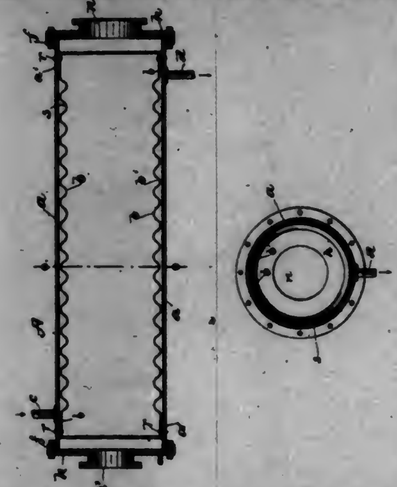
A, bent and shaped to form upper and lower opposite side loops, *d h*, and front and rear hooks, *c c* and *i i*, of the cross-wire B, bent to form an eyelet, *k*, the attached hooks D D, and the stays C C, substantially as specified.

408,642. STEAM-ENGINE CYLINDER. WALTER F. BROWN, Providence, R. I. Filed Dec. 31, 1888. Serial No. 295,008. (No model.)



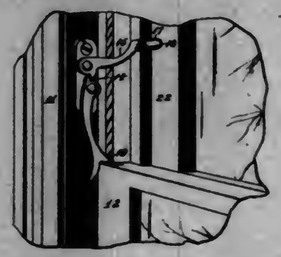
Claim.—1. A steam-jacketed cylinder made up of members or sections arranged and secured together, and having the cylinder-barrel, as E, free to expand and contract independently of the jacket-casing, and, further, having the free end of said barrel provided with a circumferential stuffing-box and gland, substantially as hereinbefore described and set forth.

2. The composite steam-jacketed cylinder hereinbefore described, consisting of the front and back end sections provided with steam and exhaust valve chests, the inner or cylinder barrel being secured to the said first end section and provided with a stuffing-box and gland fitted to expand and contract freely in the other end section, and the apertured jacket-section surrounding the inner barrel and secured to and intermediate of the end sections, all arranged and adapted for use substantially as set forth, and for the purpose specified.



3. In a steam-jacketed cylinder, the combination, with the front and back end sections, C D, having steam and exhaust chests formed therein and the jacket-casing B, uniting said sections, of the cylinder-barrel E, secured to the front section, C, and having the rear portion of the barrel fitted to move freely in a longitudinal direction in the back end section, and, further, having such free end of the barrel provided with a circumferential packing-box and gland, and means for adjustably securing the gland in position, substantially as shown and hereinbefore described, and for the purpose set forth.

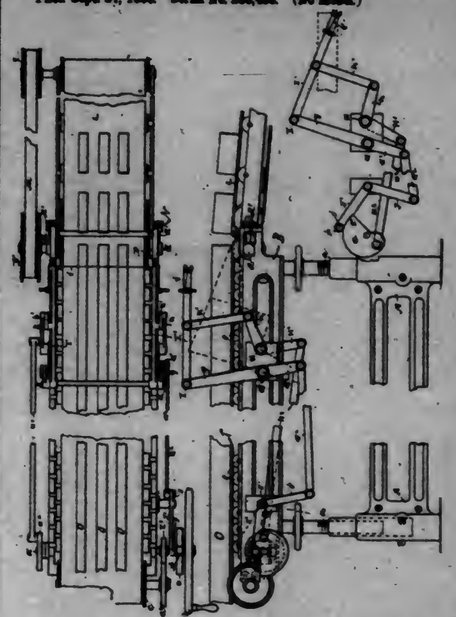
408,643. DASH-POT. WALTER F. BROWN, Providence, R. I. Filed Jan. 5, 1889. Serial No. 295,736. (No model.)



Claim.—The combination, with a drop-rod having a cup-shaped enlargement, *a*, at its lower end, of an annular plunger, *c*, a flange-plate, *e*, having a hemispherical projection formed on its upper side adapted to the cavity of the drop-rod, and a centrally-apertured hemispherical cap, *d*, having its under side connecting with the said projection of the flange-plate *e*, and adapted to the convex surface of the end *a* of the drop-rod, said flange-plate and cap being secured to the top end of the plunger, all arranged and adapted for operation substantially as shown and described.

408,644. STEAM-JACKETED RECEIVER. WALTER F. BROWN, Providence, R. I. Filed Jan. 5, 1889. Serial No. 295,734. (No model.)

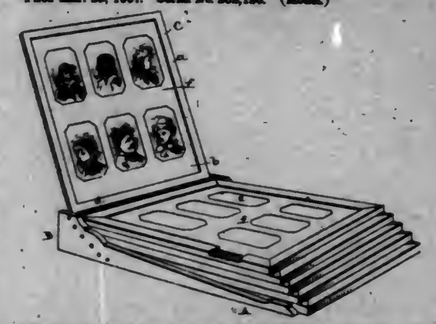
Claim.—The steam-jacketed receiver hereinbefore described, consisting of the outer shell, *a*, provided with the inlet and outlet passages *c d*, heads secured to the ends of the shell, and the corrugated inner shell or lining, *b*, made of thin metal and secured at the ends to the outer shell by rivets or bolts, thereby forming joints adapted to be calked, substantially as shown and set forth.



408,645. SASH-FASTENER. JOHN H. BURTNER, Cincinnati, Ohio. Filed Mar. 9, 1888. Serial No. 302,675. (No model.)

Claim.—1. A window fastener or holder consisting of a base-plate, an arm pivoted at the inner end above the center of said plate, provided with a spur upon the under side at the pivotal point, having a curved body and an essentially horizontal free extremity containing a flexible binding-block, and a second arm pivoted at one end below the center, provided with a spur capable of engaging the spur of the upper arm, and also provided near the free extremity upon the inner edge with a lug, all combined for operation substantially as shown and described.

2. In a sash lock or fastener, the combination, with a base-plate provided with a stop at the upper end and a second stop below the center near the inner edge, of an arm pivoted upon the said plate above the center, having a curved body and an essentially horizontal free extremity, and provided with a spur upon the under edge at the pivotal point, a lower arm pivoted below the center of the plate, provided with a spur at the pivotal point capable of contacting with the spur of the upper arm, the body of which lower arm is curved throughout its length and provided near its free extremity with a lug projecting at a right angle from the inner edge, substantially as shown and described, and for the purpose specified.

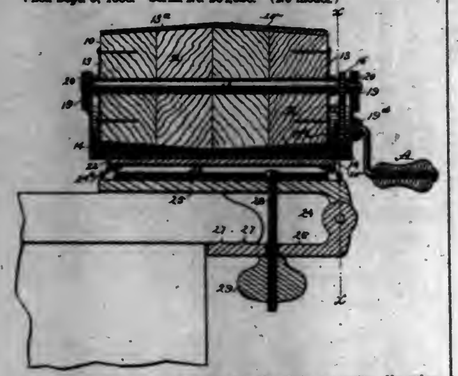


408,646. BRICK OR TILE CUTTING MACHINE. ELIJAH M. ROSS, Champaign, Ill., assignor to J. W. Penfield & Son, Willoughby, Ohio. Filed Sept. 27, 1888. Serial No. 286,402. (No model.)

Claim.—1. In brick or tile cutting machines, the combination, with a horizontally-moving carrier, of cutter mounted on the free end of swinging frame having up-and-down movement to and from the carrier, said frame being pivoted to upright arms having oscillating movement lengthwise of the carrier, and mechanism, substantially as indicated, for reciprocating such frame and oscillating such arms automatically from the movement of the carrier, substantially as set forth.

2. The combination, with a horizontally-moving carrier and tilting frame with cutter attached, said frame being pivoted to upright oscillating arms, substantially as indicated, of crank and connecting mechanism for actuating such tilting frame, and cam and connecting mechanism for oscillating the said arms, both crank and cam being operatively connected with and actuated by the said carrier, substantially as set forth.

408,647. PHOTOGRAPH-CABINET. JOHN CORBIN, Boston, Mass. Filed Mar. 22, 1887. Serial No. 232,123. (Model.)



Claim.—1. The combination, with the base having its side pieces, D, tapering, and having the tapering uprights B, formed on the upper ends of the said side pieces, and the rods *d*, arranged in echelon and having their ends inserted in the said uprights B, and the leaves having eyelets in their rear edges, which eyelets are mounted on the rods and form hinge-connections between the rods, substantially as and for the purpose described.

2. The hereinbefore-described photograph-holder, composed of the base A, having the tapering sides D, and having the tapering uprights B, formed on the upper ends of the said sides D, the rods *d*

arranged in echelon and having their ends inserted in the said openings, and the leaves composed of frames having flexible centers for the reception of the pictures and having eyelets at their rear edges, which eyelets are mounted on the said rods and form the hinge-connections between the frames and the said rods, substantially as described.

408,648. RAZOR-STROP. GEORGE H. COURSEN, Baltimore, Md.

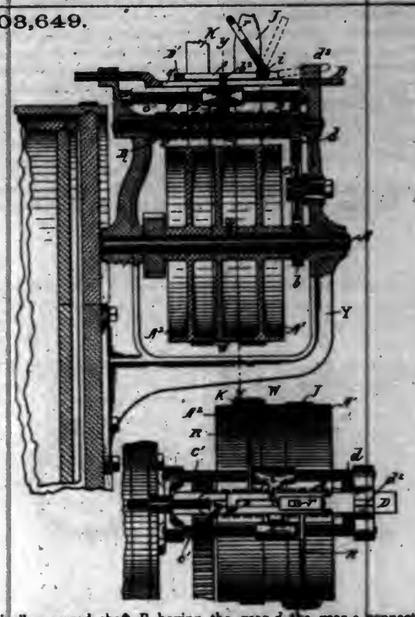
Filed Sept. 5, 1888. Serial No. 284,630. (No model.)

Claim.—1. A sharpening-wheel inclined in opposite directions from its center and formed of a series of circular sections secured face to face, with the grain of the wood in any two sections at right angles to each other, and a yielding circumferential cover or jacket for the roller, substantially as set forth.

2. The combination, with a rotatable wheel consisting of a series of united sections formed to the contour of two connected truncated cones of greatest diameter in the center, of a yielding peripheral jacket secured to the wheel, having one portion of the surface provided with a coating of a sharpening composition, substantially as shown and described.

3. The combination, with a casing and guards attached to the same, said casing and guards provided with aligning slots, of a rotatable sharpening-wheel, an axle passing through the wheel, and detachable journal-plates receiving the said axles, located between the casing and guards, said guards provided with a series of flexible tongues, substantially as shown and described.

4. The combination, with a casing and guards attached to the same, said casing and guards provided with aligning slots and flexible tongues, of a rotatable sharpening-wheel, an axle passing through said wheel, a detachable journal-plate receiving said axle, located between the casing and guards, and means, substantially as shown and described, for rotating the wheel and securing the casing to a support, as and for the purpose specified.



408,649. REVERSING MECHANISM FOR WASHING-MACHINES.

JAMES G. CRAWFORD, Boston, Mass. Filed Feb. 29, 1888. Renewed Apr. 19, 1889. Serial No. 307,872. (No model.)

Claim.—1. The combination, in a reversing mechanism, of the shaft A, the fast pulley W and the loose pulleys A' A^3 on said shaft, the gear or wheel *b*, affixed to the loose pulley A', the shaft B, having the intersecting spiral grooves or right and left threads, means, substantially as described, for transmitting motion from the gear or wheel *b* to the shaft B, whereby the latter is rotated with the loose pulley A', a pivoted dog, B', engaged with the spirally-grooved shaft and adapted to be reciprocated thereby, a stud, b^3, secured to said dog, and a belt-shipper adapted by means, substantially as described, to be acted on by the dog B' and its stud when the dog is near the ends of its reciprocating movements, as set forth.

2. The combination, in a reversing mechanism, of the shaft A, the fast pulley W and the loose pulleys A' A^3 on said shaft, the shaft B, having the intersecting spiral grooves or threads, the gear or wheel *b*, affixed to the loose pulley A', means, substantially as described, for transmitting motion from the gear or wheel *b* to the shaft B, whereby the latter is rotated with the loose pulley A', a pivoted dog, B', engaged with the shaft B and adapted to be reciprocated thereby, a belt-shipper, and an arm or lever, D', pivoted to said shipper and having a slot, *s*, formed to receive a stud or projection which moves with the dog B', said lever being movable, as described, whereby it may be separated from said stud to make the reversing mechanism inoperative, as set forth.

3. The combination, in a reversing mechanism for washing and other machines, of the shaft A, the fast pulley W, the loose pulley A^3, the loose pulley A', provided with the spur-gear *b* upon its hub, the

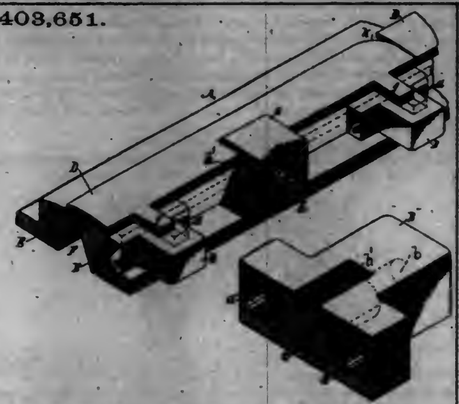
spirally-grooved shaft B, having the gear *d*, the gear *c*, connecting the gears *b* and *d*, the yoke C, the guide-rods *d' d'*, the dog B', engaged with the shaft B and pivoted to the yoke C, the shipper-rod D, provided with the hinged slotted bell-crank lever D', one arm of which is provided with the opening *r*, and the fixed lug d^3 on the frame, formed to engage the opening *r*, all arranged and operating substantially as described.

408,650. GRIPPER FOR CABLES. ELIJAH DAIBEY, Coal Bluff Fa. Filed Mar. 18, 1889. Serial No. 303,695. (No model.)

Claim.—1. The combination, with a cable, of a grip comprising a body portion provided with a recess in its upper edge, a link pivoted in said body, and a locking device adapted for contact with the link when in a horizontal position, substantially as described.

2. The combination, with a cable, of a grip comprising a body portion provided with a recess in its upper edge having oppositely-inclined walls, a link pivoted in said body having an attached handle, and a pin capable of passing through the body in contact with and above the link, substantially as shown and described.

3. The combination, with a car or other vehicle provided with an attached yoke or bail and a cable, of a grip swiveled to the vehicle yoke or bail comprising a body portion provided with a recess in its upper edge, a link pivoted in the body at one side of the recess, of a length sufficient to pass over one end of the body, and a removable locking device inserted in the body above the link, substantially as shown and described.

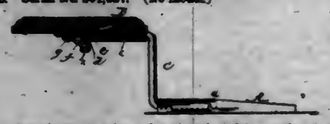


4. The combination, with a car or similar vehicle having a bail or yoke secured thereto, of a grip swiveled upon the yoke or bail comprising a body portion provided with a recess in its upper edge having oppositely-inclined side walls, a link pivoted in said body provided with a handle, and a locking-pin, all combined for operation substantially as shown and described.

408,651. GRIP-SLOT CLOSER FOR CABLE RAILWAYS. CHAS. DAVIS, Kansas City, Mo., assignor of two-thirds to Caroline Marder and Con. W. Marlin, same place. Filed Mar. 23, 1889. Serial No. 304,302. (No model.)

Claim.—1. The cap or plate covering the cable-track slot and

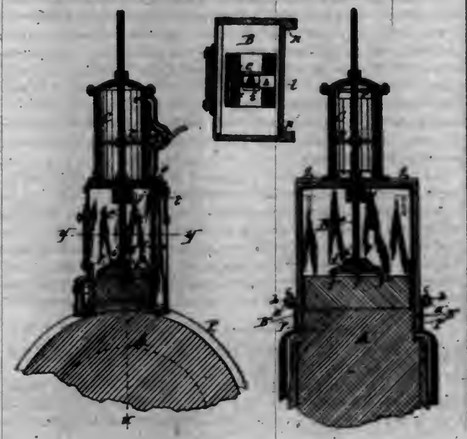
408,651.



having at one of its side edges arms resting upon blocks or seats, said arms having pendants, also provided with arms, in combination with springs placed in said seats or blocks, substantially as set forth.

2. The cap or plate covering the cable-track slot and having a lateral movement, in combination with the chair bolted or secured at one side of the slot and having its horizontal portion resting upon said plate or cap, and having a horizontal or lateral recess providing for the reception of said plate or cap as it is moved laterally, substantially as set forth.

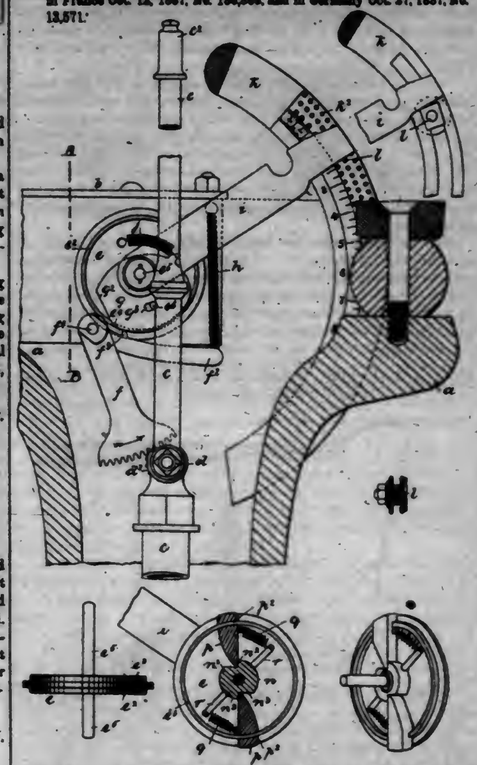
3. The combination of the cable-track having a gripper-receiving slot, the cap or plate sections curved or chamfered at the end edge and having the lateral arms provided with pendants, also having arms, the chambered seats or blocks, the springs arranged in the chambers of said blocks or seats and in the chair having a lateral recess, and its horizontal portion resting upon the top or plate section, substantially as specified.



408,652. ARM-REST. ALBERT B. DICK, Chicago, Ill. Filed Nov. 24, 1888. Serial No. 291,837. (No model.)

Claim.—1. A base, A, adapted to be placed beneath a book, and an arm-rest, B, in combination with parallel rods C C, bent at right angles at their opposite ends, which are pivoted one to the base and the other to the arm-rest, racks *b*, and pawls *d*, substantially as specified.

2. A base, A, adapted to be placed beneath a book, and an arm-rest, B, in combination with parallel rods C C, bent at right angles at their opposite ends, which are pivoted one to the base and the other to the arm-rest, racks *b*, pawls *d*, and rock-shaft D, having arms *f*, substantially as and for the purpose specified.



408,653. WOOD-PULP MACHINE. FRANK DILLS, Fulton, N. Y. Filed June 30, 1888. Serial No. 278,063. (No model.)

Claim.—1. In combination with the grinder A, the segmental plates P P, provided with flanges *a a* on their entire peripheries, the wood-holding boxes B B, mounted on said flanges and adapted to be shifted in the direction of the length of the flanges and adjustably secured thereto, and the cylinders C C, secured directly to said boxes, substantially as described and shown.

2. In combination with the grinder A and segmental side plates, P P, the wood-holding boxes B B, mounted on the peripheries of said plates and extending outward therefrom, and provided with the gates *l l*, adjustable toward and from the grinder and maintained parallel throughout their adjustment, as set forth.

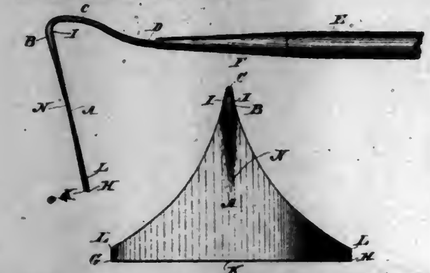
408,654. AUTOMATIC AND INSTANTANEOUS GAS-LAMP EXTINGUISHER. JAMES S. ROSE and FRANCIS W. TESTSHIRE, Birmingham, County of Warwick, England. Filed May 16, 1888. Serial No. 274,089. (No model.) Patented in England Oct. 15, 1886, No. 13,197; in France Oct. 12, 1887, No. 186,309, and in Germany Oct. 27, 1887, No. 43,571.

Claim.—1. In an automatic instantaneous gas-lamp extinguisher, the combination, with a gas-lamp and its cognate parts—such as the supply-pipe burner and plug—of automatic mechanism for turning said plug, comprising a spring-actuated lever connected to the plug, a spring-actuated motor, a lever connected to the winding-arbor of said motor, a graduated time-plate arranged in the vicinity of said lever, and a movable stop on said time-plate adapted to limit the movement of said lever, a revolving detent, and a time-wheel carried by the motor mechanism and adapted to release the spring-actuated lever at a point dependent on the amount of movement of the winding-lever, substantially as described.

2. In an automatic gas-lamp extinguisher, the combination, with a gas-supply pipe and a cock thereon, of a lever connected thereto and provided with a tooth, f^3, a spring connected to said lever, a spring-actuated motor, a lever connected to the winding-arbor thereof, a notched time-wheel carried by the motor and adapted to receive said tooth f^3, a cam connected to the winding-arbor and adapted to impinge against said tooth, whereby when the lever is depressed the tooth f^3 will be disengaged from the time-wheel, the motor-spring wound, and the gas-cock opened, substantially as described.

3. In an automatic gas-lamp extinguisher, the combination of a spring-actuated motor, a notched wheel carried on a shaft of the same, a spring-actuated lever connected to a gas-cock and having a detent to engage with said wheel, and a winding-lever connected to the wind-

ing-arbor of the motor and to the said notched wheel, whereby the depression of said lever will wind the motor and turn the notched wheel in the same direction as the winding-arbor, substantially as described.



4. In an automatic and instantaneous gas-lamp extinguisher, the combination, with automatic extinguishing mechanism comprising a spring-actuated time-motor, of a graduated time-plate, *k*, with holes k^2 and graduations, a movable peg, *l*, and a winding-lever, *i*, connected to the winding-arbor of said motor, substantially as and for the purpose as set forth.

5. In an automatic and instantaneous gas-lamp extinguisher, the combination, with a gas-lamp and chronometric or time cutting-off mechanism comprising a spring-actuated motor, a lever connected to the winding-arbor thereof, a time-wheel connected to said motor and having a notched rim, and a cam upon said arbor, of a toothed quadrant, *f*, with arm and tooth f^1 f^2, normally engaging with the said tooth resting within the notch of the time-wheel, and with the teeth engaging with a pinion on the plug-axis and adapted to rotate the said plug either for turning on or for cutting off, substantially as set forth.

6. In an automatic gas-extinguishing apparatus, the combination, with the gas-supply pipe and a cock thereon, of a spring-actuated lever which engages with said cock and is provided with a detent, a spring-actuated motor carrying a time-wheel, *c*, with notched flange c^2, a lever, *i*, attached to the winding-arbor of said motor, a slotted cam carried upon said arbor and adapted to engage with said detent, and an adjustable clutch or grip mechanism interposed between said time-wheel and said motor, all constructed and arranged substantially as described.

7. The combination, with a gas-lamp, gas-burner, or gas-pipe, *c*, of mechanism consisting of a time-plate, main lever, cam-plate *g*, toothed quadrant with arm and tooth, geared gas-plug, time-wheel with notch and face rims, clutches and bows carried by great wheel, transmitting, reduction, and regulating gear, and motive power, which are constructed and arranged and operate substantially as and for the purpose as herein described, and set forth in Figs. 1, 2, 3, 4, and 5.

408,655. HOE. ELNATHAN J. GATES, Oronoco, Minn. Filed Aug. 24, 1888. Serial No. 283,644. (No model.)

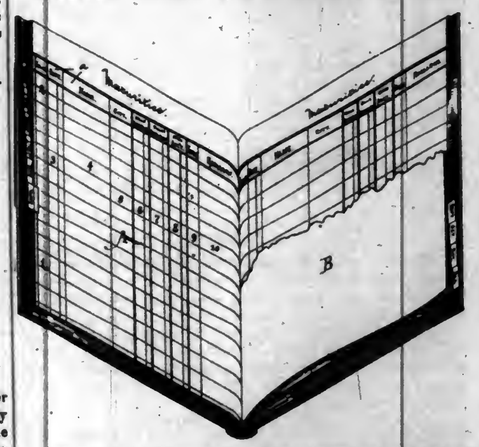
Claim.—A hoe consisting of a blade having a long straight or slightly-curved bottom cutting-edge, and side edges curving inwardly upwardly from at or near the bottom to a central integral shank, the height of the blade being about two-thirds of its width, the blade so constructed being narrow both laterally and vertically, in combination with a shank integral with the blade, which shank terminates in a neck and tang adapted to enter a handle, substantially as described.

408,656. HINGED HANDLE. JACOB GERSTLE, Portland, Oreg. Filed Jan. 14, 1889. Serial No. 296,259. (No model.)

Claim.—1. As an improved article of manufacture, a hinged handle formed of the plate A, provided with the ear A', the arm B, connected with the plate by the pintle *a*, and the sliding fastener C, substantially as specified.

2. The combination, in a hinged handle, of the plate A, provided with the ear A', the arm B, connected with the plate by the pintle *a*, the sliding fastener C, and a stop-pin, *b*, substantially as specified.

3. The combination, with a pan or other culinary vessel, of a hinged handle formed of the plate A, provided with the ear A', the arm B, connected with the plate A by a hinge-joint having the pintle *a*, and the sliding fastener C, placed on the handle and adapted to engage the ear A', substantially as specified.



408,657. LUBRICATING DEVICE. JOHN R. GLOVER, Dubuque, Iowa. Filed Feb. 18, 1889. Serial No. 300,235. (No model.)

Claim.—1. A lubricating-cup provided with an interior tube extending upward from the bottom of the cup, and a channeled sphere provided with a pendulum pivoted in the upper end of said tube, substantially as and for the purpose described.

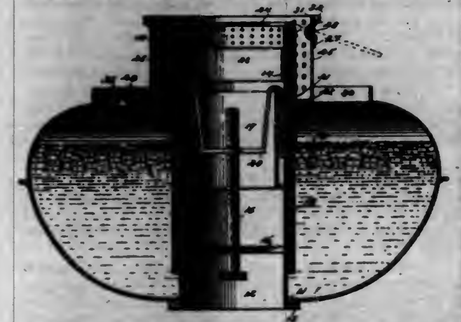
2. In combination, an oil-cup fitted with a tube, B, with an enlargement, C, at its upper end, having slots *a* and *b*, a sphere, D, with channels *c* and *d*, formed therein pivoted to said enlargement, and an arm with a ball, *g*, fixed thereto, whereby said sphere is made to oscillate and alternately admit and shut off the oil within the cup to and from the tube B, as and for the purpose described.

408,658. ACCOUNT-BOOK. SAMUEL W. GOLDBERG and EMANUEL M. TILLMANN, Dallas, Tex. Filed Jan. 18, 1889. Serial No. 296,754. (No model.)

Claim.—1. As a new article of manufacture, an account-book the pages of which are ruled to compose vertical sectional columns 1, 3, 4, 5, 6, 7, 8, 9, and 10, said columns arranged in consecutive order as named, and in said order respectively supplied upon their upper ends within spaces *a*, printed captions "Folio," "Date," "Name," "City," "Bills Payable," "Bills Receivable," "Open Account," "Term," and "Remarks," each page being supplied with parallel transverse lines 2, extending equidistantly from under the caption-spaces continuously to the bottom of the page for the purpose indicated, substantially as described.

2. An account-book having pages A and intermediate blotting-pages, B, said pages A having vertical sections 1, 3, 4, 5, 6, 7, 8, 9, and 10 arranged in successive progression from the left to the right side of said pages, said pages also ruled with transverse lines 2, all in combination with special denominate titles at the top of each column, whereby each of said columns has a special indicating-caption arranged in consecutive order to point out the functional character and purposes of each space, as and for the purpose indicated, substantially as described.

408,659. AXLE-LUBRICATOR. WILLIAM GOOD, Houston, Tex. Filed Nov. 5, 1888. Serial No. 290,053. (No model.)



Claim.—In an axle-lubricator, the combination of a frame, cross-pieces secured therein, a box having its lower portion reduced to fit in the frame and its upper portion provided with a cellar and

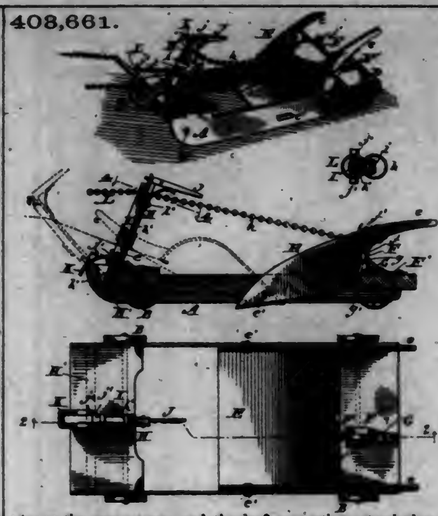
408,659.

bearings above the cellar, and set-screws in the cross-pieces to elevate or depress the box, substantially as described.

408,660. LAMP. CHARLES H. GRUBE, Robinson, Ill. Filed Apr. 18, 1888. Serial No. 271,069. (No model.)

Claim.—1. The combination, with the main wick-tube 12, open at both ends and having longitudinally-extending slots 14, the oil-cup 17 within the tube 12 and connected therewith at its lower end below the slots 14, and the wick-raising tube 18, surrounding the main tube and covering its slots, of the screw 16, journaled within the main tube, whereby longitudinal movement of the screw is prevented, the vertically-movable spider 20, having a screw-threaded aperture through which the screw passes, and arms projecting upwardly over the top of the cup 17, then downwardly therein and through the slots 14, and secured to the tube 18, substantially as set forth.

2. The combination, with the bowl, the longitudinally-slotted tube 12, open at both ends and extending up through and above the said tube, the outer tube, 21, secured to the top of the bowl concentric with and extending above the upper end of tube 12, and the vertically-sliding tube 18, surrounding the tube 12 and between which and the tube 21 the wick-space is formed, of the collar 23, secured to the upper end of the tube 12 and having a flange, 24, projecting over the upper end of the wick-space, the screw journaled within the main tube and having rotary movement only, and the vertically-movable spider operated thereby and having arms extending through the slots in tube 12 and connected to the tube 18, substantially as set forth.



3. A lamp comprising a bowl, a slotted tube, 12, open at its ends and extending through the cap above the top of the bowl, a concentric tube, 21, in the top of the bowl and projecting above the upper end of tube 12, the intermediate vertically-sliding wick-operating tube, 18, the perforated collar 23, contracted to fit in the upper end of tube 12, and having a flaring flange, 24, extending over the wick-space, the operating-screw journaled within the main tube and having rotary movement only, the spider operated thereby and having arms passing through the slots in tube 12 and secured to the tube 18, and the outer perforated tube, 25, on top of the bowl and having the chimney-holder 32, substantially as set forth.

408,661. EARTH-SCOOPER. SYLVESTER W. HALL, Elmira, N. Y. Filed Oct. 4, 1888. Serial No. 287,267. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the gage-runners and the scoop pivoted near its point and behind its cutting-edge to the gage-runners near their lower edge, about midway of their bearing-surface.

2. The combination, substantially as hereinbefore set forth, of the gage-runners, the scoop pivoted near its point and behind its cutting-

408,661.

edge to the gage-runners, and the draft-connections attached to the gage-runners at their forward end.

3. The combination, substantially as hereinbefore set forth, of the scoop, the side runners to which the scoop is pivoted, the front and rear platforms connecting the runners, the upwardly-extending hinged arm on the front platform, and a flexible connection between said arm and the rear end of the scoop.

4. The combination, substantially as hereinbefore set forth, of the scoop, the sides to which the scoop is pivoted, the front and rear platforms, the rock-bar mounted on the front platform, the detent for locking said rock-bar, and connections between the rock-bar and the scoop.

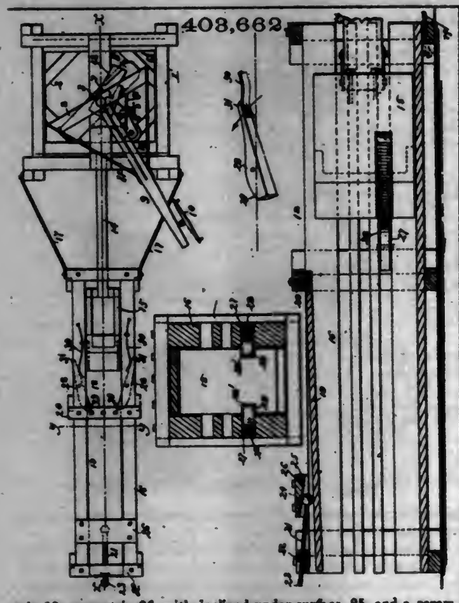
5. The combination, substantially as hereinbefore set forth, of the scoop, the side bars to which the scoop is pivoted and below which it extends, the handles for moving the scoop, the front and rear platforms, the upwardly-extending arm on the rear platform, devices for adjustably securing the scoop to said arms, and draft-connections between the team and the scoop for overturning it.

6. The combination, substantially as hereinbefore set forth, of the scoop, the side bars, the front and rear platforms, the rock-bar mounted on the front platform and hinged to the side bars, a locking bar or detent working in a groove or recess in the rock-bar, and a guide-plate in which said bar works and with which the detent engages.

7. The combination, substantially as hereinbefore set forth, of the scoop, the side pieces to which the sides of the scoop are pivoted near their lower ends, and the flexible draft-connections secured to the rear end of the scoop for actuating it.

8. The combination, substantially as hereinbefore set forth, of the scoop, the side pieces to which the scoop is pivoted, the scoop-tilter, connections between the rear end of the scoop and the tilter, and draft-connections between the scoop-tilter and the team.

408,662. BALING-PRESS. LIBEN H. HALLAM, Bolton, Tex. Filed Oct. 11, 1883. Serial No. 287,752. (No model.)

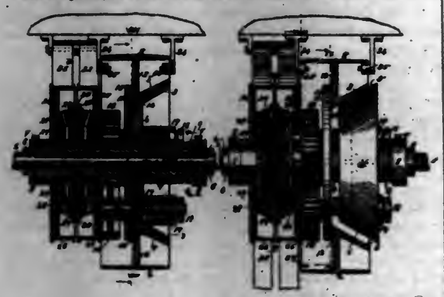


Claim.—1. A baling-press consisting of a plunger and plunger-rod, a reciprocating sliding frame connected therewith, a rotary shaft having an arm for actuating the sliding frame, a draft-sweep loosely mounted to turn on the rotary shaft, and an arm on the rotary shaft having a lug or projection against which the sweep bears, substantially as shown and described.

2. In a baling-press, the combination, with the plunger, of a sliding frame connected to the plunger, a rotary shaft, an arm secured to the shaft and provided with an anti-friction wheel at its end and one side for engaging the said sliding frame, a second arm secured to the upper end of the shaft and provided with a projection or lug, and a sweep loosely mounted on the shaft and adapted to engage the said lug to rotate the shaft, substantially as herein shown and described.

3. In a baling-press, a sliding reciprocating frame, 2, having a reciprocating sliding bar, 14, and cross-bars 13, and mounted in a frame, 1, in combination with a rotary shaft, 3, having a lateral arm, 5, adapted to alternately bear against the cross-bars 13, a lateral arm, 7, with a block, 12, at one end, and a sweep, 9, loosely pivoted on shaft 3 and engaging the lug of arm 7, substantially as shown and described.

4. In a baling-press, a receptacle, 16, having elastic compression-



403,662.

strip 19, cross-strip 26, with inclined under surface, 25, and a screw-rod, 21, with a wedging-head, 24, located between strip 26 and strip 19, substantially as described.

5. A baling-press consisting of frame 1, reciprocating sliding frame 2, mounted in frame 1 and having cross-bars 13, and reciprocating shaft 14, with plunger 15, having side grooves, 28', and located in a receptacle, 16, the vertical shaft 3 in frame 1, with lateral arm 5, having anti-friction rollers 6 and 6' and located between cross-bars 13, the arm 7 on shaft 3, with block 12, the sweep 9, loosely pivoted to shaft 3 and engaging the arm 7, and the casing 16, connected to frame 1 and having top opening, 18, spring-actuated dogs 28, located in slots 27 in the sides of receptacle 16, beneath opening 18, and top elastic compression-strip, 19, with adjusting screw-rod 21, having a ball, 24, at one end located between cross-strip 26 and elastic strip 19, substantially as described.

403,668. FRICTION-CLUTCH. ALBERT HAMPE, St. Louis, Mo. Filed Sept. 15, 1888. Serial No. 285,457. (No model.)

Claim.—1. The combination, with a driving-shaft, of a hub mounted on the shaft having a disk, a pulley-rim having an outer conical bearing, an inner truncated cone-bearing, and screw-threaded rods having pinions and separably connecting one of the bearings with the disk, and the hub having central gear-wheel, substantially as described.

2. The combination, with a driving-shaft, of a hub mounted on the shaft having a disk, a pulley-rim having an outer conical bearing, an inner truncated cone-bearing, and screw-threaded rods having pinions and separably connecting one of the bearings with the disk, the hub having central gear-wheel and bevel gear-wheel, and the friction-drum and its brake, substantially as described.

3. The combination, with a driving-shaft, of a hub mounted on the shaft having a disk, a pulley-rim having an outer conical bearing, an inner truncated cone-bearing, and screw-threaded rods having pinions and separably connecting one of the bearings with the disk, the hub having central gear-wheel and inner bevel gear-wheel, the inner friction-drum, the outer bevel gear-wheel the outer friction-drum, the hub having a spindle, bevel-pinions on the spindle, and the brakes, substantially as described.

4. The combination, with a driving-shaft, of a hub mounted on the shaft having a disk, a pulley-rim having an outer conical bearing, an inner truncated cone-bearing, and screw-threaded rods having pinions and separably connecting one of the bearings with the disk, the hub having central gear-wheel and bevel gear-wheel, the inner friction-drum, the outer bevel gear-wheel the outer friction-drum, the hub having a spindle, bevel-pinions on the spindle, and the brakes, substantially as described.

5. The combination, with a driving-shaft, of a hub, 9, mounted on the shaft, having a disk, 10, a pulley-rim, 2, having an outer conical bearing, 12 3, an inner truncated cone-bearing, 4 5, mounted on the disk-hub, and screw-threaded rods having pinions and separably connecting the cone-bearing with the disk, and the hub having the gear-wheel, substantially as described.

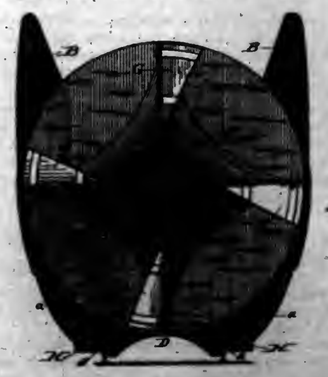
6. The combination with a driving-shaft, of a pulley-rim, 2, having the outer member, 12, formed with conical bearing 3, the hub 9, having a disk, 10, the inner member, 4 5, mounted on the disk-hub, having sockets 18 and nuts 19, the screw-threaded rods 15, mounted in the disk, having pinions 16, the hub 22, having the gear-wheel 21, and mechanism for rotating the gear-wheel hub, substantially as described.

7. The combination, with a driving-shaft, of a pulley-rim having the outer member and the inner member of the friction-clutch within the rim, connecting the shaft with the rim, and hangers provided with friction-rollers for supporting the pulley-rim, substantially as described.

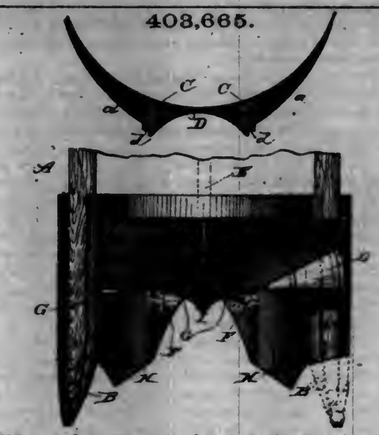
8. The combination, with a driving-shaft, of a pulley-rim, an outer conical bearing having the hub mounted on the shaft, having a disk, the inner truncated cone-bearing sliding on the hub, and the hangers provided with friction-rollers, substantially as described.

9. The combination, with a driving-shaft, of a pulley-rim having the outer conical bearing, the hub having a disk, the inner truncated cone-bearing, the screw-threaded rods having pinions, the gearing for rotating the pinions, and the hangers provided with friction-rollers for supporting the pulley-rim when not in use, substantially as described.

10. The combination of a shaft, 1, pulley-rim 2, having conical bearing 12 3, sleeve 6, hub 9, having a disk, 10, truncated cone-bearing 4 5, having sockets 18 and nuts 19, screw-threaded rods 15, having pinions 16, hub 22, having gear-wheel 21, bevel gear-wheels 24 and 23, spindle 30, having bevel-pinions 29, friction-drums 25 and 26, and brakes 32 and 32', substantially as described.



403,664. WHIFFLETREE AND HOOK. ALBERT T. HAYES, South Elgin, Ill. Filed Mar. 1, 1889. Serial No. 301,671. (No model.)



Claim.—1. In combination with a whiffletree, trace-hooks as made with two angular bends, *l l'*, therein, and with an extension, *l''*, beyond the same and pivoted directly on the whiffletree, all as and for the purposes set forth.

2. In combination with the whiffletree and its trace-rod, the center brace made in a single piece, having its central portion provided with the rabbets *g* and bolt-hole *i*, and having the arched end *e* and the curved part *f*, provided with the parts *h*, all as shown and described.

403,665. SNOW-PLOW. JOHN W. HAUSHAWOUT, Omaha, Nebr. Filed Oct. 12, 1888. Serial No. 287,960. (No model.)

403,665.

Claim.—1. In a rotary snow-plow, the combination of a series of blades rotated by a common shaft, sloping from their forward edges outward and backward in a double curve, substantially as described.

2. In a rotary snow-plow, a series of blades rotated by a common shaft, sloping from their forward edges outward and backward in a double curve, in combination with a series of reversible cutting-edges extending forward to enter the snow at an angle or with a boring movement, substantially as described.

3. In a rotary snow-plow, a series of blades rotated by a common shaft, in combination with wings hollowed out inwardly and rearwardly and forming an extension of the case upwardly and forwardly, whereby the snow is directed toward one side or the other of the track and discharged at a sufficient distance therefrom, substantially as described.

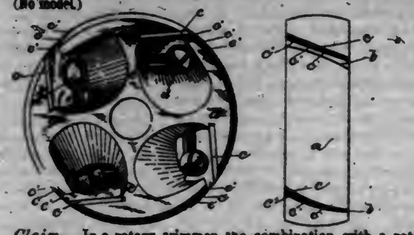
4. In a rotary snow-plow, a series of blades rotated by a common shaft and sloping from their forward edges outward and backward in a double curve, in combination with an inclosing cylindrical case, substantially as described.

5. In a rotary snow-plow, a series of blades rotated by a common shaft, in combination with a cutting-apron clearing the rails of the track at its front edge and resting thereon at its rear and arched on its under side between the rails, substantially as described.

403,666. VEHICLE-SPRING. BYRON J. HEALY, Kalamazoo, Mich. Filed Feb. 21, 1889. Serial No. 300,784. (No model.)

Claim.—1. A vehicle-spring consisting of a bowed or U-shaped spring and body-support, its middle portion journaled to a vehicle-body and its arms elastically fulcrumed by means of a cross-spring to a vehicle-body, all for the purpose specified.

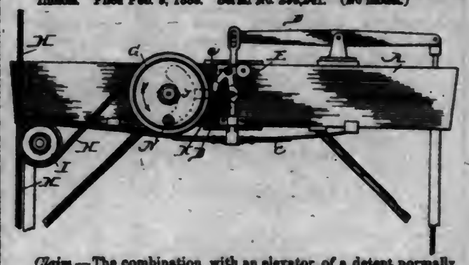
2. A vehicle-spring support made in one continuous piece, bowed or U-shaped, having the arms C C approximately at right angles to the middle portion, D, which is journaled to the vehicle-body, the free ends of the arms C C attached at G to the gear, and the arms C C C C supporting the springs and body from the gear, all for the purpose specified.



3. A vehicle-spring consisting of a bowed shaped spring and body-support having the middle portion journaled to a vehicle-body and the free ends or arms extending on each side of the body to the gear, and the semi-elliptic spring reaching across the arms and supporting the body, for the purpose specified.

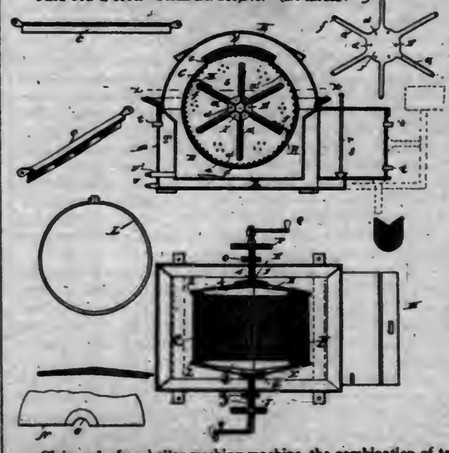
4. In combination, the bowed or U-shaped spring-supports having the middle portion pivotally attached to a vehicle-body and the ends attached to the gear, and the semi-elliptic spring having the hooked ends engaging the arms and supporting the body, as shown and described, and for the purpose specified.

5. In combination, a vehicle-spring and the supports made in one continuous piece and bowed or U-shaped, the middle portion pivotally and adjustably connected to a vehicle-body near its center, and the arms extending to the gear and elastically and adjustably fulcrumed to the body by means of a common spring, as shown and described, and for the purpose specified.



6. In combination, the vehicle-body, the spring-supports of the pattern shown, the springs with the hooked ends, the hangers to the supports, the braces, the spring-connections, and the gear, all as described and shown, and for the purposes specified.

403,667. ROTARY CUTTER. AMASA C. HEATH and FRED H. WHITE, South Boston, Mass. Filed Jan. 31, 1888. Serial No. 262,152. (No model.)

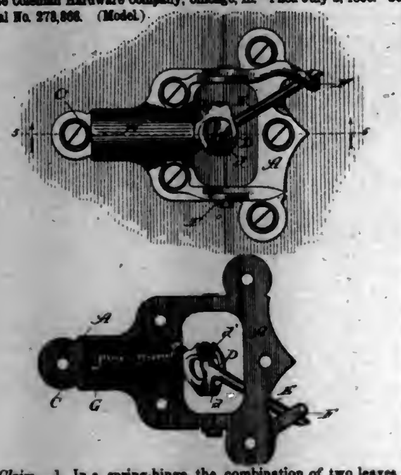


Claim.—In a rotary trimmer, the combination, with a rotary head or holder provided with a rounded or molded peripheral face, of a series of blades extending across said face and having teeth the sides of which, between the teeth of the series, are converging to form small or pointed cutting portions, and the said head in front of the said blades having escape-openings for the cuttings, substantially as set forth.

403,668. SAFETY DEVICE FOR ELEVATORS. THADDEUS W. HEERMANS, Chicago, Ill., assignor to The Crane Elevator Company, of Illinois. Filed Feb. 9, 1889. Serial No. 299,241. (No model.)

Claim.—The combination, with an elevator, of a detent normally holding the regulating or safety appliances thereof out of operation, a disk or pulley adapted to be revolved on the descent of the car, and a weight pivoted to said disk or pulley having its free end in advance of the pivoted end, the position of its free end being determined by the opposing action of the centrifugal force generated by its revolution, and a centripetally-acting spring, said advanced free end being adapted to make contact with said detent when a normal speed of descent is exceeded, substantially as described.

403,669. WASHING-MACHINE. CHARLES HESS, Danville, Ill. Filed Oct. 4, 1888. Serial No. 215,275. (No model.)



Claim.—1. In a boiler washing-machine, the combination of the outer casing, the suds-box, the revolving drum located therein and provided with convex heads, strengthening-loops extending around

the periphery of the drum, the interior braces secured to the heads of said drum and each cast in one piece, and consisting of a central convex portion, I, to fit in the closed concave center of a head and having a series of transverse rivet-holes, and the ribbed radiating arms G, having rivet-holes *f*, the gudgeons for supporting and revolving the drum, each cast in one piece separate from the drum, and the braces E, and consisting of a short stem, *g*, at the inner end provided with a flat concave plate, K, to fit snugly upon the exterior of the closed convex center of a head, said plates K and the closed centers of the heads being provided with transverse rivet-holes registering with the holes *d* in centers I, whereby the plates K and centers I are secured to the drum-heads by the same rivets passing through the same, all combined and operating substantially as described.

2. A washing-machine comprising a suds-box, a rotary drum located therein and having a corrugated periphery and convex heads and provided with a suitable opening normally closed by a door, the gudgeons for supporting the drum, each consisting of a short stem at the inner end provided with a circular concave plate fitting upon a closed exterior center of the convex drum-heads, the interior braces secured to the heads of said drum and each cast in one piece, and consisting of a central convex portion corresponding to the plates of the gudgeons and fitting in the interior center of a head, and the ribbed radiating arms projecting inwardly to catch the clothes, the said plates of the gudgeons and centers of said braces being riveted together through the drum-heads, and a pair of lifting-bars each composed of a single straight piece of sheet metal longitudinally corrugated and extending from one end of the drum to the other, secured to the end of an arm of each brace and projecting inwardly, whereby the clothes are lifted by said bars and the arms of the braces, substantially as described.

403,670. SPRING-HINGE. DANIEL M. HOYT, Morris, assignor to the Coleman Hardware Company, Chicago, Ill. Filed July 2, 1888. Serial No. 278,866. (Model.)

Claim.—1. In a spring-hinge, the combination of two leaves of suitable form provided with ears or lugs pivotally connected together at points outside of the plane of the hinge-leaves, a spring-axis arranged in bearings on one of the hinge-leaves and rotatable therein, a spring-wire coiled or bent around or partially around the spring-axis and having one of its ends held in a fixed position and the other of its ends carried around with the rotation of the spring-axis, and a lever engaging at one end with one end of the spring-axis and having its other end connected with the other hinge-leaf, whereby it is rotatable on its longitudinal axis by the folding of the hinge-leaves in that direction which rotates the spring-axis and further coils or bends the spring-wire, substantially as described.

2. In a spring-hinge, the combination of two leaves of suitable form provided with ears or lugs pivotally connected together at points outside of the plane of the hinge-leaves, a spring-axis arranged in bearings on one of the hinge-leaves and rotatable therein, a spring-wire coiled or bent around or partially around the spring-axis and having one of its ends held in a fixed position and the other of its ends carried around with the rotation of the spring-axis, and a lever arranged at an angle to the spring-axis when the hinge-leaves are open or unfolded and engaging at one of its ends with one end of the spring-axis and having its other end connected with the other hinge-leaf, whereby it is rotatable on its longitudinal axis by the folding of the hinge-leaves in that direction which rotates the spring-axis and further coils or bends the spring-wire until the lever reaches a point at right angles to the spring-axis, when the further folding of the hinge-leaves permits the spring-axis to be rotated in that direction which uncoils or unbends the spring-wire, substantially as described.

3. In a spring-hinge, the combination of two leaves of suitable form provided with ears or lugs pivotally connected together at points outside of the plane of the hinge-leaves, a spring-axis arranged in bearings on one of the hinge-leaves and rotatable therein, a spring-wire coiled or bent around or partially around the spring-axis and having one of its ends held in a fixed position and the other of its ends carried around with the rotation of the spring-axis, and a lever arranged at an angle to the spring-axis when the hinge-leaves are open or unfolded and engaging at one of its ends with one end of the spring-axis at a point within the angle and above the plane of the spring-axis and lever when the hinge-leaves are open or unfolded and having its other end connected with the other hinge-leaf, whereby it is rotatable on its longitudinal axis by the folding of the hinge-leaves in that direction which rotates the spring-axis and further coils or bends the spring-wire, substantially as described.

4. In a spring-hinge, the combination of two leaves of suitable form provided with ears or lugs pivotally connected together at points outside of the plane of the hinge-leaves, a spring-axis arranged in bearings on one of the hinge-leaves and rotatable therein and provided at one end with bearings on opposite sides of the axis, a spring-wire coiled around or partially around the spring-axis and having one of its ends held in a fixed position and the other of its ends carried around with the rotation of the spring-axis, and a lever having lugs on one end adapted to engage with the bearings on the end of the spring-axis and having its other end connected with the other hinge-leaf, whereby it is rotatable on its longitudinal axis by the folding of the hinge-leaves in that direction which rotates the spring-axis and further coils or bends the spring-wire, substantially as described.

5. In a spring-hinge, the combination of two leaves of suitable form provided with ears or lugs pivotally connected together at points outside of the plane of the hinge-leaves, a spring-axis arranged in bearings on one of the hinge-leaves and rotatable therein and provided at one end with bearings on opposite sides of the axis and adapted to engage the upper side of one lug and the lower side of the other lug of a lever and leave the opposite sides open or exposed, a spring-wire coiled around or partially around the spring-axis and having one of its ends held in a fixed position and the other of its ends carried around with the rotation of the spring-axis, and a lever having lugs on one end adapted to engage with the bearings on the end of the spring-axis at the opposite sides thereof on the upper side of one lug and the under side of the other lug and leave the opposite side open or exposed, and having its other end connected with the other hinge-leaf, whereby it is rotatable on its longitudinal axis by the folding of the hinge-leaves in that direction which rotates the spring-axis and further coils or bends the spring-wire, substantially as described.

6. In a spring-hinge, the combination of two leaves of suitable form provided with ears or lugs pivotally connected together at points outside of the plane of the hinge-leaves, a spring-axis arranged in bearings on one of the hinge-leaves and rotatable therein, an adjusting-collar mounted on the spring-axis and rotatable thereon and arranged to be locked or held at any desired position, a spring-wire coiled or bent around or partially around the spring-axis and having one of its ends connected with the adjusting-collar and the other of its ends carried around with the rotation of the spring-axis, whereby the rotation of the collar on the spring-axis increases or diminishes the tension of the spring-wire, and a lever engaging with one end of the spring-axis arranged at an angle thereto and having its other end connected with the other hinge-leaf, whereby it is rotatable on its longitudinal axis by the folding of the hinge-leaves in that direction which rotates the spring-axis and further coils or bends the spring-wire, substantially as described.

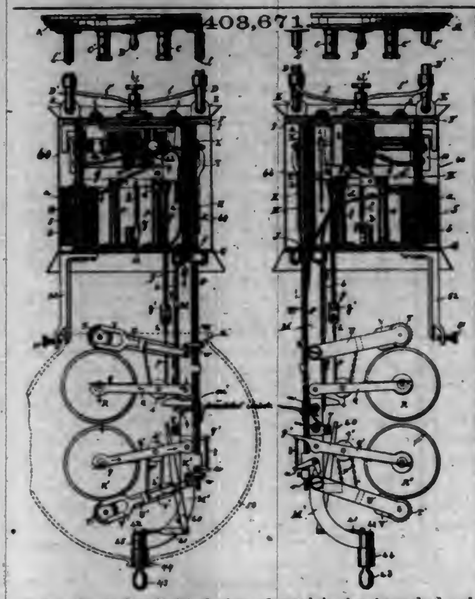
403,671. ARC LAMP. DARIUS HOUGHTON, Skowhegan, Me. Filed Dec. 15, 1888. Serial No. 293,637. (No model.)

Claim.—1. In an arc lamp, feed-rollers mounted with their peripherical face in contact with the edge of carbon disks, whereby the surface speed of the carbon disks will always be the same until the disks are burned out, substantially as set forth.

2. The positive carbon R, arms Q, pulley *r*, and hanger-bar M, in combination with feed-roller T, arm U, chain *p*, rod *g*, levers *d d'*, plunger *c*, and solenoid-magnet *a*, substantially as and for the purposes set forth.

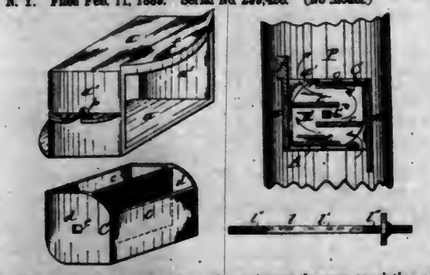
3. The negative carbon R', arms Q', pulley *r'*, and hanger-bar M', in combination with feed-roller T', arm U', chain *p'*, bell-crank lever *n*, and spring *t*, substantially as and for the purposes set forth.

4. The feed-rollers T T', arms U U', hanger-bar M M', and forked bars V V', with pawls on their ends, in combination with bell-crank levers *x x'*, clamps *w*, and rod W, to which a reciprocating movement is imparted, substantially as and for the purposes set forth.



5. In combination with a disk carbon, a carbon-holder, S, consisting of a small cylindrical piece of metal having journals *s'*, and provided with springs *s s*, whereby it adjusts itself centrally in the hole in the carbon, substantially as shown and described.

6. The carbon R, arm Q, pulley *r*, feed-roller T, forked bar V, having pawls on its end, arm U, chain *p*, rod *g*, levers *d d'*, plunger *c*, and magnet *a*, in combination with the carbon R', arm Q', pulley *r'*, chain *p'*, bell-crank lever *n*, and spring *t*, substantially as and for the purposes set forth.

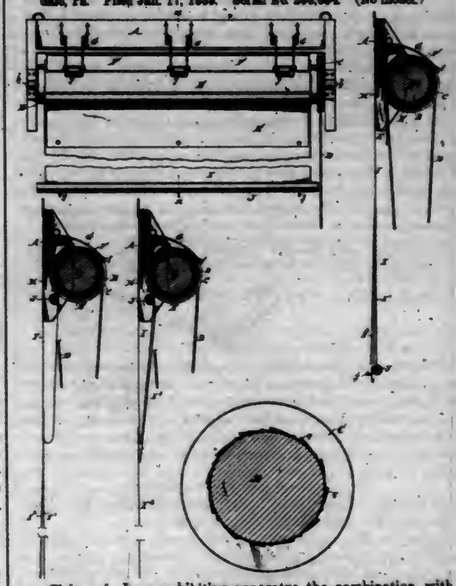


7. The switch 40, arm 41, disk 42, rod 45, and knob 43, in combination with the negative portion M' of the hanger-bar, point 7, and wire P, leading to the negative binding-post, substantially as shown and described.

8. In combination with an arc lamp, a governor consisting of a rim or ring, 35, a wheel, 31, secured to the driving-shaft 30 of an electric motor, levers 33, each pivoted at one end to the wheel 31, and the bar 34, connecting the opposite ends of the levers 33, substantially as shown and described.

9. The combination of the lever *d*, fulcrumed on post *e*, auxiliary lever *d'*, fulcrumed on post *f*, the inner ends of the levers *d d'* being connected together, whereby, when the outer end of the lever *d* is drawn down by the magnet *a*, a corresponding downward movement will be imparted to the rod *g* on the end of lever *d'*, the spring X', bar *y*, and regulating-screw *z*, for adjusting the length of the arc, substantially as set forth.

403,672. STOVE-PIPE DAMPER. GEORGE C. HUMPHREY, Delphi, N. Y. Filed Feb. 11, 1889. Serial No. 299,420. (No model.)



Claim.—1. The combination of a primary damper consisting of a case open at opposite sides and pivoted at its ends and a secondary damper consisting of diaphragms united at their ends and arranged rotatably inside of the primary damper, as set forth.

2. The combination of a primary damper consisting of a case open at opposite sides and pivoted at its ends and a secondary damper consisting of parallel diaphragms disposed successively, each with one of its side edges extending beyond that of the adjacent diaphragm alternately at opposite sides of the damper and firmly united and arranged rotatably inside of the primary damper, as set forth.

3. The combination of a primary damper consisting of a case open at opposite sides, a secondary damper arranged inside of the primary damper, and a shaft passing loosely through the ends of the primary damper and locked on the secondary damper, substantially as and for the purpose set forth.

4. The combination of the primary damper A, having the plates *a a*, each extending with one of its side edges beyond that of the other and provided with the circular apertures *b* in its ends, the secondary damper C, composed of parallel diaphragms *c c c*, disposed successively, each with one of its side edges extending beyond that of the adjacent diaphragm alternately at opposite sides of the damper, and having the end plates, *d d*, provided with a polygonal aperture, *e*, and the shaft *l*, formed with the polygonal portion *l'* and cylindrical end portions, *l' l'*, and passing through the apertures *b* and *e* of the dampers, substantially as described and shown.

403,673. EXHIBITING APPARATUS. CHARLES S. JENKINS, Lansdale, Pa. Filed Jan. 17, 1889. Serial No. 296,694. (No model.)

Claim.—1. In an exhibiting apparatus, the combination, with a fixed support adapted to be suspended at an altitude, of a rotatable support journaled therein and having a number of sheets to be exhibited secured thereto, so that when wound up their lower edges will project one beyond the other, means, substantially as described, to rotate said rotatable support successively in opposite directions, and a spring-guide secured to said fixed support and projecting over said rotatable support for the purpose of guiding the edges of the sheets as they are wound up and unwound.

2. In an exhibiting apparatus, the combination, with a fixed support adapted to be suspended at an altitude, of a rotatable support journaled therein and having a number of sheets to be exhibited secured thereto, so that when wound up their lower edges will project one beyond the other, means, substantially as described, to rotate said rotatable support successively in opposite directions, a spring-guide secured to said fixed support and projecting over said rotatable support and provided with rollers upon its edge for the purpose of guiding the edges of the sheets as they are wound up and unwound.

3. In an exhibiting apparatus, the combination, with a fixed support adapted to be suspended at an altitude, of a rotatable support journaled therein and having a number of sheets to be exhibited secured thereto, so that when wound up their lower edges will project one beyond the other, means, substantially as described, to rotate said rotatable support successively in opposite directions, and guide-rollers supported from the fixed support pressing upon the sheets at the front part of said rotatable support for the purpose of guiding their edges as the sheets are wound up or unwound.

4. In an exhibiting apparatus, the combination, with a fixed support adapted to be suspended at an altitude, of a rotatable support journaled therein and having a number of sheets to be exhibited secured thereto, so that when wound up their lower edges will project

one beyond the other, means, substantially as described, to rotate said rotatable support successively in opposite directions, guide-rollers supported from the fixed support pressing upon the sheets at the front part of said rotatable support for the purpose of guiding their edges as the sheets are wound up or unwound, and springs to press said rollers against said sheets with a yielding pressure.

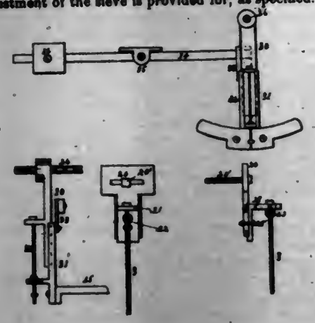
5. In an exhibiting apparatus, the combination, with a number of sheets, E, secured to a rotatable support and adapted to be rolled up thereon, of one or more sheets, I, suspended from a fixed support arranged close to said rotatable support, and means to attach said sheets E and I together at their bottoms, substantially as and for the purpose specified.

6. In an exhibiting apparatus, the combination, with a number of exhibiting-sheets, E, secured to a rotatable support and adapted to be rolled up thereon, of a sheet, I, suspended from a fixed support arranged close to said rotatable support having a number of leaves, $I' I^2$, attached to its back, and means, substantially as described, to attach the bottom of said sheet I and leaves $I' I^2$ and sheets E together for the purpose of exhibiting objects upon said sheet I and leaves $I' I^2$

7. In an exhibiting apparatus, the combination, with the supporting-frame A, of the cylinder B, having a number of sheets secured thereto so that when wound up upon said cylinder their lower edges will project one beyond the other, guides F and H, to guide the sheets when they are rolled up upon the cylinder or unrolled therefrom, and means, substantially as described, to rotate said cylinder successively in opposite directions.

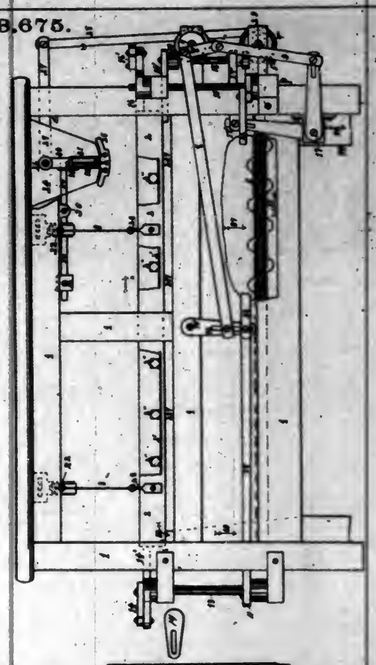
8. In an exhibiting apparatus, the combination, with the supporting-frame A, of the cylinder B, having a number of sheets secured thereto, so that when wound up upon said cylinder their lower edges will project one beyond the other, guides F and H, to guide the sheets when they are rolled up upon the cylinder or unrolled therefrom, and means, substantially as described, to rotate said cylinder successively in opposite directions, consisting of sheave C and endless band D.

408,674. INK-ERASER. CHARLES W. JOHNSTON, Louisville, Ky. Filed Jan. 17, 1889. Serial No. 296,626. (No model.)



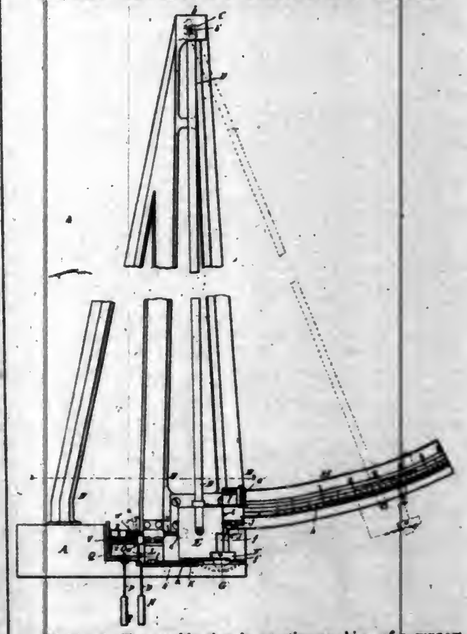
Claim.—As a new article of manufacture, a steel ink-eraser of plate or block-like construction, with its one marginal side or end of both convex form in direction of its length and rounded or of convex shape transversely thereto and finished with a file-cut dress, and having its opposite marginal side or end also of like double convex construction, but of a smooth finish on its surface, substantially as specified.

408,675. FLOUR-BOLT. JOHN JOHNSTON, Neenah, Wis. Filed Nov. 17, 1887. Serial No. 255,404. (No model.)



Claim.—1. The combination, in a flour-bolt, with the feeder, of depending swinging arms at opposite sides thereof, a plate at the lower end of said arms, and vertically-movable connections between the plate and arms and means for oscillating said plate, substantially as set forth.

2. The combination, in a flour-bolt, of the hopper 24, having an open bottom, the apron 25, the shaft 26, the hangers 30, the brackets 31, the bolts and nuts 32, the connections 33, the levers 34, having fulcra 35 and weights 36, and mechanism for imparting to the apron an oscillating motion, substantially as shown and described.



3. In a flour-bolt, the combination, with the sieve, its suspending-rod, and the machine-frame, of the plate 20, having horizontal and vertical slots, the angular bracket 21, having a slot in both arms, and bolts 20' 21' and eyebolt 22, passing through the respective slots, as shown and described, whereby lateral as well as longitudinal and vertical adjustment of the sieve is provided for, as specified.

408,675.

408,676. IMPACT TESTING-MACHINE. WILLIAM J. KEEP, Detroit, Mich. Filed July 20, 1888. Serial No. 280,462. (No model.)

Claim.—1. The combination, in a testing-machine, of a support for a hammer, a swinging hammer pivoted thereto, and a graduated arc curved to substantially correspond with the path of the hammer for gaging the force of the blow of said hammer, substantially as described.

2. The combination, in a testing-machine, of a swinging hammer, a graduated arc, a movable gage sliding on the arc and arranged to be held at any desired point thereon, and provided with a trip to retain and liberate the hammer, as desired, substantially as described.

3. The combination, in a testing-machine, of a reciprocating hammer and a transmitter arranged to receive the blow of the hammer and transmit it to the test-bar, as set forth.

4. The combination, in a testing-machine, of a support for the test-bar, a diagram-paper holder, a pencil-holder, and a connection, as the cage U, between the pencil-holder and the test-bar, arranged to be firmly clamped to said test-bar, substantially as described.

5. In a testing-machine, a hammer constructed and arranged to give the article under test a series of blows, and an intermittingly-moving diagram-paper holder, in combination with a pencil-holder connected to and moving with the article being tested, whereby the permanent sets of the succeeding blows are recorded, substantially as described.

6. In a testing-machine having a hammer constructed to give the article under test a series of blows, an intermittingly-moving pencil-holder arranged to move with the article being tested and make a zigzag line, thus recording the deflection after each blow and the total deflection of the test-bar, substantially as described.

7. In a testing-machine, a diagram-paper holder provided with means, as the moving weight, slide, and pins, for automatically moving said holder between each test, substantially as described.

8. In a testing-machine, a diagram-holder, a pencil-holder connected with the test-bar and moving therewith, and a second pencil-holder disconnected from the test-bar and operated by the first-mentioned pencil-holder, substantially as described.

9. The combination, in a testing-machine having a hammer constructed to give the article under test a series of blows, of a pencil-holder with an intermittingly-moving diagram-paper holder, substantially as described.

10. The combination, in a testing-machine having a moving hammer, of a pencil-holder, a diagram-paper holder, and means, as the dog F and slide I and intermediate connection between said dog and slide, for giving a short motion to the paper-holder at each blow of the hammer, substantially as described.

11. In a testing-machine having a moving hammer, the combination, with a pencil-carrier and a diagram-paper holder having pins o', of the slide L, spring M, and the dog F, moving with the hammer and operating through intermediate connections said slide L at each movement of the hammer, substantially as described.

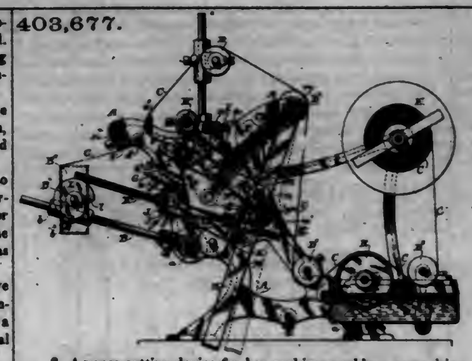
12. In a testing-machine, and in combination with the frame and hammer thereof, the clamps R R, connected with the frame and arranged to firmly hold the test-bar in place against the recoil after each blow of the hammer, substantially as described.

13. In a testing-machine, in combination with the breaker thereof, guards, as $z z$, to prevent damage from unequal breakage of the bar, said breaker and guards being arranged on opposite sides of the test-bar.

14. The combination, in a testing-machine, of a moving hammer arranged to give a series of blows and a recorder constructed to indicate the number and force of the blows given by the hammer, substantially as described.

15. In a testing-machine, and in combination with the breaker thereof and a support for the test-bar, an indicating-arm, as V, and means, as the cage U and pin u^2, for communicating the motion of the test-bar to said indicating-arm, substantially as described.

16. The combination, in a testing-machine and with the base thereof, of a vertical support for a hammer, a swinging hammer hanging therefrom, and a graduated arc curved to substantially correspond with the path of said hammer for gaging the force of the blow, substantially as described.



17. The combination, in a testing-machine and with the base thereof, of a vertical support for a hammer, a swinging hammer hanging therefrom, a graduated arc curved to substantially correspond with the path of the hammer, and a slide running on said arc provided with a holding and liberating device, as the trip J, for holding and releasing the hammer at any desired position, substantially as described.

18. The combination, in a testing-machine, of a swinging hammer, a graduated arc curved to substantially correspond with the path of the hammer, a gage for holding and releasing the hammer, and means, as the pin i, for holding said gage in any desired position, substantially as described.

408,677. PAPER-BOX-COVERING MACHINE. MARK D. KNOWLTON, Chicago, Ill. Filed Nov. 11, 1887. Serial No. 254,884. (No model.)

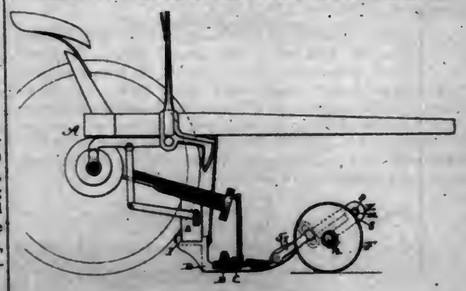
Claim.—1. A paper-cutting device for box-making machines, comprising a stationary cutter, a movable cutter, a spring actuating the movable cutter, a detent holding the movable cutter in its retracted position, a form-block, and a cam connected and turning with the form-block and having operative connection with the said detent, whereby the movable cutter may be released at a desired time, substantially as described.

408,677.

2. A paper-cutting device for box-making machines, comprising a stationary knife or cutter, a movable cutter, a spring actuating the movable cutter, a detent engaging the movable cutter for holding the latter retracted, a rotating form-block, a cam connected and turning with the form-block, and an arm connected with and moving the detent and engaging the cam, substantially as described.

3. The combination, with a stationary cutter, of a movable cutter, a spring for actuating said movable cutter, a detent for holding said movable cutter retracted, comprising a swinging arm and a spring-dog pivoted to said swinging arm, a rotating form-block, a cam connected and turning with the form-block, and an arm connected with the detent and engaging the said cam, substantially as described.

4. The combination, with a stationary cutter, of a movable cutter, a spring for actuating the movable cutter, a detent for holding the movable cutter retracted, a rotating form-block, a cam turning with the form-block and actuating the detent, and a lever for retracting the movable cutter, connected with the latter by a sliding connection, substantially as described.

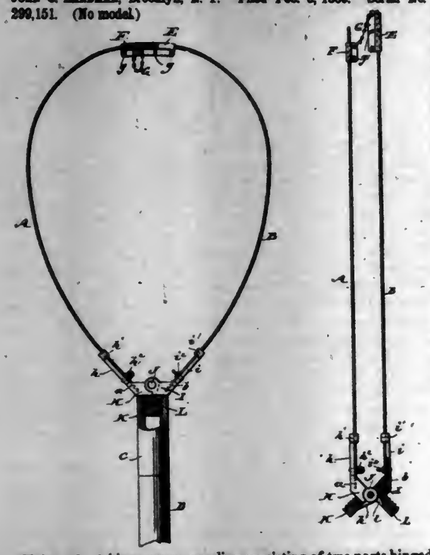


5. The combination, with a stationary cutter, of a movable cutter, a spring actuating the movable cutter, a detent holding the movable cutter retracted, a rotating form-block, a cam turning with the form-block and actuating the detent, and means for retracting the movable cutter, comprising a pivoted arm, N', a bar, O, pivoted to the said arm and connected with the movable cutter by a slotted connection, a spring engaging said arm N' for holding the latter in position to allow the forward movement of the cutter, and means connected with the said arm N' for turning the latter about its pivot, substantially as described.

6. The combination, with a stationary cutter, of a movable cutter, a spring actuating the movable cutter, a detent engaging the movable cutter for holding the latter retracted, a rotating form-block, a cam turning with the form-block and actuating the detent, a bell-crank lever, N, a connecting-bar, O, pivoted to the said bell-crank lever and having a slot-and-pin connection with the movable cutter, an actuating-lever, M, engaging the said bell-crank lever, and a spring engaging the bell-crank lever for holding the latter in position to allow the movement of the cutter, substantially as described.

408,678. METAAMIDOPHENOL. CARL KUHNAUL, Basle, Switzerland, assignor to the Society of Chemical Industry, same place. Filed Apr. 5, 1888. Serial No. 269,731. (No specimens.) Patented in Germany Mar. 18, 1888, No. 44,792, and in France Apr. 19, 1888, No. 190,096.

Claim.—The production of metaamidophenol by melting the metamonosulpho-acid of amido-benzole with alkalies at from 260° to 300° centigrade.



408,679. MOWING-MACHINE. CLINTON LA GRANGE, Guilderland Centre, N. Y. Filed Jan. 23, 1889. Serial No. 297,794. (No model.)

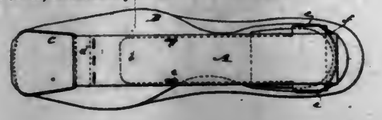
Claim.—In a mowing-machine, the combination of the finger-bar, the main shoe for said finger-bar, a carrying-wheel for said main shoe, and a spring-bearing for said carrying-wheel, said spring-bearing consisting of a stationary upper arm which is adjustably attached to said main shoe, a movable lower arm which is jointed to the outer end of said stationary arm, and a spring interposed between said arms to force them apart, the inner end of said movable arm being provided with a stud on which said carrying-wheel is fitted to rotate, as and for the purpose herein specified.

403,680. HINGE-SCREW COUPLING FOR FISHING-NET FRAMES.

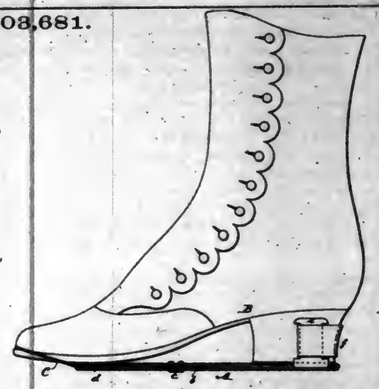
JOHN G. LANDMAN, Brooklyn, N. Y. Filed Feb. 8, 1889. Serial No. 299,151. (No model.)

Claim.—1. A hinge-screw coupling consisting of two parts hinged together and provided each with a projection, both of which projections when closed together having exterior continuous screw-threads to receive a screw ferrule or handle, and the two parts of the coupling independently of the hinge provided, respectively, with a tongue or projection and a groove or recess which interlock to strengthen the hinge-coupling against lateral strains, substantially as herein set forth.

2. In a hinge-screw coupling for scalp-net frames, the combination of two parts, H I, hinged together at J, and provided, respectively, with arms for connection of the opposite side bars of the net-frame, said parts H I provided, respectively, with threaded projections K L, forming a screw-stud, and said parts also having interlocking tongue and groove *k l*, resisting lateral strains on the coupling, substantially as herein set forth.



3. In a hinge-coupling for scalp-net frames, the combination, with two parts hinged together and provided with arms, as *h i*, and sockets *a b* at the bases of said arms, of the scalp-net frame-bars A B, held to the arms and entering the sockets *a b*, substantially as herein set forth.

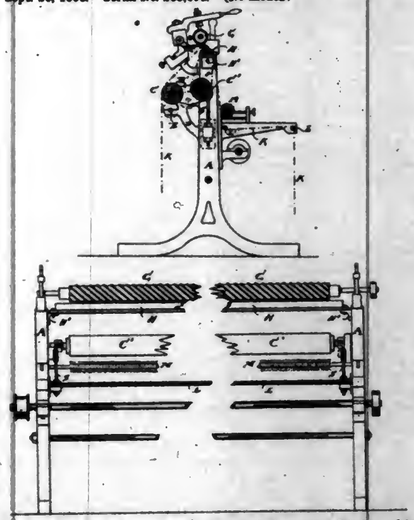


4. In a hinge-coupling for scalp-net frames, the combination, with two parts hinged together and provided with arms *h i*, having clips *h' i'*, and sockets *a b*, of the frame-bars A B, entering the clips and sockets, and screws holding the bars in the sockets and to the arms, substantially as herein set forth.

403,681. BOOT OR SHOE SOLE PROTECTOR.

LOUIS P. LANG, Allegheny, Pa. Filed Feb. 21, 1889. Serial No. 300,658. (No model.)

Claim.—1. A device for protecting the bottoms of boots or shoes from being soiled when said articles are being fitted or tried on the person, the same consisting of a longitudinally-elastic bottom cover, a wire connection at the forward end of said cover, adapted to engage with the toe part of the boot or shoe between its upper leather and welt or sole, and a raised heel-gripping attachment at the back end of said cover, substantially as shown and described.

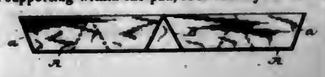


2. In a device for protecting the bottoms of boots or shoes from being soiled when said articles are being fitted or tried on the person, the combination, with the longitudinally-elastic bottom cover, A, having attached means in front for securing it to the toe part of the boot or shoe, of a flexible raised heel-gripping attachment at the back end of said bottom cover, and a base-plate supporting the same, essentially as described.

3. The combination of the longitudinally-elastic bottom cover, A, constructed to form a double web, the attached interposed plate *b*, having rear end side uprights, *c c*, the elastic band or strap *f*, connecting said uprights, and the wire loop C at the forward end of the bottom cover, substantially as shown and described.

403,682. METHOD OF CUTTING DESIGNS ON THE FACE OF FABRICS.

JOSEPH LOWDEN, Leeds, County of York, England. Filed Sept. 20, 1888. Serial No. 285,891. (No model.)



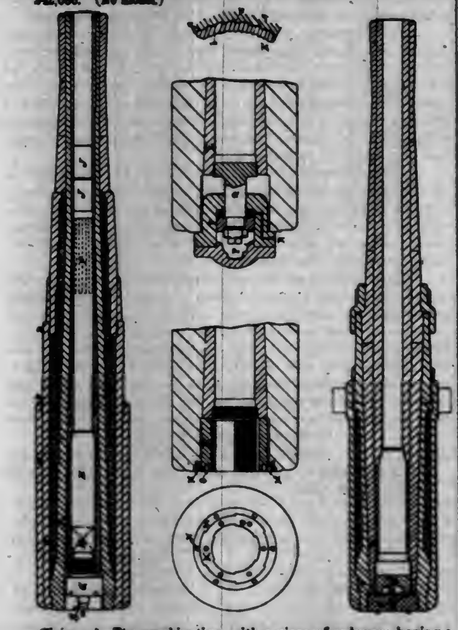
Claim.—1. The method of producing designs upon fabrics, which consists in superimposing said fabric upon a base, having the design in bas-relief thereupon, and while in such position subjecting the fabric to the action of a cutting-machine, substantially as described.

2. The method of producing designs upon fabrics, which consists in superimposing said fabric upon an endless belt on which the design is first produced in bas-relief by a cord or braid and then subjecting said fabric to the action of a cutting-machine, substantially as described.

403,683. CANDY-PAN.

JOHN H. MAGRUDER, Washington, D. C. Filed Dec. 13, 1888. Serial No. 293,420. (No model.)

Claim.—A partition for pans bent into A shape to render the same self-supporting within the pan, substantially as described.



403,683.

403,684. CONSTRUCTION OF ORDNANCE.

RAWSLEY MAITLAND, London, County of Middlesex, England. Filed June 21, 1887. Serial No. 242,066. (No model.)

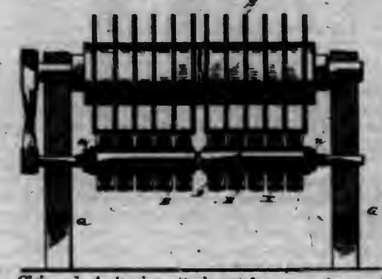
Claim.—1. The combination, with a piece of ordnance having a tapering bore and grooves or recesses near the center thereof, of a removable lining having exterior teeth or projections on its forward portion to enter said grooves or recesses and provided with an internal screw-thread at its rear, and a plug, Q, engaging said screw-thread and having an extended portion, substantially as and for the purpose stated.

2. The combination, with a piece of ordnance consisting of a series of sections and a continuous main tube having a tapering bore, grooves or recesses near the center thereof, and a rear screw-thread, of a removable lining made in a single piece and having teeth or projections entering said grooves or recesses and provided with an internal screw-thread at its rear end, the threaded ring engaging said rear screw-thread, and the block engaging said internal screw-thread, substantially as set forth.

3. The combination, with a piece of ordnance, of a lining located in the bore of the piece, a ring for retaining said lining and having grooves and recesses, and a locking-ring fitting said grooves and recesses and secured to one end of the barrel by screws passed therethrough, substantially as set forth.

403,685. BOX FOR MATCHES, &c.

JOHN F. MARSHALL, Waco, Tex., assignor to John H. Finks, same place. Filed Mar. 5, 1889. Serial No. 301,907. (No model.)

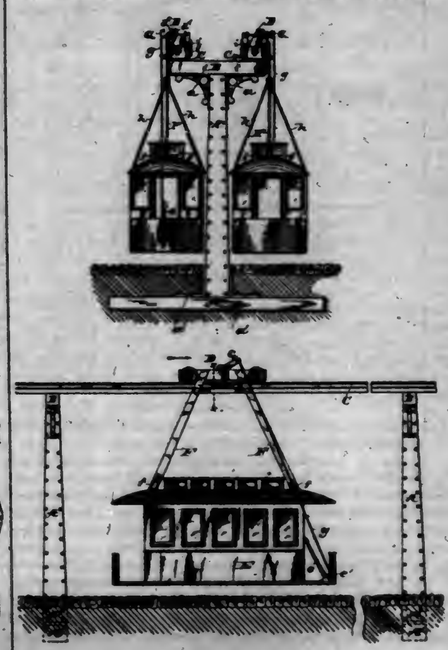


Claim.—1. The box or case having the respectively open and closed opposite extremities, the finger-slot extending between them, the permanent front portions or walls at opposite sides of said slot extending from the open to the closed extremity, and the securing flap or cover for closing the slot and open extremity to confine and protect the contents of the box or case, substantially as and for the purpose set forth.

2. The box or case open at one extremity and closed at the opposite extremity, having the finger-slot and the permanent front portions or walls at either side thereof extending from the open to the closed extremity, and with the securing flap or cover having the body-engaging lip and completely closing the open extremity and slot, substantially as and for the purpose set forth.

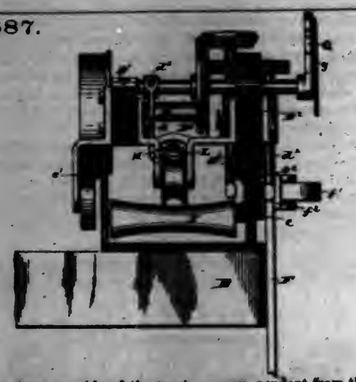
403,686. GIN-SAW CLEANER.

GEORGE P. MELCHIOR, Bellevue, Miss. Filed July 21, 1888. Serial No. 280,683. (No model.)



Claim.—1. A cleaning attachment for cotton-gins, consisting of a shaft, A, having a series of disks, B, arranged thereon, and formed with peripheries of reduced thickness provided with laterally-projecting rings of brushes, substantially as shown and described.

2. The combination, with the series of gin-saws in a cotton-gin, of a cleaner located just below the saws, and consisting of a shaft, A, having a series of disks, B, mounted thereon, and formed with peripheries of reduced thickness provided with laterally-projecting rings of brushes, substantially as shown and described.



403,687. ROAD FOR RAPID TRANSIT.

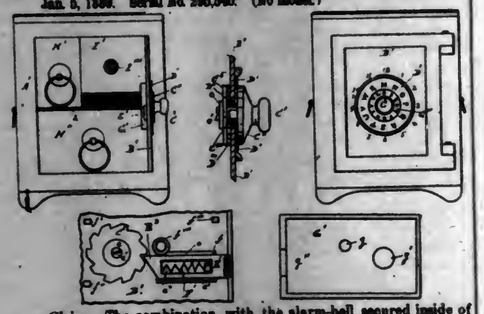
MOSES A. MENDALM, Allegheny, assignor of one-half to John T. Moore, Pittsburg, Pa. Filed May 15, 1888. Serial No. 273,961. (No model.)

Claim.—1. The combination, with a double-rail track having horizontal flange on one rail and a truck therefor, of a car suspended

403,687.

below and from one side of the truck, an arm pendent from the opposite side of the truck, and provided with a wheel which travels on the under side of the said flange, substantially as and for the purposes set forth.

2. The combination, with a double-rail track having a horizontal flange on one rail and a track therefor, of a car suspended below and from one side of the truck, a pendent arm provided with a wheel which travels on the under side of the rail-flange, and a lateral brace-wheel on the suspension-rod of the car which travels in the web of the opposite rail, substantially as and for the purposes set forth.



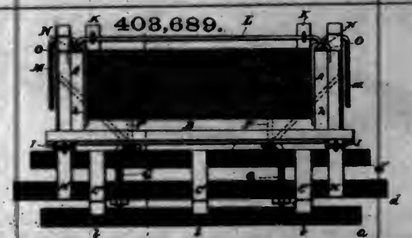
3. In an elevated railway, the U-shaped double rail track, one of whose verticals is provided with a horizontal flange, as at *d'*, substantially as and for the purposes specified.

4. In an elevated railway, the U-shaped double rail having two verticals, one of which has a single horizontal flange and the other a T-head or double flange, substantially as and for the purposes specified.

5. In an elevated railway, the combination, with the U-shaped track-iron having two unequal flanged verticals, of a rail of the common form, substantially as and for the purposes specified.

6. In an elevated-railway track for cable railways, the combination, with the U-shaped track having verticals of unequal height, of cable-rollers, and a separable cap-rail arranged on the short vertical which forms the journal-bearing of the cable-rollers, substantially as and for the purposes specified.

403,688. SAFE-ALARM. JOSEPH S. MIERS, Evansville, Ind. Filed Jan. 5, 1889. Serial No. 295,540. (No model.)

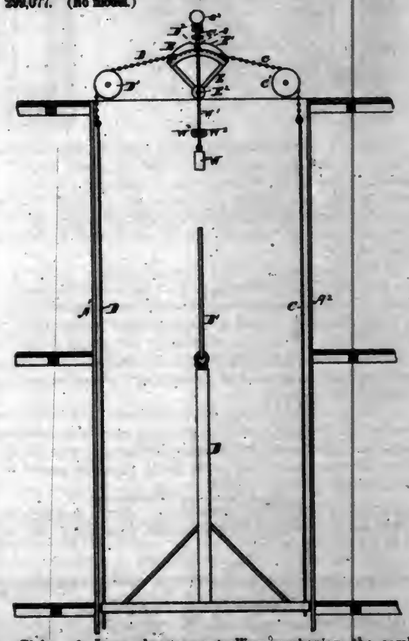


Claim.—The combination, with the alarm-bell secured inside of the safe, of the sliding rod and its actuating-spring, a projecting pin at one side of the rod, a pivoted piece, K, operated by said pin, a pivoted lever, L', and hammer M', operated thereby to strike the bell and sound the alarm when the door of the safe is opened or closed, substantially as and for the purposes set forth.

403,689. DUMPING-CAR. BERNARD MCARDLE, Geauga Lake, Ohio. Filed Sept. 25, 1888. Serial No. 286,375. (No model.)

Claim.—1. In a dump-car, the combination, with the truck and the car-body pivoted centrally and longitudinally thereon and provided at its ends with loops or staples, of the diagonal supports hinged near their lower ends to the central piece of the truck, and the rock-shafts journaled in the upper ends of the diagonal supports and provided with the lever-arms for actuating same and with hooks for engaging the loops or staples in the car-body, substantially as described.

2. In a dump-car, the combination, with the car-body pivoted centrally and longitudinally on the truck and supported in position by a rock-shaft provided with hooks adapted to engage with loops or staples in the end of the car-body and journaled in the outer ends of



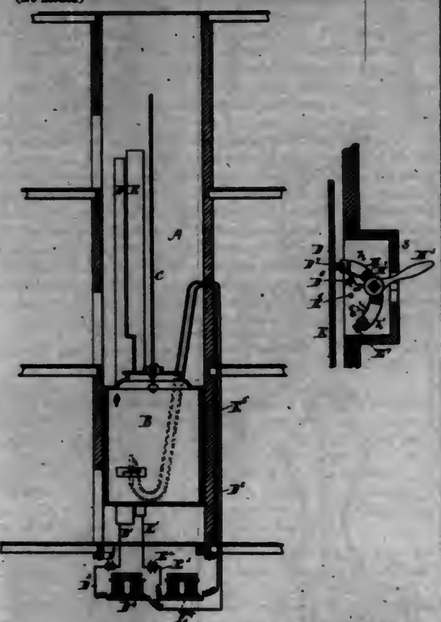
the diagonally-arranged hinged supports, of the swinging sides pivoted to the rock-shafts, substantially as and for the purpose described.

3. In a dump-car, the combination of the truck, the car-body pivoted centrally and longitudinally thereon, the diagonally-arranged supports resting upon the central longitudinal pieces of the truck, the hinged links pivotally connecting the lower end of the supports to the truck, the rock-shafts journaled in the outer ends of the supports and provided with the hooks adapted to engage the loops or staples in the car-body, and the lever-arms, all combined and arranged substantially as and for the purpose described.

4. The combination, in a centrally-pivoted car-body adapted to tilt toward either side, of the swinging gate C, hinged or pivoted to a frame supported upon the truck independent of the car-body, whereby it serves to close the side when the car-body is in its normal position and is held away from the body when the car is tilted, substantially as and for the purpose described.

5. In a dumping-car, the combination, with the truck provided with the longitudinal central bed-pieces, *d d'*, and the body centrally pivoted thereon, of the diagonal end supports resting upon and hinged near their lower ends to one of the bed-pieces of the truck, and the rock-shafts journaled in the outer ends of the supports and provided with hooks for engaging with staples on the car-body, and the gates C, hung to the rock-shafts and adapted to close the sides of the body when the car is in its normal position and to automatically open them when the car is tilted, substantially as and for the purpose described.

403,690. BELT-SHIFTING APPLIANCE FOR ELEVATORS. WILLIAM E. HICKERSON, Cambridge, Mass. Filed Feb. 7, 1888. Serial No. 299,077. (No model.)

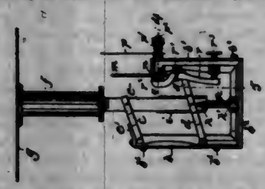


Claim.—1. In an elevator-controlling mechanism, the combination of the chains D and C with the switch-piece E and sliding rod S', substantially as and for the purpose set forth.

2. In an elevator-controlling mechanism, the combination of the chains D and C with the switch-piece E, weight W, and rope W', substantially as described, and for the purpose set forth.

3. In an elevator-controlling mechanism, the combination of the chains D and C with the switch-piece E, sliding rod S', weight W, and rope W', substantially as and for the purpose set forth.

403,691. ELECTRICAL SWITCH FOR ELEVATORS. WILLIAM E. HICKERSON, Cambridge, Mass. Filed Feb. 25, 1889. Serial No. 301,013. (No model.)



Claim.—1. In an electric switch device for elevator-carriages, the combination of the fixed electrodes D and E, arranged in offsets, with movable switch-brushes in the elevator-carriage adapted to be laterally adjusted for contact with said electrodes, substantially as and for the purpose set forth.

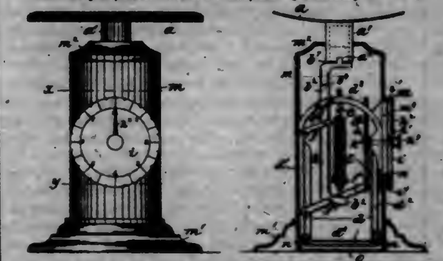
2. In an electric switch device for elevator-carriages, the combination of the electrodes D and E, arranged in offsets, with the brush-holding arc H upon the elevator-carriage having brushes and contact devices adapted to move laterally and also in and out of contact with the electrodes D and E, substantially as and for the purpose set forth.

3. In an electric switch device for elevator-carriages, the combination of the electric brush-holding arc H, having brushes and contact devices, with the switch-box S, having a lateral opening, S' S², and cross-openings 1 2 3 4 5, substantially as and for the purpose set forth.

4. In an electrical switch device for elevator-carriages, the combination of the fixed electrodes D and E, arranged in offsets, with one or more switch-brushes in the elevator-carriage adapted to make and break with said electrodes, substantially as and for the purpose set forth.

403,692. WEIGHING APPARATUS. JOHN H. HOLAN, Boston, Mass. Filed July 23, 1888. Serial No. 280,723. (No model.)

Claim.—1. The combination of the frame *b b' b²* with the levers pivoted on said frame and the weight-supporting upright pivotally connected with said levers, and a spring and supporting-upright therefor connected with the lower member, *b²*, of said frame, the said supporting-upright passing through and being attached to the upper end of said spring, which is embraced within and connected at its lower end with the said weight-supporting upright, the pointer-arbor having its bearings in the front member, *b'*, of said frame and provided with a pinion, and a rack meshing with said pinion connected with one of the levers with which the weight-supporting upright is connected, substantially as described.



2. The combination of the pointer-arbor of a weighing apparatus, said arbor having a pinion fixed thereon, and also having a threaded portion with a conical sleeve screwed upon said threaded portion, the pointer and hub therefor having a conical socket engaging said sleeve, and a spring that presses the said hub against the said sleeve, and a screw fastened to said arbor and supporting the end of said spring, substantially as described.

3. The combination of the frame *b b' b²*, the levers pivoted thereon, and weight-supporting upright pivotally connected with said levers and the spring, with an independent case or shell inclosing said frame and detachably connected therewith, the operative parts being all supported independently of said detachable shell, substantially as described.

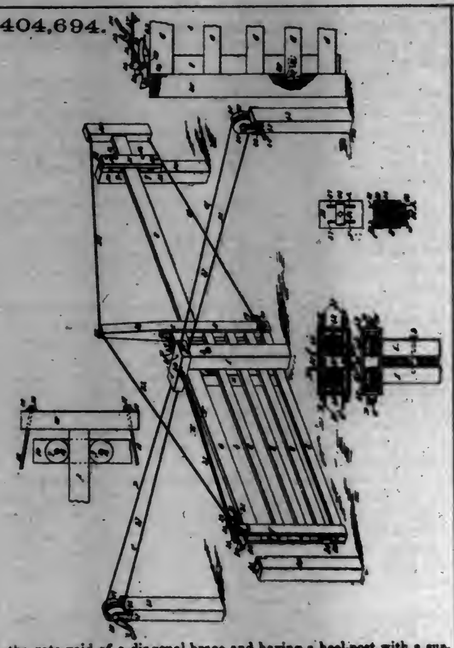
4. The combination of the frame, the levers pivotally connected therewith, and weight-supporting upright pivotally connected with said levers, and the counterbalancing-spring, with a pointer-arbor having a bearing in said frame and provided with a pinion and pointer frictionally held thereon, a rack engaging said pinion and connected with one of said levers, and a clamp for said pointer-arbor, consisting of a lever fulcrumed on said frame and having one arm that engages the end of said pinion and arbor to clamp the same against the frame-work while the pointer is being turned thereon, substantially as and for the purpose set forth.

5. The combination of the frame, the weight-supporting spring, and the pointer-arbor of a spring-balance connected therewith, with an inclosing-case having a lateral projection that receives the dial, and a detachable enlarging ring connected with said projection and having a flange overlapping said ring, and fastenings passing through the said flange of the dial and ring into the inclosing-case, substantially as and for the purpose described.

403,693. SPRING-BALANCE. JOHN H. HOLAN, Boston, Mass. Filed July 23, 1888. Serial No. 280,724. (No model.)

Claim.—1. A weighing apparatus comprising a frame, *d*, having a transverse member, *d²*, the weight-supporting standard *b*, its guiding-levers pivotally connected therewith and with the said frame, the said standard having an offset or arm at its lower end, a spring connected with the upper transverse member of said frame and with the arm of said standard, the pointer and its arbor having a bearing in said frame and provided with a pinion, and the rack meshing with said pinion and connected with one of said guide-levers, substantially as described.

2. A weighing apparatus comprising a frame, a weight-supporting standard, its guide-levers, a spring, the pointer-arbor and rack and a pinion supported on said frame, and the cylindrical shell *m*, having a base-flange, *m'*, at the outside of and above the lower end thereof, and the lateral cylindrical projection m^2 and dial *i*, supported thereon, substantially as and for the purpose described.



3. A weighing apparatus comprising a frame, *d*, having a transverse member, d^2, the weight-supporting standard *b*, having a recess, b^2, the shoulders at the ends of which engage said frame, the guiding-levers for said standard, the spring connected with said standard and with the frame d^2, and the rack connected with one of said levers, and pinion meshing with said rack, and pointer-arbor and pointer operated by said pinion, substantially as described.

404,694. SLIDING GATE. JACOB P. HOELIN, Humbar, Mo. Filed Jan. 21, 1889. Serial No. 297,040. (No model.)

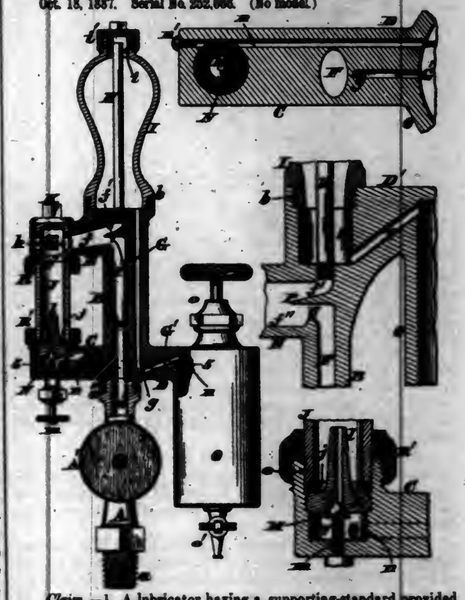
Claim.—1. In a sliding gate, the combination of the gate, the double central supporting-posts, the track-roller that carries the gate between said posts, the journal-bolt that is inserted in the posts and carries said roller, the counterpoise-bar S, secured to the heel-post of said gate, the counterpoise brace-carrier bar 15, the guide-post 10, the anti-friction rollers 9, between which said counterpoise-bar runs, the journal-frame that houses said rollers, and the journal-bolts that carry them, substantially as described, and for the purpose set forth.

2. In a sliding gate, the combination of the double central supporting-posts, the track-roller that carries the gate between said posts,

404,694.

the gate void of a diagonal brace and having a heel-post with a surmounting extension, the horizontal counterpoise-bar 8, secured to the rear of said heel-post, the guide-post 10, the anti-friction rollers it carries, between which said bar runs as the gate slides, the vertical counterpoise-bar 15 on the end of the bar 8, the clevis 20, secured to the foot of said heel-post, the lower brace-rod, 16, that hooks in said clevis and runs through the lower end of the counterpoise-bar 15, the equalizing-washer 18 on the rear end of said rod, the nut 17, that adjusts the tension of said brace-rod, the clevis 24, secured at the top of the toe-posts of the gate, the compound brace-rod 22, that hooks into said clevis, is elevated and carried in a recessed seat at top of the surmounting extension of the heel-post, and runs through the upper end of the counterpoise-bar 15, the equalizing-washer 29, and the screw-nut 28, that regulates the adjustment of said upper brace-rod, substantially as described, and for the purpose set forth.

3. In a sliding gate, the combination of the gate, the supporting-posts between which, and the track-roller on which, said gate runs, the counterpoise-bars 8 and 15 to balance and steady the gate, the guide-post 10, the anti-friction rollers journaled to said post, between which rollers the bar 8 runs, the forward extension, 38, of one of the gate-bars near the bottom, the latching-post 35, planted at the forward limit of the gate when closed, the bevel-slot 39 in said post, in which the projecting end 38 of one of the gate-bars is seated when the gate is closed, the latch-plate 34 at the head of said post, and the trip-latch on the gate that engages therewith when the gate is closed, substantially as described, and for the purpose set forth.



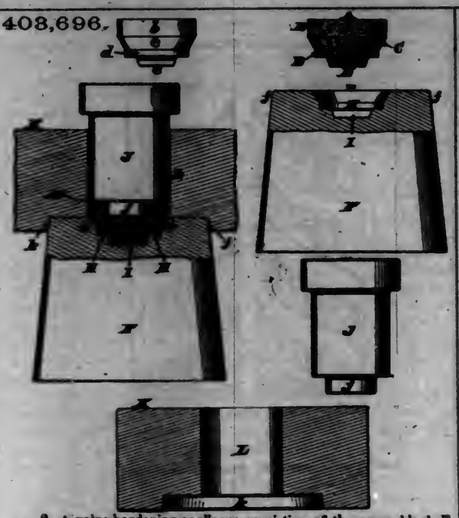
4. In a sliding gate, the combination of the gate having an elongated heel-post, the double posts 1, between which, and the track-roller 2 on which, the gate runs, the counterpoise-bars, the brace-rods, the double pulleys 42, that relatively surmount said posts, the perforated box-housing that incloses said pulleys, and the journal-bolts on which said pulleys run and that secure said pulleys and their housing to the heads of said post, substantially as described, and for the purpose set forth.

5. In a sliding gate, the combination of the gate, the two central posts between which, and the track-roller on which, said gate runs, the double pulleys 42, each journaled to the top of the post it surmounts, the box in which said pulleys are closely housed, the said box being perforated for the passage of the actuating-rope, the guide-post 10, having anti-friction rollers, the counterpoise-bars, the transversely-stationed posts 43, the journal-bearer brackets that surmount said posts, the hand-cranks 44, the axles 45, and the double draw-pulleys 48, that are mounted on said axles, substantially as described, and for the purpose set forth.

6. In a sliding gate, the combination of the double central posts between which, and the track-roller on which, the gate runs, the said gate provided with an elongated heel-post, the counterpoise-bars 8 and 15, the tension brace-rods 16 and 22, the automatic trip-latch 30, the latching-post and latch-plate with which said latch engages, the double transit-pulleys 42, journaled on the top of said central posts, the perforated box-housing that incloses said pulleys, the transverse outstanding posts 43, the journal-bearing brackets that surmount said posts, the axles having bearings in said brackets, the hand-cranks 44, mounted on said axles, the double draw-pulleys 48, the actuating-rope 37, that the crank-pulleys drive and that drives the gate, and the clamping-iron 53 and clamp-screw 54, that fastens the ends of the rope to its adjustment, substantially as and for the purpose set forth.

7. In a sliding gate, the combination of the gate, the two central supporting-posts, the track-roller journaled between said posts, on which roller the gate runs, the double transit-rollers 42, each respectively journaled to the top of the post it surmounts, the box perforated for the passage of the actuating-rope, the transversely-stationed posts 43, the mounted double draw-pulleys that surmount the last-named posts, the crank-handles that turn said pulleys, the actuating-rope 37, that coils around said draw and transit pulleys, the dividing-ridges between the concave sections of the draw-pulleys being provided with notches in which the rope is seated as it passes from one concave section to the other, arranged for the actuating-rope while operative to remain stationary in said notches, and the portions thereof on each side of said dividing-point at said notches to have relatively and alternatively as the gate opens and closes a positive draw and negative pay-out action, substantially as described, and for the purpose set forth.

408,695. LUBRICATOR. JAMES POWELL, Cincinnati, Ohio. Filed Oct. 18, 1887. Serial No. 252,666. (No model.)



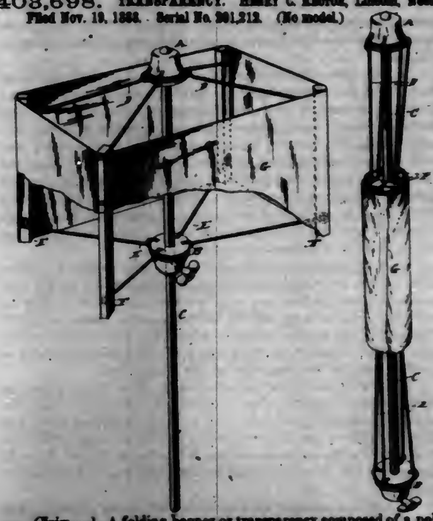
Claim.—1. A lubricator having a supporting-standard provided at bottom with a pair of lateral arms and at top with a condenser and a single lateral arm traversed by a duct communicating with the sight-feed chamber, steam-pipe, and main channel in the manner described, while the lever-arms are traversed by a channel extending from the top of reservoir to the bottom of said chamber, said reservoir being pendent from the arm, and being supplied with water by a channel or pipe leading up to the condenser, all of said parts being combined to operate substantially as set forth.

2. The combination, in a lubricator, of a channeled and counterbored standard, B F S, steam-pipe H, elevated condenser I, oil-reservoir O, and lateral arm D', which arm connects said reservoir O with the upper part of said standard B F S, and has an inclined channel, T, connecting the upper portion of said reservoir with the lower part of said counterbore S, all as herein described, and for the purpose set forth.

408,696. DIE FOR COMPRESSING VALVE-BLANKS. JAMES POWELL, Cincinnati, Ohio. Filed Oct. 22, 1888. Serial No. 288,861. (No model.)

Claim.—1. A valve-hardening appliance consisting of the swage-block F, having a pit, G, of less diameter at bottom than at top, in combination with the punch J, as herein described.

408,696.



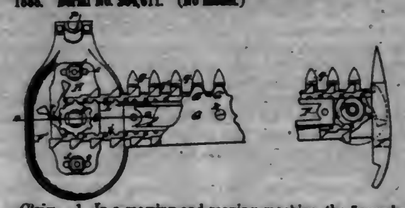
2. A valve-hardening appliance consisting of the swage-block F, having a pit, G, of less diameter at bottom than at top, in combination with the punch J and detachable curb K, the latter being provided with a bore, L, and counterbore *k*, as herein described.

3. A valve-hardening appliance consisting of the swage-block F, having a pit, G, of less diameter at bottom than at top, in combination with the punch J, which punch has at one end a shank, *j*, that enters a socket, as M, of the valve, as herein described.

408,697. WATERPROOFING STRAW GOODS. RENTON PYATT, Jr., New York, N. Y., assignor to Rogers & Pyatt, same place. Filed Dec. 17, 1887. Serial No. 258,312. (Specimens.)

Claim.—The herein-described process of waterproofing straw goods, which consists in first subjecting the goods to a bath of resin dissolved in water and sal-soda, then drying said goods, and then neutralizing the effect of the alkaline solution by an acid bath, substantially as in the manner set forth.

408,698. TRANSPARENCY. HENRY C. RENTON, Lincoln, Nebr. Filed Nov. 19, 1888. Serial No. 291,212. (No model.)



Claim.—1. A folding banner or transparency composed of a pole, frame-bars, and rods connecting each end of the frame-bars with the pole, substantially as described.

2. A folding banner or transparency composed of a pole, frame-bars, the heads on the pole, and the rods pivotally connected with the heads and with the upper and lower ends of the frame-bars, substantially as set forth.

3. The combination of the frame-bars, the fabric on the frame-bars, the head A, the rods D between the head A and the frame-bars, the head B, movable on the pole, the rods E, connecting the other ends of the frame-bars with the said head B, and the set-screw for fastening the said head B on the pole, substantially as and for the purpose described.

408,699. MOWING AND REAPING MACHINE. MARK A. REYNOLDS and HANNIBAL LABAUME, Cedar Falls, Iowa. Filed Feb. 20, 1888. Serial No. 264,611. (No model.)

Claim.—1. In a mowing and reaping machine, the finger-bar F, the inner shoe, F', outer shoe, F'', and guard-fingers *g g*, said finger-bar having a central longitudinal portion arched upwardly in transverse section, forming shoulders *m m*, adapted to serve as bearings for the cutting apparatus, in combination with a plane upper plate, G, having teeth G' G', beveled on the upper side, extending forward, and secured to said guard-fingers, substantially as and for the purpose set forth.

2. The combination of the plate G, having teeth G' G', the finger-bar F, and the guard-fingers *g g*, having lugs *g' g'*, adapted to be bent down upon the end of said teeth and secure them in position, substantially as specified.

3. In a mowing-machine, the described cutting apparatus, composed of a series of links having a body portion, *i*, with lug *i'* at one extremity and lugs *i'' i''* at the other, and provided with holes *n* and *n'*, respectively, pins *r*, connecting said links, a notch, 1, on the inner side of the link, adapted to engage with the teeth of a sprocket-wheel, and an extension, 3, with a knife thereon, the inner line of said extension coinciding with the line of the outer side, 2, of the body portion of the link, whereby the cutting apparatus is adapted to bend only in one direction, substantially as and for the purpose set forth.

4. In a mower cutting apparatus, the described section, consisting of a body portion, *i*, having a notch on the inner side adapted to engage with the teeth of a sprocket-wheel, and terminal lugs *i'* and *i''*, with suitable holes for a hinge-pin therein, and the extension 3, a portion of which constitutes the knife *i'''*, the inner line of said extension being coincident with the line of the outer side, 2, of the body portion of the section, whereby the sections when connected overlap and are locked in one direction, the said section being made of steel, substantially as and for the purpose set forth.

5. The combination of a cutting apparatus composed of a series of links with knives thereon, each of said links having hole *n* at one end and a countersunk hole, *n'*, at the other, adapted to receive the corresponding head of a pin, pins connecting said links and capable of being inserted or removed at will, and finger-bar having shoulders *m m*, corresponding practically to the vertical diameter of the links, and a plate removably secured to said finger-bar and forming an upper bearing for said cutting apparatus to prevent displacement of the loose pins, substantially as set forth.

408,700. NON-CONDUCTING JACKET. JOHN RILEY, Troy, N. Y. Filed Feb. 11, 1888. Serial No. 263,444. (No model.)

Claim.—1. A non-conducting jacket for radiating-surfaces, consisting of a base-layer, 1, the inner sheet, 3, of corrugated paper, the course or layer 5 on said corrugated paper, the outer sheet of corrugated paper on the said course or layer, and an external binding-envelope, 9, on the outer sheet of corrugated paper, substantially as described.

2. A non-conducting jacket for radiating-surfaces, comprising a fire-proof base-layer, 1, an inner corrugated sheet, 3, of non-conducting material, an outer corrugated sheet, 6, of non-conducting material, a course or layer, 5, interposed between the two corrugated sheets, and an external binding-envelope, 9, said sheets constituting an

inner set and an outer set of dead-air channels or spaces, substantially as described.

3. A non-conducting jacket for radiating-surfaces, consisting of a fire-proof base-layer, an inner corrugated sheet and an outer corrugated sheet, forming, respectively, a set of inner and a set of outer dead-air channels, a course or layer interposed between the two corrugated sheets, and a removable and replaceable textile binding-envelope buttoned in position on the jacket, substantially as described.

4. The combination, in a non-conducting jacket for radiating-surfaces, of an internal layer or sheet, 1, a course or layer, 5, an interposed corrugated sheet of paper having the alternating corrugations resting on the internal layer or sheet and the other alternating corrugations secured to a paper backing-sheet, and an external textile binding-envelope, substantially as described.

5. The combination, in a non-conducting jacket for radiating-surfaces, of an inner and an outer corrugated sheet of paper, each forming a set of separated dead-air channels, and an interposed course or layer between the corrugations of the respective paper sheets, substantially as described.

6. The combination, in a non-conducting jacket for radiating-surfaces, of an inner and outer corrugated sheet, each having an attached backing-sheet and forming a set of separated dead-air channels, and an interposed course or layer of non-conducting material, substantially as described.

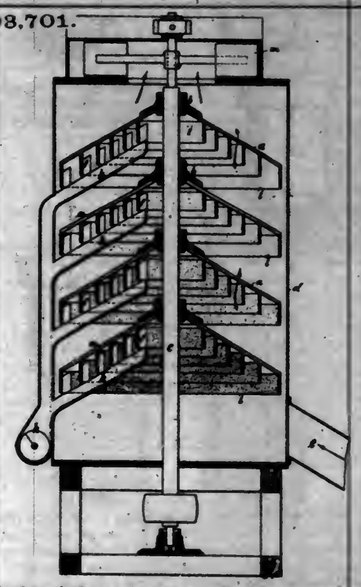
7. The combination, in a non-conducting jacket for radiating-surfaces, of an inner and outer corrugated sheet of paper forming separated dead-air channels, an interposed course or layer of asbestus and hair, and an external binding-envelope, substantially as described.

8. A non-conducting jacket for radiating-surfaces, consisting of an internal layer or sheet, an inner and an outer corrugated sheet, each forming a set of separated dead-air channels, a course or layer of felted asbestus and hair interposed between the two corrugated sheets, and an external textile binding-envelope, substantially as described.

9. The combination, with a non-conducting jacket for radiating-surfaces, of a removable and replaceable external textile binding-envelope separate and independent of the jacket and provided with a pair of longitudinal stretching-wires, and buttons and button-holes, respectively, braced by said wires, substantially as described.

10. The combination, with a non-conducting jacket for radiating-surfaces, of a removable and replaceable external binding-cover having near each longitudinal edge a stretching or distending wire, and engaging and disengaging fastening devices adjacent to and respectively braced by said wires, substantially as described.

11. The combination, with a non-conducting jacket for radiating-surfaces, of an external binding-envelope having fastening-buttons and longitudinal stretching or distending wires, one securing and holding the buttons and the other bracing the parts that engage the buttons, substantially as described.



12. The combination, with a non-conducting jacket for radiating-surfaces, of a textile binding-envelope wholly independent of the jacket and removable and replaceable at will, said envelope having at one edge a line of button-holes and at the opposite edge an extension-flap and a line of buttons, substantially as described.

13. An external binding-envelope for the non-conducting jacket of a radiating-surface, composed of a sheet of fabric having at one edge portion a row of buttons, a stretching or distending wire engaging and securing the buttons, and an extension-flap, and at the other edge a stretching or distending wire and means to engage and disengage the buttons, substantially as described.

14. The combination, with a non-conducting jacket for radiating-surfaces, of an external binding-envelope composed of a sheet of fabric having wired longitudinal edges for keeping the latter stretched or distended, and means, substantially as described, for detachably connecting the wired edges, substantially as described.

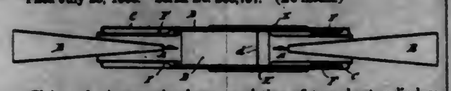
15. An external binding-envelope for a non-conducting jacket, composed of a sheet of fabric having at or near each longitudinal edge a stretching or distending wire provided with hooked ends engaging the sheet, and fastening-buttons for securing the envelope, substantially as described.

408,701. DUST-COLLECTOR. HERMANN SENF, Dresden, SAXONY, Germany. Filed Jan. 3, 1888. Serial No. 259,504. (No model.) Patented in Germany Sept. 1, 1887, No. 44,377; in France Sept. 12, 1887, No. 185,788; in Belgium Sept. 12, 1887, No. 78,942; in England Sept. 13, 1887, No. 13,425; in Italy Sept. 30, 1887, No. 23,340/262, and in Austria-Hungary Mar. 8, 1888, No. 35,496 and No. 67,088.

Claim.—1. In a dust-collector, the combination of a closed casing having an inlet for the dust-laden air, an outlet for the purified air, and an exit for the collected dust, a revolving shaft, a series of vertically-arranged concentric rings connected to the shaft with their sides substantially parallel thereto and to each other and provided with free and unobstructed openings between both their upper and lower edges, and means, substantially as described, for moving the dust-laden air in through the openings between the rings at one edge and the purified air out through the openings between the opposite edges of the rings, substantially as described, whereby the latter force the impurities by centrifugal force against their interior surfaces and the air entering the openings between the lower edges of the rings passes off through the openings between the upper edges of said rings, as set forth.

2. In a dust-collector, the combination of a casing having closed side walls, an inlet for the dust-laden air, an outlet for the purified air, and an exit for the collected dust, a rotary shaft, a series of parallel vertically-arranged concentric rings, all connected with the shaft, provided with free and unobstructed openings between their upper and lower edges and having the lower edge of one extended below the lower edge of the adjacent ring in stepped form, and air-forcing mechanism for moving the dust-laden air through the openings between the rings at one edge and the purified air out through the openings between the opposite edges of the rings, substantially as described.

3. In a dust-collector, the combination of a closed casing having an inlet for the dust-laden air, an outlet for the purified air, and a discharge-opening for the collected dust, a revolving shaft, a series of vertically-arranged concentric rings connected to the shaft with their sides substantially parallel thereto and to each other and provided with free and unobstructed openings between both their upper and lower edges, means, substantially as described, for moving the dust-laden air in through the openings between the rings at one edge and the purified air out through the openings between the rings at their opposite edges, and dust-receivers below the rings and in communication with the dust-discharge opening.



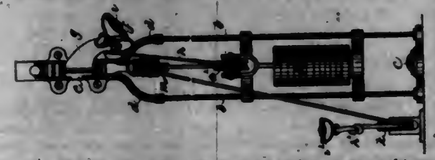
4. In a dust-collector, the combination of a casing, a rotating shaft therein, a series of concentric annular rings having smooth inner vertically-arranged faces and separated from each other at their top and bottom edges to provide for the free upward passage of air between the rings, scrapers acting to scrape the dust from the smooth inner vertical faces of the rings, and a fan for passing the air to be purified between the rings, substantially as described.

5. In a dust-collector, the combination of a casing, a rotating shaft therein, concentric rings separated at their upper and lower edges by intervening air-spaces and arranged in stepped form, with the lower edge of one projecting below the bottom edge of the adjacent one from the ring at the bottom to the ring at the top, and a fan for passing the air to be purified between the rings, substantially as described.

6. In a dust-collector, the combination of a casing, a rotating shaft therein, a series of concentric annular rings separated from each other at their top and bottom edges by intervening air-spaces to provide for the free passage of air between the rings and having vertically-arranged inner faces, scrapers for detaching the accumulating dust on said vertically-arranged inner faces, and a gutter extending under the lower edges of the rings directly beneath the scrapers to receive the dust detached by the latter, substantially as described.

7. In a dust-collector, the combination of a series of rotating rings arranged concentrically, whereby the impurities are driven out of the air forced into and through the apparatus, in combination with scrapers for removing the dust adhering to the said rings, and with curved plates fastened upon the latter, substantially as and for the purpose set forth.

408,702. CAMPAIGN-HORN. WILLIAM SELLERS, Haverhill, Mass. Filed July 23, 1888. Serial No. 280,757. (No model.)

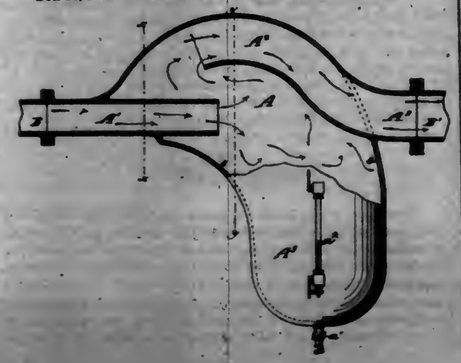


Claim.—1. A campaign-horn consisting of two short cylinders, each provided with a horn and connected together by a bar on each side and an outer cylinder provided with a central diaphragm and connected to the end cylinders by elastic cylinders in such manner that one folds upon itself and the other unfolds when the movable cylinder is pushed in one direction, and vice versa when the cylinder is pushed in the opposite direction, substantially as shown and described.

2. The cylinders A A, connected together by bars C C, and each provided with a horn, B, in combination with a sliding cylinder, D, provided with a diaphragm, *d*, and guides E E, and the elastic cylinders F, secured at one end to the cylinder D and at the other end to the cylinders A, substantially as and for the purposes set forth.

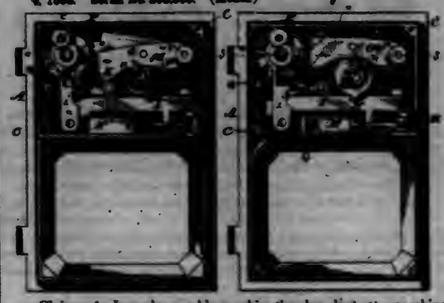
3. In combination with the cylinders A and cylinder D, the elastic cylinder F, whereby the space between the cylinders is air-tight, and yet one is free to slide upon the other without friction, substantially as set forth.

4. In a campaign-horn, a cylinder provided with a horn and a movable cylinder provided with a diaphragm, the two cylinders being connected together by an elastic cylinder in such manner that it folds upon itself when the movable cylinder is pushed in one direction and unfolds when pushed in the opposite direction, substantially as set forth.



408,708. GYMNASTIC APPARATUS. LEWIS F. SMALL, Boston, Mass. Filed Mar. 1, 1888. Serial No. 301,046. (No model.)

Claim.—1. A gymnasium apparatus comprising upper and lower pulleys and a weight combined with a cord, the ends of which are provided with stops at or near said upper and lower pulleys, and intermediate running cord guides, whereby either end of said cord may be operated while the other end is held by its stop, substantially as and for the purpose described.



2. The combination of a weight and pulley connected therewith with a cord-guiding pulley above the upper end of the path traversed by said weight, and additional pulleys at the upper and lower levels, from which the said weight is to be operated, combined with a cord extending continuously and free to run over all of said pulleys and capable of operation from either end to raise and lower said weight, substantially as and for the purpose described.

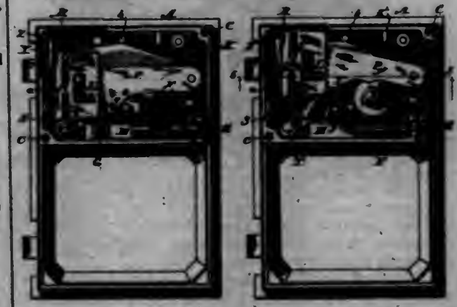
408,704. SEPARATOR. SINCLAIR STUART, Plainfield, N. J. Filed Dec. 20, 1887. Serial No. 258,490. (No model.)

Claim.—A separator comprising an inlet branch and an outlet branch, a chamber into which both said branches extend, the outlet branch being of larger diameter than the inlet branch and having its opening in the chamber above the opening for the inlet branch, and a well below both said branches, said chamber being provided with walls inclined toward the well and the whole being cast in one integral piece, substantially as specified.

408,705. LOCK. WARREN H. TAYLOR, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Dec. 4, 1882. Serial No. 260,503. (Model.)

Claim.—1. In a changeable combination key lock, the combination of the main locking-key and the tumblers in parts geared together at all times except when the combination is to be changed, substantially as set forth.

2. In a changeable combination key lock having two-part tumblers, the combination, with a movable seat which supports one part of said tumblers, an auxiliary key which disengages one part of the tumbler or tumblers from the other, and a cap-plate through which said key passes, whereby said key cannot be removed from the lock until said parts are in engagement, substantially as described.



3. In a changeable combination key lock having two-part tumblers, the combination of an auxiliary key with the gated parts of the tumblers, and a spring-actuated carrier upon which said parts are mounted, whereby said parts when separated from the spring-actuated parts tend to move against said auxiliary key, acting as a stop until the gatings of said tumblers are brought in line, substantially as described.

4. The combination, with the circular parts of the tumblers, of a pivoted frame for supporting them, adapted to be swung to one side and the other, so as to engage and disengage the circular parts of the tumblers with the other parts, substantially as set forth.

5. The combination of the oscillating seat Z, the carrier, the circular parts of the tumblers, pivot-post *h*, the slotted key-post, the cap-plate, the thumb-nut *d*, and the spring-latch *l*, substantially as set forth.

6. The combination, with the slotted key-post, of the cap-plate provided with the slots *k k'*, and the key *g*, tapered at its end, and notch *m*, substantially as set forth.

408,706. LOCK. WARREN H. TAYLOR, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Dec. 10, 1888. Serial No. 293,092. (Model.)

Claim.—1. The combination, with the pivoted oscillating seat, of the sliding tumblers carried thereby, the sliding fence, the pivoted spring-catch Y, for engaging with the notches in the sliding tumblers, the pin *c*, and the latch *d*, substantially as set forth.

2. In a changeable combination key-lock, the combination of one or more tumblers in parts, an oscillating seat which carries one part of said tumblers, and a latch, whereby the said part may be separated

from the other and held by said latch ready for resetting to a new combination, substantially as set forth.

408,707. PROCESS OF ELECTRIC SOLDERING, BRAZING, AND WELDING. ELIHU THOMSON, Lynn, assignor to the Thomson Electric Welding Company, Boston, Mass. Filed Aug. 22, 1887. Serial No. 247,509. (No model.)

Claim.—1. The herein-described method of electric welding, brazing, or soldering, consisting in passing through one or both of the parts or pieces to be operated upon a heavy electric current in the general direction of the line or plane of the joint and of a volume sufficient to bring the piece or pieces to the requisite temperature.

2. The herein-described improvement in electric welding and brazing, which consists in making either or both of the parts or pieces to be joined a portion of a continuous electric circuit formed through each or either independently of the other and carrying a heavy electric current of a volume sufficient, as described, to effect the desired welding or brazing operation.

3. The herein-described process of forming longitudinal seams or joints in or between elongated metal pieces, consisting in passing a heavy electric current through the piece or pieces longitudinally and of a volume sufficient to heat the same to the desired welding or brazing temperature, as and for the purpose described.

4. The herein-described improvement in affixing light metal pieces to a heavier or base piece, consisting in passing an electric current through the latter of a volume sufficient to heat the same to the requisite welding, soldering, or brazing temperature.

5. The herein-described improvement in forming elongated longitudinal seams or joints, which consists in heating portions of the material in successive lengths by the agency of an electric current passing longitudinally and producing the seam or joint of each section while such section is included in the electric circuit, as and for the purpose described.

6. The herein-described improvement in electric welding, brazing, forging, or soldering, which consists in surrounding the parts acted upon by the electric current by a supporting and heat-retaining jacket or envelope, as and for the purpose described.

7. The combination, with the clamps or connectors, of the intermediate bed-plate, arranged as described, to support the body through which the heating electric current passes, as and for the purpose described.

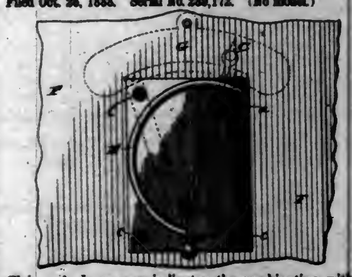
408,708. METHOD OF ELECTRIC WELDING AND BRAZING. ELIHU THOMSON, Lynn, Mass. Original application filed Feb. 21, 1887, Serial No. 228,277. Divided and this application filed Oct. 19, 1888. Serial No. 288,594. (No model.)

Claim.—1. The herein-described method of forming a welded or brazed joint, consisting in passing an electric current through the material from one side to the other of the joint and then applying lateral pressure directly to the material at the part where the joint or weld is to be formed.

2. The herein-described process of forming a butt-welded joint, consisting in forming or providing the metal with an enlargement at the point of abutment, passing a heating electric current through the material, and then applying lateral pressure to the material directly at the joint, as and for the purpose described.

3. The herein-described improved method of forming an elongated metal joint, consisting in passing a heating electric current across the joint and applying transverse or lateral pressure to successive portions of the object directly at the joint, and for the purpose described.

4. The herein-described process of electric welding, consisting in passing an electric current of large heating effect across the joint and then compressing or compacting the joint by pressure applied laterally in a direction transverse to the general line or plane, including the joint and the pieces or portions of object adjacent to the joint.



408,709. CARRIAGE-BODY JOINT. ERWIN L. UPSON, Hartford, Conn. Filed Mar. 7, 1888. Serial No. 302,351. (No model.)

Claim.—1. In a corner joint, the combination of the mitered sides, each having a channel, substantially as described, in the mitered face, and having a groove on the inner side located beyond said channel, the nut-plate in said channels, the clamp-plate fitting the inner angle of the side pieces and having lugs engaging in said grooves, and screws connecting and clamping the said plates, all substantially as described.

2. In a corner joint, the combination of mitered sides A B, each having a channel, substantially as described, in the mitered surface, and a groove on the inner side beyond said channel and of less length than the width of the side piece, the nut-plate, the clamp-plate C, engaging said grooves, and the clamp-screws, all substantially as shown and described.

408,710. OVEN-THERMOMETER. JOHN C. VOSS, El Paso, Tex. Filed Oct. 26, 1888. Serial No. 289,172. (No model.)

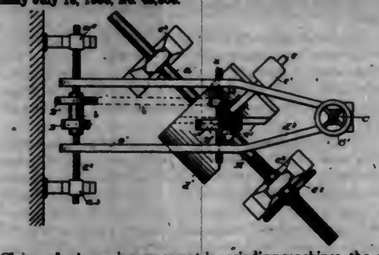
Claim.—1. In an oven-indicator, the combination, with a spindle having a lever and an index or pointer, of a compound bar secured at one end and bearing at its free end against one side of said lever, and a weight for returning the lever to its normal position.

2. In an oven-indicator, the combination, with the spindle B, provided with the weighted lever D and the index C, carried by the spindle, of the curved compound bar E, arranged to contact with the weighted lever D, substantially as specified.

3. In an oven-indicator, the combination, with the spindle B, provided with the weighted lever D and the index C, carried by the said spindle, of the curved compound bar E, arranged to contact with the weighted lever D, and the scale G, substantially as specified.

4. In an oven-indicator, the combination, with the spindle B, provided with the weighted lever D and the index C, carried by the said spindle, of the curved compound bar E, arranged to contact with the weighted lever D, and the scale G and guard H, having marked thereon different articles of food, together with figures indicating the temperature to which such articles should be subjected in the operation of roasting or baking, substantially as specified.

5. The combination, with the oven-door F, of the frame A, provided with studs *c*, the spindle B, extending through the oven-door, the weighted lever D and index C attached to the said spindle, the compound bar E, arranged to act upon the weighted lever D, and the scale G, attached to the oven-door, substantially as specified.

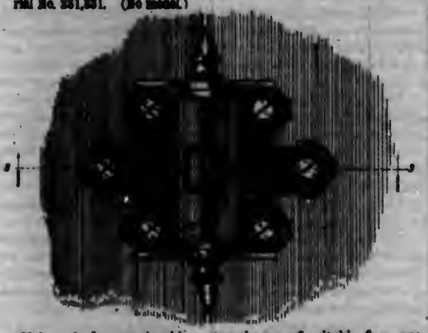


408,711. HAIR-CURLER. FRED WILSON, Decatur, Ill. Filed Mar. 13, 1889. Serial No. 303,169. (No model.)

Claim.—1. A hair-curler composed of a cylindrical coiling-rod bifurcated throughout the greater portion of its length, and a cylindrical clamp-rod pivotally connected with the integral portion of the coiling-rod, and having a clamp formation at its swinging end to embrace said coiling-rod, as set forth.

2. A hair-curler composed of a coiling-rod, comprising the integral portion *a* and forks *b b*, the latter having the internal bevels, *c*, and the rounded angles *b'*, and the clamp-rod *d*, having the right-angled bend *e*, pivotally connected with part *a*, and also having the clamp formed of the recurved portion *d'*, the bend d^2, and the deflection d^3, as set forth.

408,712. MACHINE FOR GRINDING THE CUTTERS OF WOOD-CUTTING MACHINES. OTTO A. WIRTH, Barmbeck, Prussia, Germany. Filed May 26, 1888. Serial No. 275,270. (No model.) Patented in Germany July 18, 1886, No. 43,808.



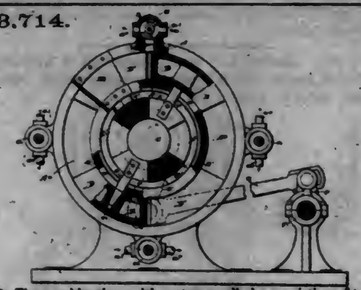
Claim.—1. As an improvement in grinding-machines, the combination of the knife holder or support and the grindstone, the former being disposed at about an angle of forty-five degrees to the latter, and the shaft for said holder having a limited movement therewith, substantially as set forth.

2. As an improvement in grinding-machines, the combination, with the grindstone, of the knife holder or support having a plate provided with a beveled or inclined edge, and the shaft running at an angle of about forty-five degrees to said grindstone, substantially as set forth.

3. The combination, with the grindstone, of the knife holder or support having upper and lower plates provided with inclined or beveled edges at right angles to each other, the shaft for said holder, and the roller against which said lower plate bears, substantially as set forth.

4. The combination, with the grindstone, of the knife holder or support having the upper and lower plates provided with inclined or beveled edges at right angles to each other, the weighted arm, the shaft having a threaded portion, and a hand-wheel and the lower roller, substantially as set forth.

408,713. SPRING-HINGE. CHARLES ZATTAU, Morris, assignor to the Coleman Hardware Company, Chicago, Ill. Filed Aug. 3, 1888. Serial No. 281,891. (No model.)



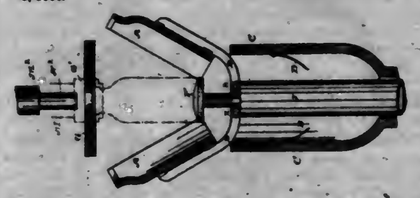
Claim.—1. In a spring-hinge, two leaves of suitable form provided with ears or lugs pivotally connected together outside of the plane of the hinge-leaves, in combination with two springs arranged, respectively, on the hinge-leaves transversely to the axis of the hinge, and a non-yielding and non-elastic link connecting the hinge-leaves together through the medium of the springs, substantially as described.

2. In a spring-hinge, two leaves of suitable form provided with ears or lugs pivotally connected together outside of the plane of the hinge-leaves and having spring chambers or cases on said leaves transverse to the axis of the hinge, in combination with springs arranged in such chambers or cases, and a link connecting such springs together, substantially as described.

408,714. STEAM-ENGINE. ROBERT T. ADELL, Cleveland, Ohio, assignor of two-thirds to Wesley Royce and John H. Francis, both of same place. Filed Nov. 26, 1888. Serial No. 291,894. (No model.)

Claim.—1. The combination, with a steam-cylinder composed of two concentric circular rims and heads, of rock-shafts, arms secured thereon and passing through the inner rim, and pistons secured on the ends of the arms.

2. The combination, with a steam-cylinder consisting of two concentric circular rims and heads secured against the outer edges of the rims, of segmental pistons arranged in series, the pistons of one series operating between the pistons of the other series, each series of pistons being mounted on a rock-shaft independent of the rock-shaft of the other series, but having a common axial line, substantially as set forth.



3. The combination, with a steam-cylinder composed of two concentric circular rims and heads secured against the outer edges of the rims, of segmental pistons located between the rims and arranged in series, the pistons of one series operating between the pistons of the other series, rock-shafts, arms passing through the inner rim and connecting the pistons and rock-shafts, and a rock-arm mounted on each rock-shaft, the said rock-arms being connected by pitmen with a crank-shaft, substantially as set forth.

4. The combination, with a steam-cylinder and segmental operating-pistons arranged in two series and operating in said cylinder, of a series of steam-chambers and a valve in each chamber, substantially as set forth.

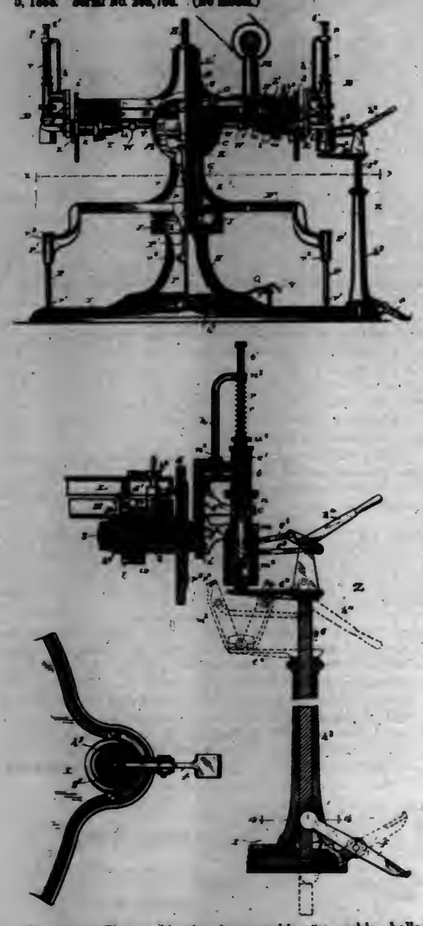
408,715. FURNITURE-POLISH. GEORGE H. ALLEN, Greenbush, N. Y. Filed July 26, 1887. Serial No. 245,242. (No specimens.)

Claim.—The herein-described composition of matter to be used for furniture-polish, consisting of oil of cedar, linseed-oil, and turpentine, in substantially the proportions specified.

408,716. MACHINERY FOR MAKING GLASS BOTTLES, &c. HOWARD M. ASHLEY, Perrysbridge, County of York, England. Original application filed Sept. 26, 1887, Serial No. 250,767. Divided and this application filed Nov. 10, 1888. Serial No. 290,505. (No model.) Patented in England Nov. 12, 1886, No. 14,727; in Austria-Hungary Sept. 19, 1887; in Belgium Sept. 23, 1887; in France Sept. 24, 1887; in Canada Jan. 3, 1888, No. 28,296; in Italy Feb. 17, 1888; in Norway Mar. 2, 1888; in Victoria Apr. 18, 1888; in New South Wales Apr. 20, 1888; in Tasmania Apr. 21, 1888; in Spain July 13, 1888, and in Portugal Aug. 3, 1888.

Claim.—1. In machinery for the manufacture of bottles and other like hollow glassware, the combination, with a suitable mold, of an exhausting apparatus comprising a bell which incloses or partly incloses such mold, substantially as hereinbefore specified.

2. In machinery for the manufacture of bottles and other like hollow glassware, the combination, with a suitable mold, of a combined head-mold and true-plate fitted to one end thereof and provided with an aperture in communication with the interior of the mold, which suspends a hollow parison within the mold, and an exhausting apparatus comprising a bell which incloses or partly incloses the mold for expanding the glass within the latter, substantially as hereinbefore specified.



3. In machinery for the manufacture of bottles and other like hollow glassware, the combination of a longitudinally-divided mold, laterally-swinging arms which carry the respective mold parts, and springs which press together the mold parts, substantially as hereinbefore specified.

4. In machinery for the manufacture of bottles and other like hollow glassware, the combination of a longitudinally-divided mold, swinging arms carrying the mold parts, and an endwise-sliding bell provided internally with springs, and which incloses or partly incloses

the mold, and by said springs presses its parts together, substantially as hereinbefore specified.

403,717. MACHINERY FOR MAKING GLASS BOTTLES, &c.

HOWARD M. ASHLEY, Ferrybridge, County of York, England. Filed Dec. 5, 1888. Serial No. 292,766. (No model.)

Claim.—1. The combination, in a machine for making hollow glassware, of a series of initial mechanisms revolving in a horizontal plane, and each comprising a parison-mold, a head-mold or collar, and a punch, and a relatively stationary finishing mechanism comprising a shaping-mold and means for applying the same to the parisons in succession, substantially as hereinbefore specified.

2. The combination, in a repeating-machine for making hollow glassware, of a horizontal rotary disk or frame, a series of initial mechanisms carried by said frame, and each comprising a parison-mold, a head-mold or collar, and a punch, and relatively stationary actuating parts coacting with said mechanisms in succession, substantially as hereinbefore specified.

3. The combination, in a machine for making hollow glassware, of a vertical pillar and a top disk supported by said pillar, which are stationary, a horizontal rotary disk or frame which rotates upon said pillar beneath said top disk and is provided at its periphery with a series of initial mechanisms, each comprising a parison-mold, a head-mold or collar, and a punch, and actuating parts carried by said top disk and coacting with the said mechanisms in succession, substantially as hereinbefore specified.

4. In a machine for making hollow glassware, the combination, substantially as hereinbefore specified, of a horizontal disk or frame carrying at its periphery a series of initial mechanisms and having a frictional surface and stops at the respective mechanisms, and a relatively stationary brake provided with a detent and coacting with said frictional surface and stops, for the purpose set forth.

5. In a machine for making hollow glassware, the combination, with an inverting-frame carrying a parison-mold and its appurtenances, of a detent for locking the same in its stationary positions, substantially as hereinbefore specified.

6. In a machine for making hollow glassware, the combination of a parison-mold and punch revolving in a horizontal plane, and a relatively stationary actuating-cam for thrusting the punch upward into the parison-mold as it passes said cam, substantially as hereinbefore specified.

7. The combination, substantially as hereinbefore specified, of a revolving series of parison-molds and punches, a correspondingly-revolving series of motion-transmitters, and a relatively stationary actuating-cam which coacts with said transmitters to thrust the punches upward into the several parison-molds in succession as they revolve.

8. The combination, substantially as hereinbefore specified, of a revolving series of parison-molds and their appurtenances, comprising punches having terminal knobs, a correspondingly-revolving series of motion-transmitters having mouths to embrace said knobs in the effective position of the punches, and a relatively stationary undulating cam to coact with said transmitters, having receiving and delivering ends at the same level, whereby the punches are thrust upward and retracted without the aid of springs and the transmitters are left in position for the next operation after each actuation thereof.

9. The combination, with an inverting-frame carrying a parison-mold and its appurtenances, of a wheel fast on the spindle of said frame and turning paths or surfaces to engage with said wheel for reverting and inverting said frame, substantially as hereinbefore specified.

10. The combination, with a divided parison-mold and its appurtenances and an inverting-frame which carries the same, of a relatively stationary part and connections between the same and the respective mold parts, whereby the mold is closed and opened simultaneously with its inversion and reversion, substantially as hereinbefore specified.

11. In combination with an inverting-frame carrying parison casting and punching devices, comprising a two-part parison-mold with laterally-moving supports, a relatively stationary part formed with eccentric paths, and slides working therein and connected with said supports to open and close such mold, substantially as hereinbefore specified.

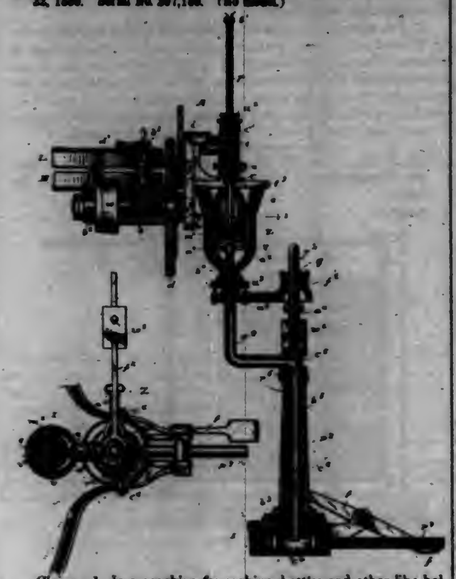
12. In combination with a horizontally-revolving series of initial mechanisms comprising parison casting and punching devices, a relatively stationary finishing mechanism comprising a shaping-mold and means for closing and opening said mold, substantially as hereinbefore specified.

13. In combination with a horizontally-revolving series of initial mechanisms comprising parison casting and punching devices, a relatively stationary finishing mechanism comprising a shaping-mold, means for raising and lowering said mold, and means for closing and opening it in its elevated position, substantially as hereinbefore specified.

14. The combination, in a repeating-machine for making hollow glassware, of a chambered central pillar, a pipe coupled to said pillar and supplied with a gaseous fluid, as air under pressure, a chambered hub embracing a perforated zone of said pillar, radial pipes leading therefrom to a revolving series of initial mechanisms, which comprise inverting-frames having hollow punches which form the cavities in the parisons, and suitable conduits connecting the radial pipes and the punches, substantially as hereinbefore specified.

15. The combination, with a horizontally-revolving series of initial mechanisms comprising parison casting and punching devices, of a conduit supplied with a gaseous fluid under pressure and communicating with each of said mechanisms, and valve mechanism for separately controlling the flow of fluid through said conduit to each of said initial mechanisms successively.

16. The combination, in a repeating-machine for making hollow glassware, of a chambered central pillar, a pipe coupled to said pillar and supplied with a gaseous fluid, as air under pressure, a chambered hub embracing a perforated zone of said pillar, radial pipes leading therefrom to a revolving series of initial mechanisms, which comprise hollow punches and suitable hollow connections, independent valves in the respective radial pipes for regulating the flow of the gaseous fluid, and suitable means, as a hand-lever and a retracting-spring, for actuating each valve, substantially as hereinbefore specified.



17. The combination, in a mechanism for casting and punching parisons, of a hollow punch, a tubular connection between the outer portion of the punch and an air-passage within the frame, and a stuffing-box at the outer end of the guideway through which the punch slides, substantially as hereinbefore specified.

18. The combination, with an inverting-frame, of parison casting and punching devices carried thereby, comprising a two-part head-mold or collar with laterally-moving supports, a lever fulcrumed to said frame, and connections between said lever and said supports, respectively, for opening and closing said collar, substantially as hereinbefore specified.

19. The combination, with an inverting-frame, of parison casting and punching devices which comprise a two-part head-mold or collar with laterally-moving supports, a lever connected by links with said supports, respectively, and a relatively-stationary path which engages with said lever to open the collar, substantially as hereinbefore specified.

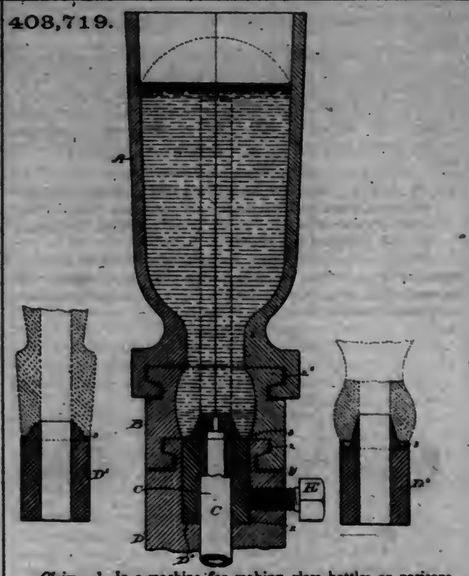
408,718. MACHINERY FOR MAKING GLASS BOTTLES, &c.

HOWARD M. ASHLEY, Ferrybridge, County of York, England. Filed Jan. 22, 1889. Serial No. 297,189. (No model.)

Claim.—1. In a machine for making bottles and other like hollow glassware, the combination, with a vertically-sliding vacuum-bell, and a divided collar adapted to suspend a hollow parison by its head, and provided with a correspondingly-divided true-plate opposed to the upper end of said bell, of a shaping-mold within said bell, comprising a bottom having a longitudinally-movable stem, and laterally-swinging sides carried by arms which are hinged to said stem, substantially as hereinbefore specified.

2. In combination with a collar adapted to suspend a hollow parison by its head and provided with a horizontal true-plate, a self-opening shaping-mold fitted to said collar at its neck end and comprising a bottom having a longitudinally-movable stem and laterally-swinging sides carried by arms which are hinged to said stem, and a vertically-sliding vacuum-bell, to close and inclose said mold, having internal springs and inclines which coact with said arms, substantially as hereinbefore specified.

3. The combination of an initial mechanism for making hollow parisons in inverted position, reverting them and suspending them by their heads in succession, which travels in a longitudinal plane and comprises an invertible parison-mold and head-mold or collar, the latter provided with a true-plate, and a relatively stationary finishing mechanism which comprises a vertically-movable shaping-mold which is normally open and lowered so as to clear the depending parisons, their molds, and the supports of the latter, and a vacuum-bell which elevates and incloses the shaping-mold and itself closes against said true-plate, substantially as hereinbefore specified.



4. The combination, substantially as hereinbefore specified, of the vacuum-pipe p^7, the swivel-coupling c^4, the vertical pipe p^6, the elbow-coupling c^5, the bent pipe p^5, and the vacuum-bell v, the latter having a stuffing-box fitted to the vertical end of said pipe p^6, whereby provision is made for adjusting and working the bell without straining the air-tight joints.

5. The combination, with the vertically-movable vacuum-bell v and relatively stationary vacuum-pipe p^5, of the arm a^2, having the stuffing-box of the bell at one end and an anti-friction gland at its other end, the guide-rod r^4, foot-lever f, counterbalance-weight w^3, and suitable connections between said arm and said lever and weight, respectively, substantially as hereinbefore specified.

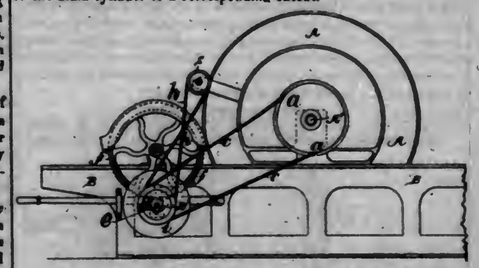
408,719. MACHINE FOR MAKING GLASS BOTTLES.

HOWARD M. ASHLEY, Ferrybridge, County of York, England. Filed Mar. 14, 1888. Serial No. 267,312. (No model.)

408,719.

Claim.—1. In a machine for making glass bottles or parisons therefor in which the bottle-head is cast in inverted position, the combination, with a suitable head-mold or collar, of a nozzle provided with a loose nipple which shapes the lip of the bottle, substantially as hereinbefore specified.

2. In a machine for making glass bottles or parisons therefor in which the bottle-head is cast in inverted position, the combination, with a suitable head-mold or collar, of a nozzle provided with interchangeable nipples and a punch to which they are all internally fitted, substantially as hereinbefore specified.



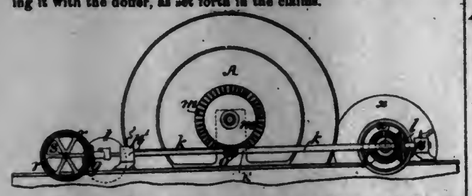
3. In a machine for making glass bottles or parisons therefor in which the bottle-head is cast in inverted position, the within-described interchangeable nipples of different patterns having at their face ends marginal shoulders of uniform height, and protruding portions to form the lip-surfaces of the bottle-mouths, in combination with a nozzle having a counterbore to which all are fitted, substantially as hereinbefore specified.

4. The combination, with a suitable parison-mold, a suitable head-mold or collar interlocked therewith, and a suitable axial punch, of a nozzle interlocked with said collar and provided with a loose nipple fitted internally to said punch, and with suitable means, as a screw, for fastening the nipple in said nozzle, substantially as hereinbefore specified.

403,720. DRIVING MECHANISM FOR CARDING-ENGINES.

GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed Oct. 5, 1888. Serial No. 215,286. (No model.) Patented in England Aug. 2, 1884, No. 10,881.

Brief.—The surface speed of the doffer is reduced during grinding, and suitable means are provided for reducing the surface speed of the main cylinder to a corresponding extent.



Claim.—1. The combination of the main cylinder and doffer-cylinder of a carding-engine with fast and loose pulleys on the main cylinder-shaft, a pulley, d, for driving the doffer-cylinder, a belt or band connecting the said loose pulley with the pulley d, and means, substantially as described, for driving the main cylinder at a speed to

correspond with the surface speed of the doffer, all substantially as set forth.

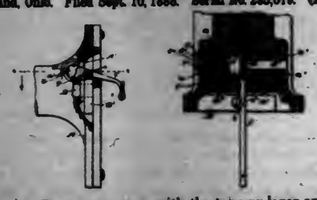
2. The combination of the main cylinder and doffer-cylinder of a carding-engine, and mechanism, substantially as described, whereby the doffer-cylinder is geared to the main cylinder to impart a slow motion thereto, with fast and loose pulleys on the main cylinder-shaft, a pulley, *d*, for driving the doffer-cylinder, and a belt or band connecting the said loose pulley with the pulley *d*, all substantially as set forth.

403,721. DRIVING MECHANISM FOR CARDING-ENGINES. GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed Feb. 23, 1888. Serial No. 264,975. (No model.) Patented in England May 18, 1886, No. 6,630.

Brief.—The doffer is given a slow motion during the grinding operation by a belt from the loose pulley of the main cylinder, and the speed of the main cylinder is correspondingly reduced by connecting it with the doffer, as set forth in the claims.

Claim.—1. The combination of the main cylinder and doffer of a carding-engine with a side shaft geared to the doffer-cylinder shaft and having a worm, *o*, a worm-wheel on the main-cylinder shaft, and devices, substantially as described, for driving the doffer-shaft, all substantially as specified.

2. The combination of the main cylinder and doffer of a carding-engine with a side shaft geared to the doffer-cylinder shaft and having a worm, *o*, keyed thereto, but movable thereon, a worm-wheel on the main-cylinder shaft, and devices, substantially as described, for driving the doffer-shaft, all substantially as specified.

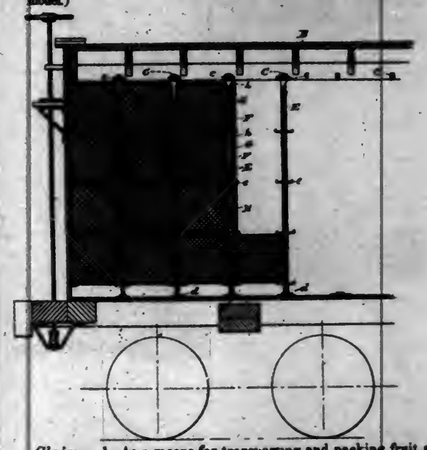


3. The combination of the main cylinder and doffer-cylinder of a carding-engine, a side shaft, *k*, geared to the doffer-cylinder, and having a worm, *o*, with a worm-wheel on the main cylinder, fast and loose pulleys on the main-cylinder shaft, a pulley, *k*, controlling the doffer-cylinder, and a band for connecting said loose pulley and the pulley *d*, all substantially as and for the purpose set forth.

408,722. HIGHWAY SIGN. JOHN S. BAILEY, Buckingham, Pa. Filed Mar. 9, 1888. Serial No. 266,897. (No model.)

Claim.—A highway sign comprising the parallel bars A, having their facing edges grooved longitudinally to receive letters, the base or bed plate E, to which the inner ends of the bars are attached, the approximately U-shaped spring-clamp B, adapted to embrace the outer ends of the bars A and retain the parts in position, said clamp being formed with projections *b* on its facing edges, which are sprung into corresponding notches on the top and bottom edges of the bars A, and the indicator-hand, substantially as specified.

408,723. SEWING-MACHINE TAKE-UP. GEORGE W. BAKER, Cleveland, Ohio. Filed Sept. 10, 1888. Serial No. 285,019. (No model.)



Claim.—1. The combination, with the take-up lever and cam, of an angular friction-block having a series of bearing-faces and a pivot-pin passing through the block and secured to the take-up lever, the said friction-block adapted to be turned on its pivot to present a new face to the cam, substantially as set forth.

2. The combination, with take-up lever, revolving cam for elevating the lever, and pivotal pin screwed into a lateral threaded hole of the lever, substantially as indicated, of spring for depressing the lever, said spring being coiled around the said axial pin, the arrangement of parts being substantially as described, whereby the action of the spring and cam, respectively, tend to tighten the screw-joint of the lever and pin, substantially as set forth.

3. The combination, with take-up lever, revolving cam for elevating the lever, and pivotal pin screwed into a lateral threaded hole in the lever, of an adjustable cap, and a spring coiled around the pivotal pin and secured at one end to said pin and at its other end to the adjustable cap, the arrangement of parts being substantially as described, whereby the action of the spring and cam, respectively, tend to tighten the screw-joint of the lever and pin, substantially as set forth.

408,724. CAR FOR TRANSPORTING FRUIT. FRANCIS M. BARBER, Washington, D. C. Filed Mar. 2, 1889. Serial No. 301,703. (No model.)

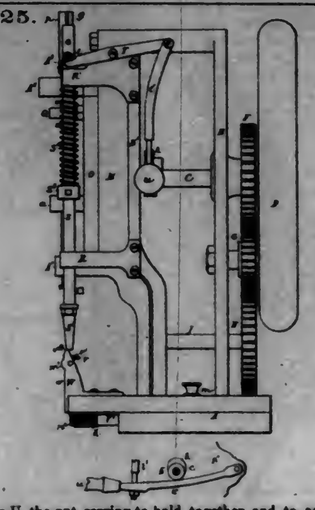
Claim.—1. As a means for transporting and packing fruit and for other purposes, a series of compartments separated from each other by partitions of reticulated material and built up of collapsible elements, substantially as described.

2. A vehicle for transporting fruit and for similar purposes, having its carrying-space subdivided by partitions of reticulated material, said partitions being removably supported in said vehicle, substantially as described.

3. A series of open-work compartments built up of elements composed of panels of reticulated material hinged together, substantially as described.

4. In a freight-car or other vehicle, the combination, with the elements or partitions adapted to form a series or ventilated compartments, of the supports comprising removable uprights and constituting a skeleton or frame-work by which the elements or partitions are removably supported, substantially as described.

5. The combination, with supports, of elements forming a series of ventilated compartments, said elements being composed each of a vertical and a horizontal panel and partitions, said parts being all made of reticulated material and hinged together, substantially as described.

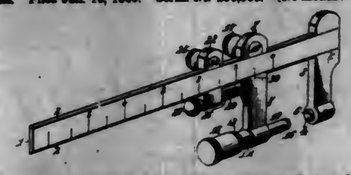


6. In a car or other vehicle, the combination, with removable supports, of removable and collapsible elements composed of reticulated material, and forming when in place a series of storage-compartments separated from each other by perforated partitions, so that the entire series is ventilated, substantially as described.

7. The combination, with supports, of elements composed of panels of reticulated material, said panels having a portion or portions hinged independently of the others, substantially as described.

408,725. PRESSER-FOOT-LIFTING DEVICE FOR SEWING-MACHINES. JONATHAN BARTLETT, Epping, and GEORGE B. WIGGIN, South New Market, N. H., assignors of one-half to John W. Hoard, Providence, R. I. Original application filed July 23, 1887, Serial No. 245,561. Divided and this application filed May 3, 1888. Serial No. 272,745. (No model.)

Claim.—1. The combination of the presser-foot and its bar brackets R R', frictional roller *t*, lever T, vertical rod *t'*, pivoted to said



408,725.

lever, lever U, the nut serving to hold together and to adjust relatively this lever and rod, and cam K on the revolving short driving-shaft C, these parts being all located above the table and co-operating substantially as shown and described.

2. In combination with the presser-foot bar, the brackets R R', roller *t*, lever T, the rod *t'*, pivoted to said lever, cam K on the short revolving driving-shaft, and lever U, having a handle on its free end and pivoted at its other end to a standard, all located above the table, substantially as and for the purposes described.

408,726. MICROMETER-GAGE. STEPHEN H. BELLOWS, Athol, Mass. Filed Jan. 16, 1889. Serial No. 296,506. (No model.)

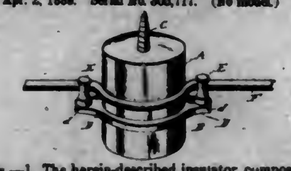
Claim.—1. A micrometer-beam caliper-gage consisting of a graduated bevel-edged flat beam having a stationary jaw, a slide adjustable on the beam and having a tubular end provided with a cylinder-extension containing on the external surface the stationary micrometer-gage graduations, a micrometer measuring-screw adjustable lengthwise in the slide and extending through the same in line with the contact-point of the stationary jaw and having a hollow shell working lengthwise upon the external surface of the cylinder-extension and having a beveled inner end provided with graduations, and a sliding block on the beam having a spring yielding connection with the slide, substantially as described.

2. A micrometer caliper-gage consisting of a graduated beam having a jaw, a slide movable on the beam and having a micrometer measuring-screw lengthwise adjustable on the slide in line with a contact-point on the jaw, a sliding block on the beam, a lengthwise-yielding screw-connection between the slide and sliding block for adjusting the slide and its screw and bringing the graduations of the beam and slide into perfect coincidence, and a spring encircling the screw-connection between the slide and sliding block, substantially as described.

3. A micrometer caliper-gage consisting of a graduated beam having a jaw, a slide movable on the beam and having a lengthwise-adjustable micrometer measuring-screw in its outer end and a socket between its opposite end and the measuring-screw, a sliding block on the beam, a cylindrical pin supported by the latter and movably engaging the socket in the slide, and a spring encircling the pin between the slide and sliding block, substantially as described.

4. A micrometer caliper-gage consisting of a graduated beam having a jaw, a slide movable on the beam and having a lengthwise-adjustable micrometer measuring device at its outer end and a screw-socket between its opposite end and the measuring device, a sliding block on the beam, a rotary cylindrical stem loose in the sliding block and screwing into the screw-socket in the slide, and a spring between the slide and sliding block, substantially as described.

5. The combination of the dovetailed beam having a jaw with the slide dovetailed to the beam and carrying an adjustable micrometer-screw, the locking-plate having a beveled edge parallel to the edge of the beam and provided with a lateral screw extending transversely through and beyond the slide, and a thumb-nut on the screw abutting the side of the slide for clamping the beveled edge of the locking-plate on the beveled edge of the beam to secure the slide in a fixed position, substantially as described.



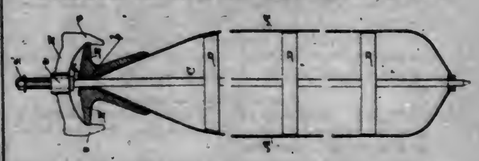
6. The combination of the dovetailed beam having a jaw with the slide dovetailed on the beam and carrying a micrometer-screw extending through the slide toward the jaw, the locking-plate having a beveled edge parallel to the edge of the beam, and a screw extending transversely through the slide, and a thumb-nut on the screw and abutting the side of the slide, substantially as described.

7. The combination, with the dovetailed beam having beveled edges and graduated on one face, of a slide dovetailed on the beam extending along one side only thereof and having one surface in the same plane as the graduated face of the beam to leave all the graduations on the latter visible, a micrometer-screw extending through and lengthwise adjustable in the slide, the locking-plate having a beveled edge engaging the beveled edge of the beam and provided with a lateral screw extending transversely through the slide, and a thumb-nut on the screw abutting the side of the slide for clamping the locking-plate on the beveled edge of the beam, substantially as described.

8. The combination, with the beam graduated on one face and having beveled edges and a stationary jaw carrying a contact-point, of a slide adjustable on the beam dovetailed and having one surface in the same plane as the graduated face of the beam and provided with an index, and a micrometer-screw carried by said slide in line with the contact-point of the stationary jaw, substantially as described.

9. A micrometer caliper-gage consisting of the graduated beam having a jaw and beveled edges, a slide dovetailed on the beam and having a screw-socket and carrying a micrometer-screw which projects through it toward the jaw and is lengthwise adjustable, a sliding block dovetailed on the beam, a rotating pin passing through the block and engaging the screw-socket in the slide, a spring encircling the pin between the slide and block, two locking-plates seated, respectively, in the slide and block and having lateral screws extending, respectively, transversely through the said slide and block and having straight beveled edges engaging one beveled edge of the beam, and thumb-nuts on the screws, substantially as described.

403,727. INSULATOR. JACOB C. BERRABE, Asbury Park, N. J. Filed Apr. 2, 1889. Serial No. 305,717. (No model.)



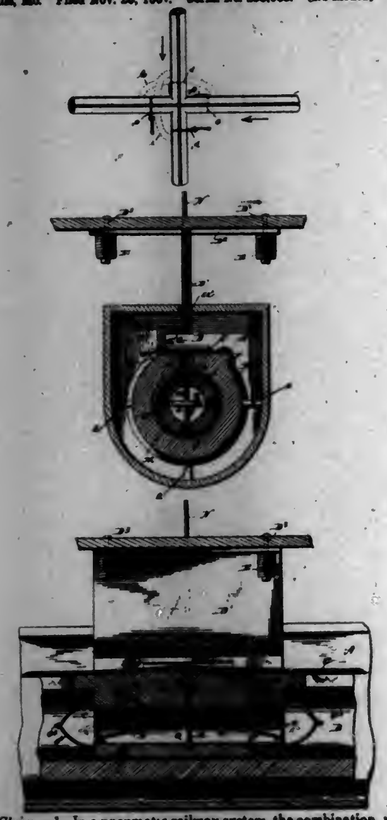
Claim.—1. The herein-described insulator, composed of the two insulating-blocks and the plate having arms held between the blocks, substantially as set forth.

2. The combination, with the two insulating-blocks, of the plate having retaining-arms held between the blocks, and having a central opening to receive a projecting portion of one of the blocks, substantially as described.

3. The combination, with the block A, having the groove *a*, of the plate D, having the retaining-arms E, substantially as and for the purpose described.

4. The herein shown and described insulator, composed of the blocks A and B, the block B having the projection *b* and the block A the groove *a*, the plate D, having the arms E and an opening, *d'*, to receive the projection *b*, and the screw C, combined and arranged substantially as set forth.

408,728. CABLE-RAILWAY-CONDUIT MOLD. IRA BISHOP, San Francisco, Cal. Filed Feb. 26, 1889. Serial No. 301,249. (No model.)

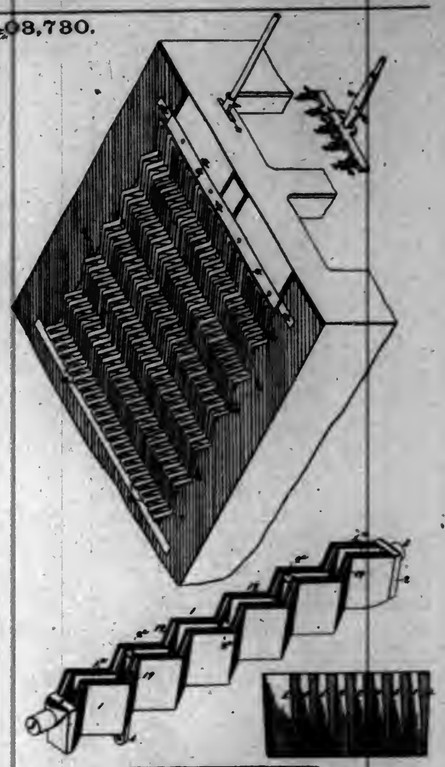


Claim.—1. A concrete-mold consisting of the separable opposing plates and the axially-rotary rod having arms rigidly secured to it, and adapted to hold the plates apart and to relieve them, substantially as described.

2. A concrete-mold consisting of the separable opposing plates, the axially-rotary rod having rigidly secured to it arms for holding the plates apart, and the locking-bar of the rod for keeping it from turning when in position, substantially as described.

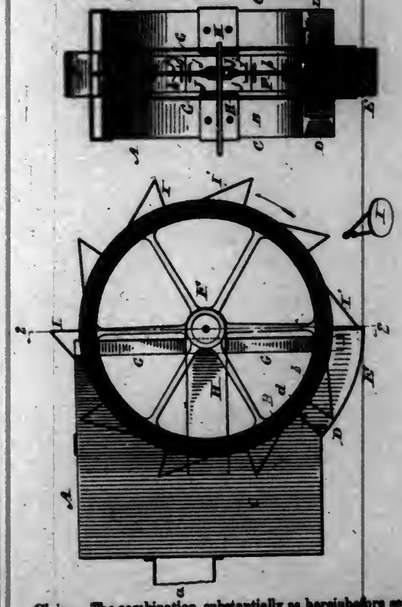
3. The concrete-mold for the construction of cable-railway conduits, consisting of the separable opposing plates within the conduit and adapted to be removed through the grip-slot, the axially rotary rod passing down through the grip-slot, and having upon it the spreading-arms for holding the plates apart and relieving them, and the locking-bar fixed upon the upper end of the rod and having its ends adapted to engage the slot rails or irons, whereby said rod is held in fixed position when in use and relieved when not in use, so that it may free the mold-plates and be withdrawn through the grip-slot, substantially as described.

408,729. PNEUMATIC RAILWAY. MEINOLPH BOSENFELD, St. Louis, Mo. Filed Nov. 23, 1887. Serial No. 255,905. (No model.)



Claim.—1. In a pneumatic railway system, the combination, with two pneumatic tubes which cross, of by-passes communicating with the tubes to bridge the point of crossing, an automatically-operated valve in each tube at one side of the point of crossing, and a manually-operated valve at the opposite side of the point of crossing, substantially as set forth.

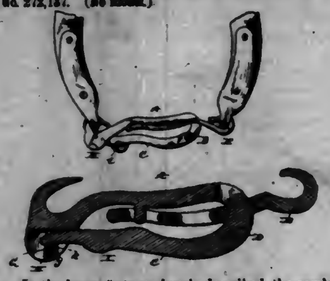
2. In a pneumatic system, the combination, with a tube having a longitudinal opening, of an elastic flap to close said opening, a web adapted to slide in the opening, a bevel-plate secured to the top of the web to move the flap, a bracket connecting the bevel-plate, and a frame attached to the car-truck, and a piston secured to the bottom of said web and adapted to slide in the tube, substantially as set forth.



408,730. GRATE-BAR FOR FURNACES. ETIENNE BOILEAU, St. Louis, Mo., assignor to Lucerne J. Peck, same place. Filed Aug. 6, 1888. Serial No. 282,033. (No model.)

Claim.—A grate-bar constructed with two zigzag webs, 1, having their upper edges formed with grooves 19, the ends 2 forming with the webs an opening, 1*, the short blocks connecting the webs at long distances, the gudgeons 3 on the ends, and the lug 4 for rocking the bar, substantially as described.

408,730.



408,731. WATER-MOTOR. BYRON R. BOWER, Bainbridge, Ga. Filed May 23, 1888. Serial No. 274,896. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, of the water-wheel having a narrow rim or periphery, the buckets rigidly secured to the periphery of the wheel, the braces extending from the outer edges of the buckets to the periphery of the wheel.

the penstock, forebay, or reservoir having an open top and a concavo-convex front wall, a flume or bucket-way joining the penstock, forebay, or reservoir at its lower front portion and provided with a slot or opening joining a slot or opening in the front wall of the penstock, and the independently-adjustable plates curved to correspond with the curvature of the front wall of the penstock and the top wall of the flume, and secured thereto by adjusting devices, so that one or more plates may be adjusted relatively to the rim of the wheel to take up wear and to prevent leakage at any desired point.

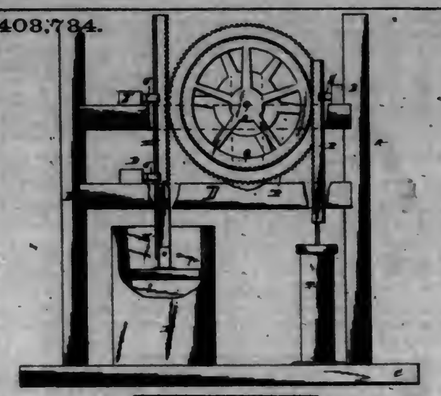
408,732. HAME-FASTENER. IRA W. BOWMAN, HARRY L. BOWMAN, and SAMPSON SHARP, East Liverpool, Ohio. Filed Apr. 26, 1888. Serial No. 272,137. (No model.)

Claim.—In the hame-fastener herein described, the combination, with the hooked plate having a housing at one end, the walls of which are provided with two shoulders, *h*, a U-shaped gravity-latch pivotally secured within the housing, one side of which is beveled, a hooked lever pivotally secured to the other end of the plate, the free end of which engages with and is automatically engaged by the latch, and an eye-plate, substantially as and for the purpose set forth.

408,733. FISHING-REEL. CHARLES K. BRADFORD, Lynnfield, assignor to William P. Kakas, Boston, Mass. Filed Dec. 13, 1888. Serial No. 293,473. (No model.)

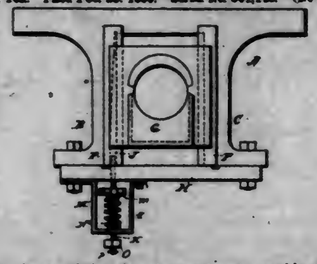
Claim.—1. In a fishing-reel frame or mounting, the combination of the sheet-metal end rings or bands, the spool-supporting end plates made in separate pieces from said rings and secured therein, and the arched or bent sheet-metal tie-plates secured to and bridging the space between the rings and having elongated bearings on said rings, said tie-plates being made separately from said rings and secured thereto by screws or other suitable fastenings, as set forth.

2. A frame or mounting composed of the disks or end plates, the rings affixed thereto and internally supported thereby, the arched or bent tie-plates secured to and connecting said rings, one of said plates being provided with ears 8 8, and the pole-attaching plate bearing on said ears and attached to the tie-plate on which the same are formed, as set forth.



3. In a fishing-reel, the combination of a frame or mounting, a shaft journaled therein, a spool mounted on said shaft, and a system of gearing connecting the shaft and spool, whereby the rotation of the shaft is multiplied in being communicated to the spool, as set forth.

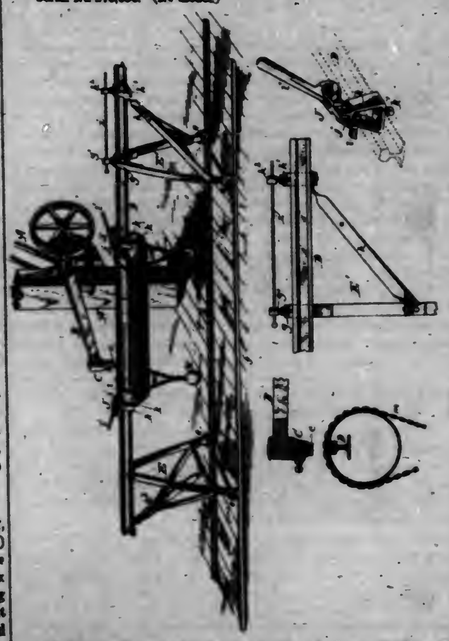
4. The frame or mounting having the end plates 5, the shaft journaled in said end plates, the spool mounted on the shaft, the eccentric stud *s'*, supported by one of the end plates, the gears 2 3, mounted on said stud and rendered adjustable thereby, and the gears 1 4, affixed, respectively, to the shaft and spool and meshing, respectively, with the gears 2 3, as set forth.



408,734. MACHINE FOR PACKING COTTON. FARLEY BRADY, Waxahachie, Tex. Filed June 23, 1888. Serial No. 277,940. (No model.)

Claim.—In a cotton-packer, the combination of the frame, guides mounted therein, rack-bars moving in the said guides, a press-box and steam-cylinder, and heads secured to the rack-bars and moving in the press-box and cylinder, respectively, cog-wheels of different diameters journaled in the frame and meshing with the rack-bars, and anti-friction rollers pivoted in the guides and bearing against the rack-bars, substantially as and for the purpose specified.

408,734.

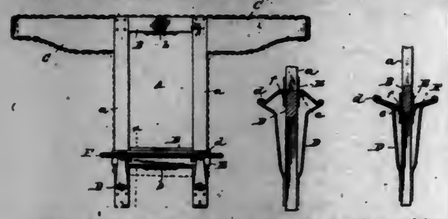


408,735. AXLE-BOX FOR LOCOMOTIVES. FRANK A. CARLSON, Dallas, Tex. Filed Feb. 25, 1889. Serial No. 301,146. (No model.)

Claim.—In an axle-box for a locomotive, the combination of the wedge, the bolt attached thereto, the flange, the spiral spring, and a suitable support for the same, substantially as specified.

408,736. MACHINE FOR BEATING AND POLISHING SHEET-METAL TUBING. WHITNEY G. CASE, Buffalo, N. Y. Filed Apr. 9, 1888. Serial No. 270,096. (No model.)

Claim.—1. The combination, with a power-hammer, of a movable supporting-bar arranged below said hammer, a truck rigidly se-



cured to one end of the bar, and a truck detachably arranged at the opposite end of the bar, substantially as set forth.

2. The combination, with a power-hammer, of a movable supporting-bar arranged below said hammer, a truck, E, rigidly secured to one end of said bar, and a detachable truck, E', arranged at the opposite end of the bar and provided with a loop embracing the bar, and a set-screw whereby the loop is secured to the bar, substantially as set forth.

3. The combination, with a power-hammer and a movable supporting-bar provided at one end with a fixed truck, of a detachable truck, E', arranged at the opposite end of the bar and provided with a loop, *g*, having a set-screw, *g'*, and a brace, *h*, having a loop, *h'*, and set-screw h^3, substantially as set forth.

4. The combination, with a power-hammer, of a movable supporting-bar provided at one end with a fixed truck, a detachable truck, E', arranged at the opposite end of the bar and provided with a loop, *g*, having a set-screw, *g'*, a brace, *h*, having a loop, *h'*, and set-screw h^3, and a locking-bar, *i*, whereby the set-screws *g'* and h^3 are held against turning, substantially as set forth.

403,737. SHIRT-STRETCHER. GEORGE COOPER, Bennington, Vt., assignor of one-half to Charles Cooper, same place. Filed Mar. 23, 1889. Serial No. 305,064. (No model.)

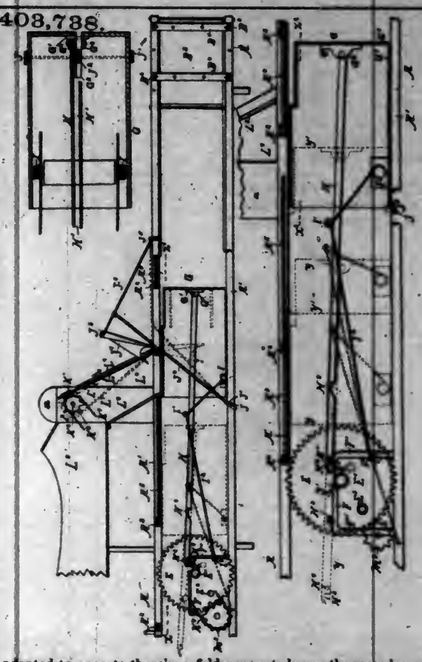
Claim.—1. The combination, with a frame for stretching and drying knit garments, of springs secured to the frame, and independent angular clamping-bar working therein and against the side of the flap of the body of the garment at any point near the spring and over the frame to stretch and hold the garment in position, as set forth.

2. The combination, with a frame having downwardly-extending bars, of springs secured on each side of said bars, extending upward and outward, the upper ends being turned inward, forming hooks, with angular clamping-bar working in the hooks and against the sides of the body of the flap of the garment at any point near the springs and over the frame to hold the garment in position, as set forth.

3. The combination, with a hinged frame having bars with upwardly-extending springs with inwardly-turned hooks at their upper ends, of a clamping-bar and shoe with their sides at an acute angle to each other, the edge of the clamp-bar inserted in the hook, and the shoe on the frame adapted to be forced down to stretch and hold a garment on the frame in position, as set forth.

4. The combination, with a hinged stretcher and drier frame having upwardly-extending springs with hooks on its sides, of a shoe-bar sliding on the side of the frame, having a clamp-bar hinged thereto, the outer edge of the clamp-bar engaging the hooks of the springs as the shoe is moved down on the frame and locked, thereby bringing the face of the clamp-bar at an acute angle with the upper portion of the shoe, as set forth.

403,738. BALING-PRESS. THOMAS J. CORNING, San José, Cal. Filed Jan. 29, 1889. Serial No. 296,016. (No model.)

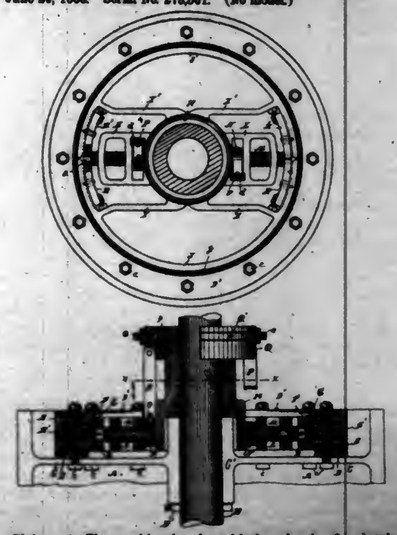


Claim.—1. In a baling-press, in combination, the bifurcated pitman having notches therein and guide-pins thereon, the wheel provided with bearing-pins—one of said pins being located near the periphery of the wheel and the other nearer the shaft of the same—projecting from the sides thereof and adapted to engage with the notches in said pitman, and guide-bars for supporting and guiding the free end of the pitman, substantially as described.

2. In a baling-press, in combination, the bifurcated pitman having notches H^3 H^3 therein and guide-pins H^4 thereon, a plunger attached to one end thereof, a wheel provided with bearing-pins E^3 E^4, arranged to engage with the notches in said pitman, and guide-bars adapted to support and guide the free end of said pitman, substantially as described, for the purpose set forth.

3. In combination, the pitman having notches H^3 H^3 therein and guide-pins H^4 projecting therefrom, a wheel provided with bearing-pins projecting from the side thereof and arranged to engage with the notches in said pitman, guide-bars adapted to receive and guide the free end of the pitman, and a plunger attached thereto and provided with a spring for propelling the same backward, after completing the compression-stroke, to the end of the retraction-stroke, substantially as described, and for the purpose specified.

4. In a baling-press, in combination, the baling-chamber, a plunger



403,738

adapted to operate therein, a folder mounted upon the press by means of swinging arms J^4, having forks J^7 attached thereto, the rock-shaft J, provided with double cranks J' and dog J^3, rigidly connected therewith, and connecting-rods J^6, substantially as described.

5. In a baling-press, in combination, the baling-chamber, a plunger adapted to operate therein, a longitudinally-reciprocating feeder, L, provided with downwardly-curved teeth projecting from the under side thereof and mounted upon the shaft K, the latter being supported by double cranks K' and axes K^2, side pieces, L^4, and part L^5, to form a spout, the folder J^8, mounted upon the press by means of swinging arms J^4, having forks J^7 attached thereto, the rock-shaft J, provided with double cranks J' and dog J^3, rigidly connected therewith, and connecting-rods J^6, substantially as described.

403,739. FRICTION-CLUTCH. HILEN C. CROWELL, Erie, Pa. Filed June 29, 1888. Serial No. 278,561. (No model.)

Claim.—1. The combination, in a friction-clutch, of a clutch-ring and a sectional friction-ring with radial shafts having elliptical or

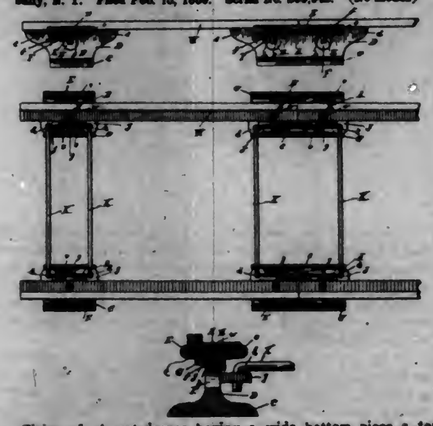
cam-shaped ends operating and adapted to be partially rotated between the ends of the sections of the friction-ring to expand the same and thereby force it outward into contact with the clutch-ring, substantially as and for the purpose set forth.

2. The combination, in a friction-clutch, of a clutch-ring and a sectional friction-ring having adjustable segments adapted to vary the openings between the ends of the sections of the friction-ring with radial shafts having elliptical or cam-shaped ends operating and adapted to be partially rotated between the adjacent ends of said adjustable segments to expand said friction-ring and force it outward against the clutch-ring, substantially as and for the purpose set forth.

3. The combination, in a friction-clutch, of the shafts M, having elliptical ends *a* thereon and mounted in radial supports L, with the cranks N, links O, sliding levers P, and sliding sleeve Q, substantially as and for the purpose set forth.

4. The combination, in a friction-clutch, of the clutch-ring D, the semicircular friction-rings J and J', mounted on the arms I I and I' I', and the adjustable segments R R', with the radial shafts M M, operating between the ends of the segments R R', the cranks N, links O, sliding levers P, and sliding sleeve Q, substantially as and for the purpose set forth.

403,740. DRILL-GAGE. IRA CULVER, Cleveland, Ohio. Filed Aug. 9, 1888. Serial No. 282,373. (No model.)



Claim.—1. The combination of the drill-guide, a main gage-blade jointed to the guide, and an auxiliary gage-blade jointed to the main gage-blade, substantially as hereinbefore set forth.

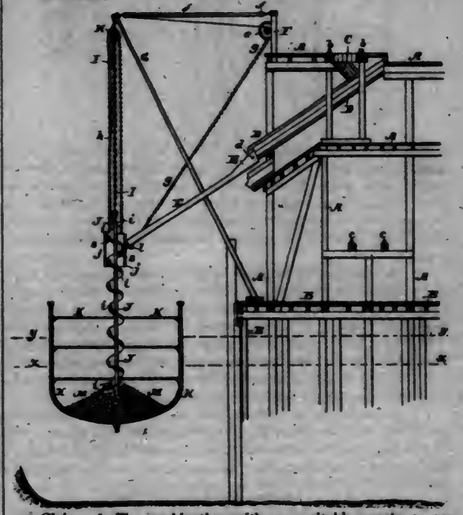
2. The combination of the drill-guide and the two gage-blades adjustably connected to each other and to the guide, substantially in the manner set forth, so that the angle at which the blades stand to each other and to the guide can be varied at will, and the elbow or apex of the angle formed by said blade can be raised or lowered with reference to the guide.

3. The drill-gage consisting of the V-guide A, the main gage-blade jointed to the guide by a slot-and-set-screw connection, and the auxiliary gage-blade C, jointed to the main gage-blade, as set forth.

403,741. STREET-RAILROAD TRACK. ROBERT DAMBMANN, Albany, N. Y. Filed Feb. 15, 1888. Serial No. 299,943. (No model.)

Claim.—1. A pot-sleeper having a wide bottom piece, a top piece, and vertical web uniting said pieces, said web having wings at its ends extending in the line of the sleeper and flush with the top piece thereof, substantially as described.

2. A sleeper having a top piece flanged at its side edges, a bottom piece, and a vertical web uniting said pieces and having extended wings *d d* at its ends, all substantially as specified.



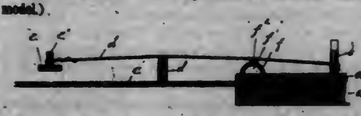
3. A pot-sleeper consisting of a base-piece, a top piece, and a central web uniting said pieces and having extended wings at its ends and laterally-projecting perforated ears on its inner face, substantially as set forth.

4. The combination of a pot-sleeper having a top piece, a bottom piece, a web, D, connecting said pieces and having wings *d d* at its ends, said web having a lateral opening through it, and the top piece having a vertical opening therethrough, with the rails, the slotted retaining-bolts, and wedge-keys, substantially as and for the purpose described.

5. The combination of the sleepers having top piece notched at its inner corners, a bottom piece, a vertical web, D, uniting said pieces and extended at its ends into wings *d d*, said web being perforated at F and said top piece at *f*, and the laterally-projecting perforated ears on the inner side of said web, with the rails, slotted bolts, and wedge-keys, and the tie-rods, all substantially as specified.

6. The herein-described pot-sleeper, consisting of a top piece laterally flanged, as described, the bottom piece, the upstanding web uniting said pieces having its ends extended into wings, the upper edges of which are flush with the top piece, and the perforated ears projecting from the inner face of said web, all substantially as and for the purpose described.

403,742. CONVEYER CONTRIVANCE FOR HANDLING COAL. JAMES M. DODGE, Philadelphia, Pa. Filed Feb. 1, 1889. Serial No. 298,338. (No model.)

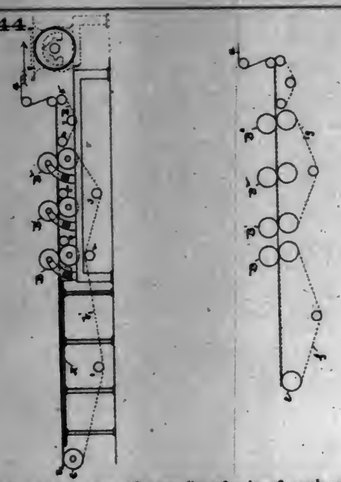


Claim.—1. The combination, with any suitable supply or conveyer trough through which the descending stream of coal is designed to pass, of a spiral trough or helical chute, J *i*, which is vertically adjustable, substantially in the manner and for the purposes set forth.

2. The combination, with any suitable supply-spout—such as seen at E—and an adjustable helical chute, of a tubular casing, *j*, surrounding a portion of the blade of said helical chute and formed or provided with a supply-nozzle, *m*, adapted to receive the material from the discharge end of the supply-spout and feed it to the upper surface of the blade of said helical chute, substantially as hereinbefore set forth.

3. The combination, with a suspended and adjustable helical chute and the cylindrical housing or casing *j*, into which the supply of material is discharged, of means by which an engagement between the blade *i* of the chute and said casing *j* is effected in such manner as to insure a given relationship of the upper surface of the blade *i* to the point or level at which the material is discharged or fed into said casing *j*, all substantially as and for the purposes set forth.

403,743. BRIDGE FOR STRINGED INSTRUMENTS. MARTIN DURICK, Buffalo, N. Y. Filed Sept. 24, 1888. Serial No. 286,151. (No model.)

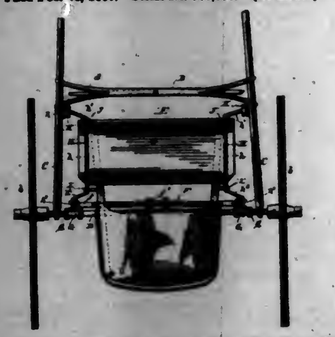


Claim.—A bridge for stringed instruments, consisting of a semi-tubular metallic strip, its open side adapted to rest upon the wrest-plank, and its upper side or apex having a raised rib or projection upon which the strings rest, substantially as shown and described.

403,744. MACHINE FOR MAKING PAPER. JOSEPH T. FLOOD Holyoke, Mass., assignor to Buchanan, Bolt & Co., same place. Filed Oct. 22, 1887. Serial No. 253,069. (No model.)

Claim.—1. The combination, with the tube-frame and driers of

408,744.



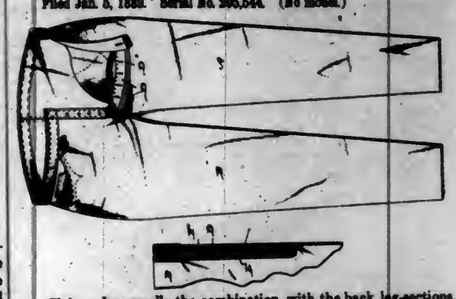
a machine for making paper, of a purality of pairs of couch-rolls located between said tube-frame and driers in such manner that the web of paper passes directly from the last pair of said rolls to the driers, and a wire serving to carry the web over said tube-frame and between each of said pairs of couch-rolls, arranged and operating substantially as described, whereby the use of press-rolls and felts is avoided.

2. In a machine for making paper, the combination, with roll *e*, of the three sets of couch-rolls B, B', and B², and wire *b'*, passing around roll e and the lower roll of set B² and between the upper and lower rolls of sets B B', substantially as and for the purpose set forth.

3. In a machine for making paper, the combination, with roll *e*, couch-rolls B B' B², and wire *b'*, arranged and operating substantially in the manner described, of rolls 6 7 8 and apron E, mounted upon said rolls, substantially as and for the purpose set forth.

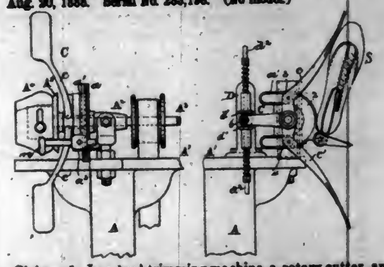
4. In a machine for making paper, the combination, with roll *e*, couch-rolls B B' B², supporting and guiding rolls 1 2 3 4 5, and wire *b'*, arranged and operating substantially as described, of rolls 6 7 8 and apron E, mounted thereon, substantially as and for the purpose set forth.

408,745. ROAD-CART. GEORGE H. FOWLER, Taughannock Falls, N. Y. Filed Feb. 18, 1889. Serial No. 300,300. (No model.)



Claim.—1. In a vehicle, the combination, with the axle, thills, and body with seat attached, of the double-armed crank-rods having their central longitudinal portions journaled in bearings attached to the vehicle-body in order to support said body, the ends of their front arms journaled in bearings secured to the thills, and the rearwardly-bent projections of their rear arms journaled in bearings attached to the axle, substantially as specified.

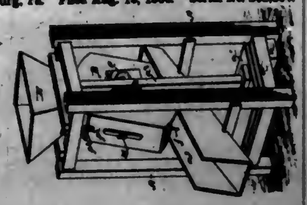
2. In a vehicle, the combination, with the axle, the thills, the vehicle-body, and the bearing-irons I J, secured to said body at suitable points and respectively provided with the bearing-slots *i* and *j*, of the boxes or blocks G, clipped to the axle at the inner sides of the thill-irons and provided with the bearing-openings *g'*, the bearing-brackets K, secured to the thills on the inner sides thereof, and the crank-rods H, having the central longitudinal parts, A, journaled in the slots *i j* of the bearing-irons, the arms *h'*, provided with the journals *k*, mounted in the brackets K, the arms *h²*, and the rearward projections, *h³*, journaled in the boxes G, substantially as specified.



3. In a vehicle, the combination, with the axle, the thills, the body, and the bearing-irons I J, secured to the body at proper points, of the bearing-boxes G, secured to the axle, the bearing-brackets K, secured to the thills, the crank-rods H, journaled in the bearing-irons I J and in the boxes G and brackets K, and consisting of the central portion, *h*, the front arm, *h'*, having the journals *k*, and the rear arm, *h³*, having the extension *h³*, and the spring *f*, with its ends looped and attached to the extension *h³* and its central part clipped to a spring-bar secured to the back of the vehicle-body, substantially as specified.

408,746. TROUSERS, &c. MAX FRANKEL, New Orleans, La. Filed Jan. 5, 1889. Serial No. 295,544. (No model.)

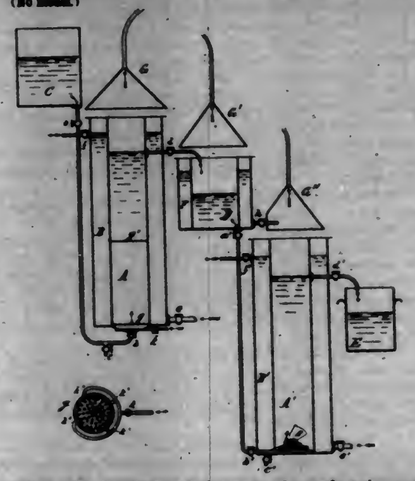
Claim.—In overalls, the combination, with the back leg-sections, of the front leg-sections, each having a tongue or longitudinal strip on their adjacent inner sides, the strip of the right front leg-section extending across the crotch and up the inner side of the left leg-section to form the inner wall of the button-hole fly, and the strip of the opposite or left leg-section folded at the crotch and carried upwardly and united with the strip of the opposite leg to form the outer wall of the button-hole fly, and a re-enforcing strip extending across the crotch and having one branch secured between the walls of the button-hole fly and the opposite branch secured to the inner wall of the button fly, substantially as specified.



408,747. HEEL-TRIMMING MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Aug. 20, 1888. Serial No. 283,196. (No model.)

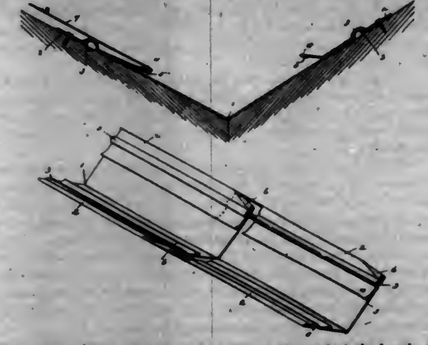
Claim.—1. In a heel-trimming machine, a rotary cutter, an edge-rest, a movable carriage upon which the said edge-rest is mounted, and a guide for the said carriage, combined with means, as a lever, against which the shoe the heel of which is being trimmed may be pressed, the pressure of the said shoe against the said lever effecting the raising or lowering of the said edge-rest while the sides of the heel are being trimmed, substantially as described.

2. In a heel-trimming machine, a rotary cutter, an edge-rest, a carriage or support for the same, and a guide for the said carriage or support, combined with a three-armed lever and with means to retain it in normal position while the rear end of the heel is being trimmed, substantially as described.



408,748. GRAIN-WEIGHING SCALES. PEARSE R. GRAHILL, Millersburg, Pa. Filed Aug. 10, 1888. Serial No. 282,897. (Model.)

Claim.—1. The vessel or receptacle having the diagonally-arranged board and the blocks or hollow chambers adjustably secured to said vessel, substantially as shown and described.

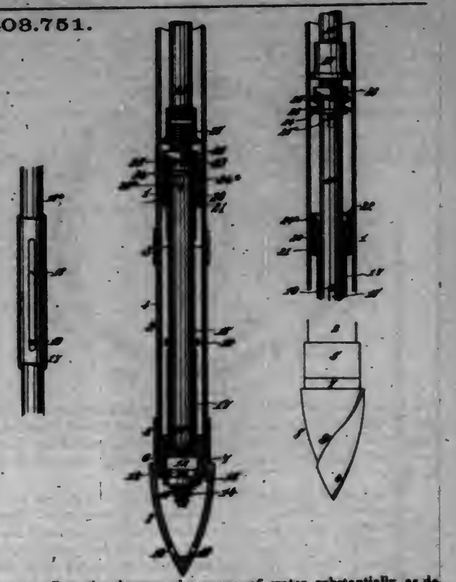


2. The combination of the frame, the movable base-board, the scales, the uprights or posts, the pivoted vessel or receptacle having the blocks or weights, the tallying device, the hopper having the swinging bottom, and the pivoted rod or bar, substantially as shown and described.

408,749. MANUFACTURING EXPLOSIVES. JOSEF A. HALBMAYR, Vienna, Austria-Hungary. Filed June 11, 1888. Serial No. 276,578. (No model.)

Claim.—The herein-described process of manufacturing explosives from tar oils, said process consisting in conducting the oils into a body of nitrating-acid from below the surface of the latter in a state of division and at the same time introducing cold air under pressure at the same point with the oils, all substantially as described.

408,750. METALLIC ROOFING. MILLARD F. HAMBLEY, Nashville, Tenn. Filed Feb. 11, 1889. Serial No. 299,414. (No model.)



Claim.—1. As an improvement in metallic roofing, the herein-described valley-sheet turned back upon itself at each side and having the nailing portions 2, the ribs 3, and the upturned edges 4, as set forth.

2. The valley-sheet herein described, turned back upon itself at each side and having the nailing portions 2, the ribs 3, and the upturned edges 4, strengthened by the hem 5, as set forth.

3. The valley-sheet herein described, turned back upon itself at each side and having the nailing portions 2, and the ribs 3, and the turned-over corner 6, for facilitating its introduction into the adjoining sheet, substantially as described.

408,751. IMPLEMENT FOR BORING WELLS. LEWIS B. HARE, Plaquemine, La. Filed Sept. 26, 1888. Serial No. 286,260. (No model.)

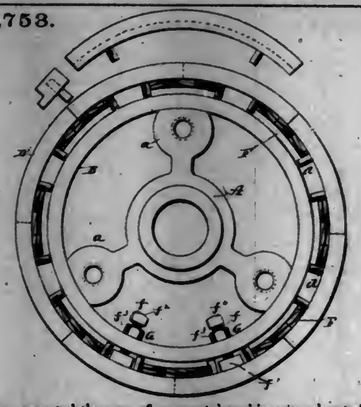
Claim.—1. In a well-boring tool, a hollow conical point having openings above the apex or cutting-point, in combination with a casting having water-ports and a spring-actuated poppet-valve opening to allow the downward passage of water, substantially as described.

2. In a well-boring tool, the combination, with a hollow conical point having openings, of a spring-actuated valve opening to water flowing downward into said point, a casting on which said valve and point are mounted, a strainer connected to said casting, a well-pipe coupled to said strainer, an interior pipe having a right and left hand male thread on its upper and lower ends, respectively, and screwed by its lower end into the casting, and valves surrounding said interior pipe above the strainer to prevent passage of water in either direction, substantially as described.

3. In a well-boring tool, the combination, with a hollow conical point having openings, of a casting to which said point is screwed, a strainer and attached pipe having a right and left thread and engaged with the casting by the latter, a sleeve loose on said pipe, resting on the casting, and having slots which receive pins projecting from the pipe, a valve-coupling supported by said sleeve and supporting a valve which prevents the upward flow of water, a concave valve-seat resting on the coupling, and an upper valve lying between a ring and a loose collar supported by pins projecting from the pipe, substantially as described.

408,752. METHOD OF OPERATING ELECTRIC FURNACES. JOHN C. HOSEA, Lockport, N. Y. Filed Aug. 31, 1888. Serial No. 284,330. (No model.)

Claim.—The method of operating an electric furnace of the kind described, which consists in enveloping or covering the charge with wood cut into small pieces, as sawdust, and then passing a current through the charge, whereby the wood is carbonized, substantially as set forth.



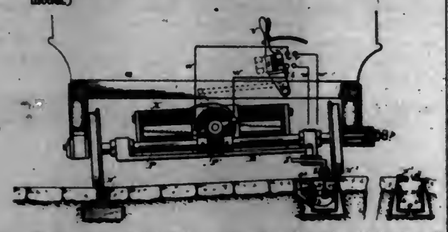
408,753. PISTON-PACKING. SAMUEL HUGHES, Charleston, S. C. Filed Jan. 9, 1889. Serial No. 296,288. (No model.)

Claim.—1. In a piston-packing, the combination, with a bull or junk ring having an outwardly-projecting flange, and a piston-follower, of segmental packing-rings arranged side by side, the edge of one ring overlapping the edge of the other, said packing-rings being secured between the follower and the flange of the bull-ring, substantially as set forth.

2. In a piston-packing, the combination, with piston-body or spider, a removable junk-ring having an outwardly-projecting flange and a follower, of segmental packing-rings greater in diameter than the bull-ring, and springs located within the space between the bull-ring and packing-rings and engaging abutments projecting inwardly from the inner faces of the segments composing the packing-rings, substantially as set forth.

3. In a piston, the combination, with a piston body or spider and

408,753.



a bull-ring mounted thereon, of segmental packing-rings located side by side and having overlapping side edges, and springs located between the bull-ring and packing-rings for exerting longitudinal pressure upon the segments of each of the packing-rings, substantially as set forth.

4. In a piston, the combination, with a hub, of segmental packing-rings carried thereby and having overlapping longitudinal edges, pins projecting from the inner faces of each of said rings, springs bearing on said pins and adapted to exert a longitudinal pressure upon the segments of the packing-rings, and a follower secured to the hub and bearing on one of said packing-rings, substantially as set forth.

5. In a piston, the combination, with a hub, of a flanged bull-ring mounted thereon, packing-rings having overlapping longitudinal edges, pins projecting inwardly from both packing-rings, springs bearing on said pins and adapted to exert a longitudinal force on the segments of both rings, and a follower secured to the hub and extending parallel with the outer faces of the packing-rings, substantially as set forth.

6. In a piston-packing, the combination, with sectional packing-rings provided with pins on their inner surfaces, of springs having central and outer coils and provided with expansible arms which engage said pins, substantially as set forth.

408,754. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa. Original application filed Feb. 17, 1886, Serial No. 192,187. Divided and application filed Sept. 13, 1888, Serial No. 285,295. Again divided and this application filed Apr. 8, 1889. Serial No. 306,397. (No model.)

Claim.—1. A road-bed for an electric railway in which one rail is higher than the other and the roadway between the rails is inclined, in combination with an electric conductor arranged at or near the higher rail, substantially as and for the purpose specified.

2. A road-bed for an electric railway in which one rail is higher than the other and the roadway between the rails is inclined, in combination with a slotted conduit arranged at or near the higher rail, substantially as and for the purpose specified.

3. A road-bed for an electric railway in which one rail is higher than the other and the roadway between the rails is inclined, in combination with a slotted conduit arranged at or near the higher rail and two working-conductors supported within said conduit, substantially as and for the purpose specified.

4. A road-bed for an electric railway in which one rail is higher than the other and the roadway between the rails is inclined, in combination with a slotted conduit arranged at or near the higher rail and two sectional working-conductors supported within said conduit, substantially as and for the purpose specified.

5. A road-bed for an electric railway in which one rail is higher than the other, in combination with a car having a horizontal body and an inclined truck or axles and wheels, substantially as and for the purpose specified.

6. A road-bed for an electric railway in which one rail is higher than the other and the roadway between the rails is inclined, in combination with a slotted conduit arranged at or near the higher rail, two working-conductors carried within said conduit, a car having inclined wheels and axles and a horizontal car-body, a frame suspended from the car and projecting down through the slot of the conduit, and brushes carried by said frame to connect with the conductors in the conduit, substantially as and for the purpose specified.

7. A road-bed for an electric railway in which one rail is higher than the other and the roadway between the rails is inclined, in combination with a car having a horizontal body and an inclined truck or axles and wheels, positive and negative working-conductors arranged at the highest end of the road-bed, and a connection between the car and said conductors to convey electricity to the motor on the car, substantially as and for the purpose specified.

8. The combination of a slotted conduit, working-conductors contained therein, a frame provided with two guide-rollers to run in the slot and guide the frame, depending tubes arranged between and close to said rollers and projecting through the slot, and insulated conductors passing through said pipes or tubes and having electrical contacts with the working-conductors, substantially as and for the purpose specified.

9. The combination of a slotted conduit, working-conductors contained therein, a frame projecting down through the slot of the conduit and provided with two guide-rollers to run in the slot and guide the frame, brushes carried by said frame to form electrical contacts with said working-conductors, depending conductor-guards arranged between and close to said rollers and projecting through the slot, and insulating-conductors passing through said guards and having electrical contacts with the working-conductors, substantially as and for the purpose specified.

10. A brush for an electric railway, consisting of a curved arm to freely move in either direction over the conductor, and a holder to contain contact-strips or wearing-pieces arranged through the holder at the point of contact to compensate for wear, substantially as and for the purpose specified.

11. The brush-arm V, made with a curved end, in combination with the wearing-pieces V^2 to project through said arm at its place of contact with the conductor, and clamping-screw V^3, substantially as and for the purpose specified.

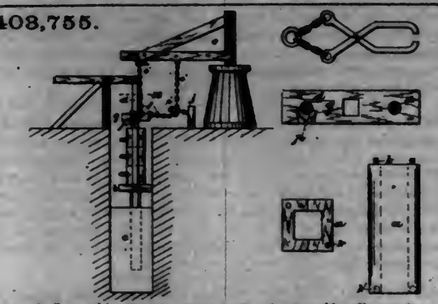
12. In an electric railway, two sectional working-conductors, in combination with a traveling motor electrically connected therewith, and a pair of brushes or contacts connecting the motor with the conductors, the said brushes being arranged one in front or in advance of the other, substantially as and for the purpose specified.

13. In an electric railway, the combination of two working-conductors having vertical working-faces, a traveling electric motor or locomotive, a brush-holder carried by said motor, and two brushes having vertical faces carried by said holder, and adapted to press one in contact with each of said working-conductors, substantially as and for the purpose specified.

14. The combination, with an electric locomotive, of a slotted conduit, and two conductors extending from said locomotive into said conduit in line with each other, and each having an independent connection with the locomotive, whereby each may be movable about a vertical axis.

15. The combination of a slotted conduit containing the working-conductors of an electric railway with a car, a frame depending from said car capable of lateral movement relative to the vehicle, and a contact device movable on a vertical axis extending from said frame and taking current from the conductors within the conduit.

16. In an electric railway, the combination of two line or working-conductors from which the motors receive current, an electrically-propelled vehicle having an electric motor, a motor-circuit thereon connecting with said line-conductors, and a switch to cut out the motor and complete the line-circuit through the car.



17. The combination of two railway parallel tracks having their adjacent rails higher than the others, with an electric conduit for each track arranged adjacent to the highest rail in each track, and an electric conductor in each conduit.

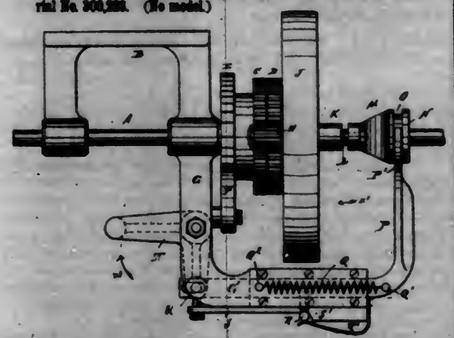
18. In an electric railway, the combination of a car-body supported on springs, an electric motor, power-transmitting connections between the motor and axle, a source of electric supply, a reversing-switch on and moving with the car-body, flexible conductors between the reversing-switch and motor, and a frame carried by the axle independent of the car-body to support the motor.

408,755. APPARATUS FOR CASTING INGOTS. JOHN ILLINGWORTH, Newark, N. J. Filed Dec. 20, 1887. Serial No. 258,440. (No model.)

Claim.—1. In combination, a sectional mold, an elevator, a die or fulcrumal bearing, and means co-operating therewith to sever an ingot from the casting, substantially as set forth.

408,755.

2. In combination, an elevator, a sectional mold, a die, a grip, and means for operating the same, substantially as set forth.



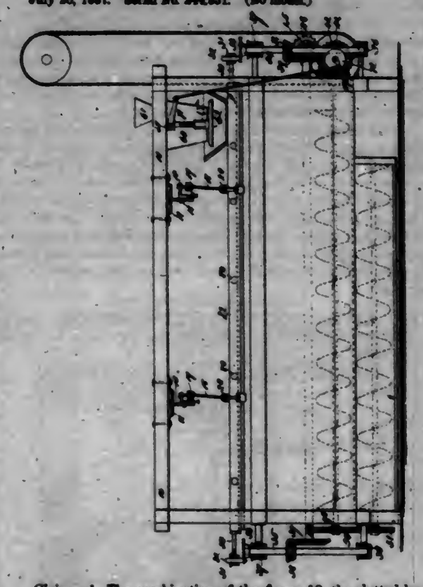
3. In combination, a vertically-disposed mold, a die arranged in a vertical line therewith, through which the casting may be caused to pass, means for presenting said casting to said die, and a grip actuated by a crane to sever the ingot from the body-casting, substantially as set forth.

4. In combination, a vertically-disposed mold, a clutch or tongs for stripping or baring an ingot cast therein, a power crane or hoist to separate an ingot from the body-casting, and a fulcrumal bearing or die to hold the body-casting while the ingot is being separated therefrom, substantially as and for the purposes set forth.

5. The combination of a series of mold-sections arranged vertically in line, means for lowering the said sections, a fulcrumal bearing and means for presenting the ingot to said bearing, and severing means, substantially as set forth.

6. In combination, a mold, a fulcrum, die, or bearing arranged at the open end of said mold, means for presenting the ingot to said fulcrum, and means for forcing the ingot against said fulcrum, substantially as and for the purposes set forth.

408,756. MECHANISM FOR IMPARTING SLOW OR FAST MOTION. JULIUS JUSTUS, Elizabeth, N. J. Filed Feb. 18, 1888. Serial No. 263,923. (No model.)



Claim.—1. In a fast-and-slow-movement mechanism, the combination, with a shaft, of two cog-wheels of the same size mounted on the shaft, one wheel being fixed and the other loose, and the fixed wheel having one tooth more than the loose wheel, a ratchet for engagement with the loose wheel, a pinion engaging said two cog-wheels and mounted on the pulley, a cross-piece fixed on the shaft, and pins for engaging said cross-piece with the pulley, substantially as set forth.

2. In a fast-and-slow-movement mechanism, the combination, with a shaft, of two cog-wheels on the same, one being fixed and the other loose, the fixed wheel having one tooth more than the loose wheel, a pawl engaging the loose wheel, a pulley mounted loosely on the shaft, a pinion on said pulley engaging the two cog-wheels, a cross-piece fixed on said shaft adjacent to the pulley, movable pins in said cross-piece for engaging the cross-piece with the pulley, a sliding clutch-piece carrying said pins, a movable arm for shifting said sliding clutch-piece, and a spring adapted to pull said sliding arm and the sliding piece toward the pulley, substantially as set forth.

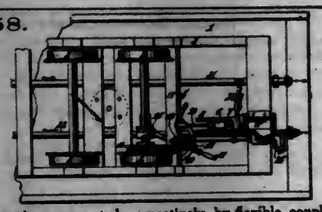
3. In a fast-and-slow-movement mechanism, the combination, with a shaft, of two cog-wheels on the same, one being fixed and the other loose, the fixed wheel having one tooth more than the loose wheel, a pawl engaging the loose wheel, a pulley mounted loosely on the shaft, a pinion on said pulley engaging the two cog-wheels, a cross-piece fixed on said shaft adjacent to the pulley, movable pins in said cross-piece for engaging the cross-piece with the pulley, a sliding clutch-piece carrying said pins, a movable arm for shifting said sliding clutch-piece, a spring acting on said sliding arm and driving the same and the sliding clutch-piece in the direction toward the pulley, a spring-actuated bolt, a cam-slide which can act on said bolt, and a lever connected with the sliding arm and with the cam-slide, substantially as set forth.

408,757. FLOUR-BOLT. JOHN JOHNSTON, Neenah, Wis. Filed July 20, 1887. Serial No. 244,851. (No model.)

Claim.—1. The combination of the frame 10, the slotted brackets 11, the bolts 12, the angular arms 13, having their horizontal arms supported by said bolts, and having their vertical arms slotted and provided with lugs 17, having vertical set-screws 16, the angular brackets 14, adjustable on the slotted arms above the set-screws, on which they rest, and the sieve having brackets 21 on its sides, with the hangers 18, provided with universal joints connecting them to the brackets 14 and 21, respectively, substantially as set forth.

2. The combination, in a flour-bolt with the feeder, of depending swinging arms at opposite sides thereof, a plate at the lower ends of said arms, vertically-movable connections between said plate and arms, springs allowing a yielding movement between the arms and connections, and means for oscillating said plate, substantially as set forth.

3. The combination, with the feeder, of the depending slotted swinging arms at opposite sides thereof, provided with outward-projecting side lugs, a plate extending under the discharge-end of the feeder, provided with rods extending upwardly through the said lugs and sliding freely therein, and lugs 65, engaging the slotted arms, and the springs supporting the rods yieldingly, substantially as set forth.

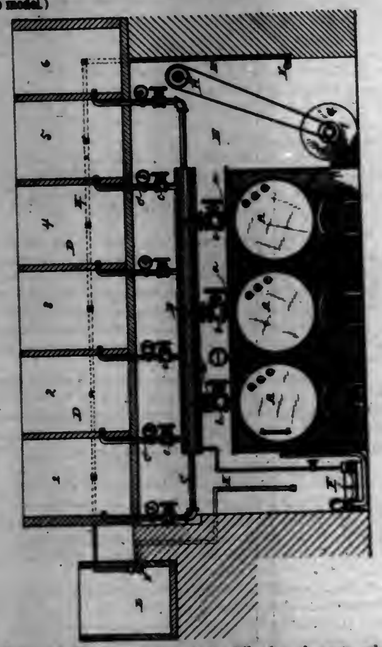


4. In a flour-bolt, the combination, with the sieve and its frame, of the apertured slats extending across the under side of said frame, blocks on the under side of the sieve, screws or pins extending from said blocks down through the slat-apertures, and springs on said screws or pins, substantially as set forth.

5. In a flour-bolt, the combination, with the sieve having blocks on its under face, and the frame to which the sieve is secured having apertured slats on its lower side, of the headed screws passing up through the apertures in the slat into the said blocks, the heads of the screws resting against the lower surfaces of said slats and limiting the upward movement of the screws and sieve, and the springs on the screws between the blocks and slats, substantially as set forth.

408,758. MEANS FOR PROPELLING RAILWAY-CARS. JOHN M. KNOX, Corsicana, Tex. Filed Jan. 3, 1889. Serial No. 295,592. (No model.)

Claim.—1. In a railway-car, the combination, with a wheel-axle, of a gear mounted loosely on said axle, a clutch for making said gear fast with the axle, a crank-shaft having a gear meshing with the axle-gear, a steam-cylinder mounted on the car-truck and having its piston and valves connected with said crank-shaft, separate live-steam

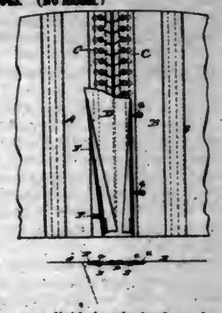


408,758.

and exhaust pipes connected, respectively, by flexible couplings to the live-steam and exhaust ports of the steam-cylinder, said pipes having at their ends flexible couplings to corresponding pipes on the adjacent car or cars, and a common steam-supply to which one of said pipes is connected, substantially as described.

2. In a railway-car, the combination, with a car-axle, of a steam-cylinder mounted on the truck-frame, a crank-shaft connected to the piston and valves of said cylinder, a gear fixed to said crank-shaft, a gear loose on the car-axle and meshing with the crank-shaft gear, a clutch splined on the axle, a shipping-lever for actuating said clutch, a live-steam pipe and an exhaust-pipe carried by said car and connected to the steam-cylinder, means for connecting said pipes to similar pipes upon an adjacent car or cars, and a steam-supply common to the steam-cylinders of several cars in a train, substantially as described.

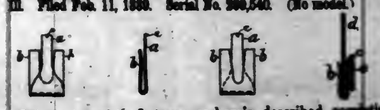
408,759. APPARATUS FOR EXTINGUISHING FIRES. CHESTY KELSEY, Philadelphia, Pa. Filed May 20, 1885. Serial No. 166,163. (No model.)



Claim.—1. The combination of the following elements, substantially as set forth, namely: a series of several boilers adapted to supply steam for operating an engine, the steam-pipe B, the separate pipes *a a*, the separate valves *b b*, whereby the steam may be taken through the said pipes *a* separately or through them all together, the series of pipes C, all communicating with the said pipe B, and each communicating separately with a compartment, D, and the separate valves *c* for the said pipes C, respectively, the said valves *b* and *c* being arranged in proximity to the boilers, substantially as set forth.

2. As a means for extinguishing fires, the combination, with a series of apartments, of two or more boilers, a main steam-pipe communicating with each of said boilers, stop-cocks between each boiler and the main steam-pipe, a series of discharge-pipes connecting with the main steam-pipe and opening into said apartments, and a series of stop-cocks, one for each discharge-pipe, arranged within convenient access of the attendant, substantially as and for the purposes set forth.

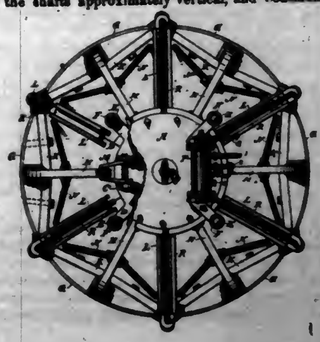
3. As a means for extinguishing fires, the combination, with a series of apartments, of a boiler, a series of discharge-pipes communicating with the boiler and opening into said apartments, a series of stop-cocks adapted to close said pipes, they being situated within convenient reach of the attendant, and a blowing mechanism, also within convenient reach of the attendant, and arranged and operating substantially as and for the purposes set forth.



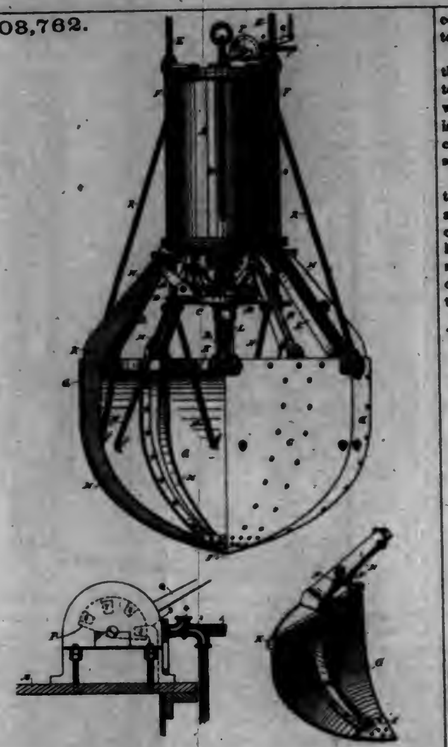
4. As a means for extinguishing fires, the combination, with a series of apartments, of a boiler, a series of discharge-pipes communicating with the boiler and opening into said apartments, a series of stop-cocks, *c*, which permit the steam to be rapidly exhausted from the boiler through one or more discharge-pipes, means for increasing the supply of water in the boiler while said valves are open, and means for forcing air to the furnace at the same time, whereby a high pressure of steam can be maintained while stop-cocks *c* are open, all of said operating devices being within convenient reach of the attendant, substantially as set forth.

408,760. CORSET. JOSEPH KOCH, New Haven, Conn., assignor to Lewis Schiele & Company, New York, N. Y. Filed Mar. 25, 1889. Serial No. 304,643. (No model.)

Claim.—In a corset divided at the back, each edge provided with the usual stays, eyelets, and lacings, the combination therewith of a vertical flap, D, over said lacings and connected at each edge to the respective sides of the corset by elastic connections, substantially as and for the purpose described.



408,761. NECKTIE-FASTENER. WILLIAM H. KRAMER, Chicago, Ill. Filed Feb. 11, 1889. Serial No. 299,540. (No model.)



Claim.—A necktie-fastener, as herein described, consisting of a single piece of sheet metal doubled upon itself and cut away so as to form three spring-arms, of which the center one is the longest and forms one side of the device, and is of about one-third of the width of and has a base as wide as the entire device, and is provided at its top with a hook, *c*, and of which the lateral arms are on the opposite side of said central arm, are of about the width of said central arm and lower than it, have vertical edges, and a slot between them extending to near the lower edge of the device, substantially as specified.

408,762. EXCAVATOR. ISAAC P. LANNING, Ione, Cal. Filed Aug. 30, 1888. Serial No. 284,151. (No model.)

Claim.—1. In an excavator, the concave spheroidal segments having their upper edges journaled on supporting-shafts about a horizontal circle and their points presented downwardly, so as to be opened and closed with a common center, said sections having the portion nearest the shafts approximately vertical, and continuing from the

408,762.

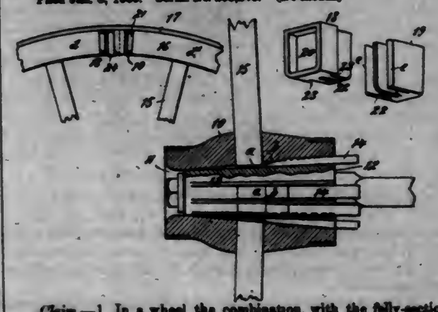
shoulder in the form of a flattened curve toward the point, substantially as herein described.

2. In an excavator, the flattened segments having their bases upward and suspended upon journal-shafts about the periphery of a horizontal circle, the points presented downwardly so as to close at a common center, in combination with the removable shoes, dovetailed or attached to the points, substantially as herein described.

3. In an excavator, the sections journaled upon horizontal shafts around a circle, with the points presented downwardly so as to close toward a common center and form a flattened hemisphere, with central ribs extending from the points up to the upper edges of the sections, and having the arms or continuations H extending inwardly, in combination with the vertically-moving cross-head and the connecting-rods uniting said cross-head with the inwardly-inclined arms, substantially as and for the purpose herein described.

4. The segments forming the excavator, having journal-shafts extending across the upper edges and turning in journal-boxes in arms which extend downwardly and outwardly from the lower cylinder-head, curved strengthening-ribs extending from the point to the top of each section, and having inwardly-projecting extensions H, in combination with the cylinder A, piston and piston-rod, the cross-head secured to the lower end of the piston-rod, and the connecting-rods M, uniting the cross-heads with the arms, substantially as and for the purpose herein described.

5. The bucket-sections having their points presented downwardly and their bases supported upon horizontally-journaled shafts turning in boxes in arms which extend downwardly and outwardly from the lower cylinder-head, said journal-shafts having the centers bent inwardly and secured to the top of the sections, so as to act as transbraces to strengthen the upper edges of the buckets, substantially as herein described.



6. The vertically-suspended cylinder with the piston, piston-rod, cross-head, and guides, the radial arms projecting downwardly and outwardly from the lower end of the cylinder, and the journal-boxes fixed to the arms, as shown, in combination with the flattened hemispherical sections having shafts the journals of which turn in these boxes, and the extension-ribs H, together with the connecting-rods M, whereby the arms H are actuated with a resultant motion derived from the vertical movement of the cross-head, substantially as herein described.

7. The connecting-rods M, made V-shaped and having the apex connected with the arms H and the open ends fulcrumed or journaled to the cross-head, substantially as herein described.

8. The circularly-arranged segments journaled at the top so that their points meet at a common apex at the bottom, the arms or extensions H, connecting-rods M, and the cross-head, in combination with the cylinder A, piston, and piston-rod by which the cross-head is actuated, and a valve whereby air or steam is admitted to act successively below and above the piston and close and open the bucket-sections, substantially as herein described.

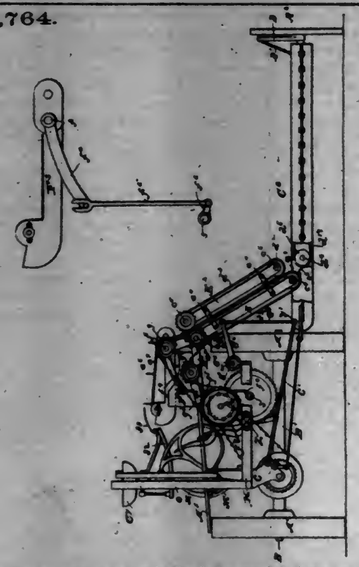
9. A dredger or excavator consisting of the segments journaled to open and close about a common apex at the bottom, lever-arms H, and connecting-rods M, in combination with a vertically-suspended cylinder, a piston, and piston-rod having at its lower end a cross-head, to which the connecting-rods M are journaled, and a valve mechanism whereby steam or air is first admitted below the piston to close the bucket-sections, and is then transferred above the piston to open the bucket-sections, substantially as herein described.

408,763. VEHICLE-WHEEL. JOHN O. LEEK, Glen Elder, Kans. Filed Jan. 3, 1889. Serial No. 295,573. (No model.)

Claim.—1. In a wheel, the combination, with the felly-sections forming the felly-circle of the tire, of clips secured on the approaching ends of the fellies, provided with spaced teeth adapted to interlock when brought together, and a wedge driven upward between one or more of the teeth and the wall of the recess receiving the same, substantially as shown and described.

2. In a wheel, the combination, with the felly-sections *d d*, of the metal clips secured on the meeting ends thereof, said clips consisting each of a body portion formed with a cavity, 20, adapted to receive the ends of the fellies, projecting teeth 22, and spaces 23, said teeth adapted to interlock when brought together, and wedges adapted to be driven up between one or more of the teeth 22 and the wall of the recess receiving the same, substantially as shown and described.

3. The combination, with the hub of a wheel having a tapering bore, spokes passing through the hub into the said bore, and the felly and the tire, of a conical or tapering thimble provided with longitudinal exterior ribs vanishing at the smaller end of the thimble, and wedges driven upon the thimble between the ribs and beneath the spokes, said wedges provided with a flat edge resting normally under the spokes and a tapering edge adapted to engage the spokes when the wedges are driven in, substantially as and for the purpose described.



4. The hereinbefore-described improvement in wheels, consisting of a hub having a tapering bore, a conical thimble inserted in said bore, provided with exterior longitudinal inclined ribs, wedges inserted between the ribs, spokes projected from the hub and bearing on the inner ends of said wedges, felly-sections attached to the outer ends of the spokes, forming a felly-circle, metal clips secured on the approaching ends of the felly-sections, provided with outer spaced integral teeth, the teeth of the sections interlocking when brought together, a tire surrounding said felly-sections, and wedges inserted between one or more of the teeth and the walls of the opposing recesses, all arranged substantially as and for the purpose described.

408,764. HARVESTER. SAMUEL D. MADDEN, Miamisburg, Ohio, assignor to Mary Madden, Sarnia, Ontario, Canada. Filed July 9, 1888. Serial No. 171,136. (No model.)

Claim.—1. The combination, with the grain-platform frame, of a grain-elevator composed of upper and lower frames connected together at their forward sides only by means of hinges, which permit the upper frame to accommodate itself to the mass of grain being elevated, and each provided with a positively-driven traveling grain-carrying apron, and driving-gears connecting the upper apron-drums at the forward sides of the elevator-frames, whereby the upper frame may move away from the lower frame at the rear side to accommodate the grain without disengaging the driving-gears, substantially as described.

2. The combination of the platform-frame provided with a heri-

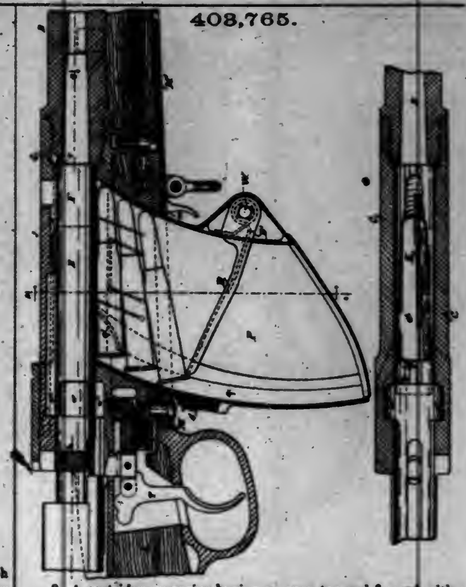
408,764.

zontal grain-carrying apron, an inclined elevator-belt, between which and the horizontal apron there is an open throatway, and loose flaps upon the elevator-apron passing through the said throatway, substantially as set forth.

3. The combination, with two traveling grain-carrying aprons arranged at angles to each other and with their ends adjacent to each other and separated by a throatway, of flexible strips e^3, carried by one of the said grain-carrying aprons to bridge the said throatway, substantially as described.

4. The combination, with the binder-frame and a platform-frame, of an intermediate frame pivotally connecting the binder and platform frames and composed of lateral bars *b*, pivoted both to the binder-frame and to the platform-frame, and the diagonal bars b^3, arranged between the bars *b* and pivoted to the binder-frame in line with the pivotal connections of the bars *b* therewith, substantially as described.

5. The combination of the table upon which the grain is delivered by the elevators, the shaft *f*, arranged above the table, the bracket b^3, supported on the shaft, the frame F^3, pivotally connected with the bracket, gear-wheels arranged between the said shaft and a shaft carried by the said frame, and a conveyer-chain driven by the last-named shaft, substantially as set forth.



408,765. MAGAZINE FOR FIRE-ARMS. PAUL MAUSER, Oberndorf-on-the-Neckar, Wurtemberg, Germany, assignor to the Waffenfabrik Mauser, same place. Filed July 3, 1888. Serial No. 278,904. (No model.) Patented in Belgium Apr. 24, 1888, No. 81,886; in England May 11, 1888, No. 7,045; in Italy June 30, 1888, No. 23,598/335, and in Spain Aug. 20, 1888, No. 8,261.

Claim.—1. A cartridge-magazine consisting of a receptacle or cup adapted for direct attachment to the gun, having an open top and formed with a pocket or extension at the lower portion of its front side, in combination with a lever pivoted to said receptacle in said pocket and arranged to vibrate within the receptacle for pressing up the cartridges, and a spring pressing said lever upwardly, whereby the lever and spring are necessarily removable from the gun with the magazine.

2. A cartridge-magazine consisting of a receptacle having an open top curved at its front and rear sides in eccentric circular arcs in order that the cartridges shall be supported one upon another at the base and by tangential contact of their bullet ends with the eccentric front side of the receptacle, and the receptacle formed with a pocket or extension at the lower portion of its front side, in combination with a lever pivoted in said pocket and arranged to vibrate within the magazine for pressing up the cartridges, and a spring in said pocket for pressing said lever upwardly.

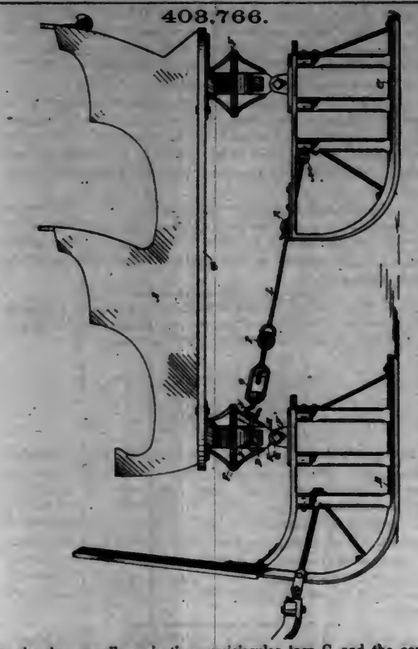
408,765.

3. A cartridge-magazine having an open top and formed with a fixed catch-tooth upon its exterior, in combination with a pivoted lever working within the magazine for pressing up the cartridges, a spring pressing said lever upwardly, a rotatively-mounted spindle to which said lever is fixed and which projects outside of the magazine, and an arm outside of the magazine fixed to said spindle, elastic in lateral direction, and arranged to engage with said catch-tooth by reason of said elasticity in order to hold said lever down against the tension of its spring and thereby throw the magazine out of operation.

4. A cartridge-magazine having an open top and provided with spring-flaps at its top on opposite sides, with their upper edges bent inwardly, formed by means of incisions in the material of its sides, and with stops or abutting shoulders on the sides of the magazine and on said flaps for preventing the pressing in of the flaps beyond the remaining portions of the sides of the magazine.

5. A cartridge-magazine having an open top and provided with spring-flaps of inverted-U shape at its top, formed by means of incisions in the material of its sides, and with stops for preventing the pressing in of said flaps beyond the remaining portions of the sides of the magazine, formed by oblique overlapping portions of said incisions.

408,766. SLEIGH. FELIX J. MEYER, Ruby Hill, Nev. Filed Oct. 6, 1888. Serial No. 287,266. (No model.)



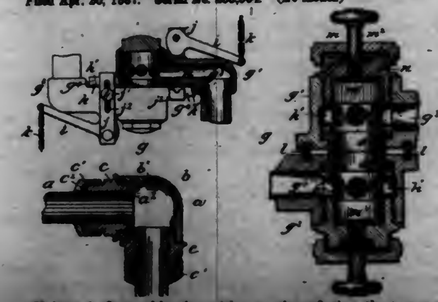
Claim.—1. In a sleigh, the two sets of runners supporting the front and rear ends of the body, respectively, in combination with the fifth-wheels and the king-bolts, by which each set of runners is connected with the sleigh-body, and the diagonal connecting-links L and turn-buckles by which the front and rear sets of runners are connected together, substantially as herein described.

2. In a sleigh, the front and rear sets of runners connected with the body of the sleigh by king-bolts and fifth-wheels, and the links or rods having their rear ends connected with the front of the rear set of runners and their front ends connected with the rear of the forward set of runners at a point above the plane of connection with the rear runners, substantially as herein described.

3. In a sleigh, the two sets of runners supporting the front and rear ends of the sleigh-body, the transverse bolsters, king-bolts, and fifth-wheels through which connection is made, and the hinged joints by which the ends of the bolsters are connected with their respective sets of runners, in combination with the connecting rods or links having their rear ends attached to the front portion of the rear sets of runners below the horizontal plane of the hinged joint and their front ends connected with the diagonally-opposite rear portions of the front runners at points above the level of the connections with the rear runners, substantially as herein described.

4. In a sleigh, the two sets of runners supporting the front and rear ends of the body, the transverse elastic bolsters, through the center of which the king-bolts of the two sets of runners pass, the clamps within which the outer ends of the bolsters are secured, having the corresponding flanges *h* and sockets *h'*, the yoke *j*, attached to each body part, the cam-levers pivoted to the yoke, and the washers located between the body parts of the coupling, all substantially as described.

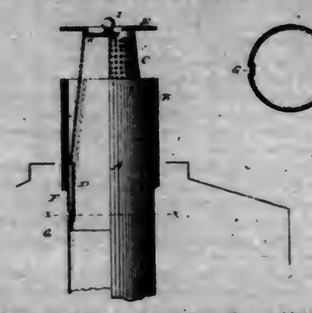
408,766.



ing the downwardly-projecting semicircular legs G, and the corresponding upwardly-curved projecting legs F, fixed upon the runners, the pins by which the two are connected together, and the concave support K, fitted upon the upper curved portion of the legs F, substantially as herein described.

5. In a sleigh, the front and rear sets of runners supporting the front and rear ends of the sleigh and turning beneath them by means of king-bolts and fifth-wheels, elastic transverse bolsters having their ends hinged to the runners, as shown, in combination with the diagonal links uniting the opposite angles of the two sets of runners, the turn-buckles by which the length and tensions of the links are regulated, and the transverse turn-buckle for taking up the slack in making short turns, substantially as herein described.

6. In a sleigh, the two sets of runners supporting the front and rear ends of the sleigh-body, the king-bolts, the fifth-wheels, the elastic bolsters supported by hinged joints upon the runners, in combination with the links crossing diagonally, and connected, respectively, with the front and rear opposite sides of the two sets of runners, the adjusting and compensating turn-buckles, and the connecting-chains uniting them with the front ends of the rear set of runners, substantially as herein described.



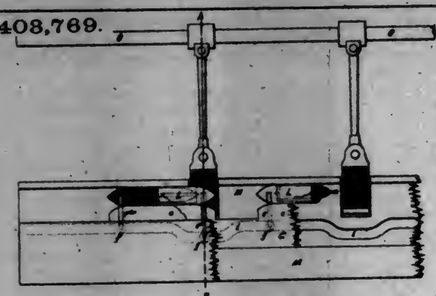
7. The double sets of runners with bolsters, and side rails secured to the ends of the bolsters, in combination with the independent detachable body, the latches attached to the body, and engaging-legs by which the body is secured to the runners, substantially as herein described.

408,767. PIPE-COUPLING. OSCAR J. MEYER, Hartford, Conn. Filed Apr. 20, 1887. Serial No. 235,504. (No model.)

Claim.—1. In combination with a section of pipe, the two-part coupling made up of the body parts f f^3, having on their bearing-

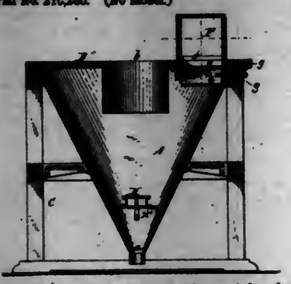
408,768. CENTRAL-DRAFT LAMP. JOHN C. MILLER, Meriden, Conn., assignor to the Meriden Brass Company, same place. Filed Dec. 17, 1888. Serial No. 293,230. (No model.)

Claim.—1. In a central-draft lamp, the combination of the central draft-tube, and an air-distributer supported by said tube and movable vertically with relation thereto, the distributer and the said tube, the one constructed with a vertical groove and the other with a corresponding projection adapted to work in said groove, and whereby limited vertical movement is permitted said distributer, substantially as and for the purpose described.



2. The combination of the central draft-tube, A, and an air-distributer, C, supported by said tube and vertically movable with relation thereto, the said tube and distributer, the one constructed with a vertical groove and the other with a corresponding projection adapted to limit the extent of vertical movement of said distributer, the upper end of the said distributer recessed and provided with a handle, substantially as described.

3. The combination of the central tube, A, and an air-distributer, C, arranged therein for vertical movement, the said tube and distributer, the one constructed with a vertical groove and the other with a corresponding projection adapted to limit the extent of vertical movement of said distributer, the said distributer diminishing in diameter toward its upper end, with a button, E, detachably secured to the upper end of said distributer, substantially as described.



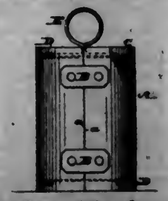
408,769. NARROW-WARE LOOM. AUGUSTO MORAES, Lisbon Portugal. Filed June 21, 1888. Serial No. 277,643. (No model.) Patented in Portugal Mar. 14, 1888, No. 1,225, and in England May 5, 1888, No. 6,718.

Claim.—The combination, with the lay or lays, of the stationary shuttle-box provided with a cam-groove, a shuttle or shuttles in said box, and the reciprocatory rule provided with an elevated rest or rests movable therewith, on which the shuttle or shuttles are supported, provided with projections which engage said cam-groove, substantially as described.

408,769.

408,770. DUST-COLLECTOR. ORVILLE M. MORSE, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed Oct. 14, 1886. Serial No. 216,285. (No model.)

Claim.—1. The combination, with the peripheral wall of the separating-case, of a head applied to one end of said wall and provided with an opening near the periphery thereof, and an external tangential inlet-spout communicating with said opening and delivering the dust-laden air into the case through said opening in the head thereof, substantially as set forth.



2. The combination, with the peripheral wall of the separating-case, of a head applied to one end of said wall and provided with an opening near the periphery thereof, an external inlet-spout communicating with said opening, and a deflector arranged within the separating-case opposite said opening and deflecting the entering current tangentially, substantially as set forth.

3. The combination, with the peripheral wall of the separating-case, of a head applied to one end of said wall and provided with an opening near the periphery thereof, an external inlet-spout communicating with said opening, and a reversible deflector arranged within the separating-case opposite said opening, substantially as set forth.

4. The combination, with the tapering separating-case having an imperforate peripheral wall and provided with an external tangential inlet-spout, a central opening for the escape of the purified air at its large end, and a dust-discharge opening at its apex, of a deflector arranged centrally within the separating-case below the air-inlet spout and above the dust-discharge opening, whereby the air-current entering the case through the dust-discharge opening is intercepted, substantially as set forth.

5. The combination, with the tapering separating-case provided with an external tangential inlet-spout and having a central opening for the escape of the purified air at its large end and a dust-discharge opening at its small end, of a central deflecting-disk, H, and an annular deflector, H', arranged one above the other within the separating-case below the air-inlet spout and above the dust-discharge opening, substantially as set forth.

408,771. FIRE-KINDLER. WILLIAM R. MYERS, Haddonfield, N. J. Filed June 14, 1888. Serial No. 277,073. (No model.)

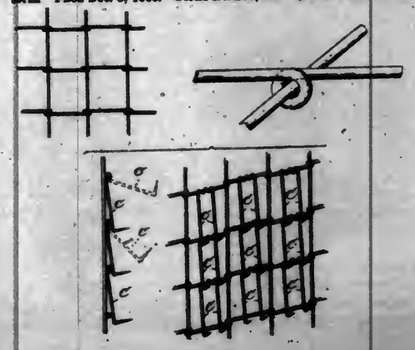
Claim.—1. A fire-kindler consisting of an expansible body with the ends of the same fastened, forming a separable joint, an expansible plate or post arranged diametrically in the body, and closing-heads, said post resting against the inner sides of the body, so that when it expands it presses the sides of the body and opens the joints thereof, substantially as and for the purpose described.

2. A fire-kindler and fuel-block consisting of a casing of a piece of sheet metal having its adjacent edges connected by straps, an indestructible filling saturated with inflammable material, the separate heads C on said filling and within said casing, and the wires D, passing through the chines of said casing outside of said heads and having their ends bent, said parts being combined substantially as described.

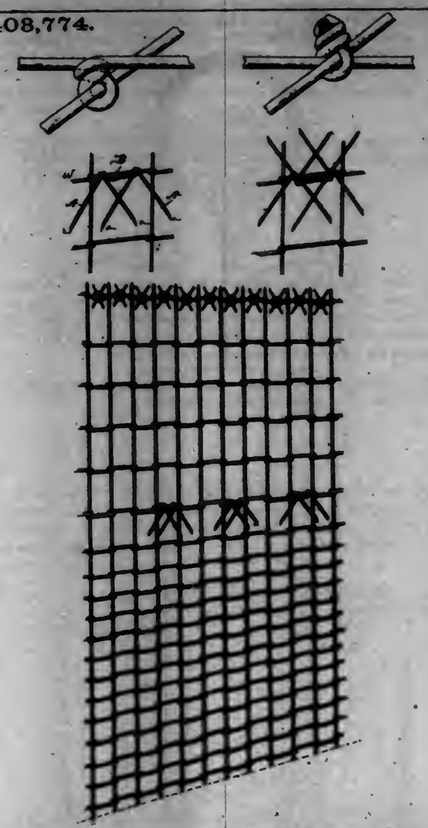
3. A fire-kindler consisting of an expansible body with its ends made separable, an expansible post or plate arranged diametrically in said body, closing-heads at the ends of the body, and wires passed through said body outside the heads thereof, substantially as and for the purpose described.

408,772. JOINT FOR FOLDING CHAIRS. AUBURN F. OLD, Brooklyn, assignor to the Andrews Manufacturing Company, New York, N. Y. Filed Sept. 24, 1888. Serial No. 286,199. (No model.)

Claim.—The herein-described pivot for folding chairs, consisting of two plates, E F, having projecting ears therefrom, by which the plates may be secured, the said plates constructed the one with a central stud to form the pivot and the other with a corresponding central recess to form the seat for the pivot, one plate constructed with studs L M on its face, the other plate constructed with recesses J K concentric to the pivot, and corresponding to the said two studs L M, the ends of the said recesses forming, respectively, shoulders *a b*, against which the said studs may come to a bearing, substantially as described.



408,773. ROCKING-CHAIR AND CARRIAGE. ARNOLD PAHLOW, Philadelphia, Pa. Filed Aug. 1, 1888. Serial No. 281,615. (No model.)



Claim.—1. The herein-described convertible chair and carriage-body, consisting of two body-sections hinged together, one of said body-sections having corner posts or uprights provided with heads, rockers having sockets to receive said heads, and caps or blocks for closing the sockets at the forward ends of the rockers to secure the heads in the said sockets, substantially as described.

2. In a convertible chair and carriage-body, the combination of the two body-sections hinged together, one of said sections having corner posts or uprights provided with heads, of rockers having sockets to receive said heads, and caps or blocks hinged in the rockers at the forward ends of the sockets for securing the heads in place and permitting the removal thereof, substantially as described.

408,774. WIRE-NETTING. ALFRED H. PEARSON, Northcote, Victoria. Filed Dec. 5, 1888. Serial No. 292,731. (No model.)

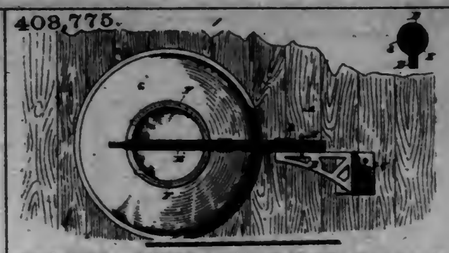
408,774.

Claim.—1. Wire-netting more especially designed for fencing, made with a square mesh, in combination with barbs pivotally connected with the cross-wires and arranged to subdivide the meshes of the netting, substantially as and for the purposes specified.

2. Wire-netting more especially designed for fencing, made with a square mesh, in combination with barbs pivotally connected with the cross-wires and arranged to project and swing in one direction only and to subdivide the meshes of the netting, substantially as and for the purposes specified.

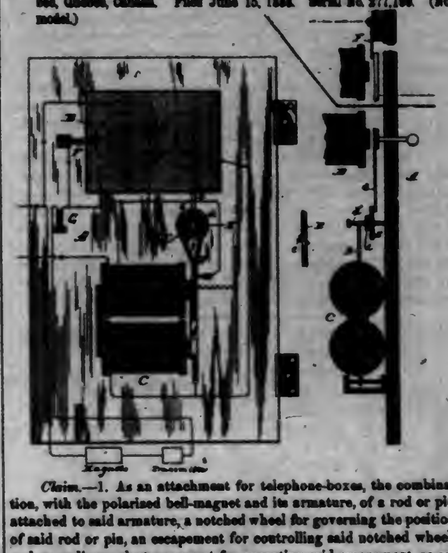
3. In a wire fence, the combination, with the fence-posts, of an open-mesh wire fabric composed of interconnected woof and weft wires, the meshes of one portion of the fabric being smaller than those of the remaining portions, substantially as and for the purposes specified.

4. In a wire fence, the combination, with the fence-posts, of an open-mesh wire fabric composed of interconnected woof and weft wires, the meshes of the fabric being larger at the upper end of the post than at the foot thereof, substantially as and for the purposes specified.



5. A wire fence composed of wire-netting the mesh of which varies from top downward, the larger meshes being at top of the fence, in combination with barbs for the larger meshes, substantially as and for the purposes specified.

6. A wire fence composed of wire-netting the mesh of which varies from top downward, the larger meshes being at top of the fence, in combination with barbs for the larger meshes, said barbs being pivotally connected with the cross-wires and arranged to subdivide the meshes, as described.



408,775. FOLDING BRACKET. JAMES H. PILSON, Washington, D. C. Filed Dec. 1, 1888. Serial No. 292,372. (No model.)

Claim.—The combination, with a swinging supporting-arm provided with a sleeve having an interior groove, of a basin-supporting rod engaged with said sleeve and provided with a feather to engage said groove, a clamp secured to said arm for removably holding a basin, and a stop-pin secured to said rod to limit its rotary movement, substantially as set forth.

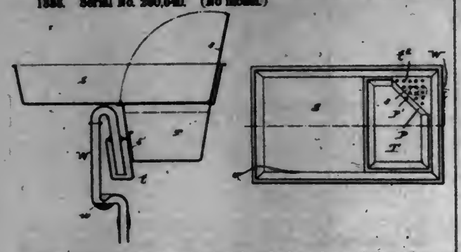
408,775.

408,776. INDIVIDUAL CALL AND SWITCH. EDWIN POPE, Quebec, Quebec, Canada. Filed June 15, 1888. Serial No. 277,169. (No model.)

Claim.—1. As an attachment for telephone-boxes, the combination, with the polarized bell-magnet and its armature, of a rod or pin attached to said armature, a notched wheel for governing the position of said rod or pin, an escapement for controlling said notched wheel, and an ordinary electro-magnet for operating said escapement, as set forth.

2. The combination, with the bell-magnet and armature in an ordinary telephone-box, and with the telephone, of a short circuit around the telephone controlled by the position of the armature, a rod or pin attached to the armature normally held by a notched wheel, so as to close the short circuit, and an electro-magnetic escapement in the main line operatively connected with the wheel, as and for the purpose set forth.

3. In a unison device for individual telephone-calls, the wheels having corresponding notches, the escapement for rotating the same step by step, two lugs attached to each of said wheels, located one upon each side of the corresponding notches and one behind the other, and a detent-rod, as *e*, adapted to impinge against said lugs to check the movement of the wheels, as set forth.

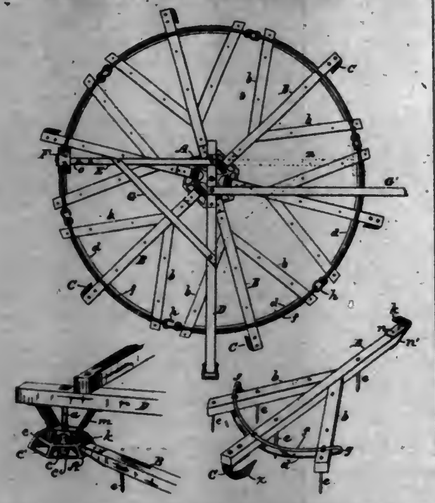


4. The combination, with the bell-armature and the notched wheel controlling its movements, of a stop, e^2, alongside the notches 8, as and for the purpose set forth.

5. In a unison device for individual telephone-calls, the wheels having corresponding notches, the escapement for rotating the same step by step, two lugs attached to each of said wheels, located one upon each side of the corresponding notches and one behind the other, a detent-rod, as *e*, adapted to impinge against said lugs to check the movement of the wheels, and retaining pieces or lugs to limit the lateral movement of said rod *e*, as and for the purpose set forth.

6. In an individual call apparatus for telephones, the magnet C, located in the main circuit, in combination with the polarized bell-magnet, also located in the main circuit, the armature of said magnet C being arranged to close a short circuit around the bell-magnet, as described.

7. In an individual call apparatus for telephones, the magnet C, located in the main circuit, in combination with the polarized bell-magnet, also located in the main circuit, the notched wheel E, operated by magnet C, the detent-rod *e*, controlled by said wheel and connected with the armature of the bell-magnet, a contact-strip, F, also connected with the bell-magnet armature, and a short circuit around the calling and speaking instruments controlled by said contact-strip, as and for the purpose set forth.



403,777. SINK. JOHN P. PUTNAM, Boston, Mass. Filed Jan. 13, 1888. Serial No. 260,642. (No model.)

Claim.—1. A sink provided with a flush-tank consisting of a receiving-chamber and a discharging-chamber, the former leading horizontally into the latter through a vertical opening or passage-way reaching to the bottom of said receiving-chamber and narrower than said receiving-chamber, and the latter furnished with an automatic discharge-siphon, the operative capacity of the passage-way between the two chambers during the last part of the operation being smaller than that of the siphon, substantially as described.

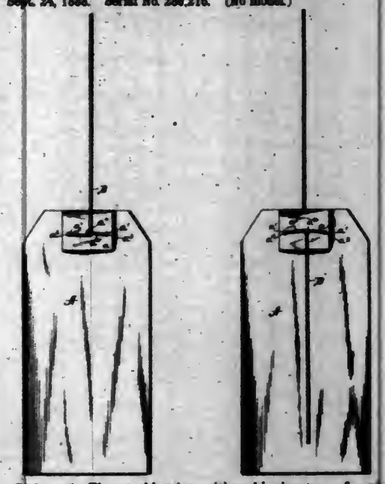
2. A flush-tank consisting of two chambers, a receiving-chamber and a discharging-chamber provided with a siphon discharge-pipe, the said receiving-chamber leading horizontally into said discharging-chamber through a vertical opening or passage-way, while the bottom of said discharging-chamber is sunk below the level of the bottom of said receiving-chamber, and the inlet-mouth of said siphon is in said sinkage, the operative capacity of the passage-way between the two chambers during the last part of the operation being smaller than that of the siphon, substantially as described.

403,778. ROTARY HARROW. ROLAND RAKESTRAW, Wyoming, Ill. Filed June 16, 1888. Serial No. 277,205. (No model.)

Claim.—1. In a rotary harrow, the combination, with a draft-beam, of a center piece provided with a central bolt-aperture, a series of division-walls and upper and lower rundles or cross-bars, and a series of harrow-sections provided with hooks to connect with said center piece, substantially as and for the purpose described.

2. The combination, with the center piece of a rotary harrow, of a series of harrow-sections, each of which is provided with a main beam, B, which is provided with a hook at its inward end, a beam, *b*, extending from each side of beam B, curved braces *d*, and rods *f*, provided with loops at their extremities, and hooks for connecting the said sections, substantially as and for the purposes described.

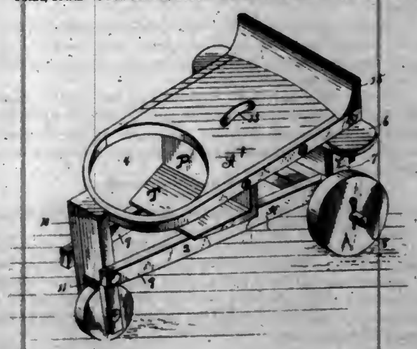
3. In a rotary harrow, a series of beams provided with teeth, said beams being provided with runners fastened to their lower sides and bent inward toward the center of the harrow, substantially as set forth and described.



4. The center piece provided with division-walls and bars *c c'*, in combination with the draft-beam provided with the stirrup *m*, which rests on the center piece, and a central securing-bolt, substantially as set forth and described.

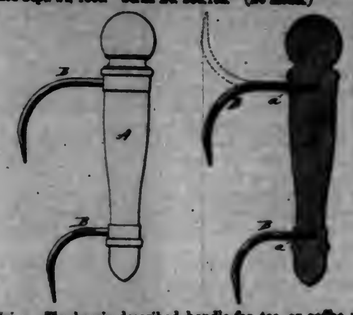
408,779. WATCH-CASE PENDANT. EDMOND C. ROBERT and ISIDORA JOSEPH, Waco, Tex. Filed Sept. 22, 1888. Serial No. 286,086. (No model.)

Claim.—The combination, with the pendant provided on its sides with arms, of a stem provided on its upper end with threads and on its lower end with an opening, the collar mounted on the stem and provided with a flange, and a collar located within the pendant and engaging the collar on the stem, substantially as specified.



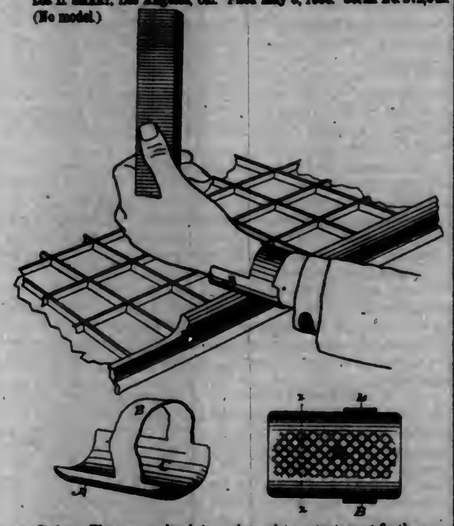
408,780. SHIPPING-TAG. FRED. G. ROTH, Morrice, Mich. Filed Sept. 24, 1888. Serial No. 286,216. (No model.)

Claim.—1. The combination, with a shipping-tag, of a wire having its ends inserted through the end openings in the strengthening-pieces, and one end passed through the center opening and under a loop on the opposite side of the tag, substantially as described.



2. The combination, with a shipping-tag, of a wire having its ends inserted through the end openings in the strengthening-pieces, and one end passed through the center opening and under a loop on the opposite side, and the other end passed through the loop a^2, formed by the portion which passes through the center, and forming a bearing for the said end, both ends having a bearing, so as to prevent the wire tearing out the holes in the strengthening-pieces, substantially as described.

403,781. MILKING-STOOL. OLIVER G. SCRIVEN, Strawberry Point, Iowa. Filed Nov. 3, 1888. Serial No. 289,927. (No model.)

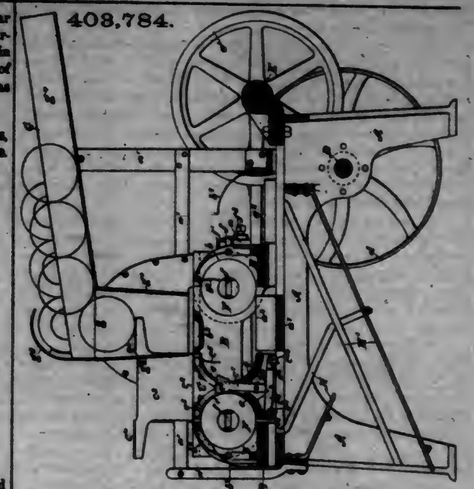


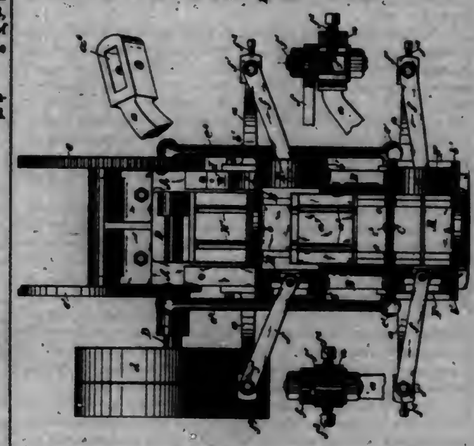
Claim.—In a milking-stool, the combination, with the triangular frame mounted on wheels, of the seat portion provided with the circular opening at its front portion, the interposed vertical guard in rear of the circular opening, and the inclined tilting board in front of the vertical guard and beneath the circular opening, substantially as described.

408,782. HANDLE FOR TEA OR COFFEE POTS. REMBRANDT SMITH, Meriden, Conn., assignor to Manning, Bowman & Company, same place. Filed Sept. 24, 1888. Serial No. 286,102. (No model.)

Claim.—The herein-described handle for tea or coffee pots and like vessels, consisting of the non-metallic body A, and the arms B B, screwed into the body A, one near each end, the projecting ends of said arms flattened and bent to the required angle and adapted to be secured to the vessel, substantially as described.

408,783. COMPOSITOR'S BRACELET WRIST-PROTECTOR. CARLOS L. SHARP, Los Angeles, Cal. Filed May 3, 1888. Serial No. 272,648. (No model.)





Claim.—The compositor's bracelet wrist-protector set forth, comprising a soft-rubber pad oblong in form having one side flat and provided with a roughened surface, and having the other side concave to fit the wrist, and provided near one end with a broad elastic band to encircle the wrist.

408,784. MACHINE FOR HEADING CANS. WILLIAM H. SMITH, Berkeley, Cal. Filed Nov. 22, 1888. Serial No. 291,593. (No model.)

Claim.—1. In a can-heading machine, the combination of a moving cross-head having a jaw for fitting one side of the can, a movable carriage having a jaw for fitting the other side, whereby the can is held between the jaws and moved with them, said carriage also receiving and carrying the heads, and pressers adapted to force the heads on the cans while the parts are in motion, substantially as described.

2. In a can-heading machine, the combination of a moving cross-head having a jaw for fitting one side of the can, a movable carriage having a jaw for fitting the other side, movable pressers, and connections for operating them through the movement of the carriage, said pressers being seated in the carriage at each end of its jaw for forcing the heads on the can, substantially as described.

3. In a can-heading machine, the combination of a moving cross-head having a jaw for fitting one side of the can, a movable carriage having a jaw for fitting the other side, pressers seated in the carriage at each end of its jaw for forcing the heads on the can, and pivoted toggle-levers operated by the movement of the carriage to operate the pressers, substantially as described.

4. In a can-heading machine, the combination of a stand having fixed side arms, a moving cross-head mounted on said stand and having a jaw for fitting one side of the can, a movable carriage mounted on the stand and having a jaw for fitting the other side of the can pressers seated in the carriage at each end of its jaw for forcing the heads on the can, and toggle-levers pivoted to the pressers and to the fixed arms of the stand, whereby they operate the pressers through the movement of the carriage, substantially as described.

5. In a can-heading machine, the combination of a moving cross-head having a jaw for fitting one side of the can, a movable carriage having a jaw for receiving the other side of the can, said carriage being mounted in the path of the cross-head, whereby it derives its movement therefrom, pressers seated in the carriage at each end of its jaw for forcing the heads on the can, and power-connections with the pressers for operating them through the movement of the carriage, substantially as described.

6. In a can-heading machine, the combination of a moving cross-head having a jaw for fitting one side of the can, a movable carriage having a jaw for receiving the other side of the can, the jaws clamping the can between them, said carriage being mounted in the path of the cross-head, whereby it derives its movement therefrom through the intervention of the can, pressers seated in the carriage at each end of its jaw for forcing the heads on the can, and power-connec-

tions with the pressers for operating them through the movement of the carriage, substantially as described.

7. In a can-heading machine, the combination of a stand having fixed side arms, a moving cross-head mounted on the stand and having a jaw for fitting one side of the can, a movable carriage mounted on the stand and having a jaw for receiving the other side of the can, said carriage being mounted in the path of the cross-head, whereby it derives its movement therefrom, pressers seated in the carriage at each end of its jaw for forcing the heads on the cans, and toggle-levers pivoted to the pressers and to the fixed arms of the stand, whereby they operate the pressers through the movement of the carriage, substantially as described.

8. In a can-heading machine, the combination of a reciprocally-moving cross-head having a jaw on each side, a movable carriage having a jaw in each end and mounted over the cross-head, whereby it lies in the path thereof and derives a reciprocating movement therefrom, pressers seated in each end of the carriage at each end of its jaws, and power-connections with the pressers for operating them through the movement of the carriage, substantially as described.

9. In a can-heading machine, the combination of a stand having fixed side arms at each end, a reciprocally-moving cross-head mounted on the stand and having a jaw on each side, a movable carriage mounted on the stand and having a jaw in each end, said carriage being over the cross-head and in the path thereof, whereby it derives a reciprocating movement therefrom, pressers seated in each end of the carriage at each end of its jaws, and toggle-levers pivoted to the pressers and to the fixed arms of the stand, whereby they operate the pressers through the movement of the carriage, substantially as described.

10. In a can-heading machine, an open-topped stand having supporting-ribs a^3, leaving a discharge-opening for the cans on each side thereof, and the runways H H', communicating with said openings, in combination with a reciprocating cross-head having a jaw on each side, a movable carriage having a jaw in each end and mounted on the stand over and in the path of the cross-head, whereby it receives a reciprocatieg motion therefrom, pressers seated in the ends of the carriage for forcing the heads on the cans, and power-connections with the pressers for operating them through the movement of the carriage, substantially as described.

11. In a can-heading machine, the combination of a reciprocally-moving cross-head having a jaw on each side, a jaw opposing each of said cross-head jaws and separated sufficiently to permit the movement of the cross-head between them, whereby cans are received between the jaws alternately at each end, and pressers for forcing the heads on the cans when confined by the jaws, substantially as described.

12. In a can-heading machine, a jaw for receiving the can and ribs for temporarily supporting the can, in combination with a moving cross-head having a jaw for clamping the can between it and the receiving-jaw, and a top forming a temporary support for the can before it drops between the jaws, substantially as described.

13. In a can-heading machine, a jaw for receiving the can and ribs a^3, for temporarily supporting said can, in combination with a moving cross-head having a jaw for clamping the can between it and the receiving-jaw, and a top on which the can rests before dropping between the jaws, and a fixed plate for pushing the can off the cross-head top by the movement of said cross-head, substantially as described.

14. In a can-heading machine, a jaw for receiving the can and ribs a^3, for temporarily supporting said can, in combination with a moving cross-head having a jaw for clamping the can between it and the receiving-jaw, and a top affording a temporary support for the can, a fixed plate for pushing the can off the cross-head top by the movement of said cross-head, and a runway above for feeding the cans, having an opening for directing them upon the cross-head top, substantially as described.

15. In a can-heading machine, a jaw for receiving the can and ribs a^3, for temporarily supporting said can, in combination with a moving cross-head having a jaw for clamping the can between itself and the receiving-jaw, and a top affording a temporary support for the can, a fixed plate for pushing the can off the top of the moving cross-head, flange-plate c^3, secured to said cross-head and having top flanges, c^4, for temporarily supporting the can above the cross-head top, and a runway for the cans, having an opening for directing them onto the flanges c^4, substantially as described.

16. In a can-heading machine, the open-topped stand A, having the can-supporting ribs a^3, and the movable carriage having a can-receiving jaw and mounted on the stand to move to and from the supporting-ribs a^3, in combination with a moving cross-head mounted on the stand and having a jaw for clamping the can between itself and the receiving-jaw of the carriage, substantially as described.

17. In a can-heading machine, the open-topped stand A, having the can-supporting ribs a^3, and the movable carriage having a can-receiving jaw and mounted on the stand to move to and from the supporting-ribs a^3, in combination with the moving cross-head mounted on the stand and having a jaw for clamping the can between itself and the receiving-jaw of the carriage, said cross-head having a top, c^3, for temporarily supporting the can, the fixed plate for pushing the can off the cross-head top, the supporting-flanges c^4, carried by the cross-head for temporarily supporting the can above the cross-head top, and the runway and opening g, for directing the cans onto the supporting-flanges, substantially as described.

18. In a can-heading machine, the open-topped stand A, having the fixed can-supporting ribs a^3, and the fixed runway G, having the opening g, with back and front guide-plates, g' g^2, in combination with the reciprocally-moving cross-head C, mounted on the stand and having a jaw, c, on each side and a top, c^3, the side plates, c^2, carried by the cross-head and having top supporting-flanges, c^4, on each end, and the movable carriage B, mounted on the stand over the cross-head and having a receiving-jaw, b, at each end, said carriage being in the path of the moving cross-head, whereby it derives a reciprocating motion therefrom, substantially as described.

19. In a can-heading machine, the carriage having a can-receiving jaw in its end, slots b^2 in the ends of its sides, for directing the heads into each end of the jaw, and a groove, b^3, in the top of its sides, for directing the can-heads to the slots, in combination with runways above for the heads and channels for directing the heads from the runways to the grooves b^3 of the carriage, substantially as described.

20. In a can-heading machine, the stand having the frame a', with side plates forming the channels a^2, and the runways g^4, formed by plates supported by frame a' and communicating with the channels a^2, in combination with the carriage mounted on the stand and having a can-receiving jaw, b, the slots b^2 in the ends of the carriage sides, for directing the heads into the ends of the receiving-jaw, and the grooves b^3 in the tops of the carriage sides, communicating with the channels a^2 and the slots b^2, substantially as described.

21. In a can-heading machine, the stand having the frame a', with side plates forming channels a^2, and the runways g^4, formed by plates supported by frame a' and communicating with the tops of the channels a^2, in combination with the movable carriage B, mounted on the stand and having a can-receiving jaw, b, in each end, the slots b^2 in the ends of the carriage sides, for directing the heads into the ends of the receiving-jaws, the grooves b^3 in the tops of the carriage sides, communicating with the channels a^2 and slots b^2, and the stop-flanges b^4, carried by the carriage and traversing the channels a^2, whereby the heads are directed alternately to each end of the carriage, substantially as described.

22. In a can-heading machine, the stand having a frame, a', with side plates forming channels a^2, each of which is divided into a forward and back portion by a rib, a^4, and the runways g^4, formed by plates supported by frame a' and communicating with the tops of the channels a^2, in combination with the reciprocating cross-head C, having a jaw, c, in each side, the movable carriage B, mounted over and in the path of the cross-head, whereby it derives a reciprocating motion therefrom, said carriage having a jaw, b, at each end, slots b^2 in the ends of its sides, and grooves b^3 in the tops of its sides, communicating with the slots and with the channels a^2, and the stop-flanges b^4, carried by the carriage and traversing the channels a^2, whereby the heads are directed alternately to each end of the carriage, substantially as described.

23. In a can-heading machine, the stand having a frame, a', with side plates forming channels a^2, each of which is divided into a forward and back portion by a rib, a^4, and the runways g^4, formed by plates supported by frame a' and communicating with the tops of the channels a^2, in combination with the reciprocating cross-head C, having a jaw, c, in each side, the movable carriage B, mounted over and in the path of the cross-head, whereby it derives a reciprocating motion therefrom, said carriage having a jaw, b, at each end, slots b^2 in the ends of its sides, and grooves b^3 in the tops of its sides, and the stop-flanges b^4, carried by the carriage and traversing the channels a^2, whereby the heads are directed alternately to each end of the carriage, and the pressers F, seated in the carriage ends, substantially as described.

24. In a can-heading machine, the open-topped stand A, having the can-supporting ribs a^3 and the fixed arms a, the frame a', the runway G for the cans and runways g^4 for the heads in the top of the frame, the guide-plates g' g^2 in the opening of the runway G, and the divided channels a^2, communicating with the ends of runways g^4, in combination with the reciprocating cross-head C, mounted on the stand and having a jaw, c, in each side, and a can-supporting top, c^3, and the side flange-plates, c^2, carried by the cross-head and having can-supporting flanges c^4, the movable carriage B, mounted on the stand over and in the path of the cross-head, whereby it receives a reciprocatieg motion therefrom, said carriage having a jaw, b, in each end, a slot, b^2, in the ends of its sides, and a groove, b^3, in the tops thereof for directing the can-heads to each end of the carriage-jaws, and the stop-flanges b^4, traversing the channels a^2, whereby the heads are directed alternately to each end of the carriage, the pressers F, seated in the carriage ends, and the toggle-levers f, pivoted to the pressers and to the fixed arms a of the stand, whereby the pressers are operated through the movement of the carriage, substantially as herein described.

25. In a can-heading machine, the reciprocating cross-head C, and the carriage B, deriving its movement from the cross-head, in combination with the stand and the binding-springs I on the stand-top, and on which the carriage rests and travels, substantially as and for the purpose herein described.

26. In a can-heading machine, the reciprocating cross-head and movable carriage, as described, in combination with the pressers F, seated in the carriage, the fixed arms a, the toggle-levers f, pivoted to the pressers, and the adjustable connection between the outer ends of the toggle-levers and the arms a, consisting of the movable pivot-pins f^* and the end and side set-screws, f^2 f^3, substantially as herein described.

27. In a can-heading machine, the pressers F, consisting of a shell having an inner flange, f^4, and an internally-threaded outer end, the bearing-plate f^5, fitted in the shell and receiving the connecting-pin, the cushion f^7 between the face of the bearing-plate and the inner flange, f^4, of the shell, and the glazed-nut f^6, fitted in the internally-threaded outer end of the shell and bearing against the plate f^5, substantially as herein described.

28. In a can-heading machine, the open-backed receiving-jaws b and the movable clamping-jaws c, between which the cans are held while being headed, in combination with the springs b^7, bearing on the cans through the open back of the receiving-jaws for throwing them out when relieved by the clamping-jaws, substantially as herein described.

29. In a can-heading machine, the movable carriage having open-backed jaws b, and the moving cross-head having jaws c, the cans being held between the jaws b and c, in combination with stationary springs b^7, adapted to press on the cans through the open backs of the jaws b and throw them out when relieved by the jaws c, substantially as herein described.

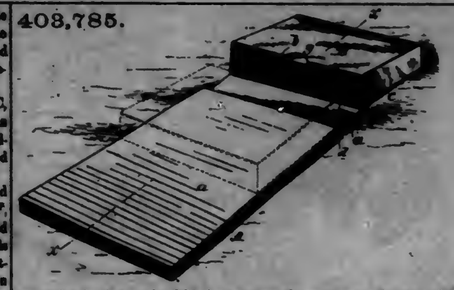
30. In a can-heading machine, the can-holding jaws b and c, in combination with the springs b^8 c^8 in the tops of the jaws b and c, respectively, for bearing down on and throwing the cans downwardly when relieved, substantially as herein described.

31. In a can-heading machine, the can-holding jaws b and c, in combination with the springs b^7, acting against the backs of the cans, and the springs b^8 c^8, acting on their tops to throw them outwardly and downwardly when relieved, substantially as herein described.

32. In a can-heading machine, the moving cross-head C, having the jaw c on each side, in combination with the pivoted swinging lever c^7, mounted in the cross-head, and having a head, c^8, the edges of which are adapted by the swinging of the lever to project alternately into the jaws c on each side, whereby the cans are thrown out of the jaws when relieved, substantially as described.

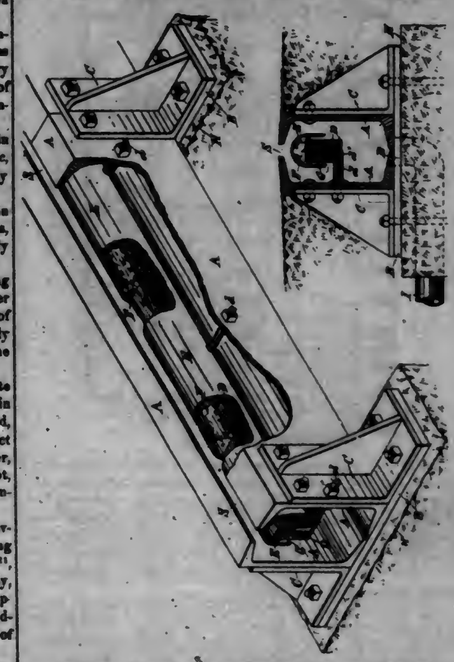
33. In a can-heading machine, the stand having the cross-plate a^7, and the moving cross-head C, having the jaw c on each side, in combination with the pivoted lever c^7, mounted in the cross-head, and having a head, c^8, the edges of which are adapted to project alternately into the jaws c on each side, the cross-foot c^9 of the lever, and the pivoted and limited cam-lugs c^{10} in the ends of the foot, adapted to come in contact with the plate a^7 of the stand, substantially as herein described.

34. In a can-heading machine, the carriage B, having the receiving-jaw b for the cans and a space at each end thereof for receiving the can-heads, said space and jaw having the straight planes b^{11}, inwardly-tapering planes b^{12}, and the straight planes b^{13}, respectively, as described, in combination with the cross-head C, having the clamping-jaw c, with its ends formed with straight planes c^{12}, corresponding to the straight planes b^{13} of jaw b and joining the taper planes of the spaces at the ends of said jaws, substantially as described.



35. In a can-heading machine, the carriage B, having the receiving-jaw b for the cans and a space at each end thereof for receiving the can-heads, said space and jaw having the straight planes b^{11}, inwardly-tapering planes b^{12}, straight planes b^{13}, and inwardly-tapering planes b^{14}, respectively, as described, in combination with the cross-head C, having the clamping-jaw c, with its ends formed with straight planes c^{12} and inwardly-tapering planes c^{13}, substantially as and for the purpose herein described.

403,785. STATIONERY-PACKET. HORATIO W. SOUTHWORTH, Springfield, Mass. Filed Jan. 14, 1889. Serial No. 296,273. (No model.)

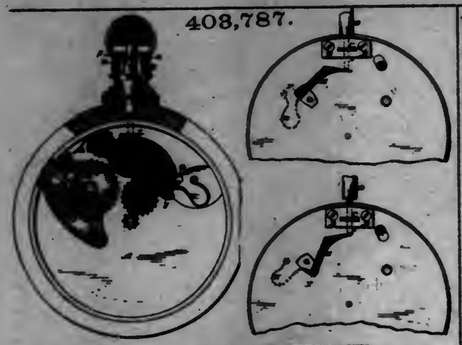


Claim.—1. Supporting and inclosing devices for writing-paper and envelopes, consisting of a book of rigid or semi-rigid material to constitute the base of a pad of writing-paper provided with an extension, C, carrying a case for envelopes having an open end which lies toward and a short distance from the line of the end of the pad, the portion of said extension between the open end of the case and the said end line of the pad being creased, as described, whereby said extension-back may be folded to present the case upon the top of the pad, with its open end closed by said intermediate portion of the extension, substantially as and for the purpose described.

2. In a stationery-packet, the combination, with a back, A, having an extension, C, the intermediate portion, m, of which being adapted to be bent in folding-lines d f, and the case B, formed on said extension, with its closed end coincident with the end of said extension and its open end with the folding-line m, of a pad of writing-paper on said back proper, with its one end coincident with the folding-line d of the said extension, substantially as and for the purpose described.

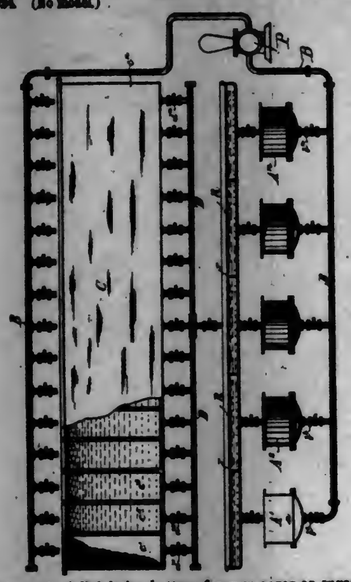
403,785.

403,786. ELECTRIC RAILWAY. FRANCIS M. SPRAGUE, San Francisco, Cal. Filed Jan. 30, 1888. Serial No. 262,067. (No model.)



Claim.—1. In an electric-railway conduit, the combination which consists of a conductor having an inverted-U-shaped cross-section, its open side down, a strip of insulating material parallel with and in the interior of said conductor, insulated and supported from the conduit-walls, and insulators interposed between said conductor and said strip.

2. In an electric-railway conduit, the combination which consists of the walls A A of the conduit, the supporting-brackets d d, the strip D of insulating material, the insulators F, and the conductor E, substantially as and for the purpose described.



403,787. STEM WINDING AND SETTING WATCH. OSCAR F. STENDAHL, Havana, Ohio. Filed Apr. 12, 1888. Serial No. 270,445. (No model.)

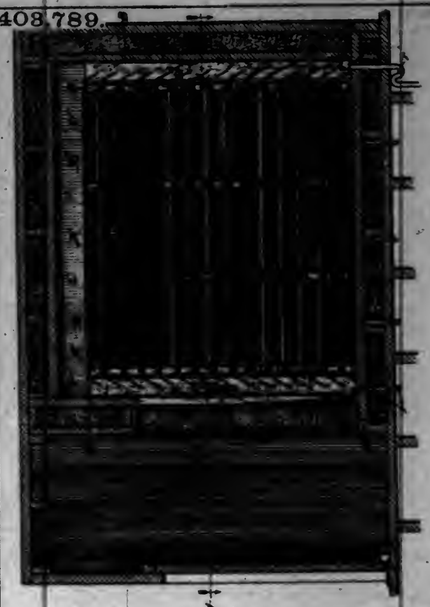
Claim.—The combination of the endwise-moving winding-stem provided with a stop, P, and a spring or springs with the sleeve which is secured inside of the pendant and has an inclined shoulder at its outer end, substantially as set forth.

408,787.

408,788. LIXIVIATING-BATTERY FOR RAW SUGAR. CARL STIEVEN, Vienna, Austria-Hungary. Filed Dec. 20, 1888. Serial No. 294,294. (No model.)

Claim.—1. A lixiviating-battery for raw sugar or sugar mass, consisting of a central cellular vessel for containing the graded lixiviating material, a series of lixiviating-vessels for containing the sugar to be treated, and an interposed distributer having independent connection with each cell of the charging-vessel and in connection with each lixiviating-vessel of the series, whereby the contents of each cell are distributed and applied equally to the sugar in each lixiviating-vessel, substantially as described.

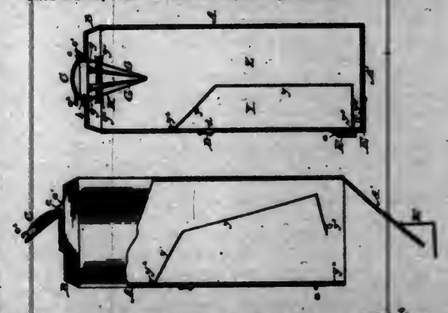
2. A lixiviating-battery consisting of the cellular vessel C, a series of lixiviating-vessels for the sugar to be treated, an interposed distributer, connections from each cell to the distributer, connections from the distributer to each lixiviating-vessel, and a return-pipe connecting with each lixiviating-vessel leading to the vessel C, with connections from said pipe to each cell, substantially as described.



3. In combination with the cellular vessel C and the lixiviating-vessels, an interposed distributer divided into compartments equal in number to the number of lixiviating-vessels, and with a capacity equal to the contents of one cell, substantially as described.

4. In combination, a cellular vessel, C, a series of lixiviating-vessels, a distributer, R, valved pipe-connections from the bottom of each cell to a pipe, D, a valved connection between said pipe and the distributer, and a valved connection from each compartment of the distributer to a lixiviating-vessel, substantially as described.

408,789. REFRIGERATOR. JOHN SWEITZER, Chicago, Ill., assignor of one-half to John H. Rapp, same place. Filed May 1, 1888. Serial No. 272,457. (No model.)



Claim.—1. In a refrigerator, the combination of an inclosure and a series of plates, F, supported in oblique position with reference to the wall, one above the other adjacent to the wall-surface and out of contact with the same along their lower edges, and each plate extending at its upper edge to or beyond the lower edge of the plate above it, the plates affording, with their support and the wall-surface, upwardly-flaring compartments G, to contain ice H, and intercommunicating vertically along the wall, thereby permitting the ice to be supplied to all the said compartments through the uppermost compartment, substantially as described.

408,789.

2. In a refrigerator, the combination of an inclosure and a series of plates, F, removably supported in oblique position with reference to the wall, one above the other adjacent to the wall-surface and out of contact with the same along their lower edges, and each plate extending at its upper edge to or beyond the lower edge of the plate above it, the plates affording their support and the wall-surface upwardly-flaring compartments G, for containing ice H, and intercommunicating vertically along the wall, thereby permitting the ice to be supplied to all the said compartments through the uppermost compartment, substantially as described.

408,790. LETTER-BOX. FARRIS T. TAYLOR, Mamaroneck, N. Y. Filed Jan. 20, 1888. Serial No. 266,019. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the letter-box divided into two compartments and having an opening at the top for the reception of packages, &c., an opening at the side for the reception of letters, an opening at the bottom through which mail-matter from both compartments may be taken, a bottom piece hinged to the lower end of the box and closing the delivery-opening therein, and covers or lids for the openings in the top and side of the box.

2. The combination, substantially as hereinbefore set forth, of the outer casing, the inner casing hinged to the outer casing, the bottom piece of the outer casing hinged to its lower end, said inner casing having an inclined top, and the outer casing being provided at the top with an opening for the reception of parcels and at the side with an opening for the reception of letters.

3. The combination, substantially as hereinbefore set forth, of a letter-box having an opening in its top, a lid to cover said opening, and a series of hinged spring-actuated sharp-pointed guard-bars within the box around its opening.

4. The combination, substantially as hereinbefore set forth, of the letter-box having an opening in its top, the sharp-pointed guard-bars arranged around said opening, the lugs to which the guard-bars are hinged, the pins projecting from the rear faces of the guard-bars, and the annular coiled spring embracing the guard-bars between the pins and normally holding the sharp-pointed lower ends of the guard-bars together.

408,791. MACHINE FOR CUTTING RIGHT AND LEFT THREADS ON NIPPLES. HARRISON H. TAYLOR, Detroit, Mich., assignor to the Michigan Radiator and Iron Manufacturing Company, same place. Filed Sept. 25, 1888. Serial No. 286,262. (No model.)

Claim.—1. In a screw-threading machine, the combination, with a support, of rotatable reciprocatory cutter-spindles located end to end, and a rotatable laterally-movable chuck to hold the work adjacent to the cutters, substantially as set forth.

2. In a screw-threading machine, the combination, with a support, of cutter-spindles, each having a rotatable and reciprocatory movement in said support end located end to end, a rotatable chuck to hold the work adjacent to the cutters, and mechanism to simultaneously reciprocate and rotate such spindles, substantially as set forth.

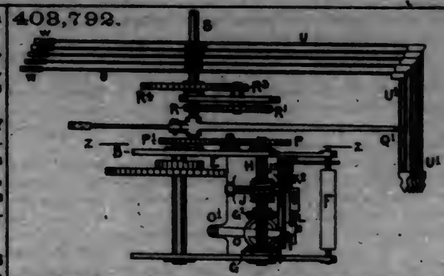
3. In a screw-threading machine, the combination, with a support, of rotatable cutter-spindles located end to end and provided each with a multiple cutter, a rotatable chuck to hold the work, and means to feed the cutters apart when in engagement with the work, substantially as set forth.

4. In a screw-threading machine, the combination, with a support, of sliding beds A' A^3, connected with a feed-screw having a right and left hand engagement with said beds, worm-gear to rotate said feed-screw, and mechanism to actuate said worm-gear, said beds provided each with a cutter-spindle, substantially as set forth.

5. In a screw-threading machine, the combination, with a support, of sliding beds A' A^3, cutter-spindles journaled in said beds, a rotatable chuck to engage the work, and mechanism to simultaneously reciprocate said beds and rotate said spindles, substantially as set forth.

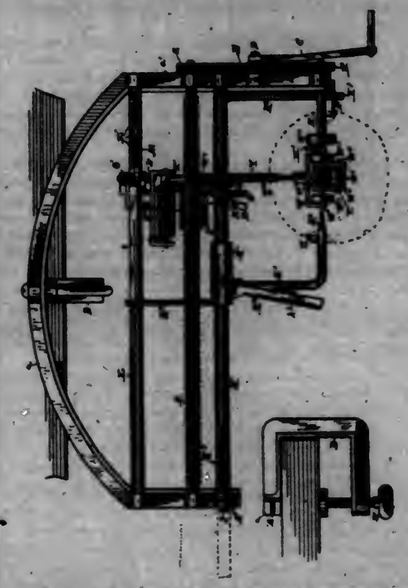
6. In a screw-threading machine, the combination, with a support, of sliding beds A' A^3, rotatable cutter-spindles journaled in said beds, a feed-screw having a right and left hand engagement with said beds, a chuck to hold the work, and mechanism to rotate said feed-screw and said chuck, substantially as set forth.

7. In a screw-threading machine, the combination, with a support, of a rotatable chuck to engage the work, sliding beds connected with a feed-screw having a right and left hand screw-tapped engagement therewith, cutter-spindles journaled in said beds, worm-gear to rotate said feed-screw, and mechanism to rotate said worm-gear, substantially as set forth.



8. In a screw-threading machine, the combination, with a support, of sliding beds A' A^3, a feed-screw having a right and left hand screw-tapped engagement with said beds, a worm-gear loosely mounted upon the feed-screw, a handle having a screw-tapped engagement with said screw, whereby the gear may be tightened thereupon, and a worm meshing with said gear, substantially as set forth.

408,792. MUSIC-LEAF TURNER. THOMAS W. TWELEY, Sheffield, County of York, England. Filed Oct. 9, 1888. Serial No. 287,622. (No model.)



Claim.—1. The shaft S, combined with the series of cranks T and corresponding balanced arms, U, arranged substantially as described, whereby on the rotation of the shaft S the respective projections U' are brought nearer and consecutively into the required position on one side the shaft and further away from the center on the other, for the purpose herein set forth.

2. The combination, with the shaft S, having the series of cranks T and the corresponding number of balanced arms U, having projection U', of the revolving arm Q, and operating-gearing connecting the revolving arm with the shaft having the cranks, substantially as described.

408,792.

408,793. VEGETABLE-PARER. HENRY G. THOMAS, Cheyenne County, Nebr., assignor to William Holt, Denver, Colo. Filed July 21, 1888. Serial No. 280,667. (Model.)

Claim.—1. In a parer, the combination of the vegetable-holding devices with the paring devices, consisting of a movable sleeve, a rod pivotally connected thereto, the knife-holder frame mounted on the end of said rod, and the rollers and knife and its controlling-spring on said frame, all substantially as described.

2. The combination of the vegetable-holding devices, the threaded rod, the sleeve moving thereon, and the knife-supporting spring-controlled rod carried by said sleeve, with the knife-carrying frame mounted on said rod and the guide-rollers and knife mounted in said frame, substantially as described.

3. The combination of the screw-shaft and sleeve thereon, the described paring devices, with the threaded clutch attached to said sleeve and engaging the shaft through an opening in the sleeve, and the dog pivoted on said sleeve and engaging the clutch, all substantially as described.

4. The combination of the frame, the shaft and sleeve, the paring devices, and the revolving brad, with the adjustable brad, its dog K^4, and collar K', substantially as described.

5. The combination of the frame and paring devices, the revolving brad H', and the shaft and sleeve, with the collar K', its dog and brad K^2, and hook K', all substantially as described.

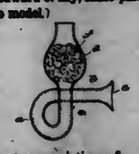
6. The combination of a revolving brad, H', the brad K^2, and the adjustable collar K' and its locking-dog, with the screw-shaft, the collar engaging the same carrying the paring devices and having a projecting arm adapted to engage collar K' upon the completion of the paring operation, substantially as specified.

7. The combination of the movable sleeve with the spring-controlled rod T^2, mounted thereon, the frame mounted on the end of

said rod, the guide-rollers mounted on said frame, and the spring-controlled knife, substantially as described.

8. The combination of the screw-shaft, the sleeve having a threaded clutch engaging said shaft, and the spring-controlled rod pivotally connected to and supported upon said sleeve, with the frame attached to the end of said rod having guide-rollers W^3, the knife mounted in said frame, and the roller W^4, for said knife and its controlling-spring, all substantially as described.

9. The combination of the holding devices for the fruit with a movable sleeve, a spring-controlled rod mounted thereon, the devices for rotating said rod, the frame on the end of said rod carrying guide-rollers, a spring-controlled knife, and a roller-guide therefor, and the spring for retaining said frame in position, substantially as described.



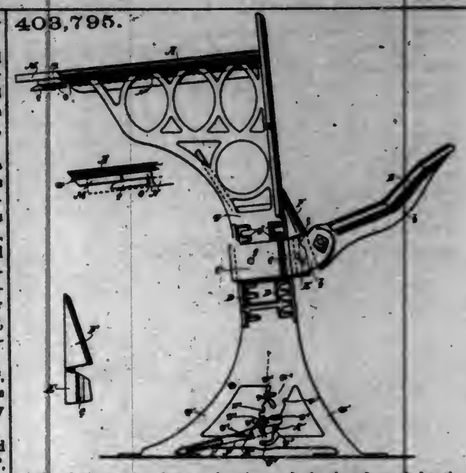
10. The combination of the main frame, the screw-shaft and revolving brad, the gearing for driving the same, and the sleeve having a half-nut or clutch engaging said screw-shaft with spring-controlled rod T^3, carried upon a frame mounted on said sleeve, the sector M, notched bar L, the spring-controlled frame on the end of shaft T^3, and the rollers and spring-controlled knife on said frame, all substantially as described.

11. The combination of the revoluble brad H', having blade H^3, and knife A', secured to the frame with the screw-shaft, the sleeve thereon, and the paring devices carried by said sleeve, substantially as described.

12. The combination of the frame, the screw-shaft I, and brad H', and gearing for driving the same, with the bar L, the sleeve P, having a half-nut or clutch engaging shaft I, and a frame thereon carrying a rod, T^3, provided with a segment, M, engaging bar L, to rotate the rod, the cutting devices on the end of rod T^3, and the shaft J and adjustable collar K' and brad K^3 thereon, all substantially as specified.

13. The combination of the frame, the revoluble screw-shaft I, and brad H', and the fixed rods J and L, with the sleeve P, mounted on shaft I, and having a clutch, S, engaging the same, the spring-controlled rod T^3, mounted on a frame on said sleeve, the knife-bearing frame mounted on said rod and the rollers thereon, and the sleeve K on rod J, its hoop K^1, and the collar K', having arm K^2, brad K^3, and its locking-dog, all constructed and arranged substantially as described.

403,794. NASAL IRRIGATOR. JOHN B. THOMPSON, Boston, Mass., assignor of one-half to Edward O. Ely, same place. Filed Aug. 21, 1886. Serial No. 211,545. (No model.)



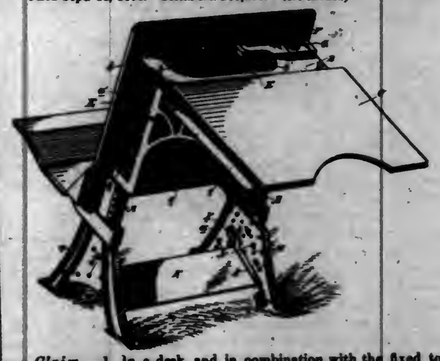
Claim.—A nasal irrigator consisting of a tube having a bulb at one end to enter the nostril, a mouth-piece at the other end to enter the mouth, said tube being bent over upon itself intermediate of its length, substantially as shown, to form a looped portion, *a*, to constitute a liquid-holding well below the said bulb, the opposite ends of the tube extending substantially at right angles with relation to each other from the looped portion *a*, as and for the purpose set forth.

403,795. SCHOOL-DESK. CHARLES R. TOWLE, San Francisco, Cal. Filed July 27, 1888. Serial No. 281,283. (No model.)

Claim.—1. In a school-desk, the sides thereof formed with longitudinal grooves and short intersecting grooves, arranged at right angles therewith, the seat, the clevises or brackets secured to said seat and embracing the sides and having pins or studs projecting from the inner sides and engaging said grooves, whereby said seat is vertically adjusted, and the movable stops E, fitted between the front sides of the clevises or brackets and back of the seat, whereby said clevises or brackets and seat are retained in position after adjustment, substantially as described.

2. In a school-desk, the sides of the desk and the seat having supporting-irons, in combination with a means for connecting the seat to the sides and adapting it to be vertically adjusted, consisting of the clevises or brackets, to which the supporting-irons of the seat are hinged, said clevises or brackets embracing the sides, the longitudinal grooves and short cross-grooves in the sides, the pins or studs in the clevises or brackets fitting in said grooves, and the removable stops E in the front ends of the clevises or brackets for holding their pins in the grooves and locking the seat, substantially as herein described.

3. In a school-desk, and in combination with its sides and the seat, the means for connecting the seat and adapting it to be vertically adjusted, consisting of the clevises or brackets hinged to the seat and embracing and movable on the sides, the longitudinal and cross grooves in the sides, and the studs or pins in the clevises or brackets fitting the grooves, the grooved stops fitting pins in the forward ends

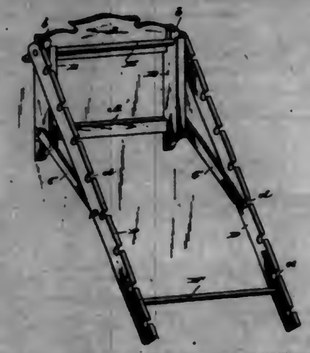


of the clevises or brackets, and acting as locks therefor and for the hinged seat, and the independent movable strip by which the stops are carried, said strip bearing against the forward edge of the side of the desk and against said bracket, to hold the latter in its forward position, substantially as herein described.

4. In a school-desk, its legs having a vertical series of notches on each edge, in combination with the vertically-adjustable foot-rest, having end arms provided with pivot-pins K, and adapted to fit in the notches of different series, whereby the foot-rest may be changed in position and turned into or out of use, and the locking-pins K' on each side of the pivot-pins and adapted to fit in the notches of different series on each edge of the legs, and to hold the foot-rest in position, substantially as herein described.

5. In a school-desk, the arm-rest hinged to the front edge of the desk-top, in combination with the sliding piece O, mounted under the desk-top and adapted to support the arm-rest when turned to position, and the short arm *o*, pivoted on the front of the sliding piece, for supporting the arm-rest when turned back under the desk-top, substantially as herein described.

403,796. SCHOOL-DESK. CHARLES R. TOWLE, San Francisco, Cal. Filed Sept. 11, 1888. Serial No. 285,130. (No model.)

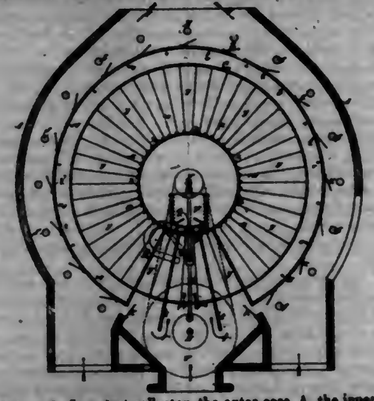


Claim.—1. In a desk, and in combination with the fixed top thereof, an adjustable top fitted and adapted to slide on the fixed top to or from the person and separated from said fixed top, whereby a space is left between them, substantially as herein described.

2. In a desk, the legs thereof having a vertical series of inclined rows of holes and projecting stop-lugs above and below said holes, in combination with the foot-rest having the end arms with projecting pins adapted to fit in said holes, and shorter projecting pins on opposite sides of the longer pins adapted to come in contact with the stop-lugs, substantially as herein described.

3. In a desk, and in combination with the legs thereof, having a vertical series of inclined rows of holes with projecting stop-lugs above and below each row, in combination with the foot-rest having the end arms with projecting pins adapted to fit the holes, and shorter projecting pins to come in contact with the stop-lugs, substantially as herein described.

4. In a desk, the legs thereof having holes more numerous in one leg than in the other and projecting stop-lugs above and below said holes, in combination with the foot-rest having the end arms with projecting pins adapted to fit the holes of the legs, and shorter pins on each side of the first-named pins adapted to come in contact with the stop-lugs, substantially as herein described.

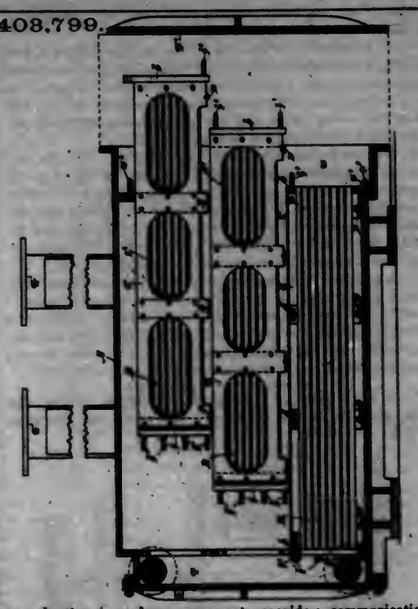


403,797. RACK FOR NEWSPAPER-FILES. CHARLES H. TOWER, Chippewa Falls, Wis. Filed Jan. 24, 1889. Serial No. 297,340. (No model.)

Claim.—1. In a newspaper file holder or exhibiting-rack, the combination of a rigid frame consisting of cross-bars A and A', having vertical side pieces, B B, the upper ends thereof being notched, supporting-bars D, connected to each other by cross-rods E and F, the bars D having notches *d d*, arms C C, pivoted to the outer edges of the vertical bars E and to the inner edges of the supporting-bars D, the parts being combined and organized substantially as shown, and for the purpose set forth.

2. The combination, in a newspaper file or rack, of a rigid frame having notches *b b*, arms C C, pivoted near the lower ends of the side pieces of the frame, the outer ends of said arms being pivoted to the inner sides of the supporting-bars D D, said supporting-bars being connected to each other by rods E F, the lower rod being of less length than the upper rod, substantially as and for the purpose set forth.

403,798. DUST-COLLECTOR. WILHELM TRAUTMANN, Berlin, Germany. Filed Oct. 27, 1887. Renewed Mar. 9, 1889. Serial No. 302,741. (No model.) Patented in England Oct. 19, 1887. No. 14,214.



Claim.—1. In a dust-collector, the outer case, A, the inner case, B, having valved openings, the shaft F, and the revolving drum C, inside the case B, provided with the compartments *g* in its periphery, and an air-exhaust operated by the shaft H and the rod *i*, and an induct and the fan D, the whole constructed and combined in the manner and for the purposes set forth.

2. In a dust-collector, as described, the drum C, constructed and intermittently rotated, as described, and combined with the pipes U, the tubes R, and the bellows V, the shaft H and rod *i*, operating said bellows, and the fan D, substantially as and for the purposes set forth.

403,799. SURFACE CONDENSER. BYRON W. TOWLE, San Francisco, Cal. Filed July 6, 1888. Serial No. 279,201. (No model.)

Claim.—1. In a surface condenser, independent sections or groups of tubes, each framed in by side plates and arranged adjacent

to each other in such a manner as to provide a communication between the sections and to permit each section to be independently removed and replaced in the condenser-shell without disturbing the others, substantially as herein described.

2. In a surface condenser, independent sections or groups of tubes, each framed in by side plates, said sections or groups being arranged the one above the other and communicating vertically, and adapted each to be separately removed from and replaced in the condenser-shell, substantially as herein described.

3. In a surface condenser, the independent sections or groups of tubes, each section or group having a tube-sheet at each end and side plates framing it in, whereby each section or group may be separately removed from and replaced in the condenser-shell without disturbing the others, substantially as herein described.

4. In a surface condenser, the independent sections or groups of tubes, each provided with a tube-sheet at each end, side plates by which each is framed in, and cross-plates bolted to the side plates and supporting the tubes between the tube-sheets, substantially as herein described.

5. In a surface condenser, independent sections or groups of tubes, each section or group having a tube-sheet at each end, side plates framing each in, and cross-plates for supporting the tubes between the tube-sheets, and rollers mounted in their lower portion, upon which said sections rest and travel, whereby they may be separately removed and replaced, substantially as herein described.

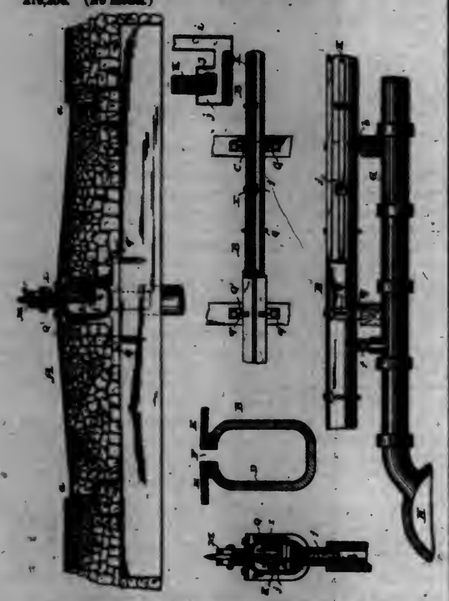
6. In a surface condenser, and in combination with the shell, independent sections or groups of tubes arranged in vertical series in the shell, each section or group having a tube-sheet at each end, side plates framing each in, and cross supporting-plates for the tubes, and rollers in the lower portion of each section or group, whereby said sections may be moved within the shell and upon each other and adapted to be readily drawn out and pushed in independently, substantially as herein described.

7. In a surface condenser, the shell A, having a back plate with holes and a front flange with fixed studs or bolts, in combination with the independent separately-removable sections or groups of tubes, each having a tube-sheet at its rear end with studs or bolts fitting in the holes of the back plate, and a front tube-sheet with holes fitting over the studs or bolts of the front flange, whereby said sections or groups are supported in the shell, substantially as herein described.

8. In a surface condenser, the shell A, having a back plate with holes and a front flange with fixed studs or bolts, in combination with the independent separately-removable sections or groups of tubes, each having a tube-sheet at its rear end with studs or bolts fitting in the holes of the back plate and a front tube-sheet with holes fitting over the studs or bolts of the front flange, the side plates framing in each section or group of tubes, and the cross-plates supporting the tubes between the tube-sheets, substantially as herein described.

9. In a surface condenser, the independent separately-removable tube sections or groups, in combination with the butt-straps secured

across their fronts and overlapping their adjacent edges, substantially as herein described.



10. In a surface condenser, the shell having fixed studs or bolts on its front, in combination with the independent separately-removable tube sections or groups having tube-sheets with holes fitting over the studs or bolts of the shell, whereby they are secured, and the butt-straps secured across the front of the sections and overlapping their adjacent edges, substantially as herein described.

11. In a surface condenser, and in combination with the shell thereof, the independent separately-removable tube sections or groups arranged in vertical series and each having tube-sheets bolted to the shell, and side plates and cross-plates, as described, whereby each may be slipped in or out without interfering with one another, and the butt-straps bolted across the front of the sections or groups and overlapping their adjacent edges, substantially as herein described.

12. In a surface condenser, the independent separately-removable sections or groups of tubes, each tube having an elongated shape in cross-section, said sections or groups being framed in by side plates and having cross-plates supporting the tubes between the ends, the sections resting upon one another in vertical series, whereby they may be separately slipped in or out, substantially as herein described.

408,800. SLOTTED CONDUIT FOR ELECTRIC CONDUCTORS.

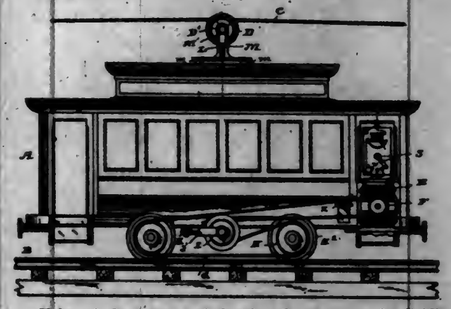
CHARLES J. VAN DEPOELE, Chicago, Ill. Filed June 6, 1888. Serial No. 276,262. (No model.)

Claim.—1. A metallic conduit for electric conductors, having a continuous interior lining of insulating material and a conductor and independent supports therefor within the conduit, substantially as described.

2. A conduit for electric conductors, comprising slotted metallic sections provided with a lining of fibrous material, impregnated with and secured to the inner walls of the said conduit by a plastic insulating compound.

3. A metallic conduit for electric conductors, having a continuous interior lining of insulating material, provided with outlets at suitable distances, and connections between said outlets, and a continuous drain independent of the conduit structure and extending along the line of the conduit, substantially as described.

4. The combination of a conduit inclosing an electric supply conductor or conductors, and formed with outlets therefrom, connections between said outlets and a drain-pipe independent of the conduit structure and extending continuously along the conduit, and connections between the drain-pipe and a suitable main sewer, substantially as described.



5. A conduit for electric conductors, comprising slotted metallic sections continuously united by suitable joints, a lining of insulating material applied to the inner walls thereof, and independent insulating conductor supports secured within the lining, substantially as described.

6. A conduit for electric conductors, comprising slotted metallic sections continuously united by suitable joints, a lining of insulating material within said conduit, metallic capping-plates resting upon the upper edges of the conduit and separated to form a continuous open slot, and independent insulating conductor supports secured within the lining, substantially as described.

7. A conduit for electric conductors, comprising a tubular body, insulated supports secured to the walls thereof and provided with metallic clamping fingers or jaws, and a conductor composed of sections the parts whereof are supported between and their ends electrically connected by the clamping-fingers.

408,801. ELECTRIC RAILWAY.

CHARLES J. VAN DEPOELE, Lynn, Mass. Original application filed June 28, 1886, Serial No. 160,410. Divided and this application filed Feb. 15, 1888. Serial No. 263,948. (No model.)

Claim.—1. In a system of electric railways, means for dividing the supply-current at starting between a plurality of motors connected in multiple arc between the main conductors, comprising an additional resistance in circuit with each motor and means for gradually withdrawing the resistance as the speed of the motor increases, substantially as described.

2. In a system of electric railways, a plurality of motors in multiple arc between the supply-conductors, a resistance in circuit with each motor acting to prevent a sudden fall of potential in the supply-circuit at starting, and means for gradually withdrawing the resistance as the counter electro-motive force rises in the motors being operated, substantially as described.

3. In a system of electric railways, a plurality of motors in multiple arc between the supply-conductors, a resistance substantially equal to the counter electro-motive force of the motor-armature at normal speed in circuit with each motor at starting, and means for gradually withdrawing the resistance as the counter electro-motive force rises, and vice versa, substantially as described.

4. In electric railways, the combination, with the supply-circuit, of a multiple-arc branch including a current-indicator, an automatic adjustable resistance, and an electro-dynamic motor, all arranged in series, substantially as described.

5. In electric railways, the combination, with parallel supply-conductors, of a plurality of motors in multiple arc between said conductors, each motor-circuit comprising a current-indicator, an adjustable resistance about equal to the counter electro-motive force of the armature of the motor at full speed, and means for automatically introducing and withdrawing the resistance in proportion to the rise and fall of counter electro-motive force in the motor, substantially as described.

6. In a system of electric railroading where a large number of vehicles are electrically propelled at one time and from the same source, a means for regulating the current by an additional resistance in circuit with each motor at the time of starting, preventing the short-circuiting of the current by placing such resistance in each motor-circuit independent of the other and corresponding to the electro-motive force of the current employed, and means for gradually withdrawing said resistance as the motor attains a certain speed, substantially as described.

7. In an electric-railway system, the combination of poles or supports placed on each side of the line of way, supporting-wires extending across the line of way and secured to opposite pairs of poles or supports, a main supply conductor or conductors suspended from the cross-wire, so as to have its under side free, and a grooved upward-pressing contact device engaging the free side of the conductor, substantially as described.

8. In an electric-railway system, the combination of poles or supports placed on each side of the line of way, supporting-wires extending across the line of way and secured to opposite pairs of poles or supports, a main supply conductor or conductors, insulating devices connected to the conductor and to the cross-wire for suspending said conductor, and a grooved upward-pressing contact device engaging the under side of the suspended conductor, substantially as described.

9. In an electric-railway system, the combination of poles or supports placed on each side of the line of way, supporting-wires extending across the line of way and secured to opposite pairs of poles or supports, a conductor or conductors arranged below the cross-wires and above the line of way, cars or balls permanently secured to the upper side of the conductor or conductors, and insulating devices connected with the cars or balls, and the cross-wires for sustaining the conductor or conductors, and an upward-pressing contact-wheel engaging the under side of the conductor, substantially as described.

408,802. GALVANIC BATTERY.

JOSEPH C. VIETTE, New York, N. Y. Filed Aug. 18, 1888. Serial No. 283,183. (No model.)

Claim.—1. A battery-cell having a partition extending from side to side of porous material, said partition being sealed in at the bottom with paraffine or other wax.

2. A battery-cell having a partition of porous material, said partition being sealed in at the bottom and top by wax or cement.

3. A battery-cell divided into two chambers by a partition of porous material, in combination with a frame or plate supporting the positive and negative electrodes and a pair of ventilating-tubes, one of said electrodes and one of said tubes extending down into each chamber, as described.

4. In a battery-cell, the plate *c*, provided with sleeve *d* and metallic thimble or cap *e*, and the vent-tubes, in combination with the positive and negative electrodes.

5. The combination, with the plate *c*, of the metallic cap or sleeve *e*, having spring-jaws for grasping one of the electrodes.

6. The combination, with the battery-cell, of the plate or frame *c*, resting upon the edge of the cell, and the sealing-block of cement or pitch for closing the mouth of the cell and securing said plate in position.

7. The insulating-strip or plate *c*, provided with the perforations through which pass the carbon and zinc elements and the vent-tubes, as set forth.

408,803. GAS-INCANDESCENT.

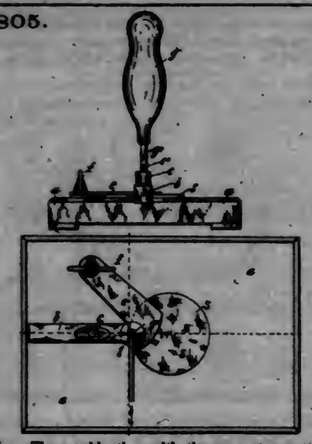
CARL A. VON WELSBACH, Vienna, Austria-Hungary, assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 31, 1888. Serial No. 269,203. (No specimens.) Patented in France Nov. 4, 1886, No. 172,094; in Belgium Nov. 4, 1886, No. 70,720; in England Mar. 13, 1888, No. 3,868; in Sweden Apr. 14, 1888, No. 667; in Germany Apr. 20, 1886, No. 41,946; in Finland July 10, 1888, No. 261; in Norway Aug. 25, 1886, No. 86; in Italy Oct. 13, 1886, XL, 415; in Portugal Apr. 6, 1887, No. 1,127; in Russia Dec. 31, 1887, No. 13,808, and in Austria-Hungary Mar. 26, 1888, No. 44,989 and No. 5,176.

Claim.—1. An incandescent burner for gas, consisting of a skeleton hood or frame containing oxide of thorium and oxide of erbium, substantially as described.

2. An incandescent burner for gas, consisting of a skeleton hood or frame containing oxide of thorium and an erbium element, as oxide of erbium, oxide of thallium, or oxide of holmium, substantially as described.

408,804. GAS-INCANDESCENT.

CARL A. VON WELSBACH, Vienna, Austria-Hungary, assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 31, 1888. Serial No. 269,204. (No specimens.) Patented in France Nov. 4, 1886, No. 172,094; in Belgium Nov. 4, 1886, No. 70,720; in England Mar. 13, 1888, No. 3,868; in Sweden Apr. 14, 1888, No. 667; in Germany Apr. 20, 1886, No. 41,946; in Finland July 10, 1888, No. 261; in Norway Aug. 25, 1886, No. 86; in Italy Oct. 13, 1886, XL, 415; in Portugal Apr. 6, 1887, No. 1,127; in Russia Dec. 31, 1887, No. 13,808, and in Austria-Hungary Mar. 26, 1888, No. 44,989 and No. 5,176.

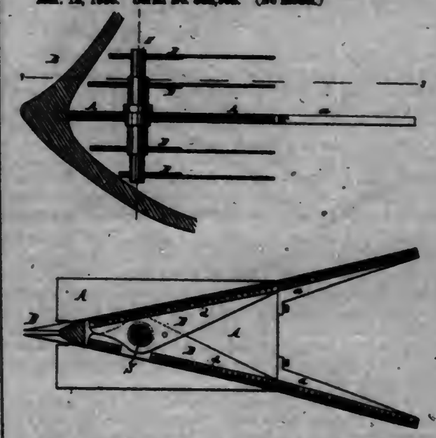


Claim.—1. An incandescent burner for gas, consisting of a skeleton hood or frame composed of the oxide of thorium and a cerite earth, substantially as described.

2. An incandescent burner for gas, consisting of a skeleton hood or frame composed of the oxide of thorium and the oxide of yttrium, substantially as described.

3. An incandescent burner for gas, consisting of a skeleton hood or frame containing the oxide of thorium, the oxide of zirconium, and a cerite earth, substantially as described.

408,805. LEATHER-THONG CUTTER.



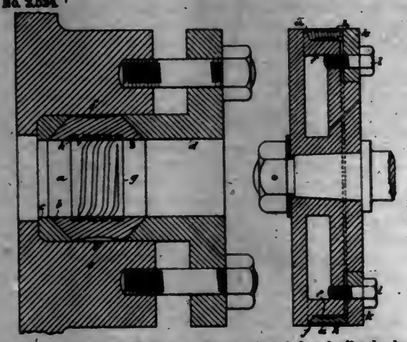
PAUL WALDER, Budo-Pesth, Austria-Hungary. Filed Sept. 13, 1888. Serial No. 285,290. (No model.)

Claim.—The combination, with the support or cutting-board *a*, having mortise *b'*, and recess to accommodate the plate *k*, of the gage *b*, adapted to said mortise *b'*, the nut and screw *c d'*, holding said gage in position in said mortise, the plate *k*, fastened partly under the inner end of said gage and formed with slot *i'*, the plate *c*, formed with the notch *i*, and extending over the plate *k* to hold a leathern disk in position while being cut, the thumb nut and screw *f*, securing said plate *c* in position, and the knife, all substantially as and for the purpose set forth.

408,806. SHIP'S RAM.

JOHN F. WARD, Jersey City, N. J. Filed Mar. 12, 1888. Serial No. 266,962. (No model.)

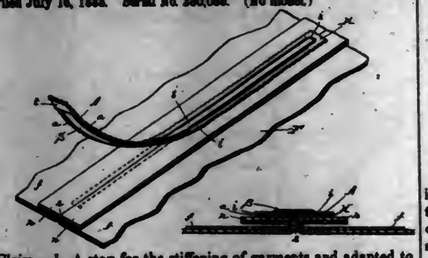
Claim.—The combination of the bow of a vessel and its ram-plate with a shaft passing through the ram-plate, and bracing plates or bars secured to the frame-work of the vessel, and through which the shaft also passes, substantially as described.



408,807. BRIDLE-CLOTHES-FASTENER.

ESTES J. WATERS, Scranton, Pa. Filed Jan. 3, 1888. Serial No. 256,201. (No model.)

Claim.—In combination, the head-board, the looped bolt secured thereto, the rectangular frame C, having the fastening-bar G, and a flexible strap, E, passing through the looped bolt and the rectangular frame, the free ends of the strap being connected by an adjustable connection, substantially as described.



408,808. METALLIC PACKING. ROBERT WEATHERBURN, London, England, assignor to Thomas Hulburd, same place. Filed Dec. 11, 1888. Serial No. 293,314. (No model.) Patented in England Feb. 20, 1888, No. 2,594.

Claim.—1. A metallic packing having beveled or inclined edges, as set forth, diverging from a hollow or concave recess in that side which is opposite its working-face, substantially as set forth, and whereby it is adapted to be compressed between two oppositely-inclined surfaces.

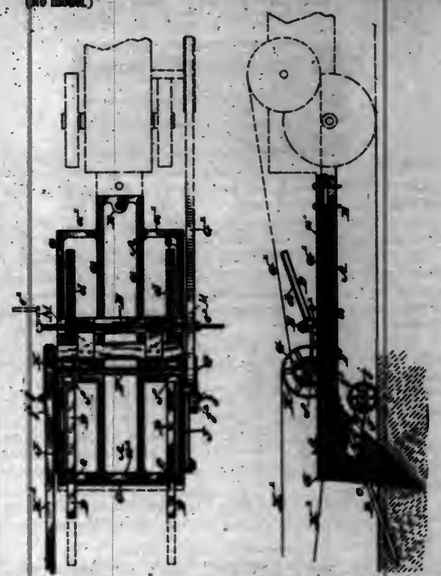
2. A metallic packing having the described hollow or concave recess in its side which is opposite its working-face and having the inclined or beveled ends diverging from said recess, as set forth, and also provided with the described series of holes or recesses filled with asbestos or anti-friction material.

408,809. GARMENT-STAY. ROSCOE B. WHEELER, Detroit, Mich. Filed July 16, 1888. Serial No. 280,089. (No model.)

Claim.—1. A stay for the stiffening of garments and adapted to be attached thereto by heat and pressure, the same consisting, essentially, of a backing of cloth, a layer of gutta-percha identical in size with said backing and secured thereto, and the resilient metallic blade, narrower and shorter than the backing and adhesive to the face of the gutta-percha in such a position as to leave an exposed margin of gutta-percha surrounding said blade at the edges and ends thereof, whereby the whole structure may be attached in position upon the garment, substantially as set forth.

2. A garment-stay, the same consisting of a steel, S, and the fabric faced with gutta-percha tissue, whereon the steel S is centrally placed, and to which it is adherent, the aforesaid elements being arranged in the order and adapted to operate as and for the purpose set forth.

408,810. SASH-FASTENER. JOSEPH R. WEBB, Denver, Colo. Filed Feb. 26, 1888. Serial No. 301,290. (No model.)

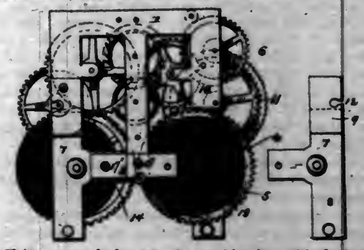


Claim.—1. As an improvement in sash-fasteners, the combination of the pivoted rod and the upper and lower catches, the latter being secured to said rod and operated in advance of the former, which is pivoted independent of said rod, substantially as set forth.

2. As an improvement in sash-fasteners, the combination of the pivoted rod, the upper and lower catches, the latter being secured to said rod and provided with an end tongue, and the spring bearing against said tongue, substantially as set forth, said upper catch being pivoted independent of said rod, as stated.

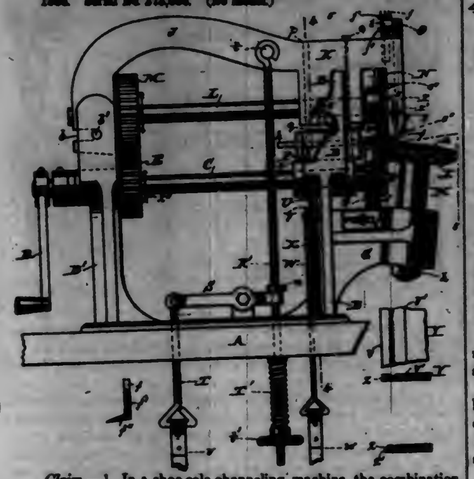
3. As an improvement in sash-fasteners, the combination of the pivoted rod, the upper and lower pivoted catches having projecting end tongues, said upper catch being pivoted independent of said rod, the dog secured on said rod and having end shoulders for engaging said tongue of the upper catch, the spring bearing against said lower catch, and the finger-bar secured to said rod, substantially as set forth.

408,811. ANCHORING DEVICE FOR PORTABLE MACHINES. JOHN C. WHITE, Swatara, Pa. Filed July 23, 1888. Serial No. 281,283. (No model.)



Claim.—1. The frame A, with anchor C, having the diagonal opening *c*, the rods D, having racks on their upper ends and passing through the opening *c*, the rotary shaft E, having thereon the gear-wheels M, engaging said racks, said parts *b* being combined substantially as described.

2. The frame A, with anchor C, having the arms J, secured at their upper ends to said anchor, and having at their lower ends the shaft *j*, with wheels *j'* thereon, said parts being combined substantially as and for the purpose set forth.



3. A frame and anchor at one end thereof, a shaft journaled in said frame and having the pulleys G and H thereon, a portable machine coupled to said frame at end opposite said anchor and having a rotary shaft with a pulley thereon, said pulley being connected with said pulley G by band G', said parts being combined substantially as and for the purpose set forth.

408,812. CLOCK-FRAME. DAVID A. WIANT, New Bethlehem, Pa. Filed Jan. 24, 1888. Serial No. 261,751. (No model.)

Claim.—In a clock-work, the combination, with the back plate, front plate, and the ordinary train of gearing, of the detachable part 7, inclosing the mainspring and having a portion cut out to give room for one end of the arbor of the striking-wheel, and the bar or portion 14 of the detachable part secured to the bar 15 of the frame by the joining-bar or flat piece 16, secured to the rear side of the horizontal bars of the frame and of the detachable part by screws fitted in registering perforations in said bars, substantially as specified.

408,813. SHOE-SOLE-CHANNELING MACHINE. GEORGE B. WILCOX, South New Market, and JONATHAN BASSETT, Epping, N. H., assignors of one-half to John W. Hazard, Providence, R. I. Filed May 7, 1888. Serial No. 273,092. (No model.)

Claim.—1. In a shoe-sole-channeling machine, the combination, with the knife-block support, of the knife-block O, adjustably supported thereon and having the yoke *i*, and the adjusting-screw *j*, provided with the collars *j'*, substantially as shown and described.

2. In a shoe-sole-channeling machine, the combination, with a standard, B, having the vertical arms, as set forth, of the removable knife-block P and its horizontal knife, and the recessed guideways *w w*, all substantially as shown, and for the purposes described.

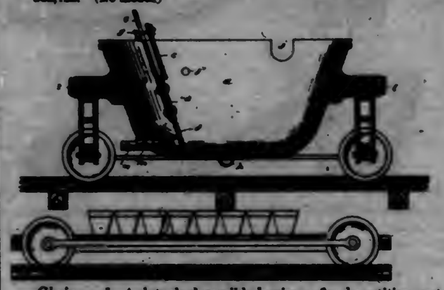
3. In a shoe-sole-channeling machine, the combination, with the removable block P, of the knife *k*, screw *k'*, and slot *k''*, all substantially as shown and described.

4. In a shoe-sole-channeling machine, the combination, with the knife-block P and its frame or support, of the loose rod U, having its upper end adapted to bear against the bottom of said block and to raise it in its frame independently of the other mechanism, and the lever V, all substantially as shown, and for the purpose described.

5. In a shoe-sole-channeling machine, the combination of the knife-block P, the loose rod U, with its upper end adapted to come into direct contact with said block, the lever V, and vertically-adjustable rod or stop X, all substantially as and for the purpose described.

6. In a shoe-sole-channeling machine, the combination of the block P, having the adjusting-screw *o*, with the frame J, having the vertical hole *p*, all substantially as and for the purpose described.

7. In a shoe-sole-channeling machine, the combination, with the removable frame J, pivoted at *b'*, of the rod *d* and the adjusting-screw *e*, said rod and screw serving to support the outer end of the frame J and to adjust the same vertically, substantially as described.



408,814. PAPER-REEL. HOMER T. WILSON, Harrodsburg, Ky. Filed Sept. 7, 1888. Serial No. 284,781. (No model.)

Claim.—1. The combination, with a suitable frame and a paper roll mounted therein and revolving upon an axial support, of two plates, one of them fixed with reference to rotation in contact, respectively, with the ends of the roll, and means for pressing them against said ends with any desired degree of force, whereby the ends of the rotating roll may be subjected to any desired retarding friction, substantially as set forth.

2. The combination of the standards B B, the gudgeon E, and disk H, formed integrally with one of them, the disk H', bearing the gudgeon E', and having a recess in its opposite face, the screw I, in the axial line of the first gudgeon, working in the opposite standard and provided with a lock-nut, K, and a nose-threaded end entering said recess, substantially as and for the purpose set forth.

408,815. DETACHED CRUCIBLE FOR LEAD-FURNACES. NEWTON B. WILSON, Seguin, Tex. Filed Aug. 14, 1888. Serial No. 282,732. (No model.)

Claim.—1. A detached crucible having a fixed partition and a movable gate applied or adapted to be applied thereto, substantially as and for the purposes set forth.

2. The combination, in a detached crucible, of a fixed partition, having a straight horizontal lower edge at such height as to afford an open and unobstructed passage thereunder for the mushy surface lead, with a detachable gate adapted to completely shut off said passage, substantially as set forth.

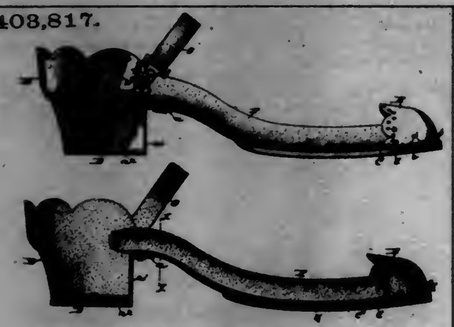
408,816. SINGLETREE ATTACHMENT. PHILIP S. WHEMAN, Springfield, Ohio, assignor of one-half to Ross Mitchell, same place. Filed Feb. 16, 1888. Serial No. 263,130. (No model.)

Claim.—1. The combination, with a singletree having its under side near the end recessed, of a gravitating pawl mounted to recede into said recess as the trace is slipped over the recess and against the under edge of the pawl, whereby the pawl without hand manipulation recedes before the trace and allows the trace to slip into place.

2. The combination, with a singletree having a recess in the under side thereof near its end, of a gravitating pawl having its outer end pivoted within said recess, and a projection to limit its descent and arranged to recede into said recess without hand manipulation when the trace is slipped over the singletree and against the under edge of the pawl.

3. The combination, with a singletree having a shoulder projecting therefrom and a recess in the under edge and between said shoulder and its end, of a gravitating pawl within said recess, and having a pin or projection which limits its descent, the pawl being arranged to recede into the recess without hand manipulation by the act of putting on the trace.

4. The combination, with a singletree having a recess in its under side near its end and a shouldered frame secured thereto, with a slot opposite said recess, of a gravitating pawl having its outer end pivoted within said recess, and a projection from its inner end which engages said frame, the pawl being arranged to recede into the recess without hand manipulation by the act of putting on the trace.

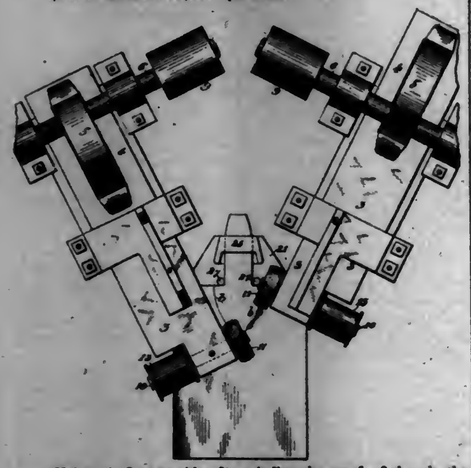


5. The combination, with a singletree and a recess formed in the under side near the end thereof, of a gravitating pawl pivoted at one end within said recess and having a projection to limit its descent, and an anti-rattling spring which holds the pawl firmly in its gravitated position, the pawl being arranged to recede into the recess without hand manipulation by the act of putting on the trace.

6. The combination, with a singletree and a frame secured to the outer end thereof and constituting a recess, of a gravitating dog pivoted at its outer end within said recess and a projection to limit its descent, the pawl being arranged to recede into the recess without hand manipulation by the act of putting on the trace.

7. The combination, with a slotted frame adapted to be secured to a singletree and having a shoulder and lugs extending therefrom, of a gravitating pawl having its pivot-pin fitted to said lugs, and a projection at the other end which engages the frame, and an anti-rattling spring coiled about its pivot-pin, terminating in upper and lower branches or prongs, the pawl being arranged to recede into the recess without hand manipulation by the act of putting on the trace.

408,817. OVERSHOT. SAMUEL C. WELTY, Chippewa Falls, Wis. Filed June 6, 1888. Serial No. 276,497. (No model.)



408,817.

Claim.—1. The combination, with the sole, the toe E, and the side pieces, F, of the metal heel and counter, the heel having a tang to which the sole is secured and the side pieces being fastened at their ends to the counter and toe, respectively, substantially as described.

2. The herein-described overshoe, composed of the following elements: the metal heel and counter having a tang, the sole and insole secured to the said tang, the sides F, fastened at their rear ends to the counter and having their lower edges lasted in between the sole and insole, the metal toe having an outer flange and secured to the sole by nails driven through the flange and fastened to the front ends of the said sides F, the soft lining applied to the heel-counter and the toe, the instep-strap, and the extra pieces applied to the heel and the sole, substantially as and for the purpose described.

408,818. MACHINE FOR GRINDING SHOVEL-BLANKS. JOSEPH R. WOLL, Pittsburg, Pa., assignor of one-half to Henry J. Thoma and William M. McCombs, same place. Filed Mar. 17, 1887. Renewed Mar. 7, 1889. Serial No. 302,389. (No model.)

Claim.—1. In a machine for grinding the scarfs of shovels, the combination, with a table for supporting the blank, of two rotary grinding-wheels having reciprocating bearings arranged to converge over the table, and mechanism for imparting alternate reciprocatory motion to said bearings, substantially as and for the purposes specified.

2. In a machine for grinding the scarfs of shovels, the combination, with an oscillatory or vibratory table, of a rotary grinding-wheel, bearings therefor arranged to move in a line tangential to a circle described around the pivot of the vibratory table, and mechanism for reciprocating the grinding-wheel and its bearings, substantially as and for the purposes specified.

3. In a machine for grinding the scarfs of shovels, the combination, with a horizontally-reciprocating grinder, of a sliding gravity or drop table having an oscillatory shovel-bed, and a pivoted lever, by means of which the sliding table can be raised, substantially as and for the purposes specified.

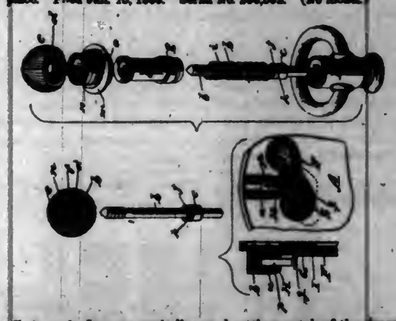
408,819. TOBACCO-HANGER. WILLIAM S. WOOTEN, Scottsburg, Va. Filed Apr. 12, 1888. Serial No. 270,521. (No model.)

Claim.—1. The combination, in a sectional hanger, of a plurality of separate uprights suspended and attachable one to the other, as described, and the tobacco-sticks S carried by said uprights.

408,819.

2. The combination of the tier *a*, the strips G, the uprights F, suspended from said strips, the cross-piece or lever H, and the tobacco-sticks S, carried by their middles by said uprights, substantially as set forth.

3. The combination, with the uprights having a series of lateral mortises, of the tobacco-sticks held by their middles in said mortises and provided with the grooves *s* for the cord, substantially as set forth.



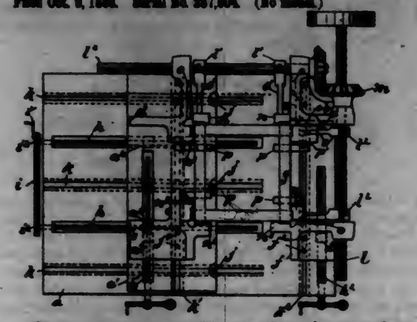
4. The combination, with the tobacco-hanger, of the gravitating lever H, pivoted in the same, and the strips G, substantially as set forth.

5. The combination, with the suspended hangers, of the strips connecting the lower ends of said hangers to prevent oscillation, contact, and breaking of the tobacco-leaves.

6. In a tobacco-hanger, the combination of uprights provided with tobacco-sticks, means, substantially as described, for suspending the topmost upright, and latches for detachably connecting the uprights end to end and suspending them one from the other, as set forth.

7. The combination of the upper beams or tier, *a*, the rigid and central uprights, F, having suspension devices at their upper ends and sustained by said tier, and having their lower ends at such height as to leave the lower part of the barn unoccupied, and the tobacco-sticks S, secured by their middles to said uprights, the latter being removable, substantially as set forth.

408,820. STEM WINDING AND SETTING WATCH. ABRAHAM H. YEAKEL, Sellersville, Pa., assignor to Crossman & Yeakel, same place. Filed Jan. 15, 1889. Serial No. 296,302. (No model.)



Claim.—1. In a stem winding and setting watch of the described class, the combination of the tilting yoke, yoke-spring, socketed arbor, plunger working in said arbor, and spring-actuated arbor-stem or key-pin bearing against the plunger and yoke with a greater downward pressure than the lifting-power of the yoke-spring, substantially as and for the purpose set forth.

2. In a stem winding and setting watch of the described class, the combination of the socketed winding and setting arbor, shouldered arbor-stem or key-pin, spiral spring, crown or winding-knob having a downwardly-projecting central threaded socket for the attachment of the arbor-stem, the inner sleeve encircling said stem and its spring, the collar screwed adjustably into the inner rim of the winding-knob, and the pendant, substantially as and for the purpose shown and set forth.

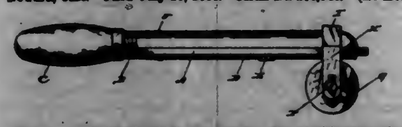
3. In a stem winding and setting watch, the combination of the case, pendant, central shouldered stem-arbor or key-pin, the washer

working on the shoulder of said pin, the spiral spring, shouldered sleeve, socketed and threaded crown or winding-knob, and the collar attached adjustably to the crown and adapted to slide upon the pendant, substantially as and for the purpose shown and set forth.

408,821. BOX-MAKING MACHINE. EDWARD ABBE, Chicago, Ill. Filed Oct. 6, 1888. Serial No. 287,604. (No model.)

Claim.—1. In a box-making machine, a base carrying one fixed and three adjustable standards, in combination with vertical and fixed jaws and oppositely-placed parallel and reciprocating jaws on said standards, said jaws moving in a vertical plane and in a line parallel to the base, substantially as specified.

2. In a box-making machine, a slotted base carrying one fixed and three adjustable standards, in combination with vertical fixed jaws, and oppositely-placed and parallel reciprocating jaws on said standards, and vertically-adjustable hangers attached to said standards to support the box, and fastening devices between said base and standards, substantially as specified.



3. In a box-making machine, a channeled base, in combination with one fixed and three adjustable standards provided with vertical and fixed jaws, and oppositely-placed and reciprocating jaws, and equally-speeded shafts connected and at right angles to each other, carrying eccentrics connected to and operating said jaws, and fastening devices between said channeled base and standards, substantially as specified.

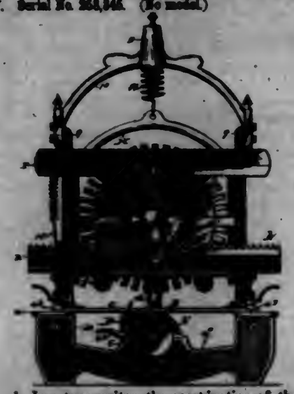
4. In a box-making machine, a base provided with a fixed and an adjustable standard and carrying an adjustable base having a fixed and an adjustable standard, said standards being relatively adjustable to each other and provided with fixed vertical jaws, in combination with parallel and opposed reciprocating jaws on said standards and mechanism to actuate said reciprocating jaws, substantially as specified.

5. In a box-making machine, a base provided with a fixed and an adjustable standard and carrying an adjustable base having a fixed and an adjustable standard, said standards being provided with fixed vertical jaws, in combination with parallel and opposed reciprocating jaws actuated by equally-speeded shafts placed at right angles to each other and carrying actuating mechanism connected to said reciprocating jaws, substantially as specified.

6. In a box-making machine, a base carrying a fixed and an adjustable standard, in combination with vertical and fixed and oppositely-placed parallel and reciprocating and toothed jaws on said standards, said jaws moving in a vertical plane and in a line parallel to the said base, said teeth bearing on the dovetail tenons having teeth a^5, spaced as described, substantially as specified.

408,822. HAND PRINTING APPARATUS. THOMAS BARTHOLOMEW, Newark, Ohio. Filed July 20, 1886. Serial No. 209,560. (No model.)

Claim.—1. In hand printing apparatus, the combination of a bar having an inking-pad upon one of its faces and a printing-cylinder mounted upon said bar to roll along said pad, whereby the cylinder may be inked upon one side while its opposite side prints upon any surface over which it is rolled.

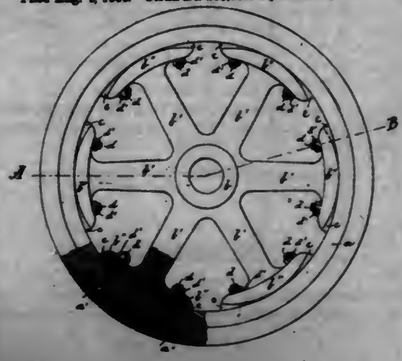


2. A handled bar, a sliding saddle mounted thereon, a printing-cylinder revolubly secured to said saddle, an inking-pad fixed to said bar tangent to said cylinder, and a spring adapted to resist while permitting the movement of the cylinder from its normal position, all combined substantially as set forth.

3. The combination, with a handled bar, of a printing-cylinder revolubly mounted in a saddle sliding on said bar and an inelastic cord fixed at each end to the opposite ends of the bar, passing once about the cylinder, and fixed thereto at one point, whereby the cylinder rotates equally in passing bodily through equal distances along the bar and conversely.

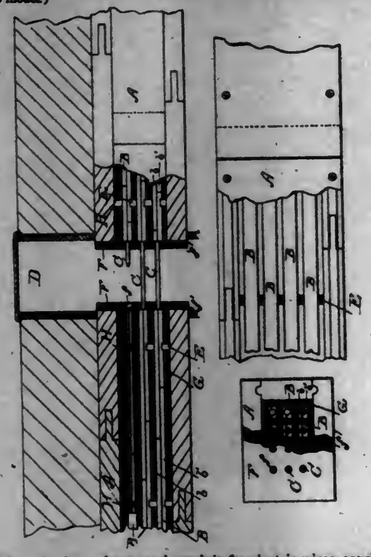
4. In a hand printing apparatus, an inking-pad and a printing-cylinder mounted to roll along said pad while printing with its opposite side, said cylinder having a letterless elemental space, and said pad an inkless band registering with said space as the cylinder passes along the pad, substantially as and for the purpose set forth.

5. The combination, with the bar A, having the adjustable handle C, of the pad D, divided and secured to the bar by the clamp E, the saddle I, sliding upon said bar and carrying the rotating cylinder G in contact with said pad, the elastic strip O upon said cylinder, the cord Q Q', passing around and having its middle point secured to said cylinder and its ends secured to the bar upon opposite sides of the cylinder, and the spring K, acting against said saddle and reacting against said handle, substantially as set forth.



408,823. TYPE-WRITING MACHINE. JOHN W. BARTLETT, Moline, Ill., assignor of one-fourth to George W. Walker, same place. Filed Dec. 23, 1887. Serial No. 258,945. (No model.)

Claim.—1. In a type-writer, the combination of the spring-suspended sliding frame carrying the inking-rolls, the type-wheel having radial type, the sliding rack-bar supported in a grooved cross-bar of said frame, the pinion on the shaft of said type-wheel engaging said rack, the indicating-bar applied to said frame, the handled pointer carried by the sliding rack-bar, and the type-carriage having the slotted guide-finger engaging a circularly-arranged series of studs upon the type-wheel, substantially as set forth.



2. In a type-writer, the combination of the spring-suspended sliding frame carrying the inking-rolls, the type-wheel having radial type, the sliding rack-bar supported in a grooved cross-bar of said frame, the pinion on the shaft of said type-wheel engaging said rack, the indicating-bar attached to said frame, the handled pointer carried by the sliding rack-bar, the type-carriage having the slotted guide-finger engaging a circularly-arranged series of studs upon the type-wheel, the cross-rod carrying levers having spring-connection with the supporting-frame of the type-wheel frame and provided with pawls engaging ratchet or rack bars of the horizontal or base frame, said sliding type-wheel frame having a finger acting upon one of said pawl-carrying levers, substantially as set forth.

408,824. WOOD-RIM PULLEY. WILSON W. CAREY, Lowell, Mass. Filed Aug. 4, 1888. Serial No. 281,967. (No model.)

Claim.—The herein-described improved wood-rim pulley, consisting of the wood rim *a* and the metal spider *b*, having radial arms *b'* and the curved or inclined feet *b'' b''*, substantially as described, combined with the curved or inclined wedges *c c* and fastening-bolts *d*, as and for the purpose set forth.

403,825. UNDERGROUND CONDUIT FOR ELECTRICAL CONDUCTORS. CHARLES B. COLE, Detroit, Mich., assignor to the Cole Conduit Company, same place. Filed Oct. 11, 1888. Serial No. 287,801. (No model.)

Claim.—1. An underground conduit for electric wires, consisting of a wooden box or casing saturated with an insulating material, separable wooden tubes, also thoroughly insulated, into which the wires may be inserted, insulating-bridges adapted to keep the tubes in place, and a filling of plastic insulating compound adapted to exclude moisture, substantially as described.

2. An underground conduit for electric wires, consisting of a wooden box or casing saturated with an insulating material, separable wooden tubes saturated with an insulating material, in which the wire may be laid, said tubes being united throughout their length by groove-and-tenon joints, separate insulating-bridges adapted to sustain the tubes in proper position, and a filling of a plastic insulating compound adapted to exclude the moisture, substantially as described.

3. An underground conduit for electric wires, consisting of a wooden casing having a removable top, said casing and top saturated with paraffine, separable wooden tubes saturated with paraffine and adapted to receive the wires, the separate parts of said tubes united throughout their length by groove-and-tenon joints, separate insulating-bridges provided with recesses *b*, in which the tubes rest, end pieces for the casing consisting of a sheet of rubber and a cap of wood saturated with paraffine, the wood and rubber provided with orifices corresponding to the ends of the tubes, and a filling of a plastic insulating compound adapted to exclude the moisture, substantially as described.

4. An underground-conduit casing consisting of bottom, sides, and top made of wood, the ends of said bottom, sides, and top each joined to its meeting part by a deep mortise-and-tenon joint, the top or top and sides caused to break joints with the bottom of the casing, substantially as described.

403,826. TRANSFERRING PAPER FILE AND BINDER. WILLIAM A. COOKE, Jr., and CHARLES S. COOKE, Brooklyn, N. Y. Filed Jan. 19, 1887. Serial No. 224,821. (No model.)

Claim.—1. The combination of the transferring-file composed of united tubes 20 20, which form the detachable members of the binder, with the wires 17 17, having balls *k* on the ends, and the studs 18 18, substantially as specified.

2. The sequent combination of the tubular transferring-file, the fixed wires of a temporary file, and the fixed members of the binder, substantially as specified.

403,827. DEVICE FOR FORMING CIRCLES, CURVES, AND GEOMETRICAL FORMS. JOHN F. EARHART, Cincinnati, Ohio, assignor of one-half to John E. Richardson, same place. Filed June 11, 1888. Serial No. 276,672. (Model.)

Claim.—1. A device for curving or bending printers' rules, consisting of a frame and a holder pivoted therein just out of the center and provided with an opening through which the rule is fed, and side guards to guide the same, and a shaft journaled in the frame suitably provided along its length with a recess to hold one end of the rule.

2. In a rule curving or bending device, the combination of the frame, the movable holder pivoted therein and having a hollow handle, S, and side guards, M and N, with the crank-shaft journaled in the frame at right angles with the holder and adapted to receive along its length an end of the rule.

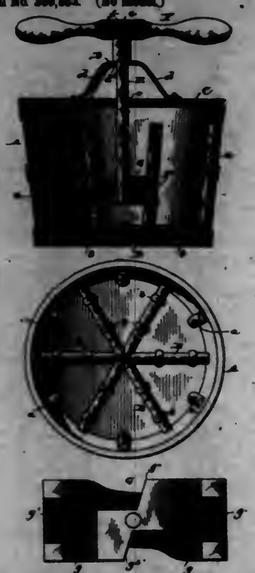
3. The combination of frame A, the pivoted holder I, having hollow handle S at one end and fixed guard M at one side, and a movable guard, N, at the other, and a suitable shaft to bend the rule.

4. In a machine, as described, the holder I, having fixed guard M on one side and a movable guard, N, on the other, provided with headed pins O, each having springs thereon, and the headed lugs R in the side of the holder, whereby the upper face of the holder can be adapted to receive wide or narrow pieces of metal rule.

5. The rocking holder I, upon which the metal rule is held and guided, pivoted near its center in the frame and having its forward end in close proximity to the shaft E, made as described and journaled in the frame, whereby in the operation of the machine the forward end of the holder can be brought in contact with the shaft or the metal thereon with any desired force.

6. In a metal-rule-bending device, the combination of the following elements, viz: a frame, a rocking holder pivoted near its center in the frame and constructed and adapted to contain and guide the rule, and the shaft constructed as described and journaled in the frame and located at right angles to the holder, all substantially as set forth.

408,828. PIPE-TRIMMING DEVICE. GEORGE T. PETTENGILL, West Chester, Pa. Filed Mar. 21, 1889. Serial No. 304,143. (No model.)

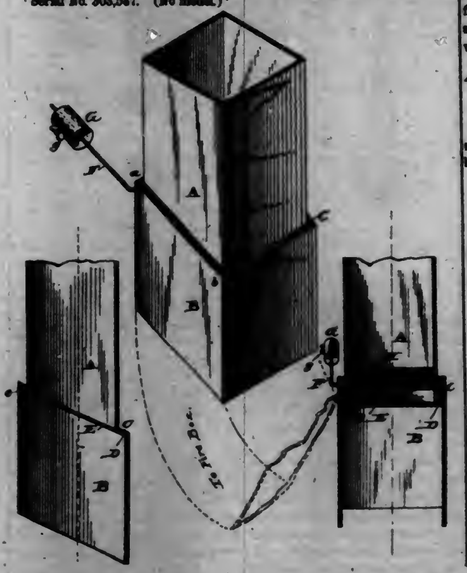


Claim.—1. A tool for trimming pipes, having a revolving cutter set at a suitable angle, in combination with an interchangeable guide mounted on and locked with a central mandrel or axis, substantially as described.

2. A tool for trimming pipes, consisting of a conical shell having an adjustable cutter lying in a slot thereof and provided with a mandrel rigidly mounted in the axis of the cone, said guide having a curved flange interlocking with a groove or channel in the mandrel and provided with a cam abutting against a cam on said mandrel, substantially as described.

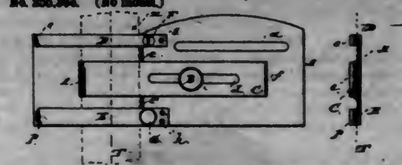
3. A tool for trimming pipes, consisting of a mandrel having a conical shell provided with a slot in which lies an adjustable cutter, said mandrel having a tenon provided with a laterally-projecting cam, a tubular guide on said mandrel having a curved flange provided with an opening permitting the cam on the mandrel to pass and the curved flange to be turned beneath the said cam and the latter brought against a cam-stop on the curved flange, substantially as described.

4. In a pipe-trimming tool, a mandrel, 1, having a handle, 2, and provided with a rigid conical shell, 3, having a slot, 4, a knife, 5, mounted on a bracket, 6, on the shell and adjustable in said slot, a guide, 12, slipped on said mandrel and provided with a curved flange, 13, having an opening, 14, through which passes a cam, 10, on the reduced end of the mandrel, the guide being turned to carry said flange 13 under the cam 10 and bring the latter against a cam-stop, 15, on one end of the flange 13, substantially as described.



408,829. WASHING-MACHINE. LOUIS FLEISCHHAUER, Perry, Tex., assignor of one-third to Johannes Weikart, same place. Filed Apr. 6, 1888. Serial No. 269,823. (No model.)

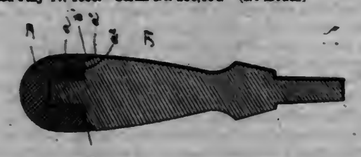
Claim.—1. A rubber for washing-machines, adapted to be attached to the lower end of a shaft constructed substantially rectangular with beveled sides, and whose bottom has inward cuts reversely arranged in the sides to form parallel oblique abrading edges g^2, and angular end cuts, g', substantially as described.



2. A washing-tub having radial ribs of equal width throughout their lengths running to a common center, and having a pair of rollers arranged on each rib at an equal distance from said center to form a uniform support for a rubber, and said ribs also forming pockets between each, and the sides of the tub having upright ribs projecting down centrally between the ends of said radial ribs to form counteracting abrading projections, as described, substantially as set forth.

408,830. CHUTE FOR FEEDING SAWDUST TO STEAM-BOILERS. GEORGE W. FLOOD, Pentwater, Mich., assignor of two-thirds to Edgar G. Maxwell and William R. O. Sands, same place. Filed Mar. 16, 1889. Serial No. 303,567. (No model.)

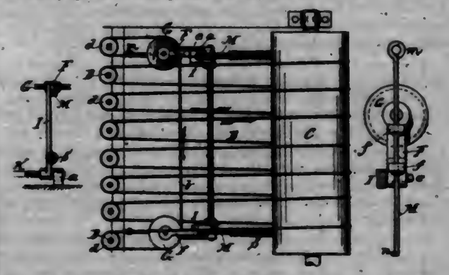
Claim.—In a device or chute for feeding sawdust to steam-boilers, the combination of the feeding duct or chute, consisting of the contracted upper part, A, and enlarged lower part, B, whereby an inside inclined shoulder or offset, D, is formed, automatic cut-off, and deflector H, substantially as and for the purpose herein shown and described.



408,831. GUIDING ATTACHMENT FOR SEWING-MACHINES. ANTON H. FRENCH, Chicago, Ill., assignor, by mesne assignments, of one-half to Gustav Ernst Langer, same place. Filed Nov. 16, 1887. Serial No. 255,344. (No model.)

Claim.—1. A guiding attachment for sewing-machines, comprising a stationary plate, A, provided with the springs D and E and guiding studs or stops *c* and *c'*, and an adjustable plate, C, having a guiding-flange, *c*, whereby tape or ribbon of any desired width may be conducted under the springs and over the plate C to the stitch-forming mechanism, substantially as described.

2. In a guiding attachment for sewing-machines, a stationary plate, A, having at one end near its side edges the springs D and E, said springs being adjustable near their fastening places, and a sliding plate, C, located between said springs and being parallel to the same, said plate C being guided between the stops or studs *c* and *c'* on the plate A, said stops *c c'* forming with the stop *c* on the sliding plate a guide for any width of tape or ribbon passing over the sliding plate C and under the springs D and E, substantially as set forth.

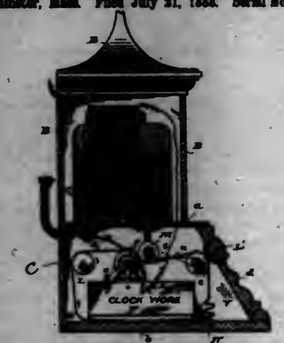


408,832. TOOL-HANDLE. CHARLES D. FULLER, Minneapolis, Minn. Filed July 17, 1888. Serial No. 280,164. (No model.)

Claim.—In a tool-handle, the combination, with the wooden body having its ends circumferentially rabbeted and provided with a central screw-threaded projection, and a flat annular bearing-surface at the base of said projection, of a metal cap having a threaded recess to receive the projection of the wooden body, a flat annular shoulder at the base of the cap surrounding the threaded recess, and a peripheral flange tapering from the annular shoulder, whereby, when the cap is screwed in place, the wood at the end will be compressed and prevented from splitting, substantially as described.

408,833. BAND-TENSION REGULATOR FOR SPINNING-MACHINES. JAMES GAUPP, Worcester, Mass., assignor to Joseph M. Bassett, same place. Filed Mar. 13, 1889. Serial No. 303,362. (No model.)

Brief.—The object of the invention is to provide improved mechanism for controlling and regulating the tension of continuous bands employed for driving a series of spindles.

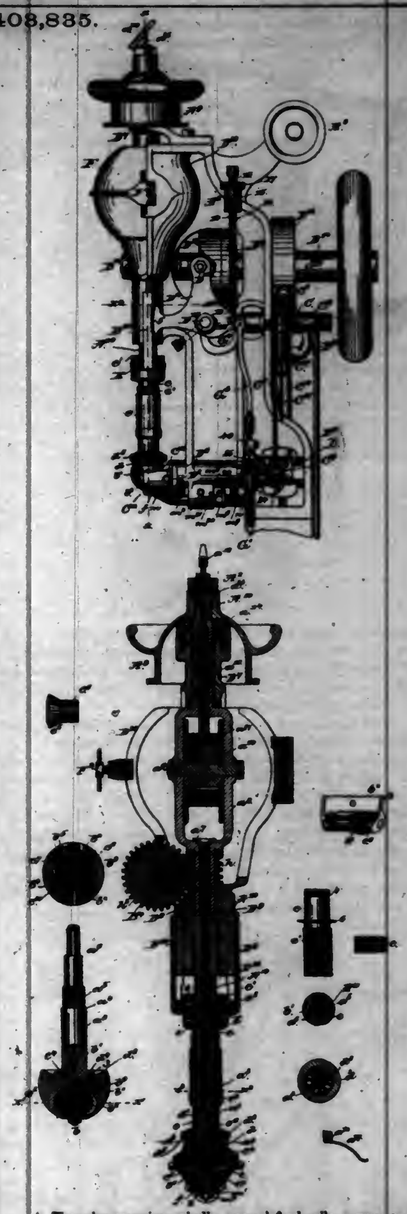


Claim.—1. A spindle-band regulator having a pair of pulleys or sheaves for guiding the spindle-driving band at the limits of the section or row of spindles, in combination with a rocker-shaft, a pair of swinging arms fixed upon and connected by said rocker-shaft, sheave-carriers pivoted on said swinging arms, and a tension-spring for giving backward pressure thereon, substantially as set forth.

2. The combination, with a cylinder, C, spindles D, and continuous band B, of the regulating-sheaves G, their supporting-carriers F, the upright backwardly and forwardly swinging arms I, on which said carriers are pivoted, the rocker-shaft K, connecting said arms, the guide-rods M, and tension-spring S, substantially as set forth.

3. The guide rod or wire M, having its forward end loosely attached to the frame, as at *m*, its rear end provided with a stop, *n*, and the sheave-supporting carrier having perforated lugs that embrace said guiding-wire, in combination with the band-guiding sheave, the swinging arm, the tension-spring, the spindle-band, and cylinder, substantially as and for the purpose set forth.

408,834. MECHANICAL MUSICAL INSTRUMENT. WILLARD H. GILMAN, Boston, assignor to Charles H. Dresser and William S. Reed, both of Leominster, Mass. Filed July 21, 1888. Serial No. 280,598. (No model.)



Claim.—1. The combination of a plurality of bells severally representing one or more musical notes, electro-magnetic means for severally actuating said bells, an electric circuit including said electro-magnetic means, a series of spring-fingers, G, controlling said electric circuit, the rotatable cylinder E, also included in said electric circuit, clock-work mechanism for rotating said cylinder, the perforated sheet N, passing between the fingers G and the cylinder E, and guiding-rollers M, L, and L′ for said sheet, substantially as described.

2. The combination, with a plurality of bells, of electro-magnetic means for severally actuating said bells, an electric circuit including said electro-magnetic means, a series of spring-fingers, G, also included in said circuit and severally connected with their respective electro-magnetic means, a single bar of insulation separating and supporting said spring-fingers G, a rotatable cylinder, E, also included in said electric circuit, the perforated sheet N, passing between the fingers G and the cylinder E, clock-work mechanism for actuating said cylinder E, and guiding-rollers for the said sheet N.

3. As a new article of manufacture, the combination, with the casing B, having a receptacle for the battery C, of the battery C, located therein, a series of bells, A A, mounted upon the casing B in a suitable manner, electro-magnetic means for actuating severally said bells, an electric circuit extending from said battery C to said electro-magnetic means, a series of spring circuit-controllers severally connected in said electric circuit and normally resting upon the face of the metal cylinder, a metallic cylinder also included in said electric circuit, a sheet of flexible material provided with perforations arranged to pass between said spring circuit-controllers and said cylinder, and mechanism for feeding said perforated sheet between the circuit-controllers and cylinder, the whole being mounted upon a suitable casing, in the manner shown, substantially as described.

408,835. MACHINE FOR UNITING SOLES TO UPPERS. LOUIS GOSOW, Winchester, assignor to James W. Brooks, principal trustee, Cambridge, and Frank F. Stanley, associate trustee, Boston, Mass. Filed July 30, 1888. Serial No. 281,267. (No model.)

Claim.—1. In a machine for uniting soles and uppers, a wire-carrying spindle and feed-rolls having gears c^7 c^8 and a gear, c^{10}, combined with the beveled gear having a sleeve-like portion, c^4, and with a gear to engage and rotate the said beveled gear, substantially as described.

2. The wire-carrying spindle, its geared feed-rolls, and a gear, *d*, having a clutch, and gearing between the said gear and the feed-rolls combined with a clutch-sleeve having spiral or diagonal flutes and with a reciprocating feeding-sleeve having spiral or diagonal flutes to actuate the said clutch-sleeve, substantially as described.

3. The wire-carrying spindle, its geared feed-rolls, and the screw-stud c^3, having an opening coinciding with the wire-passage, combined with the gear *d* and intermediate bevel-gear rotated thereby and in engagement with one of the feed-rolls, to operate substantially as described.

4. The wire-carrying spindle, geared feed-rolls, a gear, as *d*, having a clutch portion, and means intermediate the said gear and the feed-rolls, and a clutching-sleeve having spiral or diagonal flutes, and a feeding-sleeve having co-operating spiral or diagonal flutes, combined with a stop for the clutching-sleeve in its longitudinal movement, whereby the clutch-faces of the clutching-sleeve and the gear *d* may be separated and the clutching-sleeve be thereafter rotated for the proper distance, substantially as described.

5. In a machine for uniting soles and uppers, a horn or support for the work, a continuously-rotating fluted spindle provided with feed-rolls, and a reciprocating feeding-sleeve fluted to engage flutes of the spindle and to be rotated in unison therewith, the said feeding being farther fluted spirally or diagonally, combined with a clutching-sleeve having spiral or diagonal flutes and rotating at the speed of the spindle in one direction, and with gearing intermediate the said clutching-sleeve and the feed-rolls, the reciprocations of the feeding-sleeve longitudinally during its rotation with the spindle causing the clutching-sleeve to vibrate or oscillate about the spindle as it travels with the latter to feed the wire intermittingly, substantially as set forth.

6. The rotating wire-carrying spindle and the wire-carrying spool located between its ends, combined with bearings for the said spindle both above and below the spool, and with feed-rolls having gears meshed one with the other, and with means carried by and rotating with the spindle to rotate the said feed-rolls intermittingly, substantially as described.

7. The wire-carrying spindle, the wire-carrying spool between its ends, and bearings for the spindle above and below the spool, combined with the chambered pulley A^5, embracing the upper bearing, substantially as described.

8. The wire-carrying spindle and the spool between the ends of the spindle, combined with a spring-actuated presser-plate to bear upon the wire, substantially as described.

9. The wire-carrying spindle and its spool and presser-plate having a shank, a^{15}, combined with means to retain the presser-plate lifted from the spool, substantially as described.

10. The wire-carrying-spindle, the feeding-sleeve, and the yoke to support the said sleeve, combined with a lever reciprocating the said yoke and with a cam to actuate the said lever, substantially as described.

11. The wire-carrying spindle, the feeding-sleeve, and the yoke to support the said sleeve, combined with a lever reciprocating the said yoke, and with a cam to actuate the said lever, and with an upwardly-pressed horn, a measuring-leg connected with the said lever, and intermediate connections between the said leg and horn, substantially as described.

12. The wire-carrying spindle, the feeding-sleeve, and the yoke to support the said sleeve, combined with a lever reciprocating the said yoke, and with a cam to actuate the said lever, and with the rod 12, spring 14, and adjusting-nut 16, to operate substantially as described.

13. The wire-carrying spindle and a throat, *b*, combined with the cutter-carriers and the adjustable arc-shaped cutters having their cutting-edges in line with each other, to operate substantially as described.

14. The wire-carrying spindle having the spherical end a^9, feed-rolls therein, means to rotate the feed-rolls, and the throat *b*, combined with the cutter-carriers concaved at their upper sides to permit the rotation of the spherical head of the spindle and with the cutters and clamps to hold them, substantially as described.

15. The cutter-carrier D^9, having a tubular shank, and the cutter-carrier C^{10}, having its shank C^9 extended through the said tubular shank, combined with a lever, means to actuate it, and connecting mechanism between the said lever and the shanks of the said cutter-carriers to actuate them simultaneously in opposite directions, substantially as described.

16. The cutter-carrier D, having a tubular shank, and the cutter-carrier C^{10}, having its shank C^9 extended through the said tubular shank, combined with a lever, means to actuate it, and connecting mechanism between the said lever and the shanks of the said cutter-carriers to actuate them simultaneously in opposite directions, and with a stop and means to retain the said lever normally against the said stop, substantially as described.

17. The horn, the lever B^9, with which it is connected, and the rod B^8, combined with the two-armed lever B^9 $B^{9\times}$, having a roller or other stud, and with a cam, B^{13}, to automatically depress the horn at the proper time, substantially as described.

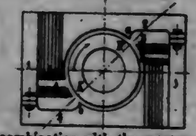
18. The lever D^{14}, its attached measuring-leg having a collar, 40, the oscillating rod 22, and the block 25, attached thereto, combined with a stop, substantially as described, actuated by the said block to prevent the descent of the said measuring-leg when it is desired to arrest the feed of the wire, substantially as described.

19 The feed-wheel having beveled teeth, the box by which the wheel is supported, and the shaft m^2, having beveled teeth to engage the said wheel, combined with a ratchet-wheel and with a pawl and means to operate the pawl to rotate the shaft, substantially as described.

20. The feed-wheel having teeth at its periphery and teeth m' at its under side, a shaft, m^2, to actuate the said feed-wheel, the ratchet of the said shaft, and the pawl and pawl-carrier, the box m^4, and friction-washer m^{12}, interposed between the ratchet-wheel and box, combined with means to act upon the said shaft and press it into the said box, the friction-washer preventing any accidental slipping of the ratchet-wheel on the shaft, substantially as described.

21. The wire-carrying-spindle having the spherical end a^9, feed-rolls carried by the said spindles to rotate the said feed-rolls, and a throat, *b*, combined with cutter-carriers concave at their upper sides to permit the rotation of the spherical end of the spindle and with means, substantially as described, to oscillate the said cutter-carriers.

22. The wire-carrying spindle, its feed-rolls, means to rotate them, and the throat *b*, combined with the cutter-carriers concave at their upper sides and convex at their lower sides, and with the rest *f*, concave at its upper side next the said cutter-carriers, substantially as described.



23. In a sailing-machine for uniting soles to uppers, a feed-wheel, the shaft m^2, to rotate the said feed-wheel, and the box or bearing m^4, in which the said shaft rotates, combined with a bearing in which the said box is made longitudinally adjustable, thereby enabling the feed-wheel to operate against the edge of the sole notwithstanding different distances at which the fastenings may be set back from the edge of the sole, substantially as described.

24. In a machine for uniting soles to uppers, a spindle to carry the wire, a spool-supporting yoke, and a spool having its center of rotation in line with the wire-passage through the said spindle, combined with the two bearings D^7 D^8, and the cup-like rigid portion D^{10}, connecting the said bearings, and the door E, to form a cover for the said cup D^{10}, substantially as described.

25. In a machine for uniting soles and uppers, a rotating wire-carrying spindle and a reel for the double-threaded wire rotating with the spindle, combined with feed-rolls for the wire and means to rotate them, the said feed-rolls having a series of projections, as *v*, which on the opposite feed-rolls are exactly in line, and with spaces also exactly in line, whereby the said projections and spaces are adapted to enter the exactly-opposite grooves and embrace the exactly-opposite threads *w* of the said double-threaded wire, substantially as described.

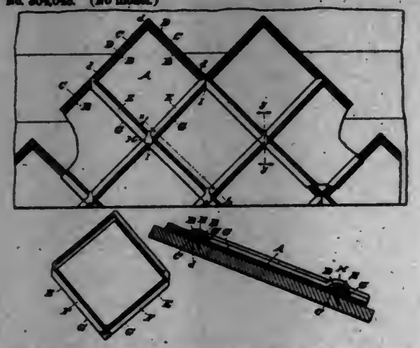
26. In a machine for uniting soles to uppers, the wire-carrying spindle having the enlarged lower end, combined with feed-rolls geared together and driven by a gear located wholly within the said enlarged lower end, substantially as described.

408,836. DYNAMO-ELECTRIC MACHINE. ALPHONSE I. GRAVIER, Paris, France. Filed Jan. 9, 1888. Serial No. 260,184. (No model.) Patented in France Jan. 17, 1887, No. 180,864; in Belgium Apr. 18, 1887, No. 77,108, and in England Apr. 18, 1887, No. 5,709.

Claim.—1. In combination with the rotatory armature of a dynamo-electrical machine, field-magnets provided on each side of said armature with two electro-magnetic cores of unequal magnetism and additional polar portions of less magnetism than either of said cores arranged after them in the direction of the armature's rotation, the cores of higher magnetism being in advance of the other cores and the said additional polar portions being magnetically connected with the magnetic frame of the machine intermediate the said cores of less magnetism of one pole and the bases of the more highly-magnetized cores of the succeeding pole, substantially as described.

2. In combination with the rotatory armature of a dynamo-electric machine, field-magnets provided with cores composed of two metals of unequal magnetic capacity, as soft iron and cast-iron, with the metal of greater capacity in advance, substantially as described.

3. In combination with the rotatory armature of a dynamo-electrical machine, field-magnets provided with cores or polar portions of like polarity, made of metal of different magnetic capacity, the core or polar portion whose metal is of greater capacity being in advance, substantially as described.

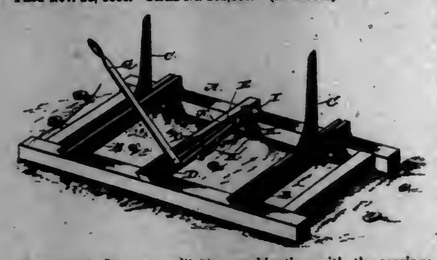


4. In combination with the rotatory armature of a dynamo-electric machine, field-magnets provided with cores of like polarity differing in cross-section and arranged with smaller cores in advance of the larger core or cores of the same polarity, substantially as described.

5. In combination with the rotatory armature of a dynamo-electrical machine, field-magnets of which the last, taken in the direction of the armature's rotation, is provided with a polar prolongation extending in the same direction preceded by a core with a smaller polar portion and of higher magnetism, substantially as described.

6. In combination with the rotatory armature of a dynamo-electrical machine, field-magnets having cores with their axes of winding transverse to the armature-axis and their polar ends turned toward the armature and provided with a prolongation extending from one side of a core of each pole and fastened at its outer end to the base or bases of the core or cores of the opposite pole, the prolongations lying on opposite sides of the armature and forming a magnetic yoke or frame of the machine, as well as polar portions for distributing field magnetism to the armature, substantially as described.

7. The improved dynamo-electrical machine provided with field-magnets whose normal magnetism diminishes in the direction of the armature's rotation and which are excited with said normally-diminishing magnetism by inducing-wire substantially equal in length to the induced wire of the armature, substantially as described.



408,837. ROOFING-TILE. JOHN E. GOURTH and CARL W. BRAUN, Denver, Colo. Filed Feb. 21, 1888. Renewed Mar. 20, 1889. Serial No. 304,045. (No model.)

Claim.—1. A roofing-tile consisting of the flat surface having the ribs B near two of its edges, and the concavo-convex, having the miter portions I, substantially as specified.

2. A roofing-tile consisting of the flat surface A, having the ribs B and C and the channel D at two of its edges, the nail-opening, as described, and the concavo-convex edges having the raised portions H and the miter ends, substantially as specified.

408,838. LOG-PULLER. MILTON HARSON, New Edinburg, Ark. Filed Nov. 28, 1888. Serial No. 292,060. (No model.)

Claim.—1. In a saw-mill, the combination, with the carriage, having the block D, of the lever G, pivoted to the said block, the arm H, hook or finger I, connected at the lower end to the end of the arm H, and the connecting-rod L, connecting the upper end of the hook to an intermediate point of the lever, all constructed and arranged substantially as and for the purpose specified.

2. In a saw-mill, the combination, with the carriage A, having the head-blocks B B, movable standards C C, secured to said blocks B, and the block D between the blocks B, of the lever G, pivoted to the block D, arm H, pivoted on the same pivot with the lever, the spring M under the free end of the said arm, finger or hook I, connected at the lower end to the free end of the arm H by the link K, the connecting-rod L, connecting the upper end of the hook to the lever at a point above the pivot thereof, and the ears N N on the upper side of the arm H at the forward end, to guide the motion of the connecting-rod L, all constructed, arranged, and operated substantially as specified.

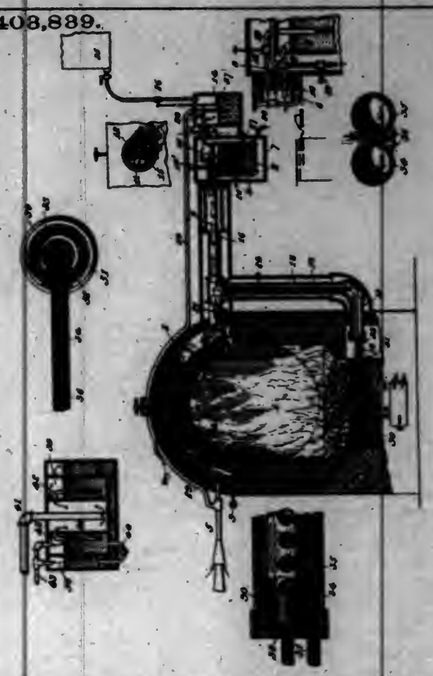
408,839. FURNACE AND APPARATUS FOR PRODUCING AND BURNING GASEOUS VAPORS. GEORGE H. HARVEY, Pittsburg, Pa. Filed June 6, 1888. Serial No. 276,285. (No model.)

Claim.—1. In combination, a blower connected by an air-conduit with an air-heating chamber, a burner adjacent to said chamber, an oil-receptacle of a carburetor, an air-conduit connected to convey air from the heating-chamber to the interior of the oil-receptacle, and a conduit connected to convey carbureted air to the burner, the conduit for carbureted air being inclosed to maintain its heat, substantially as specified.

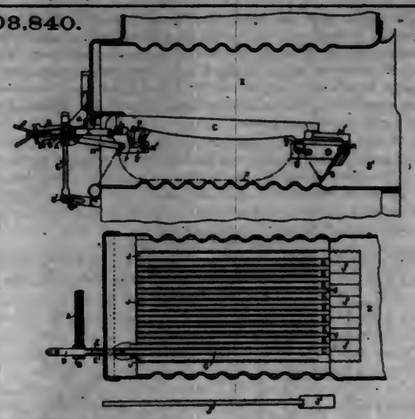
2. In combination, a blower connected by an air-conduit with an air-heating chamber, a burner adjacent to said chamber, two carbureting oil-receptacles, an air-conduit provided with branches or extensions connecting the air-heating chamber with each receptacle, and a conduit connected with the burner and provided with branches or extensions connecting the same with the upper part of each carburetor, whereby two bodies of oil may be used to carburet air and the carbureted air from both may be mingled and conveyed to the burner, substantially as specified.

3. The combination of a blower connected by an air-conduit with an air-heating chamber, a burner adjacent to said chamber, a carbureting oil-receptacle, a conduit for heated air connecting the heating-chamber and carburetor, and a conduit for carbureted air connecting the carbureting oil receptacle and burner, the conduit for carbureted air being inclosed in the hot-air conduit, substantially as and for the purpose set forth.

4. The combination of a blower connected by an air-conduit with an air-heating chamber, a burner adjacent to said chamber, an air-conduit connecting the air-heating chamber and a carbureting oil-receptacle, and a by-pass pipe connecting the blower and the carbureting oil-receptacle, substantially as specified.



5. The combination of a blower connected by an air-conduit with an air-heating chamber, a burner adjacent to said chamber, two carbureting oil-receptacles, one of which is incased, a hot-air conduit connecting the heating-chamber with the space between the casing and its inclosed oil-receptacle, and also connecting said chamber by the medium of branch or extension pipes with both oil-receptacles, a pipe connecting the oil-receptacles for transferring oil, and a conduit for carbureted air connecting the receptacles with the burner, substantially as specified.

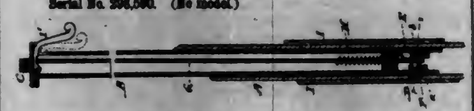


6. The combination of a blower connected by a conduit with a heating-chamber, a burner adjacent to said chamber, two carbureting oil-receptacles, one of which is incased and on a lower level than the other, a hot-air conduit connecting the heating-chamber with the space between the casing and its inclosed oil-receptacle and also, by the medium of branch or extension pipes, with both oil-receptacles, a pipe connecting the oil-receptacles for transferring oil, and a conduit for carbureted air connecting the receptacles with the burner, substantially as specified.

7. The combination of a blower connected by an air-conduit with a heating-chamber, a burner adjacent to said chamber, two carbureting oil-receptacles, one of which is incased and on a lower level than the other, which latter is provided with devices for automatically regulating the height of the liquid fed into the same, a hot-air conduit connecting an air-heating chamber with a space between the casing and its inclosed oil-receptacle, and also connecting said chamber by the medium of branch or extension pipes with both oil-receptacles, a pipe connecting the oil-receptacles for transferring oil, and a conduit for carbureted air connecting the receptacles with the burner, substantially as specified.

408,840. GRATE FOR FURNACES. THOMAS HENDERSON, Liverpool, England. Filed July 10, 1888. Serial No. 279,208. (No model.) Patented in England Oct. 2, 1876, No. 3,812.

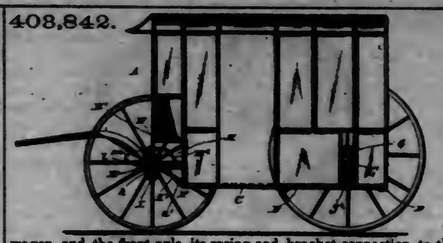
Claim.—1. In combination, the horizontally-reciprocating bars K, a fixed bearer supporting the rear ends, an anti-friction roller supporting their front ends, the alternate bars J, having projections located near the forward end and supported at their rear ends upon a fixed bearing, an actuating-shaft having flanges formed thereon, and means for actuating said shaft, one of said flanges engaging the bars K for reciprocating them back and forth and the other flanges engaging the projections on the bars J, whereby they are tilted, substantially as described.



2. The combination of the shaft P, having vertical and horizontal flanges N N', a bar, C, having a notch formed therein and adapted to engage the vertical flange N, grate-bars K, having notches formed therein also adapted to engage said vertical flange, alternate bars J, having projections formed on their lower surface near the forward end and engaging the horizontal flange N', and means for actuating said bar C, whereby horizontal reciprocation is given the bars K and the bars J are tilted, substantially as described.

3. The combination of the alternate bars K with the alternate bars J, having horizontal flanges J' located below the level of the grate-surface and extended laterally and longitudinally beyond and for a short distance below the rear ends of the alternate bars K, whereby a flat dead-surface is formed with small or no air-spaces, substantially as described.

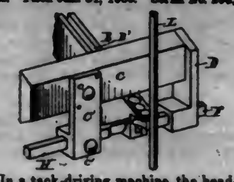
4. In combination with the shaft P, having vertical and horizontal flanges N N', bars J, having notched projections near their forward end adapted to engage the horizontal flange N', alternate bars K, having notches therein adapted to engage the vertical flange N, said notches being wider relatively to the flange N than the notches in the projections on the bars J, and means for actuating the shaft P, whereby in the movement thereof the bars J will be tilted before the bars K are reciprocated, substantially as described.



408,841. LAMP-STANDARD. WILLIAM C. HOGAN, Meriden, Conn., assignor to Edward Miller & Company, same place. Filed Feb. 4, 1889. Serial No. 298,590. (No model.)

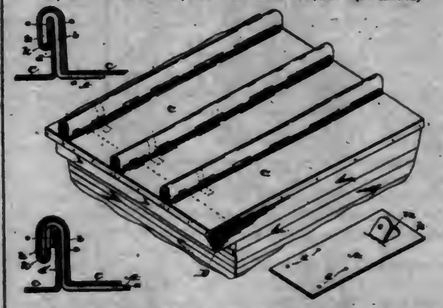
Claim.—In a lamp-standard, substantially such as described, consisting of two tubes, one stationary and the other telescopically adjustable within the stationary tube, the combination therewith of a shoe attached to the lower end of the inner tube and so as to take a bearing upon the inner surface of the outer tube at one side, a corresponding shoe detached from the inner tube, but arranged opposite the attached shoe, the said two shoes constructed with seats upon their inner sides, a strut arranged in said seats, but of greater length than the distance between the said two seats of the shoe when in operation and so that the said strut lies in a diagonal plane, a rod within the inner tube, its lower end in connection with the said detached shoe, the rod extending upward to a convenient point above the outer tube, with means, substantially such as described, to force the said rod downward, and a spring the tendency of which is to yieldingly raise the said detached shoe, substantially as described.

408,842. DELIVERY-WAGON. GEORGE L. HOWLAND, Topsham, Me. Filed Mar. 16, 1888. Serial No. 268,581. (No model.)



Claim.—1. The low-bodied wagon having the rear-axle chamber, the front-axle recess, and the low entrance portion, in combination with the rear axle, its elliptic spring and shackle connections, and the hanger-block secured to said spring and to the bottom frame of the wagon, and the front axle, its spring and bracket connection to the wagon-body, substantially as specified.

2. In a low-bodied wagon, the combination, with the recessed front and projecting front ledge over said recess, of the bearing-bracket having a goose-neck brace, the front axle, its spring supporting said bracket, the king-bolt, and its overhanging pivoted brace, substantially as specified.

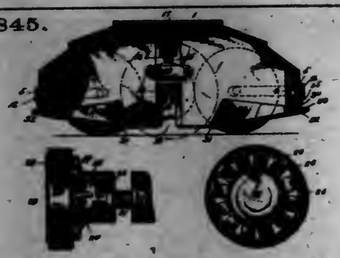


3. In a low-bodied wagon, the combination, with the transverse rear-axle recess having open ends, of the rear axle and its transverse elliptic spring in said recess, the shackles connecting the spring to the axle, and the hanger-block clipped to the spring and bolted to the sill-bar of the wagon, substantially as specified.

408,843. TACK-FEEDING MACHINE. LEANDER D. JUNKINS, Somerville, Mass. Filed Jan. 31, 1888. Serial No. 262,363. (No model.)

Claim.—In a tack-driving machine, the head-plate A, having a raceway-piece, B, the slide C, having rigidly attached to it the arms C' and D, in which are fixed, respectively, the segregating-bar H and the feed-bar F, as described, and adapted to operate substantially as set forth.

408,844. SHEET-METAL ROOFING. ALVIN C. KAUFFMAN, Canton, Ohio. Filed Oct. 30, 1888. Serial No. 289,490. (No model.)



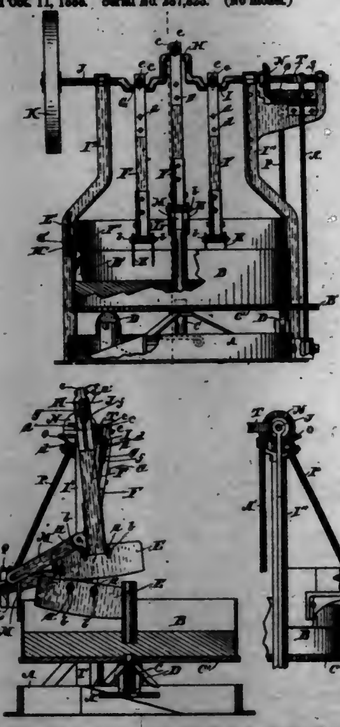
Claim.—In devices for securing sheet-metal roofing in position, the combination, with two adjacent upturned flanges of the sheets of metal of different heights, of an anchoring-piece secured at one end to the roof and projecting up between the said adjacent flanges of the sheets of metal, the anchoring-piece having a tongue partially severed therefrom, the base of the tongue being located at the upper edge of the lowermost of the two upturned flanges, the top of the anchoring-piece being embraced by a folded-over edge of the higher of the two upturned flanges, and the opening formed in the anchoring-piece by the partial severing of the tongue therefrom being free to receive the tongue in the finished seam, substantially as set forth.

408,845. CARPET-SWEEPER. GEORGE W. KELLEY, Goshen, Ind. Filed May 26, 1888. Serial No. 275,167. (No model.)

Claim.—1. In a carpet-sweeper, a case having its side walls projected beyond its end walls and longitudinally recessed, in combination with L-shaped spring-arms mounted in the recesses and projecting to the end of the case and provided with bearings, and drive-wheels mounted on said bearings, substantially as specified.

2. In a carpet-sweeper, a case the side walls of which are projected beyond the end walls, and are provided with longitudinal re-

408,845.



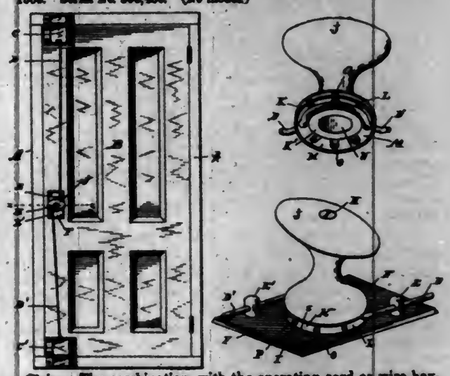
cases, in combination with L-shaped spring-arms secured in the recesses and projecting to the ends of the case and provided with bearings, drive-wheels mounted on the bearings, and bifurcated springs secured to the case and bearing against the drive-wheels, substantially as specified.

3. The case 1, slotted, as at 13, and formed with ways 14, in combination with the sliding plate 15, having the stud 16, the interposed spring 17, the depending shaft receiving spring-arms 18, and the keeper 19, substantially as specified.

4. The shaft 20, having the reduced neck portion 21 and end portion, 22, in combination with the pulley 23, having the body portion 24, mounted on the end of the shaft, said body being slotted, as at 26, bent, as at 27 and 28, and an outer rim, 25, substantially as specified.

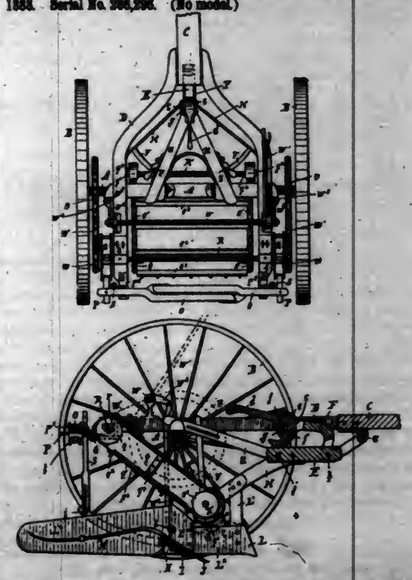
5. In a carpet-sweeper, a brush-roll provided with a pulley at one end, the same consisting of a strip of metal secured to the roll to form a cylinder or body and slotted from its outer to near its inner edge, the slotted portion being flared and terminating in bent ends, and a frictional band mounted on the flared portion, substantially as specified.

408,846. MACHINE FOR CUTTING MEAT. HENRY KOEPP, Milwaukee, Wis., assignor of one-half to Frederick X. Hedden, same place. Filed Oct. 11, 1888. Serial No. 287,233. (No model.)



Claim.—1. In a meat-cutting machine, the combination, with the knife-bars F and the thereto-attached knives, of two crank-shafts, J and L, respectively connected with the respective ends of said knife-bars, and mechanism for rotating both of said crank-shafts, substantially as and for the purpose specified.

2. In a meat-cutter, the combination of the crank-shaft J, mounted in journal-bearings upon the supporting-standards I" I", knife-bars F, journaled at their upper ends to the arms of said crank-shaft J, crank-shaft L, connecting-bars M, pivoted at their upper ends to the lower ends of said knife-supporting bars F and journaled at their opposite ends to the arms of said crank-shaft L, knives E E, affixed to the lower ends of said bars F, and rotating meat-block B, all substantially as and for the purpose specified.



3. The combination, with the stationary frame of the machine, of the bracket E, provided with slot J', lever H', pivoted at one end to said bracket E and provided with slot K', bolt or pin G, secured at one end to said lever H' within said slots J' and K' and at its opposite end to the plow-supporting arm F', arm F', and plow D', all substantially as and for the purpose specified.

408,847. BOLT. CHARLES J. LARSENBACH, Dorchester, Iowa, assignor of one-half to Jacob F. Force, Minneapolis, Minn. Filed Jan. 16, 1889. Serial No. 296,486. (No model.)

Claim.—The combination, with the operating cord or wire having its ends connected to the oppositely-arranged spring locks or bolts, of the operating device consisting of the knob-plate, guide-studs, spindle, and recessed and apertured knob-disk and knob, constructed and combined to operate in the manner and for the purpose substantially as herein shown and set forth.

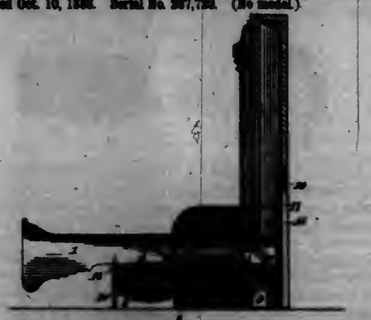
408,848. POTATO-DIGGER. JAMES H. LEWIS, Detroit, Mich., assignor of one-half to Charles G. Hampton, same place. Filed Mar. 6, 1888. Serial No. 266,296. (No model.)

Claim.—1. The combination, with a plow and supporting-frame of a potato-digger, substantially as described, of a carrier mounted on a frame pivotally secured at its rear end in bearings longitudinally adjustably secured to the frame and free to rise and fall at its front end, and a stop on the side plow to support said front end, substantially as described.

2. In a potato-digger, substantially as described, the combination of the supporting frame or bounds D, the transverse shaft R, the boxes *r*, in which said shaft is journaled, the supporting-brackets *s*, adjustably secured to the bounds, the sprocket-wheels *m*, secured upon said shaft and provided with drive-connection from the ground-wheel, the frame *q* of the carrier pivotally sleeved upon the shaft R, the shaft R', journaled in the lower ends of the frame *q*, and the carrier mounted upon the shafts R R', substantially as described.

3. In a potato-digger, substantially as described, the combination of the supporting frame or bounds D, the transverse shaft R, the boxes *r*, in which said shaft is journaled, the brackets *s*, supporting said boxes, adjustably secured to the bounds, the sprocket-wheels *m*, secured upon said shaft and provided with drive-connections from the ground-wheels, the carrier-frames *q*, sleeved upon the shaft R at their rear ends and loosely journaled upon their front ends, the extension-joints in said carrier-frames, the shaft R', journaled in the front ends of the carrier-frames, the sprocket-wheels mounted upon the shafts R R', and the carrier-chains *o'* and rakes *o²*, substantially as described.

4. In a potato-digger, substantially as described, the combination, with the shaking grates M, mounted in the rear of the plow, of the vibrating shaker-arms O, mounted upon the rear end of the frame transversely thereof and hinged to the rear extension of the bounds, the striker-arms P, transverse shaft R and its drive-connection with the ground-wheels, and the wheels Q, mounted upon the shaft R and provided with striker-arms or cocks, substantially as described.



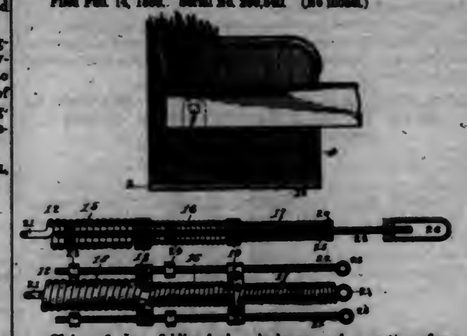
5. In a potato-digger, the combination, with the supporting-frame mounted upon the axle, of the plow-beam E, the lever F, pivotally secured to the plow-beam and fulcrumed at its forward end to the plow-frame, substantially as described, the elevised rear end, *c*, of the lever F, the eccentric cam-lever *d*, mounted therein, and adjusting-bolts *f f*, the parts being arranged to operate substantially as described.

408,849. WATCH-MAKER'S STAKING-TOOL. GASPARD MARTEL, Boston, Mass. Filed Mar. 1, 1889. Serial No. 301,850. (No model.)

Claim.—The stationary perforated bed-plate *b* and stationary base *a*, having the post or standard *c* and vertical pivot-pin *d*, having its axis coinciding with that of the plate *b*, in combination with the stake or punch carrying arm *e*, pivoted on the pin *d*, and a locking device for securing said arm to the standard *c* after being adjusted, substantially in a manner and for the purpose set forth.

408,850. BED-LOUNGE. ARTHUR H. MERRILL, Hartford, Conn. Filed Oct. 10, 1888. Serial No. 287,732. (No model.)

Claim.—1. In a bed-lounge, a bed-case and a mattress-frame, which is pivoted in said bed-case and is provided with socket-piece 16, in combination with a lounge-seat hinged to said bed-case and provided with pins 11, which are adapted to engage said socket-pieces, substantially as and for the purpose specified.



2. In a bed-lounge, a bed-case, a mattress-frame which is pivoted in said bed-case, and a reversible lounge-seat which is provided with legs 10 and is hinged to the base of said bed-case, in combination with one or more eyes and hooks 12, whereby said seat and frame are fastened rigidly together when each bed-lounge is arranged for use as a bed, substantially as and for the purpose specified.

3. In a bed-lounge, a bed-case, a mattress-frame which is provided with a socket-piece, 16, and is pivoted in said bed-case, and one or more springs which are adapted to facilitate the manipulation of said mattress-frame, in combination with a seat fitted to said bed-case and provided with a pin which is adapted to enter said socket when the bed-lounge is disposed as a lounge, substantially as and for the purpose specified.

4. In a bed-lounge, a bed-case, a mattress-frame which is pivoted in said bed-case, and a reversible seat which is hinged to the base of said case, in combination with one or more hooks and eyes, which are attached to said seat and mattress-frame and are adapted to fasten them firmly together when said bed-lounge is disposed as a bed, substantially as and for the purpose specified.

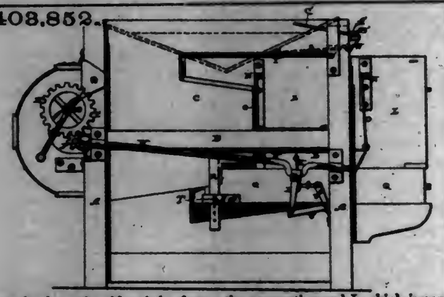
5. In a bed-lounge, a bed-case, a mattress-frame which is pivoted in said bed-case, a spring engaging both said mattress-frame and said bed-case and tending to raise the former to its erect position, and a reversible seat which is hinged to the base of said bed-case, in combination with one or more hooks and eyes, which are attached to said seat and mattress-frame and are adapted to fasten said seat and mattress-frame firmly together when the bed-lounge is disposed as a bed, substantially as and for the purpose specified.

408,851. FOLDING BED. ARTHUR H. MERRILL, Hartford, Conn. Filed Feb. 14, 1888. Serial No. 263,840. (No model.)

Claim.—1. In a folding bed, a bed-case and a mattress-frame which is pivoted in said case, in combination with a compound coiled spring attached to said case and to said frame, and consisting of a series of two or more coiled springs of unequal strength or elasticity, which are fastened end to end, and are provided with a corresponding number of terminal perforated heads, and an axial rod carrying an equal number of nuts adjustable thereon which are adapted to engage said heads, respectively, substantially as and for the purpose specified.

2. In a folding bed, a bed-case, a mattress-frame which is pivoted in said case, and a series of coiled springs of unequal strength or elasticity which are provided with terminal heads, in combination with an axial screw-threaded rod carrying nuts adjustable thereon which are adapted to engage said heads within said spring, substantially as and for the purpose specified.

3. In a folding bed, a bed-case, a mattress-frame which is pivoted in said case, and a series of two or more coiled springs of unequal strength or elasticity arranged in line, provided with heads fastened together and attached to said bed-case, in combination with a screw-threaded traction-rod which is provided with nuts for engagement with said heads and is attached to said mattress-frame, substantially as and for the purpose specified.



4. In a folding bed, a bed-case, a mattress-frame which is pivoted in said case, and a number of unequal-coiled springs, joined in one, provided with heads and attached to said bed-case, in combination with a screw-threaded traction-rod which is provided with nuts adjustable thereon for engagement with said heads and is attached to said mattress-frame, substantially as and for the purpose specified.

5. In a folding bed, a bed-case and a mattress-frame which is pivoted in said bed-case, in combination with a number of coiled springs of unequal elasticity having a fixed attachment to each other and to said bed-case, and provided with a traction-rod which has a fixed attachment to said mattress-frame and a sliding attachment to said springs, substantially as and for the purpose specified.

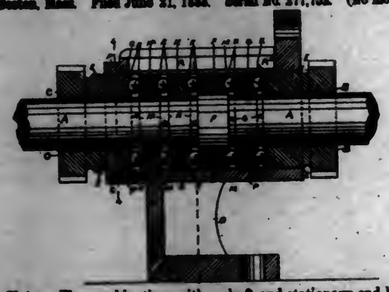
408,852. FANNING-MILL. ROBERT MILLER, Hebron, Nebr. Filed Feb. 6, 1889. Serial No. 298,905. (No model.)

Claim.—1. The combination of the cranked shaft H, which ex-

408,852.

tends along the side of the frame, the connecting-rod I, which is connected at its upper end to the crank, and the bent cranked lever U, which is pivoted upon the frame-work, and which has its outer end attached to the connecting-rod and its inner end to the lower shoe, substantially as shown.

2. The combination of the cranked rod, the connecting-rod connected thereto and provided with the perforated flange, the bent lever connected to the lower end of the connecting-rod for operating the lower shoe, the connecting-rod K, fastened to the flange, and the upper shoe, substantially as described.

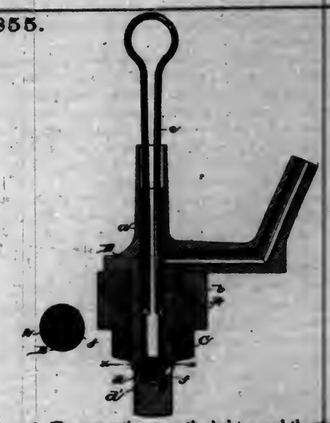


3. The combination of the movable portion of the bottom of the hopper, the rod connected thereto, the connecting-rods, the levers or arms, the operating-shaft, and suitable bearings for the shaft, substantially as specified.

408,853. BUCKLE AND BACK-BAND HOOK. REESE MUSSER, Calvert, Tex. Filed Jan. 14, 1889. Serial No. 296,571. (No model.)

Claim.—The back-band hook and buckle consisting of the plate having at one edge the parallel arms, each formed in a proximately U shape, and the proximately U-shaped hook having unequal-lengthed arms and hung or pivoted between two of the longitudinal portions of the U-shaped arms of said plate, the pivotal connection or point being near the inner end of the hook and the inner or free ends of the plate-arms, substantially as shown and described.

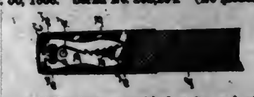
408,854. ANTI-FRICTIONAL BEARING FOR SHAFTS. FRED BRINK G. MYERS, Winthrop, assignor of one-half to Wellington P. Smart, Boston, Mass. Filed June 21, 1888. Serial No. 277,782. (No model.)



Claim.—The combination, with a shaft and stationary end bearings therefor, of a fixed and of loose collars on the shaft, having grooves or ways K in their opposite faces severally concentric with the shaft, loose balls J, located between and rolling in the grooves of said collars, and loose blocks L, placed between and separating the balls, substantially as described, for the purposes specified.

408,855. SUPPORT FOR SPINNING-SPINDLES. JAMES H. NORTHROP, Hopedale, Mass., assignor to George Draper & Sons, same place. Filed Jan. 2, 1889. Serial No. 295,193. (No model.)

Brief.—The object of the invention is to prevent the rotation of the step and the bolster in the supporting-case by means of a single pin.



408,855.

Claim.—1. The supporting-case, the bolster, and the step therein, each notched as described, combined with a single vertically-placed pin or stop, *f*, to engage both the step and bolster, substantially as described.

2. The supporting-case, the bolster notched at its lower end, and the step therein, notched as described, the bolster and step being connected together adjustably by screw-threads, combined with a pin or stop to engage both the step and the bolster to restrain them from rotation, substantially as described.

408,856. BILLIARD-CUE. WILL R. OWENS, Springfield, Dak. Filed Nov. 30, 1888. Serial No. 292,294. (No model.)

Claim.—1. A billiard-cue provided at its end with a tip-fastener made in two parts pivoted together and having jaws, and a locking-bolt passing between them to hold and secure the tip, substantially as described.

2. In combination with a cue slotted at its end, a tip-fastener placed in said slot and composed of two parts pivoted together and having jaws above and serrated lower ends, and a bolt to spread the serrated ends of the parts and hold the fastener in the cue, as well as secure the tip, substantially as described.

3. In combination with the cue slotted at its end, the tip-fastener made in two parts pivoted together and having jaws above serrated and the bolt to spread the lower ends of said fastener, the ferrule B, to cover the end of the cue, and the tip-fastening mechanism, substantially as shown and described.

408,857. SPLIT PULLEY. MARSHAL T. REEVES and MILTON O. REEVES, Columbus, Ind., assignors to the Reeves Pulley Company, same place. Filed Sept. 24, 1888. Serial No. 286,208. (No model.)

Claim.—1. A split pulley consisting of the following elements, namely: two substantially semi-cylindrical sections, each having tenons projecting from its straight side at one side of its central plane, and corresponding recesses arranged on the other side of said central plane, the recesses in one section being adapted to receive the tenons of the other section, each section having a central hole passing through the plane of the pulley at right angles thereto, and a keyway arranged on one side of said central hole communicating therewith and extending transversely through both sections and their tenons, and a key fitted to said keyway, all combined and arranged substantially as specified, whereby the two sections are held together to form a complete cylinder.

2. In a pulley, the combination of two like semi-cylindrical sections, each having tenons projecting from its straight edge, and corresponding recesses to receive said tenons, and having a central hole passing through the plane of said section at right angles thereto, and keyways arranged on opposite sides of the central hole, said keyways being formed partly in each of the sections and extending through said tenons, and wedge-shaped keys fitted in said keyways, and a split hub fitted in said central hole, all arranged to co-operate substantially as specified, whereby the two sections are held together so as to form a complete cylinder, and the parts of the split hub are at the same time clamped together.

3. A belt-pulley having a central hole passing through the plane of the pulley at right angles thereto, and having a keyway formed therein at one side of said central hole and communicating therewith, a wedge-shaped key fitted in said keyway, and a split hub mounted in said central hole.

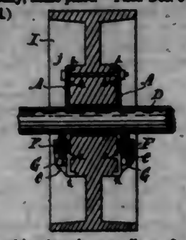
408,858. HUB FOR SPLIT PULLEYS. MARSHAL T. REEVES and MILTON O. REEVES, Columbus, Ind., assignors to the Reeves Pulley Company, same place. Filed Sept. 24, 1888. Serial No. 286,210. (No model.)

Claim.—1. The combination, in a split pulley, of two substantially semi-cylindrical diametrically-separable sections, each provided on its side with a semicircular annular groove, and a metallic hub adapted to be secured to the web of said pulley, and having an annular flange adapted to fit in said grooves, whereby the two pulley-sections are held together, substantially as specified.

2. A hub for split pulleys, consisting of two substantially semi-cylindrical diametrically-separable metallic sections, each having an annular lug projecting beyond the line of division, and a corresponding recess receding from said line, the recess in each section being adapted to receive the lug of the other section, and screws passing through the body of the hub into said lugs, whereby the two sections are secured together, substantially as specified.

3. A hub for split pulleys, consisting of two substantially semi-cylindrical diametrically-separable metallic sections, each having an annular lug projecting beyond the line of division, and a corresponding recess receding from said line, the recess in each section being adapted to receive the lug of the other section, screws passing through the body of the hub and through said lugs, whereby the two sections are secured together and the hub also thereby secured to a shaft, and an annular flange projecting from the hub and adapted to enter the web of the pulley, whereby the hub is adapted to hold the two sections of a split pulley together, all substantially as specified.

408,859. SPLIT PULLEY. MILTON O. REEVES and MARSHAL T. REEVES, Columbus, Ind., assignors to the Reeves Pulley Company, same place. Filed Nov. 24, 1888. Serial No. 291,751. (No model.)



Claim.—1. A split pulley having a web formed of two like sections, each consisting of two disk segments secured together one upon the other, one of said segments being less than a half-circle, and the other segment being correspondingly more than a half-circle, so that when the two sections are placed together their larger segments overlap and the smaller segment of each forms with the larger segment of the other a complete circle.

2. A wooden pulley provided with a pair of metallic plates secured to opposite ends of the wooden hub of the pulley, each of said plates having a central opening of larger diameter than the shaft, and two lugs projecting inward from one of the sides of said opening, a keyway arranged in the side of the opening opposite the space between said lugs, and a key, all arranged to co-operate to secure the pulley on a shaft, substantially as specified.

3. A pulley having a central opening of larger diameter than the shaft, a pair of radial lugs projecting inward from one side of said opening and engaging the shaft, and a key arranged on the opposite side of the shaft to force the shaft against the lugs, whereby the pulley is secured upon the shaft, substantially as specified.

408,860. HUB-PLATE FOR WOODEN PULLEYS. MILTON O. REEVES and MARSHAL T. REEVES, Columbus, Ind., assignors to the Reeves Pulley Company, same place. Filed Dec. 31, 1888. Serial No. 295,067. (No model.)

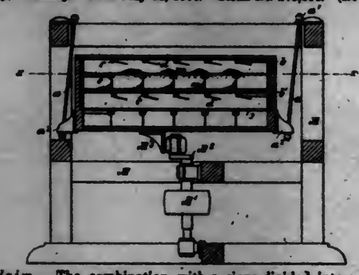
Claim.—The combination, in a pulley, of a pair of metallic plates secured to opposite ends of the hub of the pulley, each of said plates having a central bearing adapted to fit one side of the shaft, a radial slot extending from said bearing to the periphery of the plate, a pair of lugs projecting from the outer side of the plate on opposite sides of said slot, a bar adapted to slide in said slot and arranged to engage said lugs, and means for forcing the bar against the lugs by pressure against the shaft mounted in the bar, whereby the pulley is secured to the shaft, substantially as specified.

408,861. TEMPORARY COVERING FOR PULLEYS. MILTON O. REEVES, Columbus, Ind., assignor to the Reeves Pulley Company, same place. Filed Feb. 26, 1889. Serial No. 301,080. (No model.)

Claim.—The above-described temporary covering for pulleys, consisting of a strip of paper or other wrapping material arranged to cover the face of the pulley, a series of wooden bars, each having a series of transverse grooves in one side, said bars being arranged at intervals outside of said wrapping-strip around the periphery of the pulley substantially parallel with its axis, and a cord passed around the pulley over the bars, resting in said grooves therein and tightly secured thereon, all substantially as and for the purpose specified.

408,862. SUPPORT FOR SPINNING-SPINDLES. JOHN S. KNIGHTON, Lowell, assignor of one-half to George Draper & Sons, Hopedale, Mass. Filed Aug. 26, 1888. Serial No. 283,780. (No model.)

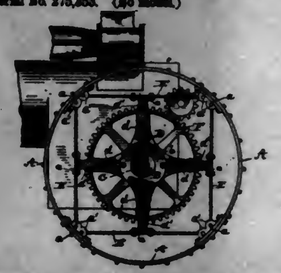
Brief.—The object of the invention is to improve the construction of spindle-supports wherein the lower end of the spindle is allowed to move and to enable the step to move both vertically and laterally with the end of the spindle.



Claim.—1. The combination, with a sleeve-whirl spindle, a supporting case or holder, and a rigid bolster-bearing therein, of an independent elastic step-holder separated from the bolster, but securely held at or near its upper end within the said case, and a step connected to and carried by the lower freely-movable portion of the said step-holder, the said step-holder normally acting to keep the step in the desired or central position in the said case, substantially as described.

2. The combination, with the sleeve-whirl spindle, the supporting case or holder, and the rigid bolster-bearing, of the elastic step-holder *h*, firmly held at or near its upper end in the said supporting-case, and step *f* therein and suspended by the said step-holder, the step-holder being free to yield both laterally and vertically within the said supporting-case, substantially as described.

3. The combination, with a sleeve-whirl spindle, a supporting case or holder, and a bolster-bearing therein, of an independent elastic step-holder separated from the bolster, but securely held at or near its upper end within the said case or holder, and a step connected to and carried by the lower freely-movable portion of the said step-holder, the said step-holder normally acting to keep the step in substantially central position in the said case, substantially as described.



4. The combination, with a sieve-whirl spindle, a supporting case or holder, and a bolster bearing therein, and a laterally-movable step, of a step-holder composed of wire coiled to form a spring, the upper end of the said step-holder being securely held within said supporting case or holder and being connected at its lower end to the said step to suspend it in the case, whereby the step, besides being free to yield laterally, is also enabled to yield vertically, substantially as described.

408,863. SIFTING APPARATUS. HERMANN SEEK, Dresden, Saxony, Germany. Filed July 11, 1888. Serial No. 279,668. (No model.)

Claim.—The combination, with a sieve divided into compartments, of flaps or doors opened and closed by movement of the sieve for propelling the material along the sieve, substantially as described.

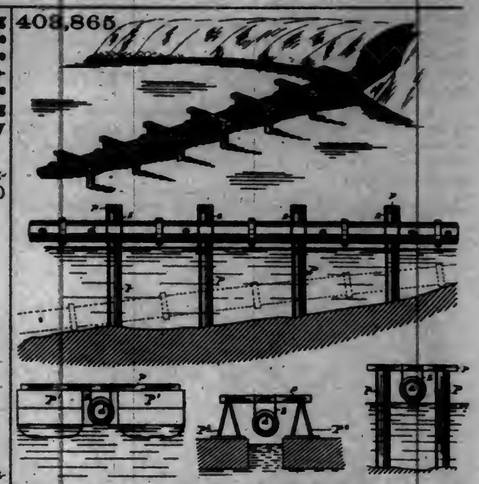
408,864. WHEEL. JESSE WALRATH, Racine, Wis. Filed May 26, 1888. Serial No. 275,253. (No model.)

Claim.—1. A wheel provided with three or more bar-springs interposed between the hub and the tire or rim, each spring being connected at its ends to the said tire or rim at points independent of the connections of the other springs, substantially as described.

2. A wheel provided with three or more bar-springs interposed between the hub and the tire or rim and connected to the hub, each spring being connected at its ends to said tire or rim at points independent of the connections of the other springs, substantially as described.

3. A wheel provided with three or more bar-springs, each spring being connected to the tire or rim at points independent of the connections of the other springs and connected centrally or intermediately with arms rigidly attached to said hub in line with said arms, substantially as described.

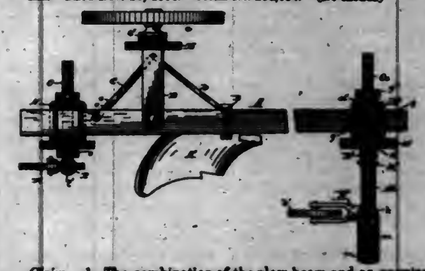
4. The combination, with the rim or tire, of bar-springs having their ends attached to said rim or tire at points independent of the connections of the other springs, arms rigidly attached to the hub and extending radially therefrom, and a flexible connection between each of the springs and one of the said arms, substantially as described.



5. The combination, with the rim or tire, of the hub and spider rigidly attached thereto, bar-springs, each connected to the rim or tire at points independent of the connections of the other springs, and links connecting the spider-arms centrally with the said springs in line with said arms, substantially as described.

6. The combination, with the rim or tire, of the hub, arms rigidly attached thereto and extending radially therefrom, and two series of bar-springs in different vertical planes interposed between the hub and the tire or rim, each spring having its ends connected to the rim or tire and connected intermediate its ends with one of the said radial arms, the ends of one set of springs being connected to the tire or rim intermediate the ends of the other set of springs, substantially as described.

408,865. APPARATUS FOR LAYING PIPE. JOHN P. WARD, Jersey City, N. J. Filed July 28, 1888. Serial No. 280,712. (No model.)



Claim.—The herein-described means for laying piping, said means

408,865

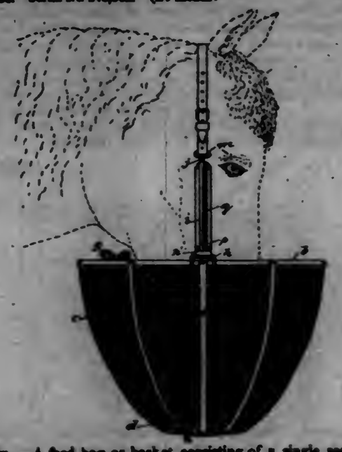
consisting of supports combined with spaced slings each of a strength sufficient to support only its own section, so that on the severing or freeing of one of the slings the extra weight thrown on the other slings will cause them to break and the whole length of piping to drop, all substantially as set forth.

408,866. SULKY-PLOW. EDMUND C. WHITEVEAR, South Bend, Ind. Filed Nov. 27, 1888. Serial No. 291,957. (No model.)

Claim.—1. The combination of the plow-beam and an angularly-adjustable casting mounted thereon, with the shaft, its lever and locking sector therefor, and a caster-wheel connected to said shaft, but capable of an independent lateral swinging movement below the same, and the devices for locking said wheel, substantially as specified.

2. The combination of a plow, a casting secured to the beam thereof, and a short shaft journaled in said casting, and a lever for shifting said shaft, with a caster-wheel loosely connected to and swinging below said shaft and vertically adjusted thereby, and the devices for locking said caster-wheel independently of its movement by the shaft, substantially as described.

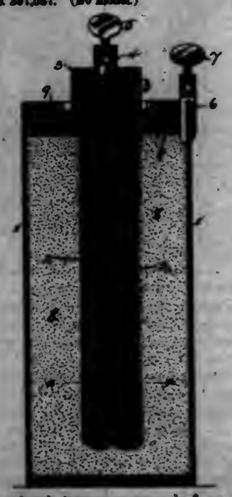
3. The combination of the casting having a bearing in its under surface and a sector on one end, and the shaft mounted in said bearing, with the caster-wheel yoke connected to and swinging horizontally beneath said shaft, and the lever on said shaft, and its catches for respectively engaging the sector and locking the swinging yoke, substantially as described.



4. The combination of the casting, the shaft journaled therein having a depending stud, G', and the lever and sector for adjusting said shaft, with the caster-wheel yoke having a perforated boss mounted on said stud, a bracket rising from said boss, and a locking-arm secured to said bracket, and a catch on said lever engaging and locking said arm, all substantially as and for the purpose described.

5. The combination, with a plow, of a casting secured to the beam thereof and angularly adjustable thereon, the shaft journaled in bearings on said casting, and the caster-wheel connected to said shaft, and the mechanism for adjusting and locking the caster-wheel independently of the shaft, substantially as set forth.

6. The combination of the plow the bar B, extending to the land-side thereof, the wheel adjustably mounted on the end of said bar, and the adjustable braces for said bar respectively clipped and bolted to the beam, with the pair of castings F and N, respectively in front and in rear of the plowshare, the adjustable horizontal shafts jour-



naled in said castings, the front and rear swinging caster-wheels on said shafts, and the locking devices for said wheels, all constructed and arranged substantially as specified.

408,867. FEED-BAG. JOHN H. WILLIAMS, Boston, Mass., assignor to the Boston Feed Basket Company, of New Hampshire. Filed May 10, 1888. Serial No. 273,502. (No model.)

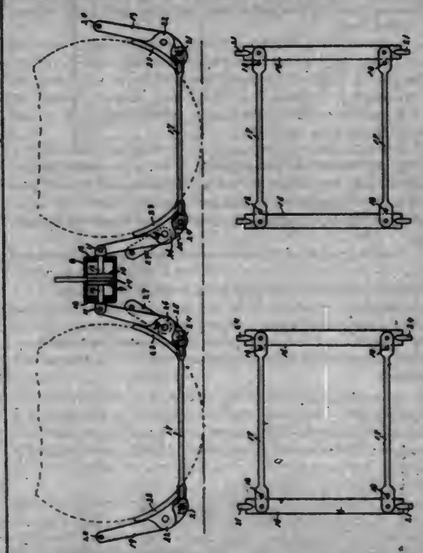
Claim.—A feed bag or basket consisting of a single seamless piece of wire-cloth, having the upper edge or rim bound by strips of metal inclosing the upper edge of the fabric, broad metallic strips extending at short intervals from the binding of the rim around the body of the basket outside of the same, a metallic housing hinged to the binding-rim, a supporting-rod extending into said housing, and a spring interposed between the lower end of the rod and the upper end of the housing, whereby weight in the basket will compress the spring, substantially as and for the purposes set forth.

408,868. GALVANIC BATTERY. DON J. ARNOLD, Omaha, Nebr., assignor of one-half to Marian B. Coryell, same place. Filed Jan. 26, 1888. Serial No. 297,827. (No model.)

Claim.—1. A galvanic battery composed of a receiving and retaining jar and a solid filling consisting of litharge, chloride of zinc, muriate of ammonia, oxide of mercury, and a cement, as plaster-of-paris or hydraulic cement, a carbon or carbons, contact-posts, and a sealing-cap of asphaltum or mineral pitch.

2. A galvanic battery composed of a receiving and retaining jar, a solid filling consisting of litharge, chloride of zinc, muriate of ammonia, oxide of mercury, and a cement, as plaster-of-paris or hydraulic cement, a plurality of round carbons, a clamp inclosing and binding the upper ends of said carbons together, contact-posts, and a sealing-cap of asphaltum or mineral pitch.

3. A galvanic battery consisting of a jar, a plurality of round carbons contained therein, a clamp inclosing and binding said carbons together, contact-posts connected, respectively, to said carbon-clamp and jar, a solid filling surrounding said carbons and filling the spaces between the same and the jar, and a sealing cap or cover, whereby the battery is rendered incapable of being affected by atmospheric influences and can be readily transported from place to place without injury to or displacement of the current-exciting filling.

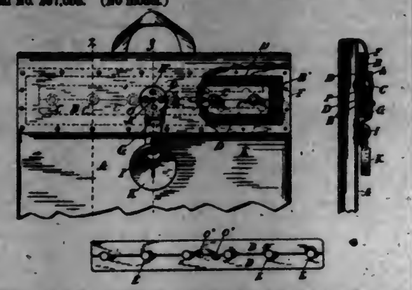


408,869. RECOVERING SPENT ALKALI. VICTOR G. BLOEDE, Baltimore, Md., assignor of one-half to John Bancroft, Wilmington, Del. Filed Apr. 13, 1888. Serial No. 270,503. (No specimens.)

Claim.—The process herein described for the recovery or rehabilitation of spent alkaline liquors, consisting of the following steps: first, the saturation or supersaturation of said liquors with phosphoric acid, thereby effecting the precipitation of the fatty and coloring matters; second, decanting or filtering the liquor from the separated impurities; third, when found desirable, destroying the residuary color in the decanted liquor with chlorine or its equivalent, and, fourth, subjecting the clarified liquor to the action of lime, barium, or other equivalent compounds capable of entering into an insoluble combination with or extracting the phosphoric acid and liberating the soda or potash in an available form as carbonate or hydrate.

408,870. RECOVERING ALKALI. VICTOR G. BLOEDE, Baltimore, Md., assignor of one-half to John Bancroft, Wilmington, Del. Filed June 13, 1888. Serial No. 276,998. (No specimens.)

Claim.—The process herein described for the utilization or recovery of spent alkaline lyes, consisting in the saturation or supersaturation of said lyes with sulphurous acid, thereby effecting the separation of the impurities and producing a sulphite or bisulphite of the alkali available as such, and the further conversion of the said sulphites or bisulphites into hydrates or carbonates by subjecting them to the action of caustic or carbonate of lime, barium, or other equivalent compounds.



408,871. LOCOMOTIVE-DRIVER BRAKE. GEORGE A. BOYDEN, Baltimore, Md., assignor to the Boyden Power Brake Company, same place. Filed Dec. 15, 1888. Serial No. 293,573. (No model.)

Claim.—1. In a locomotive-driver brake, the combination, with a cylinder provided with two separate pistons, a supply-port in said cylinder between said pistons, the two floating levers 25, the brake-shoes 23, pivoted to said floating levers, the levers 19 and their brake-shoes, of the brake-beams 16 and the adjustable connecting-beams 17, whereby the brake-shoes may be adjusted on opposite sides of the wheels, substantially as specified.

2. The combination, with the floating levers 25 and the piston-rods by which they are operated, of the brake-beams 16 and brake-shoes, the adjustable tie-rods 17, pivoted to the levers 25 and 19 on opposite sides of the driver, and the links to which said floating levers are fulcrumed, substantially as specified.

408,872. MAIL-BAG. HOMER L. BOYLE, Grand Rapids, assignor of one-half to Horace B. Peak, Allegan, Mich. Filed Jan. 21, 1889. Serial No. 297,092. (No model.)

Claim.—1. The combination, with a bag having buttons and a flap having holes adapted to said buttons overlapping its mouth for closing the same, of a pair of parallel clamping-bars arranged connectedly to said flap, and a hasp pivoted to said flap, connected with said bars, and adapted to open and close said bars for embracing said buttons, substantially as described.

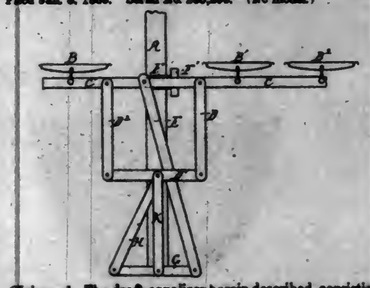
2. In combination with a bag having buttons arranged near its mouth and a flap having a lining having holes adapted to said buttons overlapping its mouth, a frame arranged between said lining and flap, and a pair of parallel clamping-bars arranged connectedly to said flap, a hasp pivoted to said flap, connected to said bars, and adapted to open and close the same, substantially as described.

3. In combination with a bag having a flap overlapping the mouth, said flap being provided with a lining and with a frame inserted between said lining and flap, forming a chamber, substantially as described, and having buttons attached to said bag for securing said flap, adapted to pass through openings in said lining into said chamber, substantially as described, and clamping-bars arranged in said chamber, adapted to embrace the shanks of said buttons, substantially as described, a hasp pivoted to said flap and connected with the clamping-bars and adapted to open and close said bars, substantially as described.

4. In combination with a bag having buttons attached and a flap having a lining provided with holes adapted to said buttons, overlapping the mouth, and having a frame inserted between said lining and flap, clamping-bars attached to a pivoted hasp adapted to open and close said bars for embracing the buttons and arranged inside of said frame, substantially as described.

5. In combination with a bag having buttons attached and having a flap provided with a lining having button-holes adapted to said buttons, clamping-bars arranged between the lining and flap, adapted to embrace the buttons and opened and closed by a pivoted hasp attached to said flap and connected with said bars, substantially as described.

6. In a bag provided with buttons arranged near the mouth and having a flap provided with a lining having holes adapted to receive the heads of the buttons, overlapping its mouth, the combination of a frame arranged between said lining and flap, clamping-bars arranged between the lining and flap and inclosed by said frame, and a pivoted hasp attached to said flap, connected with said bars, and adapted to cause the same to approach and recede from each other, substantially as described.

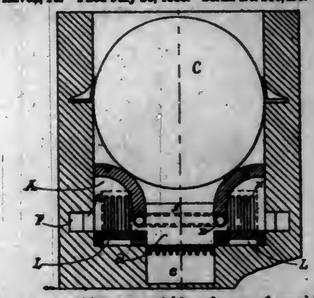


7. The combination, with a bag having a flap and provided with buttons adapted to secure the same, substantially as described, of a pivoted hasp attached to said flap and having a plate provided with curved slots arranged underneath the head thereof, and pins attached to clamping-bars arranged, secured to said flap, and adapted to close said bars, substantially as described.

8. In a mail-bag having a flap and buttons for securing said flap, arranged substantially as described, the combination, with a pair of clamping-bars having notched edges adapted for closing upon either side of the shanks of said buttons for locking the same, substantially as described, of a hasp pivoted to said flap and provided with pins connecting with said bars for opening and closing the same, and a plate having curved slots adapted to said pins arranged underneath the head of said hasp, substantially as described, and for the purposes herein set forth.

9. In a mail-bag substantially such as described, having a flap overlapping its mouth for closing the same, and buttons for securing said flap, the combination of a lining provided with holes, secured to the under side of said flap, a frame arranged between said lining and flap, a pair of clamping-bars provided with notched edges adapted for inclosing the shanks of said buttons, arranged in said frame, a hasp having a plate provided with curved slots arranged underneath the head thereof, pivoted to said flap, and provided with pins adapted to said curved slots, connected to said bar for opening and closing the same, substantially as described.

10. In a mail-bag having a flap having a lining overlapping its mouth and buttons for securing the same, substantially as described, the combination of a frame arranged and secured between said lining and flap, clamping-bars having notched edges adapted to the shanks of said buttons arranged in said frame, a hasp pivoted to said flap and having a plate having curved slots secured underneath the same, and pins connecting said bars and hasp, substantially as described, and a staple secured to said bag and adapted to said hasp for locking said bag, substantially as described.



408,873. DRAFT-EQUALIZER. ALFRED G. BROWN, Egan, Dak. Filed Jan. 3, 1889. Serial No. 295,209. (No model.)

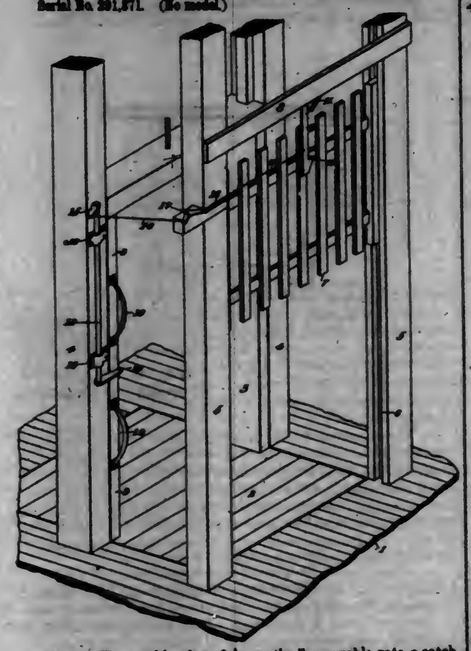
Claim.—1. The draft-equalizer herein described, consisting of the levers C and C', the diagonal brace E, the cross-bars D' and G, the parallel fulcrum-arms D and D^2, and the braces H and K, substantially as described.

2. In a draft-equalizer, the combination, with the pole, of the levers C and C', the fulcrum-arms D and D^2, the cross-bar D', the diagonally-arranged brace E, the bar F, having plate F on its end, the cross-bar G, and the braces H and K, substantially as described.

408,874. SMOKE AND GAS CONSUMING FURNACE. JOHN BURNS, Rochester, N. Y., assignor of one-half to Rowland W. Fredericks, Lock Haven, Pa. Filed July 20, 1888. Serial No. 280,455. (No model.)

Claim.—1. A coking-oven within a furnace formed by an arch resting on a circulating water-pipe connected to the boiler and the side wall of the furnace, and having space N communicating with the fire-chamber, in combination with communicating flues and openings entering the fire-chamber above the grate-bars and below the space N, substantially as herein described.

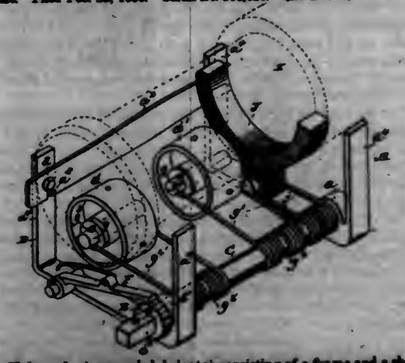
2. A flue within a furnace with a coking-oven located above it and openings and flues connecting said flue and coking-oven, in combination with flues or openings entering the fire-chamber above the grate-bars, for the purpose substantially as herein described.



3. The combination, with a furnace, of a boiler, C, connecting with circulating water-pipe B, supporting fire-brick arch E, of coking-chamber A, forming communicating space N between the fire-box D and coking-chamber A, and flues M, L, K, and H, connecting coking-chamber A and fire-box D, substantially as set forth.

4. The combination, with a furnace, of a boiler, C, connecting with circulating water-pipe B, supporting the fire-brick arch E of coking-chamber A, forming communicating space N between fire-box D and coking-chamber A, with flues M, L, K, and H, connecting coking-chamber A and fire-box D, and flues F and G, substantially as set forth.

5. In a furnace, as described, having a coking-chamber and fire-chamber with communicating space N between them, the combination of the coking-chamber A, flues H and K, and the connecting-opening M, entering the fire-chamber above the grate and below the opening N, substantially as described.



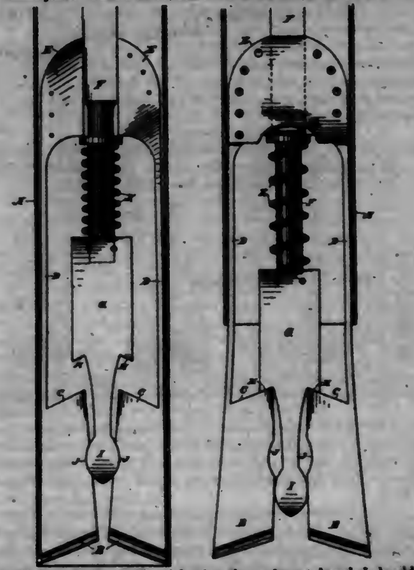
6. A coking-oven within a furnace having a close bottom to prevent air from passing up through the coal coking therein, in combination with a water-pipe connected to the boiler for the circulation of water therein and an arch supported thereon and constituting the side and top of the coking-chamber and forming a communicating space, N, between the furnace and the coking-chamber, substantially as specified.

408,875. ELEVATOR-HATCHWAY. MICHAEL J. DALY, Pittsburg, Pa., assignor to William C. Barr, Jr., same place. Filed Nov. 26, 1888. Serial No. 291,571. (No model.)

Claim.—The combination of the vertically-movable gate, a catch, 9, for retaining the same, a vertical rotary shaft, 12, provided with a projecting lever and connected by connections 16 and 18, and a bell-crank lever, 17, with the said catch, and cams 19, fixed to one of the uprights of the elevator-car, and adapted to engage said lever and thereby to rotate the shaft and to operate said catch, substantially as described.

408,876. CAR-AXLE LUBRICATOR. WILLIAM H. DANIELS and REBA CORLEY, St. Louis, assignors to Charles D. Moody, Webster Grove, Mo. Filed Feb. 25, 1888. Serial No. 265,583. (No model.)

Claim.—1. A car-axle lubricator consisting of a frame and a shaft provided with arms on which the lubricating-wheel is mounted, said shaft being adjustable to raise the said wheel to different heights, substantially as described.

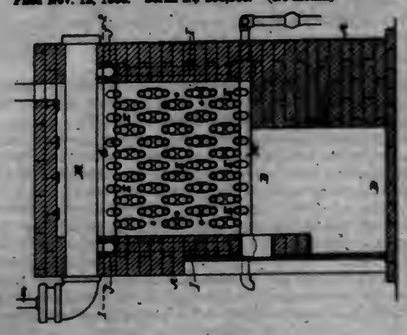


2. The combination of the uprights, the shaft, ratchet, and pawl, the wheels, and the spring-arms, substantially as described.

3. The combination of the uprights, the shaft, ratchet, and pawl, and the drip-collar, said drip-collar being supported from said shaft, substantially as described.

4. The combination of the uprights, the arm connecting the uprights, the shaft, and the wheels, said wheels being supported from said shaft, substantially as described.

5. The combination of the uprights, arm connecting said uprights, the shaft, ratchet, and pawl, wheels, drip-collar, and the spring-arms supporting said wheels and drip-collar, substantially as described.

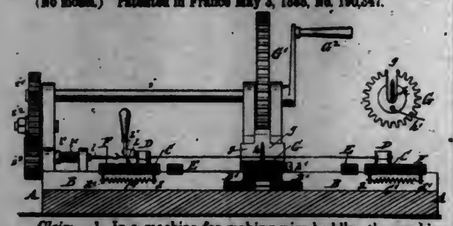


408,877. WELL BORING OR DRILLING APPARATUS. JEREMIAH H. DAY, San Francisco, Cal., assignor of one-half to Joseph Frary, same place. Filed Feb. 11, 1888. Serial No. 263,697. (No model.)

Claim.—1. The drill-rod having the undercut beveled shoulders at the lower end and the spear-head extending below these shoulders, as shown, in combination with the independent drill-shanks lying upon each side of the drill-rod and spear-head, the shanks of the drills being provided with shoulders corresponding with and engaging these of the rod when the latter is lowered, and having concavities or depressions within which the spear-head is inclosed when the rod is raised, substantially as described.

2. The drill-rod with undercut shoulders and spear-head, as shown, the drills inclosing said rod, having concavities within which the spear-head may lie, and shoulders which engage the shoulders upon the rod, in combination with a spring and a sliding collar or plate between which and a fixed collar upon the rod the spring is compressed, substantially as described.

408,878. STEAM-BOILER. ALBERT M. DIEHNER and ELMER E. SMITH, Wilkes-Barré, Pa., assignors to F. C. Sturges, trustee, same place. Filed Nov. 12, 1888. Serial No. 290,566. (No model.)



Claim.—1. The combination, in a steam-boiler, of the two quadrangular frames, each having a series of zigzag steam-generating tubes, and flanged connecting-pipes with a steam-drum having flanged T-branches secured to the flanges of the said connecting-pipes, the whole forming a steam-generating structure, substantially as described.

2. The combination, in a steam-boiler, of the quadrangular frames, each having a series of zigzag pipes connected thereto, the lower longitudinal pipe forming a mud-drum, the upper longitudinal pipe forming a steam communication with the steam-drum, and the vertical pipes built in the walls of the furnace and acting as return-tubes for water that may gain access to the steam-pipes, substantially as described.

3. The combination, in a steam-boiler, of the quadrangular frame composed of the mud-drum, upper steam-pipes, and return-tubes, with a series of zigzag pipes, each set communicating at the bottom with the mud-drum and at the top with the steam-pipe, and a steam-drum connected to said pipe, substantially as described.

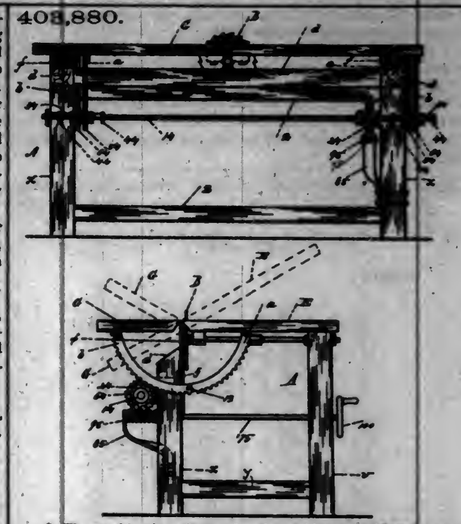
4. The combination, in a boiler, of the two quadrangular frames, each composed of horizontal and vertical pipes, with a series of zigzag pipes, each set communicating at the bottom with one of said horizontal pipes and at the top with the other horizontal pipe, substantially as described.

403,879. MACHINE FOR MAKING WIRE HEDDLES. EMMANUEL EMERAYAT, Lyons, France. Filed Aug. 27, 1888. Serial No. 283,834. (No model.) Patented in France May 3, 1888, No. 190,347.

Claim.—1. In a machine for making wire heddles, the combination of spring-actuated slide-plates having vertical studs or posts, fixed abutments at both sides of said slide-plates, and a rotary pinion located intermediately between said slide-plates, said pinion being provided with a radial recess and a fixed spindle in said recess, substantially as set forth.

2. The combination of guided and spring-actuated slide-plates having vertical lugs or posts, fixed abutments at each side of said slide-plates, a rotary pinion located intermediately between said slide-plates, said pinion being provided with a radial recess and a fixed spindle in said recess, and a rotary and spring-actuated spindle having a hook-shaped end in line with said lugs and central spindle, substantially as set forth.

3. The combination of longitudinally-guided or spring-actuated slide-plates having studs or posts, fixed abutments on each side of said slide-plates, a rotary pinion supported in fixed bearings intermediately between said slide-plates, said pinion being provided with a radial recess, a fixed spindle in said recess, a rotary and spring-actuated spindle at one end of the machine and in line with the studs and central spindle, and a cutting device arranged transversely to the rotary end spindle for cutting off the twisted end of the heddle, substantially as set forth.



4. The combination of a supporting bed-plate having longitudinal guideways, spring-actuated slide-plates guided on said ways, fixed abutments at each side of said guideways, upright studs or posts on said plates, a rotary pinion supported midway between said slide-plates on fixed bearings of the ways, a rotary and spring-actuated spindle having a hook-shaped inner end located in line with the posts and central spindle, and a cutting device arranged transversely between the hook-shaped end of the rotary spindle and the stud next adjoining the same, substantially as set forth.

408,880. CIRCULAR SAWING MACHINE. FREDERIC R. FARWELL, Fitchburg, assignor of one-half to Henry A. Hawley, Waltham, Mass. Filed Sept. 17, 1888. Serial No. 285,576. (No model.)

Claim.—1. The combination of a saw-bench, a table proper hinged to the front thereof, a leaf, also hinged to the front thereof, a segmental rack attached to said table, a segmental rack attached to said leaf, a longitudinal shaft supported in bearings of said bench, and pinions on said shaft for engaging said segmental racks for adjusting the table and leaf simultaneously, substantially as described.

2. The combination of a saw-bench, a table proper hinged to the front thereof, a leaf, also hinged to the front thereof, a segmental rack attached to said table, a segmental rack attached to said leaf, a longitudinal shaft supported in bearings of said bench, and pinions longitudinally adjustable on said shaft for engaging said racks simultaneously or independently, substantially as described.

408,880.

3. The combination of a saw-bench, a table proper hinged to the front thereof, a leaf, also hinged to the front thereof, a segmental rack attached to said table, a segmental rack attached to said leaf, a longitudinal shaft supported in bearings of said bench, and pinions longitudinally adjustable on said shaft for engaging said racks simultaneously or independently, said racks being provided with pin-holes for a locking-pin.

4. The combination of a saw-bench, a table proper hinged to the front thereof, a leaf, also hinged to the front thereof, a segmental rack attached to said table, a segmental rack attached to said leaf, a longitudinal shaft supported in bearings of said bench, and pinions on said shaft for engaging said segmental racks for adjusting the table and leaf simultaneously, a transverse shaft provided with a hand-wheel and with a worm, and a pinion on said longitudinal shaft engaged by said worm, substantially as described.

408,881. REVERSING-GEAR FOR STEAM-ENGINES. DAVID A. FRAZER, Manistique, Mich., assignor of two-thirds to Oscar S. Rodenbaugh and Isaac M. Rodenbaugh. Filed Feb. 21, 1889. Serial No. 300,763. (No model.)

Claim.—1. In a steam-engine having two cylinders and two single-acting pistons, said cylinders having ports at each end of the stroke of said pistons and having a D-valve adapted for admitting steam to said ports, an intermediate valve adapted to change the steam to the opposite sides of said ports for reversing the motion of the engine, substantially as described.

2. In a steam-engine, the combination of two cylinders having single-acting pistons and ports at each end of the stroke of said pistons, a slide-valve having a port at either end, each port adapted for supplying steam to a separate cylinder, and an intermediate valve adapted to shift the current of the steam to the opposite sides of the respective pistons, substantially as described.

3. In a steam-engine, in combination with two cylinders having single-acting pistons and ports at each end of the stroke of said pistons, a slide-valve having a port at either end, each port adapted for supplying steam to a separate cylinder, and an intermediate rotary valve having segmental chambers adapted to shift the current of the steam to opposite sides of the respective cylinders, substantially as described.

408,882. SEED-SOWER. MICHAEL FREEMAN, Racine, Wis., assignor to the S. Freeman & Sons Manufacturing Company, same place. Filed Sept. 24, 1888. Serial No. 286,146. (No model.)

Claim.—1. In a sower, the combination of a revoluble casting provided with a central stay-piece and a series of radial wings, arranged on opposite sides of the stay-piece, cut-off shells for the winged portions of the casting, and means, substantially as described, for rotating said casting and laterally adjusting the shells in opposite directions, as and for the purpose set forth.

2. In a sower, the combination of a revoluble casting provided with a series of radial wings and a central annular groove, a ribbed box for engagement with the groove, cut-off shells for the winged casting, and means, substantially as described, for actuating said casting and adjusting the shells, for the purpose set forth.

3. In a sower, the combination of a revoluble casting provided with a series of radial wings and a central stay-piece having an annular groove, a ribbed box for engagement with the groove, cut-off shells for the winged casting, and means, substantially as described, for actuating said casting and adjusting the shells, for the purpose set forth.

4. In a sower, the combination of a revoluble casting provided with a series of radial wings, cut-off shells for the winged casting having closed outer ends provided with openings, and means, substantially as described, for actuating the casting and adjusting the shells, as and for the purpose set forth.

5. In a sower, a revoluble casting comprising a central stay-piece and radial wings arranged on opposite sides of the stay-piece, cut-off shells for the winged portions of the casting, and means, substantially as described, for actuating the casting, laterally adjusting the shells, and for locking the latter in their adjusted position, as set forth.

6. In a sower having its floor provided with a slot, the combination of a revoluble casting provided with a central stay-piece and a series of radial wings arranged on opposite sides of the stay-piece, cut-off shells for the winged portions of the casting, levers connected at their inner ends to said shells, an arm pivoted to the machine-floor and connected at its extremities with the outer ends of said levers, a screw-threaded projection on the pivoted arm passed up through the slot in said machine-floor, and a set-nut arranged on said projection, substantially as set forth.

7. In a sower, the floor thereof provided with a slot and graduations for the same, in combination with a revoluble casting provided with a central stay-piece and a series of radial wings arranged on opposite sides of the stay-piece, cut-off shells for the winged portions of the casting, levers connected at their inner ends to said shells, an arm pivoted to the machine-floor and connected at its extremities with the outer ends of said levers, a screw-threaded projection on the pivoted arm passed up through the slot in said machine-floor, and a set-nut arranged on said projection, substantially as set forth.

8. In a sower, the combination of the machine-floor provided with seed-openings, cut-off plates for said openings, an angular flange depending from said floor adjacent to the openings therein, a revoluble casting provided with a series of radial wings, cut-off shells for the winged casting designed to close in against the lower edge of said flange to form a trough therewith, and means, substantially as described, for actuating the casting and adjusting the shells, as and for the purpose set forth.

9. In a sower, the combination, with the distributer and a feeding mechanism, of a cup having a movable bottom pivotally connected to the distributer-shaft and provided with discharge-openings, substantially as set forth.

10. In a sower, the combination of a revoluble casting provided with a series of radial wings and a central stay-piece, a box surrounding the stay-piece and provided with a bearing for the distributer-shaft, cut-off shells for the winged casting, and means, substantially as described, for actuating said casting and adjusting the shells, as and for the purpose set forth.

11. In a sower, the combination, with the distributer and a feeding mechanism, of a cup having a movable bottom pivotally connected to the distributer-shaft and provided with discharge-openings, and a handle projecting from said bottom of the cup, substantially as set forth.

12. In a sower, the combination of a revoluble casting provided with a series of radial wings, adjustable cut-off shells for the winged casting, a seed-cup arranged below said casting and provided with a pivotally-adjustable bottom having openings therein, and a distributer arranged below the seed-cup, substantially as set forth.

13. In a sower, the combination of the machine-floor provided with seed-openings, cut-off plates for the openings, a revoluble casting provided with a series of radial wings, adjustable cut-off shells for the winged casting, a seed-cup arranged below said casting and provided with a pivotally-adjustable bottom having openings therein, and a distributer arranged below the seed-cup, substantially as set forth.

14. In a sower, the combination of the floor A, provided with seed-openings, the shaft I, having bearings depending from said floor, the casting N, fast on said shaft and provided with radial wings N' and stay-piece N², a box surrounding the stay-piece and provided with a bearing for the upper end of a distributer-shaft, the drive-shaft D, bevel-geared to said distributer-shaft, sprocket-gear connecting the shafts D I, and adjustable shells surrounding the winged casting, substantially as set forth.

15. A sower comprising the floor A, provided with seed-openings *m*, depending bearings *b*, and angular flange U, the shaft I, arranged in said bearings, the casting N, fast on said shaft and provided with radial wings N', the cut-off shells P P' for said casting, the arm R, pivoted to the machine-floor, levers Q Q', connecting the ends of said levers with the cut-off shells, the seed-cup V, distributer F, and the drive-shaft D, geared to said distributer and shaft I, substantially as set forth.

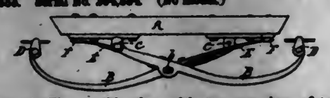
16. In a sower, the combination, with a distributer and a feeding mechanism, of a cup having a movable bottom pivotally connected to the distributer-shaft and provided with a central spreading-rib and bottom openings, and a handle projecting from said bottom of the cup, substantially as set forth.

17. In a sower, the floor thereof provided with a ring, a hopper having its lower end fitted within the ring, and another ring secured to said lower end of the hopper and bolted to said floor, substantially as set forth.

18. In a sower, the floor thereof cast with a ring, a hopper having its lower end fitted within the ring, and another ring detachably connected to said lower end of the hopper and provided with an inwardly-projecting flange for attachment to said floor, substantially as set forth.

408,883. OSCILLATING PIPE-JOINT. RICHARD GRIMM, Greenbush, N. Y., assignor of one-fourth to William H. Hogeboom, same place. Filed Jan. 14, 1889. Serial No. 296,264. (No model.)

Claim.—1. In a pipe-joint, the combination of two elbows, each provided near their adjoining ends with an exterior smooth surface, a ring, a gasket, and a thimble secured to each elbow and having a flange in contact with the gasket, one of the elbows having a barrel moving freely on the said smooth surface and extending over the rings, gasket, and thimble, having a threaded portion meshing with threads on a nut moving freely on the smooth portion of the other elbow, substantially as described.

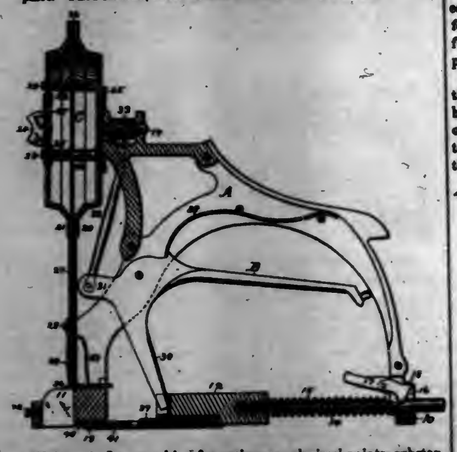


2. In a pipe-joint, the combination of two elbows, each provided near their adjoining ends with an exterior smooth surface, a ring, a gasket, and a thimble secured to each elbow, the nut A on one elbow having a threaded surface meshing with threads on the barrel C on the other elbow, with the nut L, secured to the barrel C and provided with a thread meshing with a thread on the nut A, substantially as described.

408,884. PIPE-COUPLING. RICHARD GODARE, Greenbush, N. Y., assignor of one-fourth to William H. Hopkirtall, same place. Filed Jan. 17, 1888. Serial No. 266,617. (No model.)

Claim.—In a pipe-coupling, consisting of two similar sections, the combination of a pipe provided with a gasket near one end, and also provided with an annular flange, a coupling-sleeve enveloping said pipe, a shaft passing through said coupling-sleeve provided with a cam operating in contact with said annular flange, a latch-hook pivoted to said coupling-sleeve, one end thereof engaging with a lug attached to the coupling-sleeve on the opposite section, the other end of said latch-hook provided with a recess in contact with one end of a cam-lever securely attached to the said cam-shaft, all substantially as described

408,885. CARRIAGE-SPRING. JOHN HERRMANN, Mount Vernon, assignor of one-half to Frederick C. Althoff, Evansville, Ind. Filed Dec. 20, 1888. Serial No. 294,884. (No model.)



Claim.—1. The combination, with the cross-bar, of two levers secured to the opposite ends thereof and extending out therefrom in opposite directions, and a spring arranged between the levers and supported by the said levers and connected with said cross-bar, substantially as described.

2. The combination, with a cross-bar of a buggy, of two levers pivotally secured to the opposite ends and sides thereof and extending downward in opposite directions, and a spring interposed between the levers and supported by the same, its upper ends movably connected with the cross-bar, substantially as described.

3. The combination, with the cross-bar of a buggy, of the clasps, as C, and guides, as F, formed of single pieces of metal in substantially L shape, the levers B, pivotally secured in said clasps, and the spring E, arranged between the levers, its ends working in said guides, substantially as described.

4. The combination, with the cross-bar of a buggy, of two levers, as B, pivoted to the opposite ends and sides thereof and having elongated slots formed therein, as at *b*, of a leaf-spring, as E, interposed between the levers, having a yoke, as G, on its under side, which is formed with oppositely-extending cylindrical arms fitting in said slots, the ends of said springs working in guides on the cross-bar, substantially as described.

408,886. MACHINE FOR DRIVING GLAZIERS' POINTS. FRANKLIN HOLLAND, New Britain, Conn., assignor to the Stanley Works, same place. Filed Nov. 26, 1888. Serial No. 292,078. (No model.)

Claim.—1. In a machine for acting on glaziers' points, substantially as described, a revolving receptacle for delivering said points, having circular flanges flaring outwardly from each other and rigidly connected together, with a thin delivery-space at the periphery between the confronting faces of two adjoining flanges, substantially as described, and for the purpose specified.

2. In a machine for driving glaziers' points, the combination of a receptacle having two confronting flanges with a delivery-space between, feeding and driving mechanism, the lever B for operating the same, and mechanism connected therewith for imparting a partial revolution to the receptacle for each reciprocating movement of said lever, substantially as described, and for the purpose specified.

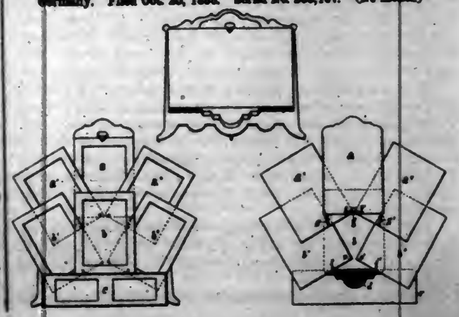
3. In a machine for driving glaziers' points, the combination of the chute 27, spring 29, having an inwardly-projecting arm, the spring-pressed slide 36, driving mechanism, and the lever B, having an arm, 30, for operating said driving mechanism and slide, substantially as described, and for the purpose specified.

4. In a machine for driving glaziers' points, the combination of the foot 11, having a vertical opening through it, a driver-guard fitted to move across the said opening in said foot, a driver underneath said guard, mechanism for operating said guard and driver, and feeding mechanism—as, for instance, the chute 27, spring 29, and slide 36—for feeding the points edgewise and delivering only one point at a time upon the top of said guard, substantially as described, and for the purpose specified.

5. In a machine for driving glaziers' points, the combination of the foot 11, having a vertical opening through it, a driver-guard fitted to move across the said opening in said foot, a driver underneath said guard, and mechanism for operating said guard and driver, substantially as described, and for the purpose specified.

6. In a machine for driving glaziers' points, the combination of the foot 11, having a vertical opening through it, the reciprocating hammer-block 12, the driver 13, secured thereto, and the sliding and spring-pressed driver-guard, the said foot having the lower face of the front wall of its opening extending downwardly substantially even with the under side of said driver-guard, substantially as described, and for the purpose specified.

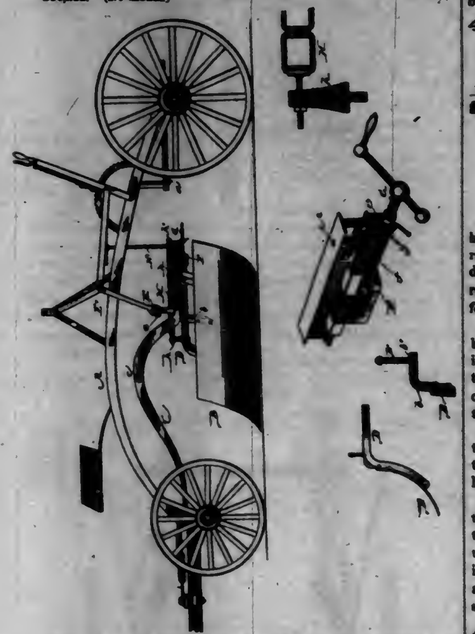
7. In a machine for driving glaziers' points, the combination of the hammer-block 12, the driver connected therewith, the guide-rod attached to said hammer-block and having the recess or notch 16, the spring 15, the retaining-pawl 17, pivoted in the frame A, for engaging said recess, and the spring-actuated lever B, for moving said hammer-block and releasing said pawl, substantially as described, and for the purpose specified.



8. In a machine for driving glaziers' points, the combination of the hammer-block and driver, guide-rod 14, spring 15, a device for holding the hammer-block in its rearward position, the spring-actuated lever B, having an arm, 30, for pressing the hammer-block against its spring, said having the outer end of said lever adapted for engagement with the holding device for disengaging it, substantially as described, and for the purpose specified.

9. In a machine for driving glaziers' points, the combination of the foot 11, the hammer-block and driver and their operating mechanism, with the adjusting-screw 42 in the front of said foot, substantially as described, and for the purpose specified.

10. In a machine for driving glaziers' points, the combination of the chute 27, the spring 29, having an inwardly-projecting arm above its lower end, the reciprocating slide 36, adapted to close the lower end of the chute and also to bear against the lower end of said spring for withdrawing its projecting arm from the chute, and mechanism for operating said slide, substantially as described, and for the purpose specified.



11. In a machine for driving glaziers' points, the combination of the foot 11, having a vertical opening through it, the reciprocating hammer-block, the driver secured thereto, the sliding driver-guard over said driver, and means for moving said guard separately from the movement of the said driver, substantially as described, and for the purpose specified.

408,887. PICTURE-EXHIBITOR. GEORGE D. KNIPP, Stuttgart, Germany. Filed Oct. 26, 1888. Serial No. 289,167. (No model.)

Claim.—In an upright folding album, the combination consisting of the central frames *a b*, the base *d*, the frames *a' a''*, hold to central frame *a* by pivots *l l'*, the straps *s s'*, to limit the fall of frames *a' a''*, the nose *g*, adapted to engage with the channel *k*, the frames *b' b''*, the legs fixed to said frames *b' b''* with the central frame *b*, the grooves made in the base *d*, the grooves made in the central frame *a*, adapted to engage with the guide *h*, made on the back portion, *c*, and the cover *e*, substantially as shown and described.

408,888. ROAD-SCRAPER. GEORGE H. MILLER, Ashton, assignor to Frederick C. Austin, Chicago, Ill. Filed July 17, 1888. Serial No. 280,252. (No model.)

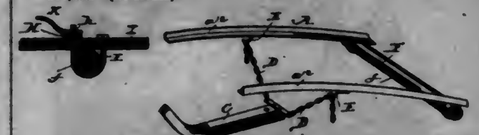
Claim.—1. The combination and arrangement, substantially as hereinbefore set forth, of the reversible scraper-blade, the draft-bar extending over and to the rear of the scraper-blade, and the segment positioned as a whole in rear of the scraper-blade, said segment having its forward downwardly-extending end portions formed to provide abutments which back the scraper-blade, and having its horizontal portion which is back of its said end portions connected with the draft-bar in rear of the scraper-blade by a sliding connection which permits the segment to turn with the horizontal reversing movement of said scraper-blade, for the purpose described.

2. The combination of the arched draft-bar C and the reversible scraper-blade pivotally connected with the arched draft-bar at or near the rear end of the arch *c*, which said arch rises forwardly from a point over the top edge of the scraper-blade, as and for the purpose set forth.

3. The combination, substantially as hereinbefore set forth, of the draft-bar extending over and to the rear of the scraper-blade, and the scraper-blade provided with an arm, *b*, which is rigidly secured to the scraper-blade and pivoted to the draft-bar.

4. The combination, substantially as hereinbefore set forth, of the arched draft-bar C and the reversible scraper-blade having an arm, *b*, which is attached to the scraper-blade and pivoted to the draft-bar at the rear termination of the arch *c*.

5. The combination, substantially as hereinbefore set forth, with the scraper-blade, of the segment attached to the scraper-blade, and the bearing adjustably attached to the draft-bar and supporting the segment, for the purpose described.



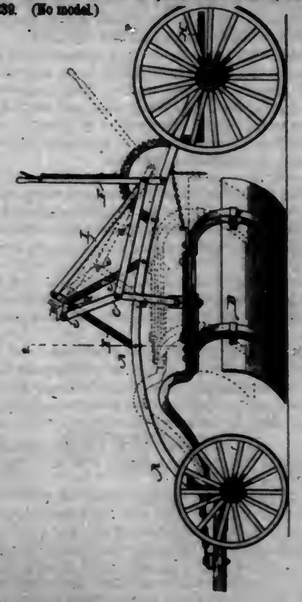
6. The combination, substantially as hereinbefore set forth, with the laterally-tilting scraper-blade, of the segment hinged to the scraper-blade, and a bearing supporting said segment and adjustable coincident with the line of progression, for the purpose described.

7 The combination, substantially as hereinbefore set forth, of the reversible scraper-blade, the draft-bar extending over and to the rear of the scraper-blade, the segment arranged back of and as a backing for the scraper-blade, and having in rear of the latter a connection with the draft-bar, which permits the segment to turn independently of the draft-bar, a chain-wheel mounted upon the draft-bar in rear of the scraper-blade, and a chain passing about the chain-wheel and attached to the segment.

8. The combination, substantially as hereinbefore set forth, of the scraper-blade, the segment hinged to the scraper-blade, and the arm *b*, attached to the upper portion of the scraper-blade and pivotally connected with the pivot B', for the purpose described.

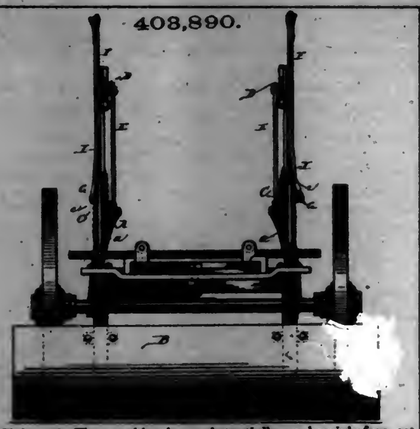
9. The combination, with the scraper-blade, of the segment arranged in rear of the scraper-blade, and having the terminals of its downwardly-bent end portions hinged to the back of the scraper-blade, substantially as described.

408,889. ROAD-SCRAPER. GEORGE H. MILLER, Ashton, assignor to Frederick C. Austin, Chicago, Ill. Filed Jan. 28, 1888. Serial No. 297,333. (No model.)



Claim.—1. In a road-scraper, the combination, substantially as hereinbefore set forth, of the body-frame supported to slide upon the rear axle, the scraper-blade connected with a draft attachment and drawn by a direct draft from ahead, and a stay device connecting the rear portion of the draft attachment with the side of the body-frame, for the purpose described

2. The combination, substantially as hereinbefore set forth, of the body-frame provided with a tubular bearing, F, the rear axle extending through said tubular bearing, the scraper-blade with a draft attachment and drawn by a direct draft from ahead, and a stay device connecting the rear portion of the draft attachment with the sides of the body-frame.



3. The combination, with the body-frame and rear axle, of the tubular bearing F, attached to the body-frame and fitted to slide upon the rear axle, and the clamp H, arranged to lock together said tubular bearing and rear axle.

4. The combination, substantially as hereinbefore set forth, with the rear axle, of the body-frame having its rear end portion arranged to slide upon said rear axle, the clamp for locking the body-frame upon the rear axle, and the adjusting device K, arranged for adjusting said clamp, and having a foot-piece within reach of the foot of an attendant standing upon the rear platform, I, for the purpose described.

408,890. ROAD-SCRAPER. ORTUS R. MOASE, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed Jan. 2, 1889. Serial No. 290,239. (No model.)

408,890.

Claim.—1. The combination, substantially as hereinbefore set forth, with the scraper-blade, of a suspending device therefor having an individual lift, and an auxiliary lifting device arranged for operation conjointly with said suspending device and adapted for raising the point from which the latter is suspended, whereby during the conjoint action of said two lifting devices the scraper-blade may be raised to a distance equal to the sum of their respective lifting movements, for the purpose described.

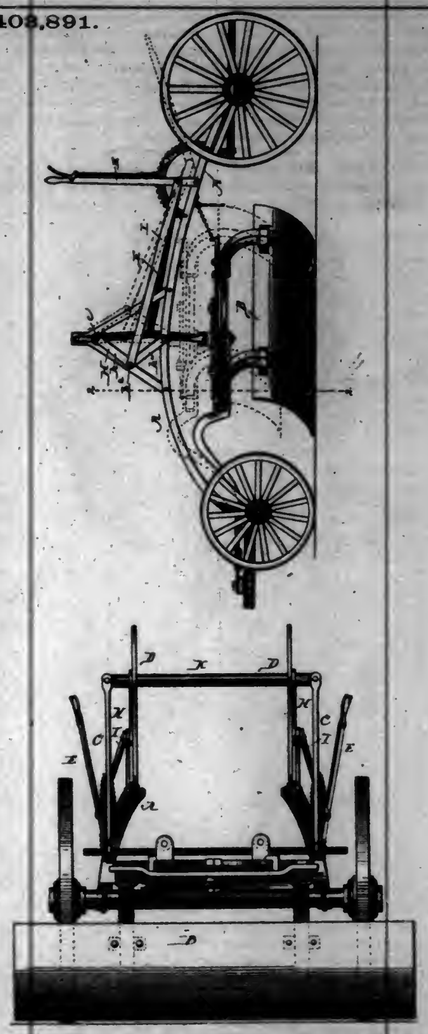
2. The combination, with the scraper-blade, of a suspending device therefor having an individual lift, an auxiliary lifting device for raising the point from which said suspending device is hung, and a single hand-lever connected with and arranged for simultaneously operating said two lifting devices, substantially in the manner set forth, whereby the individual actions of said lifting devices are primarily caused from one operation of the hand-lever.

3. The combination, substantially as hereinbefore set forth, with the scraper-blade, of a suspending device therefor having an individual lift, an auxiliary lifting device consisting of a bell-crank, from which said suspending device is hung, whereby the point from which the said suspending device is hung can be raised by the action of the bell-crank, and at the same time the said suspending device be actuated to raise the scraper-blade to the extent of its individual lifting action.

4. The combination, substantially as hereinbefore set forth, with the scraper-blade, of a suspending device therefor having an individual lift, an auxiliary lifting device for raising the point from which said suspending device is hung, and a hand-lever connected with said two lifting devices, whereby their individual lifting actions can be simultaneously caused by the one hand-lever.

5. The combination, substantially as hereinbefore set forth, of the scraper-blade, a scraper-blade-suspending device consisting of the elbow or toggle jointed hanger, and auxiliary lifting-lever from which said elbow or toggle jointed hanger is suspended, said auxiliary lifting-lever being arranged to swing in a direction to permit the rise and fall of the point from which the hanger is suspended from said auxiliary lifting-lever, for the purpose described.

6. The combination, substantially as hereinbefore set forth, of the scraper-blade, the elbow-jointed hanger, an auxiliary lifting-lever from which the elbow or toggle jointed hanger is suspended, a hand-lever, and links respectively connecting the hand-lever with said elbow or toggle jointed hanger and auxiliary lifting-lever, for the purpose described.



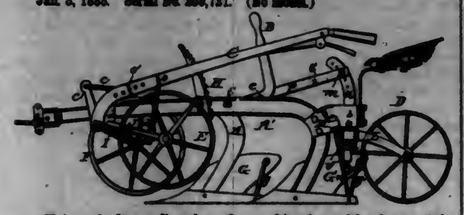
7. The combination, substantially as hereinbefore set forth, of the scraper-blade, the elbow-jointed hanger C, and the bell-crank from which said elbow or toggle jointed hanger is suspended, for the purpose set forth.

8. The combination, substantially as hereinbefore set forth, of the scraper-blade, the elbow or toggle jointed hanger, the bell-crank from which the elbow or toggle jointed hanger is suspended, the hand-lever, and link-connections between the hand-lever and said jointed hanger and bell-crank, for the purpose described.

408,891. ROAD-SCRAPER. ORTUS B. MEARS, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed Jan. 2, 1888. Serial No. 259,260. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the scraper-blade, a hanger with which the scraper-blade is connected, a toggle pivotally supported at one end upon the body-frame of the machine and having its opposite free end provided with a pivot from which the hanger is suspended, and an upright guide by which said pivot is guided in such up and down movements as it may have as a result of the opening and closing of said toggle.

408,891.

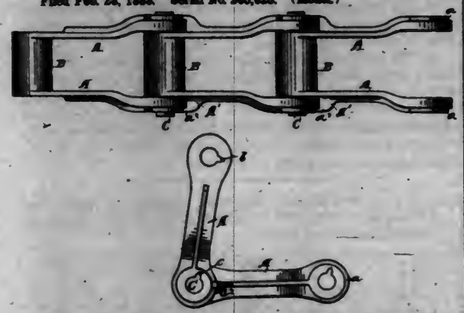


2. The combination, substantially as hereinbefore set forth, of the scraper-blade, the toggle H, supported upon the body-frame of the machine, a hanger connected with the scraper-blade and suspended from a pivot on the free end of the toggle, means for guiding said pivot in its up-and-down movement, and a hand-lever fulcrumed upon the body-frame of the machine and connected by a link, 1, with said toggle.

3. The combination, substantially as hereinbefore set forth, of the scraper-blade, the elbow or toggle jointed hanger connected with the scraper-blade and suspended from a movable support, and the toggle H, supported upon the body-frame and connected with said movable support from which the hanger is suspended, whereby, while the hanger may by suitable application of power be operated for raising the scraper-blade, the toggle H may by a similar application of power be operated as an auxiliary to the lift of the scraper-blade.

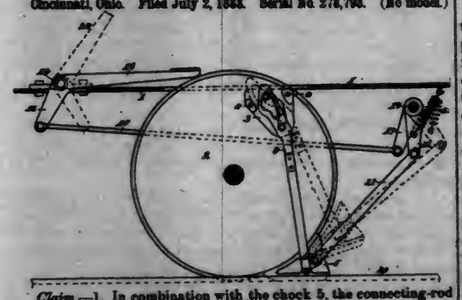
4. The combination, substantially as hereinbefore set forth, of the scraper-blade, the elbow or toggle jointed hanger with which the scraper-blade is connected, the toggle-lever fulcrumed on the body-frame of the machine and at its free end connected with the hanger, which is pivotally suspended from said end of the toggle-lever, and a couple of links, respectively connecting said toggle-lever and said jointed hanger with a hand-lever, for the purpose described.

5. The combination, substantially as hereinbefore set forth, of the scraper-blade, hangers connected with the scraper-blade, a vertically-sliding cross-bar from which the hangers are suspended, and toggle-levers pivoted at their lower ends upon the body-frame and at their upper ends connected with said cross-bar, for the purpose described.



408,892. WHEEL-PLOW. GILPIN MOORE, Rock Island, Ill. Filed Jan. 3, 1888. Serial No. 259,731. (No model.)

Claim.—1. In a sulky-plow, the combination, with a beam of the same and a bracket bolted thereto, of an upright pivoted in said bracket and provided with a caster-wheel, a jointed rod, *p*, pivoted adjustably to the upper end of said standard, and the angular lever B, pivoted to said beam and to said rod *p* at different points, substantially as set forth.



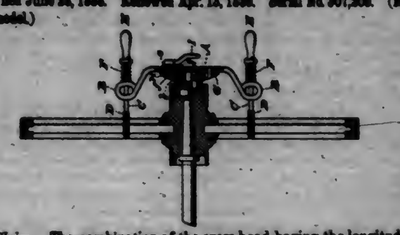
2. In a sulky or wheel plow, the combination, with a beam of the same and a bracket bolted thereto, of an upright, K, pivoted in said bracket and provided with curved perforated upper end, a caster-wheel connected with said upright, a jointed rod, *p*, a bolt, *m*, for adjustably connecting said rod with the upright, a projection, *v*, formed upon the end of said rod, an angular lever, B, pivoted to said beam and to said rod *p* at different points, and provided with a stop, *v'*, to engage the projection *v* and lock the rod *p* in position, and foot-lever *f*, substantially as set forth.

408,893. DRIVE-CHAIN. DAVID J. SHELDRICK, Columbus, Ohio. Filed Feb. 28, 1888. Serial No. 265,623. (Model.)

Claim.—In a drive-chain, the combination of the U-shaped links having in the ends of the side bars the circular pintle-seats provided with grooves *b*, the overlapping ears formed on the side bars on parallel planes therewith and adapted to prevent the outer ends of the side bars from spreading, and the cylindrical pintles provided with spurs *c c*, substantially as set forth.

408,894. CHOCK-BLOCK FOR TRAM-CARS. JOSEPH W. SIMS, Cincinnati, Ohio. Filed July 2, 1888. Serial No. 278,793. (No model.)

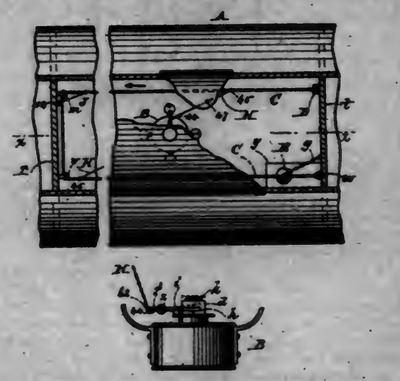
Claim.—1. In combination with the chock 5, the connecting-rod 8, hinged to said chock and to the bracket 3, provided with slot 10 and stud 9, attached to the connecting-rod 8 and turning in said slot 10, substantially as herein specified.



2. In combination with the chock 5, connecting-rod 8, provided with slot 11, and the bracket 3, provided with pin 12, projected into said slot and forming a bearing for the raising and lowering, substantially as herein specified.

3. In combination with the chock 5, the connecting-rod 8, provided with slot 11 and pin 9, and the bracket 3, provided with slots 10 and pin 12, for guiding the movement of the chock in raising and lowering, substantially as herein specified.

4. In combination with the chock 5, the connecting-rod 21, hinged to said chock and to the crank 17, connecting-rod 15, and lever 13, whereby the chock is elevated and depressed, substantially as specified.



5. The chock 5, having its upper surface of a contour to fit the car-wheel, its lower surface of a contour to fit the track and rigidly connected to the connecting-rod 8 and hinged to the connecting-rod 21, for elevating and depressing said chock, substantially as herein specified.

408,895. WRENCH. WILSON B. SMITH, Beloit, Wis., assignor of two-thirds to Joseph Gem and Andrew C. Hutchison, both of same place. Filed June 26, 1888. Renewed Apr. 12, 1889. Serial No. 307,208. (No model.)

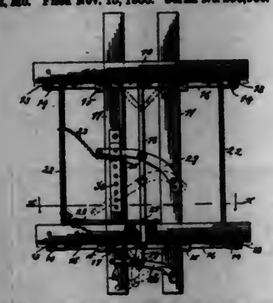
Claim.—The combination of the cross-head having the longitudinal slot and the inwardly-turned scroll-ends, the rods having the hook ends covered with a soft material, and the handle, the spiral springs between the handle and the scroll-bearing, the fixed jaw, the adjustable jaw having the flanges *d*, the set-screw, and the washer, substantially as specified.

408,896. LAMP-EXTINGUISHER. BENJAMIN D. STEVENS, Burlington, Vt. Filed Mar. 26, 1888. Serial No. 268,457. (No model.)

Claim.—1. In a device for extinguishing lamps in a railway-car, the combination of the following instrumentalities, to wit: a lamp disposed within said car and provided with an extinguisher proper, a cord mounted adjacent to said lamp, a tension-spring connected with said cord, a chain connecting said cord with the extinguisher proper of the lamp, a weight for actuating the extinguisher proper when said chain is slackened, and a pull connected with said cord, whereby the cord may be moved to slacken the chain and extinguish the lamp, substantially as described.

2. In a device for extinguishing lamps in a railway-car, the combination of the following instrumentalities, to wit: a lamp disposed within said car and provided with an extinguisher proper, a cord mounted adjacent to said lamp, a tension-spring connected with said cord, a gravitative ball connected with said cord, a stand or support for said ball, from which it may be dislodged by the overturning or partial overturning of the car, a chain connecting said cord with the extinguisher proper of the lamp, a weight for actuating the extinguisher proper when said chain is slackened, and a guide pulley or pulleys for the cord, substantially as set forth.

3. In a device for extinguishing the lamps in a railway-car, the cord C, spring D, pulleys *m v w*, ball E, stand *b*, lamp B, provided with the pivoted lever *f* and sleeve *d*, weight *x*, for actuating said lever, and the chain H, connecting said lever and the cord C, combined and arranged to operate substantially as set forth.



403,897. TIE-BAR CLIP FOR SPLIT SWITCHES. AXEL O. STROM, Austin, assignor to the Strom Manufacturing Company, Chicago, Ill. Filed Feb. 19, 1888. Serial No. 300,266. (No model.)

Claim.—1. A clip, A, for pivotally connecting a tie-bar with a switch-rail, of general U shape, substantially in the best form described, and having a base, *p*, and lateral openings *o* above the base to admit the pin for pivotally connecting a tie-bar with it, substantially as described.

2. A clip, A, for pivotally connecting a tie-bar with a switch-rail, comprising arms *r* in the best form described, affording the parts *q* and *q'*, a base, *p*, joining the parts *q'* at their ends, lateral openings *o* in the arms above the base to admit the pin for pivotally connecting the tie-bar with the clip, and perforated ears *l*, extending laterally from the ends of the parts *q* of the arms, substantially as described.

403,898. DOG ATTACHMENT FOR LOG-CARS. ROBERT J. THOMPSON, Grandin, Mo. Filed Nov. 15, 1888. Serial No. 290,906. (No model.)

Claim.—1. The combination, with the bolster or cross-beam of a log carrier or loader, of dogs pivoted near the opposite ends of said beam, push-bars connected at one end to the said dogs, toggle-levers connected at their outer ends to said push-bars, and an operating-lever connected with the pivotal ends of said toggle-levers, substantially as and for the purpose described.

2. The combination, with the bolster or cross-beam of a log carrier or loader, of dogs pivoted near the opposite ends of said beams, push-bars connected to the said dogs, toggle-levers connected at their outer ends to the push-bars, an operating-lever connected with the pivotal ends of the toggle-levers, and means, substantially as shown, for locking the said lever, substantially as shown and described.

3. The combination, with the front and rear bolsters or cross-beams of a log-carrier, of dogs pivoted near the outer ends of said bolsters, push-bars connected at one end to said dogs, toggle-levers connected at their outer ends with the inner ends of the push-bars, a longitudinal bar pivotally connected to the front and rear set of toggle-levers, an operating-lever connected with the said longitudinal bar, and means, substantially as shown, for locking the operating-lever in position, substantially as and for the purpose described.

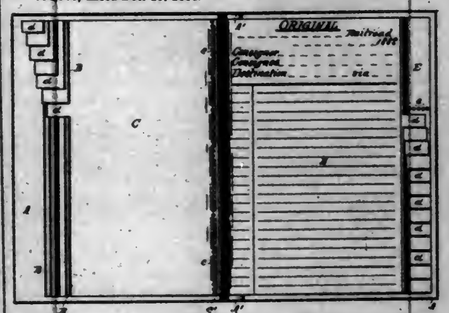
4. The combination, with the bolsters or cross-beams of a log carrier or holder, of dogs pivoted to the said bolster or cross-beams, push-bars pivoted to said dogs, toggle-levers pivoted to the push-bars, an operating-bar engaging the toggle-levers of each bolster, an operating-lever connected with the operating-bar, and a lock-lever adapted to engage the said operating-bar, substantially as shown and described.

5. The combination, with the bolster or cross-beam of a log carrier or holder, of dogs pivoted thereto, a push-bar pivoted to said dogs, an apertured jacket inclosing said push-bars, toggle-levers pivoted to the push-bars and to one another, one of which toggles is projected to form a lever-handle, locking-pins adapted to enter the apertures of the jacket, a locking-bar, and a link connecting said locking-bar and the toggle-levers, all combined for operation substantially as shown and described.

6. The combination, with the bolster or cross-beam of a log carrier or holder, of dogs pivoted thereto, a push-bar pivoted to said dogs, an apertured jacket inclosing said push-bars, toggle-levers pivoted to the push-bars and to one another, one of which toggles is projected to form a lever-handle, locking-pins adapted to enter the apertures of the jacket, a locking-bar, a link connecting the locking-bar and the toggle-levers, a hook secured to the bolster adapted to receive the locking-bar, and shoulders formed upon the outer face of two opposing toggles, all combined for operation substantially as shown and described.

REISSUES.

11,003. EMBOSSED METALLIC PLATE. ALFRED C. HAFELY, New York, N. Y. Filed Apr. 11, 1888. Serial No. 306,919. Original No. 378,442, dated Feb. 28, 1888.



Claim.—1. The method herein specified of ornamenting thin metallic plates, consisting in oxidizing or discoloring the surface of the metal to render the same dark, pressing the metallic plate between dies to produce ornamental figures or designs in relief, and polishing the higher portions of the embossed figures or designs to reveal the color that contrasts with the oxidized surface, substantially as set forth.

2. The method herein specified of producing ornamental embossed copper plates, consisting in oxidizing uniformly the surface of the copper by sulphuret of potash or similar chemical substances to render the same dark and embossing the foil or sheet of copper, substantially as set forth.

3. The embossed copper plate having a dark oxidized surface and the dark color removed on the high portions to reveal the contrasting colors, substantially as set forth.

4. The method herein specified of producing thin ornamental metallic plates, consisting in oxidizing or discoloring the surface of the metal to render the same dark, attaching to the thin metal a backing of fibrous material, pressing the thin metal between dies to produce ornamental figures or designs, and polishing the higher portions of the embossed figures or designs to reveal the color that contrasts with the oxidized surface, substantially as specified.

11,004. INDEXED SHIPPING-BOOK. FREDERICK C. JOHNSON, Minneapolis, Minn. Filed Feb. 2, 1889. Serial No. 298,494. Original No. 304,576, dated Dec. 18, 1888.

Claim.—1. The combination, with a book having permanent and detachable leaves in alternation, of projecting index-tags provided on the one set of leaves and arranged in separate series, substantially as set forth.

2. In a book, the combination, with the leaves having projecting index-tags arranged in series, of detachable leaves at intervals covering the tags and separating the several series, substantially as set forth.

3. In a shipping-book, the combination, with the permanent leaves and the detachable leaves having projecting index-tags arranged in series along the margins, of the interposed leaves covering the tags and dividing them into sets and provided with perforations for detaching them, substantially as set forth.

PHOTO LITH. NORRIS PETERS

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

HURLBUT *v.* SCHILLINGER *et al.*

Decided April 22, 1889.

1. SCHILLINGER—CONCRETE PAVEMENTS—REISSUE.

Reissued Letters Patent No. 4,364, granted May 2, 1871, to John J. Schillinger, for an improvement in concrete pavements, as it stood after the filing of the disclaimer, (March 1, 1875,) was not open to the objection that it was not for the same invention as that of the original Patent No. 105,599, dated July 19, 1870.

2. SAME—INVENTION CONSTRUED.

Thus sustained and construed the invention is held to consist in dividing the pavement into blocks, so that one block can be removed and repaired without injury to the rest of the pavement, the division being effected by either a permanent or a temporary interposition of something between the blocks.

3. INFRINGEMENT.

The use of a bottom layer of coarse cement, and placing on it a course of fine cement, and dividing the upper course into blocks by a trowel run partially or wholly through the upper course while it is plastic, in a line coincident with the joints between the sections in the lower layer, accomplishes the substantial results of Schillinger's invention, in substantially the way devised by him, and is within the patent as it stands after the disclaimer.

4. SAME—FIRST CLAIM.

The first claim of the reissue, as it stands after the disclaimer, is infringed, because the defendant's pavement is a concrete pavement, laid in detached blocks or sections, substantially in the manner shown and described in the specification of the reissue, the detached blocks in the upper course being the equivalent of the detached blocks or sections of the Schillinger pavement.

5. SAME—SECOND CLAIM.

The second claim of the reissue is infringed, because the temporary use of the trowel or cutting-instrument, to divide the upper course into blocks, is the equivalent of the tar-paper of the Schillinger patent, the cutting making a division which controls the cracking, and facilitates the taking up and relaying of the blocks or sections in the upper course "without disturbing the adjoining sections," and the trowel being interposed to effect its object during the process of forming the pavement on the spot where it is to remain.

6. MEASURE OF DAMAGES.

The rule that "when the entire profit of a business or undertaking results from the use of the invention, the patentee will be entitled to recover the entire profits, if he elects that remedy," applied.

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

Mr. L. L. Bond and *Mr. E. A. West* for the appellant.

Mr. George W. Hey for the appellees.

Mr. Justice BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Northern District of Illinois, by John J. Schillinger and Elmer J. Salisbury against J. B. Hurlbut, founded on the alleged infringement of Reissued Letters Patent No. 4,364, granted to John J. Schillinger, May 2, 1871, for an "improvement in concrete pavements," on the surrender of original Letters Patent No. 105,599, granted to said Schillinger, July 19, 1870. The defenses set up in the answer are the invalidity of the reissue, want of utility in the invention, want of novelty, and non-infringement.

The bill was filed in October, 1882. Salisbury having died, the suit was, so far as his interest was concerned, revived in March, 1884, in the name of Olive G. Salisbury as administratrix. The interest of Salisbury was that he was the exclusive licensee under the reissued patent for the State of Illinois. Issue having been joined, proofs were taken on both sides, and on the 15th of May, 1884, the court entered an interlocutory decree, adjudging that the reissued patent was valid, that the defendant had infringed it, and that the administratrix of Salisbury recover profits and damages from the 26th of August, 1882, the date of the license to Salisbury. The decree also ordered a reference to a master to take an account of the profits and the damages.

The master took proofs, and on the 30th of September, 1884, filed his report, to the effect that between August 26, 1882, and May 20, 1884, the defendant had laid 70,909 feet of pavement by the use of the plaintiff's patent, for which he should be held to account; and that the plaintiffs had shown an established license-fee of 5 cents a square foot, or $3,545.45, as damages, which amount he reported. He also reported that the defendant's profits had amounted to 4 cents a square foot. The defendant excepted to this report, and, on a hearing, the court held that the evidence did not establish a fixed license-fee as a royalty, and that the proper amount of recovery was the defendant's profits, at the rate of 4 cents a square foot, or $2,836.36; and it entered a final decree, on the 16th of November, 1885, for that amount. The defendant has appealed from that decree.

The specifications, claims, and drawings of the original and the reissued patents are as follows, the specifications and claims being placed in parallel columns, the parts of each which are not found in the other being in italic, and the drawings of the original and the reissue being the same:

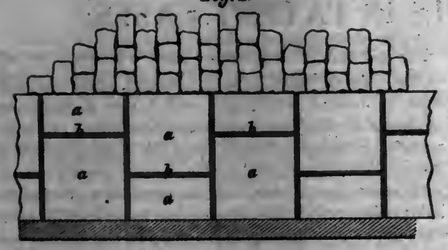
Original.	*Reissue.*
Be it known that I, JOHN J. SCHILLINGER, of the city, county, and State of New York, have invented a new and useful Improvement in Concrete Pave-	Be it known that I, JOHN J. SCHILLINGER, of the city, county, and State of New York, have invented a new and useful Improvement in Concrete Pave-

ments; and I do hereby declare the following to be a full, clear, and exact description thereof, which will enable those skilled in the art to make and use the same, reference being had to the accompanying drawing, forming part of this specification, in which drawing—

Figure 1 represents my pavement *in plan view*. Fig. 2 is a vertical section of the *pavement*.

Similar letters indicate corresponding parts.

Fig. 1.



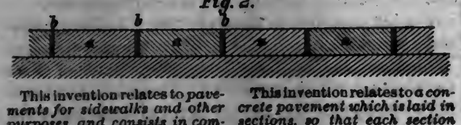


Fig. 2.

This invention relates to *pavements for sidewalks and other purposes, and consists in combining*, with the joints of concrete *pavements*, strips of tar-paper or equivalent material arranged between the several blocks in such a manner as to produce a suitable tight joint and yet allow the blocks to be raised separately without affecting *or injuring* the blocks adjacent thereto.

In carrying out my invention I form the concrete by mixing cement with sand and gravel or other suitable *materials* to form a *suitable* plastic *composition*, using about the following proportions: One part, by measure, of cement; one part, by measure, of sand, and from three to six parts, by measure, of gravel, *using* sufficient water to *make* the mixture plastic; but I do not confine myself to any proportions for making the concrete composition. While the mass is plastic I lay or spread the same *upon* the foundation or bed of the pavement, either in *molds* or between movable joists of the proper thickness, so as to form the edges of the concrete blocks *a a*, &c. When the block *a* has *been formed I take strips of tar-paper b, of a width equal or almost equal to the height of the block, and place them up against the edges of the block in such a manner that they form the joints between such block and the adjacent blocks.* After completing one block, *a*, I place the tar-paper *b* along the edge where the next block is to be formed, and I put the plastic composition for such next block up against the tar-paper joint and proceed with the formation of the new block until it is completed. In this manner I proceed *in making all the blocks* until the pavement is completed, interposing tar-paper between their several joints, as described. The paper constitutes a tight water-proof joint, but it allows the several blocks to heave separately from the effects of frost, or to be raised or removed separately, whenever

This invention relates to *a concrete pavement which is laid in sections, so that each section can be taken up and relaid without disturbing the adjoining sections.* With the joints *of this sectional* concrete *pavement are combined* strips of tar-paper or equivalent material arranged between the several blocks *or sections* in such a manner as to produce a suitable tight joint and yet allow the blocks to be raised separately without affecting the blocks adjacent thereto.

In carrying out my invention I form the concrete by mixing cement with sand and gravel or other suitable *material* to form a plastic *compound*, using about the following proportions: One part, by measure, of cement; one part, by measure, of sand, and from three to six parts by measure, of gravel, *with* sufficient water to *render* the mixture plastic; but I do not confine myself to any *definite* proportions *or materials* for making the concrete composition. While the mass is plastic I lay or spread the same *on* the foundation or bed of the pavement, either in *molds* or between movable joists of the proper thickness, so as to form the edges of the concrete blocks *a a*, *one block being formed after the other.* When the *first* block has *set* I *remove the joists or partitions from between it and the next block to be formed, and then I form the second block, and so on, each succeeding block being formed after the adjacent blocks have set, [and since the concrete in setting shrinks, the second block when set does not adhere to the first, and so on,] and when the pavement is completed each block can be taken up independent of the adjoining blocks. Between the joints of the adjacent blocks are placed strips b of tar-paper or other suitable material in the following manner:* After completing one block, *a*, I place the tar-paper *b* along the edge where the next block is to be formed, and I put the plastic composition for such next block up against the tar-paper joint and proceed with the formation of the new

occasion may arise, without injury to the adjacent blocks. The paper *does not adhere* when placed against the *edge of the fully-formed* block, and therefore the joints are always free between the several blocks, although *adherence may take place between the paper and* the *plastic* edges of the blocks *which are* formed after the *paper* joints *are set up in place.*

What I claim as new, and desire to secure by Letters Patent, is—

The arrangement of tar-paper or its equivalent between adjoining blocks of concrete, substantially as and for the purpose *described.*

What I claim as new, and desire to secure by Letters Patent, is—

1. *A concrete pavement laid in detached blocks or sections, substantially in the manner shown and described.*

2. The arrangement of tar-paper or its equivalent between adjoining blocks of concrete, substantially as and for the purpose *set forth.*

On the 1st of March, 1875, Schillinger filed in the Patent Office the following disclaimer:

To the Commissioner of Patents:

Your petitioner, John J. Schillinger, of the city and county and State of New York, represents that Letters Patent of the United States, Reissue No. 4,364, bearing date May 2, 1871, were granted to him for an improvement in concrete pavements. That he has reason to believe that, through inadvertence, accident, or mistake, the specification and claim of said Letters Patent are too broad, including that of which your petitioner was not the first inventor, and he therefore hereby enters his disclaimer to the following words: "And since the concrete in setting shrinks, the second block when set does not adhere to the first, and so on," and which occurs near the middle part of the said specification, and to the following words near the end of the specification: "In such cases, however, where cheapness is an object, the tar-paper may be omitted and the blocks formed without interposing anything between their joints, as previously described. In this latter case the joints soon fill up with sand or dust, and the pavement is rendered sufficiently tight for many purposes, while the blocks are detached from each other and can be taken up and relaid each independent of the adjoining blocks." Your petitioner hereby disclaims the forming of blocks from plastic material without interposing anything between their joints while in the process of formation. Your petitioner owns the said patent and the whole interest therein, except in the following places or territory, for which he has granted exclusive licenses under royalty, or sold rights under said patent, to wit, the counties of Kings, Queens, and Richmond, New York State; Hartford county, Connecticut; the District of Columbia; the States of New Jersey, Georgia, Maryland, Louisiana, Texas, Ohio, Michigan, Missouri, and Illinois, which above-named States and places comprise all the territory for which he has sold or granted exclusive licenses or rights in or under said patent, to the best of his recollection, knowledge, and belief.

The words specifically disclaimed by the disclaimer are embraced in brackets in the copy of the specification of the reissue above set forth.

The Schillinger patent has been before several of the circuit courts of the United States, and also before this Court, for adjudication.

In the Circuit Court for the Southern District of New York, before Judge Shipman, in February, 1877, in *Schillinger* v. *Gunther*, (14 Blatchford, 152, and 2 Ban. & Ard., 544, and 11 O. G., 831,) and in the same case, before Judge Blatchford, in August, 1879, (17 Blatchford, 66, and 4 Ban. & Ard., 479, and 16 O. G., 905;) in the Circuit Court for the District of California,

before Judge Sawyer, in May, 1881, in *California Artificial Stone Paving Co.* v. *Molitor*, and *The Same* v. *Perine*, (7 Sawyer, 190, and 8 Fed. Rep., 821, and 20 O. G., 813;) in the Circuit Court for the Northern District of New York, before Judge Blatchford, in July, 1883, in *Schillinger* v. *Greenway Brewing Co.*, (21 Blatchford, 383, and 17 Fed. Rep., 244, and 24 O. G., 495;) and in the Circuit Court for the Southern District of Ohio, before Judge Sage, in June, 1884, in *Kuhl* v. *Mueller*, (21 Fed. Rep., 510, and 28 O. G., 541;) the patent was sustained. In the Supreme Court of the District of Columbia, in general term, in July, 1885, in *Schillinger* v. *Cranford*, (4 Mackey, 450, and 37 O. G., 1349,) it was held void, on the question of novelty. It was also interpreted by Judge Sawyer, in the Circuit Court for the District of California, in *California Artificial Stone Paving Co.* v. *Freeborn*, in January, 1883, (8 Sawyer, 443, and 17 Fed. Rep., 735,) and by Judge Deady, in the Circuit Court for the District of Oregon, in August, 1887, in *Schillinger* v. *Middleton*, (31 Fed. Rep., 736.)

The patent was before this Court in *California Paving Co.* v. *Molitor*, (113 U. S., 609,) in March, 1885, but only on a question of contempt, and in *California Paving Co.* v. *Schalicke*, (119 U. S., 401,) in December, 1886.

We are of opinion that the proper construction of the reissued patent is, that the invention consists in dividing the pavement into blocks, so that one block can be removed and repaired without injury to the rest of the pavement, the division being effected by either a permanent or a temporary interposition of something between the blocks. Concrete pavement had been laid before in sections, without being divided into blocks. The effect of the disclaimer was to leave the patent to be one for a pavement wherein the blocks are formed by interposing some separating material between them. To limit the patent to the permanent interposition of a material equivalent to tar-paper, would limit the actual invention. The use of a bottom layer of coarse cement, and placing on it a course of fine cement, and dividing the upper course into blocks by a trowel run partially or wholly through the upper course while it is plastic, in a line coincident with the joints between the sections in the lower layer, accomplishes the substantial results of Schillinger's invention, in substantially the way devised by him, and is within the patent as it stands after the disclaimer. The disclaimer took out of the first claim of the reissue only so much thereof as claimed a concrete pavement made of the plastic material laid in detached blocks, without interposing anything in the joints in the process of formation, leaving that claim to be one for such a pavement laid in detached blocks, when free joints are made between the blocks, by interposing permanently or temporarily between them, in the process of their formation, tar-paper or its equivalent.

In *California Paving Co.* v. *Schalicke*, (*supra*,) it was said, (p. 406:)

> The evidence in the present case shows that the defendant, during the process of making his pavement, marked off its surface into squares. But the question is whether he, to any extent, divided it into blocks, so that the line of cracking was controlled, and induced to follow the joints of the divisions, rather than the body of the block, and so that a block could be taken out, and a new one put in its place, without disturbing or injuring an adjoining block. The specification makes it essential that the pavement shall be so laid in sections "that each section can be taken up and relaid without disturbing the adjoining sections." Again, it says that the joint between the blocks "allows the several blocks to heave separately, from the effects of frost, or to be raised or removed separately, whenever occasion may arise, without injury to the adjacent blocks." This is essential; and, in all the cases where infringement has been held to have been established, there have been blocks substantially separate, made so by the permanent or temporary interposition of a separating medium or a cutting-instrument, so that one block could upheave or be removed without disturbing the adjoining blocks. The patentee, in the disclaimer, expressly disclaimed "the forming of blocks from plastic material without interposing anything between their joints while in the process of formation." It appears that the defendant laid his pavement in strips from the curb of the sidewalk inward to the fence, in one mass, and then marked the strip crosswise with a blunt marker, which is made an exhibit, to the depth of about one-sixteenth of an inch; but it is not shown that this produced any such division into blocks as the patent speaks of, even in degree. There were no blocks produced, and, of course, there was nothing interposed between blocks. The mass underneath was solid, in both layers, laterally. So far as appears, what the defendant did was just what the patentee disclaimed. The marking was only for ornamentation, and produced no free joints between blocks, and the evidence as to the condition of the defendant's pavements after they were laid shows that they did not have the characteristic features above mentioned as belonging to the patented pavement.

In its decision in the present case, which was made before that in the Schalicke case, the Court said that the case was in no way different, so far as infringement was concerned, from the cases against Perine and Molitor and the case against the Greenway Brewing Company.

In the Schalicke case it was said, in the opinion of this Court, in regard to the pavement in the Molitor case:

> The defendant's pavement was made by cutting a lower course into sections with a trowel, to a greater or less depth, according to the character of the material, making a joint, and doing the same with an upper course, the upper joint being directly over the lower joint. Into the open joint, in each case, was loosely put some of the partially-set material from the top of the laid course, answering the purpose of tar-paper. A blunt and rounded joint-marker, which was said to be one-sixteenth or one-eighth of an inch in depth, was then run over the line of the joints, marking off the block. The pavement was weaker along the line of the joint than in any other place. This was held to be an infringement.

It was also there said that, in the Greenway Brewing Company case—

> it was held that the second claim of the reissue was infringed by a concrete pavement which had an open cut made by a trowel entirely through two courses of material, the line of cut in the upper course being directly over the line of cut in the lower course, and that the interposition of the trowel, though temporary, was an equivalent for the tar-paper, even though the joint was left open after the trowel was removed, and was not made tight.

In the present case, the only pavement for which the defendant was held liable was what was called in his account or statement before the master "concrete flag pavement," the manner of constructing which is thus described by Mr. Perkins, a witness for the plaintiff:

> First, joists are placed seven to eight feet apart, in front of the property where the work is to be laid. First, one stone is formed by placing a joist across between the others at right angles, generally at about four feet from the place of beginning. In this space a mortar, composed of sand, gravel, and cement, is put and thoroughly tamped, so that the coarse material will be from three to four inches in thickness, leaving about one-half inch on top for a mortar composed of sand and cement, which is troweled off and made even with the top surface of the joists. Then the short joist that is put in at right angles, as before described, is taken up and placed about the same distance as before, and again filled in. The finer material in the coarse concrete is generally worked next to the joist, so as to make a good, smooth, strong edge. When the top stuff is put on this last stone, and finished over on top with a trowel, the joint between the two stones being marked on the outer joist, a trowel is drawn through the top stuff to make a joint straight to correspond with the joint below.

The evidence is satisfactory that the trowel was used to cut through or into the top layer to an extent sufficient to make such a separation of the top layer into blocks, at a line corresponding with the joint below between the sections of the first layer, as to control the cracking of the top layer, by dividing it substantially into separate blocks. This division depends on

the depth of the cut. The defendant contends that the object and effect of the marking with the trowel was only to give to the pavement the appearance of flagging; but the evidence is entirely clear, that the cut was made sufficiently deep, in proportion to the thickness of the upper layer, to make such a separation of the upper layer into blocks as would compel any tendency to crack to follow the line of the cut made by the trowel and not run off into the body of the layer; and that thus the object of Schillinger's invention was attained. The defendant is, by the report of the master and the decree of the circuit court, made liable only for concrete flagging so laid and cut as to produce such result. The defendant was particular to have the cut in the upper layer made with the trowel directly over the line between the two sections of the lower layer, and it is shown that the upper layer of his pavement thus made would come up in separate blocks. He made his lower course of sand, gravel, and cement mixed in the proportions of one part of cement to six or seven of sand and gravel, while he made his upper course of one-half sand and one-half cement, made plastic with water. The lower course of his flagging was composed of material in which there was only one part of cement or adhesive substance to six or seven parts of non-adhesive substance, and there was but a slight tendency to adhere between the faces of the two sections in the lower course, while as the upper layer was composed one-half of adhesive substance, the tendency was for its material to adhere strongly. Therefore, a cut in the upper course, coincident with the joint below, would permit any action of the settling of the lower course, through frost or upheaval, to extend to the top of the upper course through a joint cut in that course, of sufficent depth to prevent the tendency of the upper course to crack in its body rather than in the line of the cut.

We are, therefore, of opinion that the first claim of the reissue, as it stands after the disclaimer, is infringed, because the defendant's pavement is a concrete pavement, laid in detached blocks or sections, substantially in the manner shown and described in the specification of the reissue, the detached blocks in the upper course being the equivalent of the detached blocks or sections of the Schillinger pavement; and that the second claim of the reissue is infringed, because the temporary use of the trowel or cutting-instrument, to divide the upper course into blocks, is the equivalent of the tar-paper of the Schillinger patent, the cutting making a division which controls the cracking, and facilitates the taking up and relaying of the blocks or sections in the upper course "without disturbing the adjoining sections," and the trowel being interposed to effect its object during the process of forming the pavement on the spot where it is to remain.

The invention of Schillinger was a very valuable one. The evidence is that it entirely superseded the prior practice of laying concrete pavements in a continuous, adhering mass.

The defendant introduced in evidence, on the question of novelty, the following patents: English patent to Claridge, No. 7,489, of 1837; English patent to D'Harcourt, No. 7,991, of 1839; United States patent to Russ, No. 5,475, of 1848; English patent to Chesneau, No. 350, of 1852; English patent to Coignet, No. 2,659, of 1855; English patent to De la Haichois, No. 771, of 1856; and United States patent to Van Camp, No. 93,142, of July 27, 1869. All of these patents, except the Van Camp patent, were introduced in evidence on the part of the defense in the case against the Greenway Brewing Company, and it was held in that case that none of them anticipated the Schillinger invention. A copy of the record in that case, embracing the pleadings, and the evidence and patents put in by the defendant in it, on the question of novelty, forms part of the record in the present case.

An examination of the patents put in evidence by the defendant, in connection with the testimony in regard to them, shows that the Claridge pavement was not a concrete pavement, and was not formed in detachable blocks, but was a continuous asphalt pavement; that the D'Harcourt pavement was not a concrete pavement laid in detached blocks or sections, nor could one section be removed without disturbing adjacent sections; that the Russ patent shows a concrete foundation for a stone pavement, the pavement proper being constructed of granite or syenite placed on top of the concrete foundation, such concrete foundation not being formed in detachable blocks, but only being provided at certain places with removable panels, consisting of frames filled with concrete, to be lifted out to give access to water-pipes or for other purposes; that the Chesneau pavement was not a concrete pavement laid in detached sections or blocks, but was a continuous pavement, provided with panels to give access in certain places to gas and water pipes, the panels being made of sections set in frames, which were removably inserted in the surrounding pavement, and there was no arrangement of tar-paper or its equivalent between adjoining blocks of concrete, for the purpose set forth in the Schillinger patent; that the Coignet patent did not show a concrete pavement, made in detachable blocks after the manner of Schillinger's, and built on the ground where it was to remain; that the De la Haichois pavement was not a concrete pavement laid in detachable blocks or sections, or having the arrangement of tar-paper or its equivalent between adjoining blocks of concrete, like that of Schillinger; and that the Van Camp patent showed only blocks formed in molds, and removable from the molds, or the pavement to be laid cemented in the molds, and it not being stated that the blocks should be formed on the spot where they were to remain, nor that they should be formed of cement and gravel or sand. It further appears that, in the Van Camp patent, when the blocks are made in molds, they are like bricks, or artificial stones, or wooden blocks, which are prepared and then brought to the place where they are to be laid and put down in the usual manner; and that, when the blocks remain in the molds and are thus laid, they do not present a uniform wearing-surface of concrete, or constitute a concrete pavement formed in detachable blocks by joints.

Other testimony as to prior public use was introduced in this case, taken from the record in the case of *Schillinger* v. *Phillip Best Brewing Co.*, in the Circuit Court for the Eastern District of Wisconsin, which testimony was also introduced in the case against the Greenway Brewing Company, having been taken in November, 1882. In the decision in the latter case it was correctly said of that testimony:

So far as it refers to prior use in Germany, not shown in a patent or printed publication, it was duly objected to in this case and must be excluded. As to the cement malt-floor which Row laid in Baltimore twenty-five years ago, he shows that it was not made in sections detachable by free joints. The testimony of Botzler as to a prior malt-floor laid by him in Chicago is too indefinite to amount to sufficient evidence to defeat a patent.

So far as that testimony related to a pavement used in Germany, it was objected to at the time it was introduced in this case, as incompetent. It was clearly inadmissible under section 4923 of the Revised Statutes, because it did not show anything that had been patented or described in a printed publication.

We do not think that the reissued patent, as it stood after the filing of the disclaimer, was open to the objection that it was not for the same invention as that of the original patent. Whatever there was of objectionable matter inserted in the specification or the first claim of the reissue, when it was granted, was removed by the disclaimer. The reissue was granted within ten months after the original. The single claim of the original patent was repeated in the reissue as the second claim of the latter, and the first claim of the reissue, as it stood after the disclaimer, did not expand beyond the claim of the original what was claimed in the reissue.

As to the amount of the decree, we think the court properly awarded the sum of 4 cents per square foot as the profits of the defendant, and that it was right to give to the plaintiff the entire profits made by the defendant by the laying by him of his concrete flagging, in view of the testimony in the case. It clearly appears that the defendant's concrete flagging derived its entire value from the use of the plaintiff's invention, and that if it had not been laid in that way it would not have been laid at all.

In *Elizabeth* v. *Nicholson Pavement Co.*, (97 U. S., 126, 139,) it is said that "when the entire profit of a business or undertaking results from the use of the invention, the patentee will be entitled to recover the entire profits, if he elects that remedy." This language was quoted with approval in *Root* v. *Railway Co.*, (105 U. S., 189, 203.) As in the case of the Nicholson patent, so in the case of the Schillinger patent, the pavement was a complete combination in itself, differing from every other pavement, and the profit made by the defendant was a single profit derived from the construction of the pavement as an entirety. (*Callaghan* v. *Myers*, 128 U. S., 617, 665, 666.)

Within the decision in *Garretson* v. *Clark*, (111 U. S., 120,) the proof in this case is satisfactory, that the entire value of the defendant's pavement, as a marketable article, was properly and legally attributable to the invention of Schillinger.

The decree of the circuit court is affirmed.

U. S. Circuit Court—Southern District of New York.

HAKE v. BROWN *et al.*

Decided March 5, 1889.

1. HAKE—VISITING-CARDS.

Letters Patent No. 219,464, granted September 9, 1879, to Philip Hake, for an improvement in visiting-cards, *Held* valid as to the first claim, which covers the process of arranging cards in oblique packs and beveling and ornamenting and finishing the sides and ends of the whole pack as though it were one card, but invalid as to the second claim, covering the product, which is old in the sense of the patent law.

2. DISCLAIMER—INFRINGEMENT.

The patent might be held to be invalid on account of its covering the product, of which the patentee is not the inventor, and which is a material and substantial part of the thing patented, (R. S., 4920;) but regarding this as claimed through inadvertence, accident, or mistake, without any willful default or intent to defraud or mislead the public, the patentee may file a disclaimer to the second claim now, and thereupon have a decree for the infringement of the first claim, without costs.

Mr. Arthur v. Briesen for the plaintiff.
Mr. Walter D. Edmonds for the defendants.

WHEELER, *J.*:

This cause rests upon Patent No. 219,464, dated September 9, 1879, and granted to the orator for an improvement in visiting-cards. The patent describes a method of making beveled-edged cards and of ornamenting the edges by piling them obliquely, first, so that the slope of the pack will correspond with the desired bevel, compressing them to hold them in that position, beveling and ornamenting and finishing the whole pack on the sloping edge, which will bevel, ornament, and finish that edge of each separate card by each operation, and of successively treating the other sides and ends of the pack in the same manner; by which means the whole pack is treated as readily as one card. The first claim is for the method of treating cards in this manner, and the second is for a card so treated. The defenses are want of novelty, want of patentability, and lack of proof of infringement.

According to the evidence bevel-edged cards were not new at the date of the orator's invention; neither was beveling in packs new; but arranging cards in oblique packs and treating one side or end till all the cards were complete on that side or end, as if they were one card, and treating the other side and ends successively in the same manner does not appear to have been known before. By this process the packs can be grooved or embossed and ornamented in a manner to present beveled designs upon the edges of such cards, which could not be produced by treating cards separately, and the making of bevel-edged cards of any design is greatly facilitated. This method seems to be ingenious and useful. Such an arrangement of mechanical operations that produces a new and useful result, or an old result in an easier or better manner, is understood to be patentable. (*Cochrane* v. *Deener*, 94 U. S., 789; *Telephone Cases*, 126 U. S., 1.) The first claim of the patent, therefore, appears to be good and valid for the method described.

There is nothing new about the bevel-edged cards produced by this process except that they are made in this way. They do not differ from those made in any other way, unless they do in design. The process does not inhere to the product so that it differs from any like product made in any other way, as was the case with Cummings's invention of rubber plates and teeth, in *Smith* v. *Goodyear Dental Vulcanite Co.*, (93 U. S., 486,) or the driven well, in *Eames* v. *Andrews*, (122 U. S., 40.) The product itself here is old, in the sense of the patent law, and there can be no patent for it, although produced in this new way. (*McCloskey* v. *Du Bois*, 9 Fed. Rep., 38; 8 Fed. Rep., 710;

McCloskey v. *Hamill*, 15 Fed. Rep., 750.) The second claim of this patent, therefore, appears to be invalid. The plaintiff's evidence tends directly to show that the defendants use this process, and the defendants do not in testimony deny that they do, nor dispute or meet this testimony. Upon this state of the evidence the infrigement is found, as a fact, to exist of the first claim.

The patent might be held to be invalid on account of its covering the product, of which the patentee is not the inventor, and which is a material and substantial part of the thing patented. (Rev. Stat., sec. 4920, sub-div. Fourth.) But when such material or substantial part has been claimed through inadvertence, accident, or mistake, without any willful default or intent to defraud or mislead the public, a recovery may be had for the infringement of any part which is *bona fide* the inventor's own—that is, a material and substantial part of the thing patented and definitely distinguishable from the part claimed without right, but without costs, unless a disclaimer is filed before suit brought. (Section 4922.) The benefits of the provisions of this section are to be denied if the entry of a disclaimer has been unreasonably neglected or delayed; but waiting to take the judgment of a court is allowable. (*Burdett* v. *Esty*, 15 Blatchf., 349; 3 Fed. Rep., 566.) No such willful default or intent to defraud or mislead appears or is claimed to exist thus far in this case. The orator therefore appears to be entitled to file a disclaimer of the second claim now, and thereupon to have a decree as to the first claim without costs.

Upon the filing of a duly-attested copy from the Patent Office of a disclaimer of the second claim let a decree be entered that the first claim is valid, and for an injunction and account accordingly, but without costs.

U. S. Circuit Court—Southern District of Ohio, Western Division.

THE SEIBERT CYLINDER OIL CUP COMPANY *v.* THE WILLIAM POWELL COMPANY.

Decided 1889.

LICENSE—INFRINGEMENT.

The defendant is a licensee of the Detroit Lubricating Company under a license which is limited upon its face to patents owned by that company. The Detroit Lubricating Company is the licensee of the complainant under a contract which does not grant an exclusive license for the manufacture or use of the Gates patent owned by the complainant, and which is infringed; *Held* that the defendant was not protected by its license in the manufacture of articles under the Gates patent.

Mr. Edmund Wetmore, Mr. J. H. Raymond, and *Messrs. Peck & Rector* for the complainant.

Mr. George J. Murray for the defendant.

SAGE, *J.*:

The complainant sues as assignee for infringement of Patent No. 138,243, granted to John Gates 29th of April, 1873, for improvements in lubricators for steam-engines. The validity of the patent, although denied in the answer, is not contested. The lubricators manufactured and sold by the defendant contain the complainant's invention. The defense rests solely upon the following facts: December 1, 1883, the complainant and the Detroit Lubricator Company (which was the owner of patents claimed to anticipate complainant's) entered into a contract that neither party should sue the other, or directly or indirectly authorize suit against the other or its agents or vendees, under any of the patents then or thereafter to be owned by it; that neither should imitate the styles or shapes of lubricators made by the other, and that, whereas the Seibert Company was the owner in whole or in part of certain Letters Patent granted to Nicholas Seibert for improvements in lubricators, and the Seibert Company claimed and the Detroit Company denied that the Detroit Company had infringed and was infringing the same, the Detroit Company should thereafter pay royalties, as specified in the agreement, to the Seibert Company so long as the Seibert Company should perform its covenants and stipulations and during the life of the agreement, which was to continue in force until the expiration of the Seibert patents, and in consideration thereof the Seibert Company agreed not to molest the Detroit Company, its agents or vendees, by suit or otherwise, for any alleged infringements of said Nicholas Seibert patents outside of the New England States. The Seibert Company also agreed not to authorize the use of the Nicholas Seibert patents outside of the New England States except as above. This agreement amounted to a license to the Detroit Company, and it included the Gates patent. (*Seibert Co.* v. *Detroit Co.*, 34 Fed. Rep., 216.)

The defendant is a licensee of the Detroit Lubricator Company. The license, upon its face, is limited to patents owned by that company. The lubricators manufactured by the defendant, although different in style and shape from that shown and described in the Gates patent and from those made by the Seibert Company, are nevertheless infringements of the Gates patent.

The contract of December 1, 1883, does not grant to the Detroit Company an exclusive license for the manufacture or use of the Gates patent. That feature of the contract appears only in the stipulation relating to the Nicholas Seibert patents. This conclusion disposes of the entire defense. The contract in evidence between the Seibert Company and the Western Railroad Association cannot avail the defendant. The Detroit Company and the defendant are alike strangers to it. It is only an agreement by the Seibert Company to release upon terms the railroad companies composing the association from any and all claims on account of their use of lubricators purchased from the Detroit Company or from its successors, assigns, agents, or licensees. This view of the case renders it unnecessary to consider whether the contract of December 1, 1883, between the Seibert Company and the Detroit Company has been rescinded.

A decree will be entered for the complainant for an injunction and account.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., May 17, 1889.

SIR: The Secretary of the Interior has ordered that A. C. Stokely, of Red River Iron Works, Ky., be not recognized after this date as attorney or agent in the prosecution of any claim or other matter before this Department or any bureau thereof.

Very respectfully,

E. M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

DESIGNS.

19,112.—FIRE-PLACE GRATE.—*Edsord L. Caley*, Philadelphia, Pa., assignor to *Gilbert Combs, John Bowden*, and *John H. Bowden*, Freehold, N. J. Application filed January 9, 1889. Serial No. 295,995. Term of patent 7 years.

19,113.—WOVEN FABRIC.—*John W. Fries*, Salem, N. C. Application filed May 2, 1889. Serial No. 309,370. Term of patent 14 years.

19,114.—ORNAMENTATION OF GLASSWARE.—*Thomas G. Hembes*, Corning, N. Y. Application filed April 29, 1889. Serial No. 308,074. Term of patent 14 years.

19,115.—TABLE.—*Peter Herbert*, Cincinnati, Ohio. Application filed January 14, 1889. Serial No. 296,294. Term of patent 3½ years.

19,116.—PLAQUE.—*Joseph Locke*, Toledo, Ohio, assignor to *The W. L. Libbey & Son Company*, same place. Application filed April 18, 1889. Serial No. 307,843. Term of patent 7 years.

19,117.—CARRIAGE RUG OR ROBE.—*Andrew M. Newlands*, Galt, Ontario, Canada. Application filed March 28, 1889. Serial No. 305,174. Term of patent 7 years.

19,118.—FRAME FOR ELECTRIC BELLS.—*William H. Powell*, Philadelphia, Pa., assignor to *J. Elliott Shaw*, same place. Application filed April 16, 1889. Serial No. 307,504. Term of patent 7 years.

19,119.—PENCIL.—*Gavin Rose*, Bridgeport, Conn. Application filed April 6, 1889. Serial No. 306,257. Term of patent 3½ years.

19,120.—SALT-BOX OR CONDIMENT-HOLDER.—*Albert Steffin*, New Bedford, Mass. Application filed November 10, 1887. Serial No. 254,339. Term of patent 7 years.

19,121.—THIMBLE.—*John F. Simons*, Philadelphia, Pa. Application filed February 15, 1889. Serial No. 300,060. Term of patent 14 years.

19,122.—TABLE-SERVICE.—*James G. Warren*, Providence, R. I. Application filed December 5, 1887. Serial No. 257,061. Term of patent 7 years.

19,123.—COUP.—*Abijah Wallace*, Stroudsburg, Pa., assignor of two-thirds to *Meyer Dittenhoefer*, New York, N. Y. Application filed April 25, 1889. Serial No. 308,619. Term of patent 3½ years.

19,124.—BACK OF A COUP.—*Abijah Wallace*, Stroudsburg, Pa., assignor of two-thirds to *Meyer Dittenhoefer*, New York, N. Y. Application filed April 25, 1889. Serial No. 308,620. Term of patent 3½ years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,629.—RAZOR-STROPS.—*American Enamel Company*, Providence, R. I. Application filed April 4, 1889. Used since June, 1888.

"The word 'GOLDSCHMIDT,' the initials 'I. P. G.,' and the word 'BERLIN.'"

16,630.—CORK AND CORK ARTICLES.—*Arnold & Co.*, Lancaster, Pa. Application filed March 16, 1889. Used since May 2, 1860.

"The abbreviation 'R,' ('prescription' or 'recipe.')"

16,631.—VETERINARY LINIMENT.—*Mirum Sulz-Bacher*, New York, N. Y. Application filed October 17, 1887. Used since September 26, 1887.

"The representation of a man in a Brother Jonathan suit with the words 'TESTED AND APPROVED' issuing from his mouth."

16,632.—INDIA-RUBBER BOOTS AND SHOES.—*Boston Rubber Company*, Boston, Mass. Application filed April 8, 1889. Used since January 15, 1889.

"The representation of a bell."

16,633.—NATURAL MINERAL WATERS.—*Erich Brünler*, New York, N. Y. Application filed April 1, 1889. Used since February 15, 1889.

"The word 'AURORA.'"

16,634.—SOAP.—*Benjamin Brooke & Company*, Philadelphia, Pa. Application filed November 19, 1888. Used since September, 1886.

"The words 'MONKEY BRAND.'"

16,635.—SOAP.—*Benjamin Brooke & Company*, Philadelphia, Pa. Application filed November 19, 1888. Used since December, 1879.

"The representation of a monkey viewing a reflection in a pan or skillet."

16,636.—PLATED SEAMLESS FILLED WIRE AND ARTICLES MADE THEREFROM.—*Burdon Seamless Filled Wire Company*, Providence, R. I. Application filed March 22, 1889. Used since October 26, 1888.

"The letter 'S' inclosed by a wreath."

16,637.—WINE, GIN, RUM, AND BRANDY.—*James E. Davis*, Detroit, Mich. Application filed April 10, 1889. Used since May 1, 1885.

"The word 'ST. BERNARD.'"

16,638.—MUSTARD.—*William G. Dean & Son*, New York, N. Y. Application filed April 4, 1889. Used since September 1, 1877.

"The representation of the earth, with clouds and lightning."

16,639.—MUSTARD.—*William G. Dean & Son*, New York, N. Y. Application filed April 4, 1889. Used since October 1, 1873.

"The word 'ARDENTER.'"

16,640.—PRESERVED AND CANNED FRUITS AND VEGETABLES.—*Patrick F. Gillespie*, Chicago, Ill. Application filed March 27, 1889. Used since November 1, 1888.

"The representation of a shield and the letters 'L. J. C.' above it, together with the words 'P. F. GILLESPIE,' arranged in a semicircle above the shield, and the words 'CHICAGO' and 'ILLINOIS' on either side of the shield."

16,641.—SHOES.—*Hamilton Hay*, Stoneham, Mass. Application filed April 9, 1889. Used since January 1, 1888.

"The words 'BIG DRIVE.'"

16,642.—SHOE-ELASTIC, BOOTS, AND SHOES.—*Herbert & Rapp Company*, Boston, Mass. Application filed April 5, 1889. Used since March 15, 1889.

"The word 'HUB.'"

16,643.—COMPOSITION FOR SHIPS' BOTTOMS.—*M. Holzapfel & Co.*, Newcastle-upon-Tyne, England. Application filed March 21, 1889. Used since April 21, 1883.

"The fac-simile signature 'HOLZAPFEL & Co.'"

16,644.—WHEAT-FLOUR.—*Walter, Horning & Co.*, Pittsburg, Pa., and Minneapolis, Minn. Application filed March 20, 1889. Used since January 1, 1889.

"The word 'AVALON.'"

16,645.—WHEAT-FLOUR.—*Walter, Horning & Co.*, Pittsburg, Pa., and Minneapolis, Minn. Application filed March 20, 1889. Used since May 1, 1887.

"The word 'IVORY.'"

16,646.—WHEAT-FLOUR.—*Walter, Horning & Co.*, Pittsburg, Pa., and Minneapolis, Minn. Application filed March 20, 1889. Used since February 1, 1880.

"The words 'GOLDEN WEDDING.'"

16,647.—WHEAT-FLOUR.—*Walter, Horning & Co.*, Pittsburg, Pa., and Minneapolis, Minn. Application filed March 20, 1889. Used since January 1, 1889.

"The word 'UNA.'"

16,648.—WHEAT-FLOUR.—*S. C. Hurt & Son*, Lynchburg, Va. Application filed April 2, 1889. Used since 1868.

"The words 'WHITE ROCK MILLS' and a double chain-like line composed of dashes inclosing the same."

16,649.—WATER-COOLERS AND COMBINED WATER COOLER AND FILTER.—*The John C. Jewett Manufacturing Company*, Buffalo, N. Y. Application filed March 25, 1889. Used since January 1, 1885.

"The words 'NEW ERA.'"

16,650.—REMEDY FOR ROUGHNESS OF THE SKIN AND FOR BURNS AND CHAFING.—*Frederick W. Lyons* and *Edward Ziegler*, Jersey City, N. J. Application filed November 9, 1887. Used since October 1, 1886.

"The compound word 'ANTI-CHAP.'"

16,651.—WHIPS AND LASHES.—*Massasoit Whip Company*, Westfield, Mass. Application filed April 3, 1889. Used since January 15, 1887.

"The words 'THE A. C. BARNES WHIP CO.'"

16,652.—MANUFACTURES FROM MINERAL AND OTHER SUBSTANCES FOR BUILDING AND DECORATING, INCLUDING CEMENT.—*McLean & Company, (Limited,)* London, England. Application filed March 21, 1889. Used since August 8, 1887.

"The representation of the head of a dog."

16,653.—PAPER CLOTHING.—*New York Paper Clothing Manufacturing Company*, New York, N. Y. Application filed April 4, 1889. Used since February 14, 1889.

"The word 'ZERO.'"

16,654.—GLOVES.—*Emile Ott*, Paris, France. Application filed April 3, 1889. Used since March 15, 1889.

"The word 'CENTENAIRE.'"

16,655.—CANNED SALMON.—*Pacific Packing Company*, San Francisco, Cal. Application filed March 14, 1889. Used since February 1, 1889.

"The word 'NATIONAL.'"

16,656.—COFFEE.—*George Ropes*, Boston, Mass. Application filed March 27, 1889. Used since July 1, 1875.

"The capital letter 'R,' inclosed in lines outlining the form of a diamond."

16,657.—CANNED SALMON.—*Royal Packing Company*, San Francisco, Cal. Application filed March 14, 1889. Used since February 1, 1889.

"The word 'CHIEFTAIN' and the pictorial representation of a tattooed face and feathered head of an Indian chief within a circle, and a fish upon the opposite end of the label."

16,658.—COTTON LININGS.—*Frank L. St. John*, New York, N. Y. Application filed February 18, 1889. Used since January 2, 1889.

"The word 'BEDFORD,' on a silver-colored parallelogram."

16,659.—REMEDIES FOR RHEUMATISM.—*William Henry Southard*, Leadville, Colo. Application filed March 16, 1889. Used since July 5, 1888.

"The words 'MOUNTAIN WONDER.'"

16,660.—BISCUIT.—*Wilson-Cass Company*, Philadelphia, Pa. Application filed March 22, 1889. Used since December 10, 1888.

"The word 'HEALTH' associated with a square figure containing the representation of a field of grain with two girls in the foreground, a parallelogram containing a picture of a grassy meadow on which eight children are circling hand in hand, and a parallelogram containing a representation of a grove of trees near which are two young girls, while in the foreground are two others, all in appropriate colors."

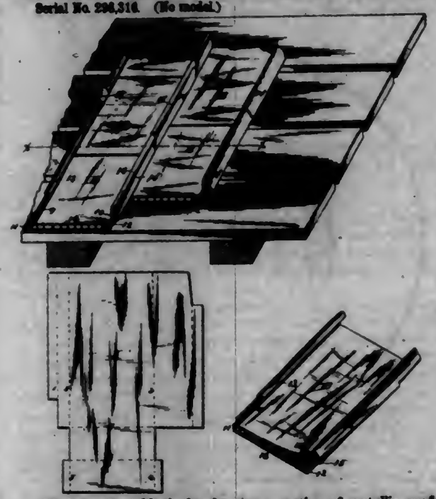
5,920.—Title: "MATT WAX COLOR."—*Grunewald & Busher*, Chicago, Ill. Application filed March 16, 1889.

5,921.—Title: "E. MERCIER & Co." (FOR BRANDY.)—*Edward Kane & Son*, Brooklyn, N. Y. Application filed May 6, 1889. (Trade-Mark Registered.)

5,922.—Title: "YUCATAN PLUG TOBACCO."—*R. J. Kittick*, Chicago, Ill. Application filed April 17, 1889.

5,923.—Title: "ANIMATING GUM." (FOR MEDICATED CHEWING GUM.) *Henry J. Kintz*, Alexandria, Va. Application filed April 29, 1889.



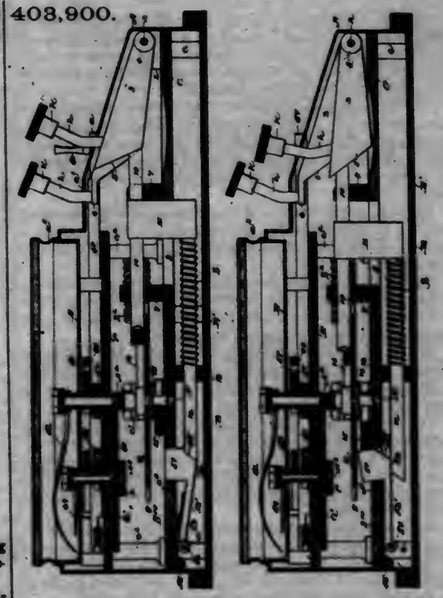
5,924.—Title: "KHASAN'S SANTIN." (FOR ANTI-SUDORIFIC POWDERS.)—*Naum Khasan*, New York, N. Y. Application filed February 8, 1889. (Trade-Made Registered.)

5,925.—Title: "COMPOUND VEGETABLE PANACEA."—*Frank H. Libby*, Saco, Me. Application filed May 2, 1889.

PATENTS

GRANTED MAY 28, 1889.

403,899. SHEET-METAL ROOFING. JOHN W. AMBRAHN, Allegheny, Pa., assignor to John Davis, same place. Filed Feb. 1, 1889. Serial No. 298,316. (No model.)



Claim.—1. A blank for forming a section of metallic roofing adapted to be folded on the lines 1 2 3 4 5 6 7 8, substantially as described.

2. A section of metallic roofing having vertical and angular flanges on its sides and a rabbet or seat at one end below the plane of the body of the section, substantially as described.

3. A section of metallic roofing having flanges 9 10 11 12 13 14 15 and a rabbet or seat, 16, formed by a double fold and integral with the sections, substantially as described.

403,900. ADDING-MACHINE. SAMUEL R. AUSTIN, Fort Valley, Ga. Filed June 10, 1887. Renewed Apr. 22, 1889. Serial No. 308,214. (No model.)

Claim.—1. In an adding-machine, a series of sliding rods of different lengths having forward-inclined ends, and a series of key-levers having corresponding projecting inclined ends adapted to engage with the forward ends of the said rods, substantially as described.

2. The combination, with the sliding rods having depending projections formed therewith, a spring-actuated rod connected to the said depending projection, and the key-levers, substantially as described.

3. In an adding-machine, the series of sliding rods of different lengths, the key-levers for actuating the same, the levers 14 and 15, to be actuated by the rods, and the registering mechanism worked by the movement of the levers 14 and 15, as set forth.

4. The combination, with the sliding rods of varying lengths mounted in suitable bearing-strips, of the key-levers engaging with the forward ends thereof, the lever 14, normally resting against the inner ends of said rods, and the coiled spring for returning said lever 14 to its normal position, substantially as described.

5. In an adding-machine, the combination of the key-levers 3, having the enlarged inclined ends 4, the projections 5, alternately formed with said lever, the key-post projecting above the said levers, and the sliding rods 10, of varying lengths, with which said levers engage, substantially as described.

6. The combination of the key-levers, the sliding rods 10, having rods 12, encircled by coiled springs connected to the under part thereof, levers 14 and 15, and the stop-levers 52, the registering mechanism operated by rods 10, and the stop mechanism operated by rods 12, substantially as described.

7. The combination, with the rods 10, having the projections 11, of the rods 12, encircled by coiled springs, substantially as described.

8. The combination, with the rods 10, having the projections 11, of the rods 12, encircled by coiled springs, the levers 52, having the projecting ends 54, and the spring for returning said levers 52 to their normal position, substantially as described.

9. The combination, with the levers 14 and 15, of the slide-pawl in connection with the lever 15 and the master-gear G, the stop mechanism for the lever 15, and the key-levers for actuating lever 14, and also to control the stop mechanism, substantially as described.

10. The combination, with the levers 14 and 15, of the key-levers for actuating the said levers 14 15, the slide-pawl in connection with

the lever 15, the master-gear G, in connection with the arbor A', and the index on the top portion of said arbor, substantially as described.

11. The combination, with the levers 14 and 15, of the spring-actuated slide-pawl in connection with the lever 15, operating in a line to the center of the master-gear G, the key-levers for working the levers 14 and 15, and the spring-actuated pawl for holding the master-gear in its desired position, substantially as described.

12. In an adding-machine, the combination, with the master-gear G, connecting with the registering mechanism, of the lever 15, for actuating the same, said lever having the hollow screws adapted to be filled with felt or the like and engaging the surface of the said master-gear, as set forth.

13. The combination, with the lever 14, of the link 27 connecting said lever with the lever 15, the slide block or pawl 29, and the vertically-arranged stud or pin adapted to engage the teeth of the master-gear G, substantially as described.

14. The combination, with the lever 15, carrying the spring-actuated sliding pawl, and the lever 14, of the arms projecting outwardly from the side thereof and adapted to engage with the spring-actuated sliding pawl, and the key-levers and sliding rods for actuating the lever 14, substantially as described.

15. The combination, with the lever 15, having the central recessed enlargement, of the stop-levers 52, having the forward enlarged ends, and the spring for returning said levers to their normal position, whereby the movement of the said lever 15 is limited proportionately to the length of the slide-rod 10, substantially as described.

16. In an adding-machine, the combination, with the key-levers, of the rods 12 actuated thereby, the master-gear G, the lever 15, operated by the key-levers, and the stop-levers 52, operated by the rods 12, as set forth.

17. The combination, with the slide-rods 10, connecting with the registering mechanism, of the key-levers 3, having the enlarged inner inclined ends, whereby a positive motion between the two parts is at all times afforded, substantially as described.

18. The combination, with the levers 14 and 15, of the slide-pawl carried by the lever 15, the master-gear operating in connection with said slide-pawl, and the pinion mounted upon the same arbor as the master-gear, substantially as described.

19. In combination with the master-gear G' and the actuating mechanism therefor, rods 10, of different lengths, to work the actuating mechanism, rods 12, encircled by springs and of varying lengths, and the levers 52, which are adapted to be projected upward to limit the movement of the actuating mechanism for the master-gear, substantially as described.

20. In combination with the levers 14 and 15, the diagonally-arranged slots in said lever, the slide-block arranged in connection with said diagonal slots, the spring-actuated rod, and the vertically-arranged pin mounted in the said sliding block and adapted to engage with the teeth of the master-gear, substantially as described.

21. The combination of the lever P', having the straight and curved portions *p* and *p'* formed integrally, the central projections formed therewith, the heart-cams mounted on the arbors of the indices, and the draw rod or lever whereby the indices may be returned to their normal position, substantially as described.

22. The combination, with the levers 3, constructed as herein set forth, of the slide-rods 10, the spring-actuated rods 12 in connection therewith, the levers 14 and 15, the slide-pawl mounted in connection with the lever 15, the master-gear G, the rear pawl adapted to engage with the said master-gear, and the stop-levers 52, substantially as described.

23. The combination, with the plate C, of the bearing-strips 7 and 8, mounted thereon and forming the front and rear walls of a slot, 9, constructed in said plate, and the slide-rods 10, having the depending projections 11, to which the rods 12 are secured, substantially as described.

24. In combination with the master-gear G, the hollow screws filled with felt and engaging the faces of the gear, as and for the purpose set forth.

25. In combination with the master-gear G, connecting with the registering mechanism, the spring-actuated graduated rods 10, the key-lever actuating the rods 10, the swinging lever engaging and turning the master-wheel, the said swinging lever being actuated by the rods 10, and the stop mechanism, also actuated by the movement of the sliding rods 10 to limit the movement of the swinging lever, as set forth.

26. In combination with the master-wheel G, connecting with the registering mechanism, the spring-actuated graduated rods 10, the transmitting mechanism operated by the sliding rods to move the wheel G, and the stop mechanism, also operated by the sliding rods to limit the movement of the transmitting mechanism and correspondingly limit the movement of the wheel G, as set forth.

27. In combination with the key-levers, the spring-actuated graduated sliding rods 10 operated thereby, the spring-actuated swinging levers operated by the sliding rods, the wheel G, the pawl on the levers to engage the wheel, and the stop-levers 52, also graduated and operated by the rods 10 to be thrown up in advance of the swinging levers to limit the movement of the latter, as set forth.

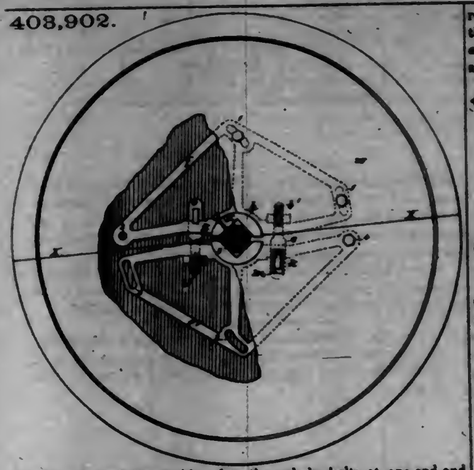
28. In combination with the master-gear G, the swinging levers to engage and actuate the gear, the key-levers to move the swinging levers, and the hollow screws filled with felt and fitted to the swinging levers, the felt being pressed by the screws against the gear, as set forth.

29. In combination with the master-gear G, the spring-actuated swinging levers 14 15, arranged above and below the gear, the pawl carried by the lower lever, 15, to engage the gear, the spring-actuated sliding rods 10 12, actuated by the key-levers, the rods 10, actuating against the lever 14, the stop-levers 52, to limit the movement of the lever 15, said stop-levers being actuated by the rods 12, as set forth.

408,901. ADJUSTABLE SPLIT PULLEY. HENRY C. BAILEY, Edinburg, Ind. Filed Jan. 17, 1889. Serial No. 296,677. (No model.)

Claim.—1. A pulley comprising two sections, the web provided with a central open space, the hub formed of two parts, each part provided with a semicircular flange fitting into corresponding central spaces formed in the web, and means connecting such flanges for uniting the hub-sections and clamping them upon the shaft, substantially as shown and described.

2. A split pulley comprising two sections, the web formed so as to leave an open space between its parts, the hub formed in two sections, each section having integral therewith a semicircular flange adapted to enter the space formed in the web and secured to the web by bolts passing through slots to admit of the parts of the hub being drawn together without any strain upon the pulley-sections, such hub being provided with a shaft-opening having a corrugated surface for gripping the shaft, and means—such as bolts—for drawing the flanges of the hub together and clamping the hub-sections to the shaft, substantially as shown and described.

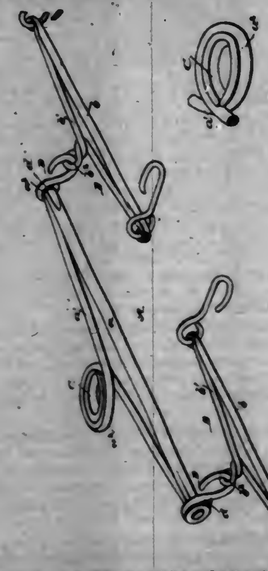


3. A split pulley comprising two sections, its web having a central recess formed therein to admit the hub-flanges, a hub formed in two sections, each one provided with a flange for entering the recess in the web, and with projections formed on the ends of the flanges, having threaded openings to receive bolts for clamping the hub-sections together, and having squared openings formed in the hub-sections for admitting the shaft, all combined substantially as described.

408,902. ADJUSTABLE SPLIT PULLEY. HENRY C. BAILEY, Edinburg, Ind. Filed Jan. 31, 1889. Serial No. 298,283. (No model.)

Claim.—1. A pulley comprising two sections, the web having a central open space between its sides, the hub formed of two parts, each provided with a flange fitting into the central space of the web, each flange having an opening for a hinge-bolt upon one end, slots for securing the bolts at the other angles or corners of the flange, and openings on each side of the hub-section to admit the passage of clamping-bolts, in combination with such clamping-bolts and means for clamping the hub-sections upon the shaft, and bolts for allowing the adjustment of one end of each section, substantially as shown and described.

2. A pulley comprising two sections abutting upon their edges, the web thereof formed with an open space between its sides, the hub formed in two sections having a squared shaft-opening, each section integral with a flange adapted to fit in the space between the parts

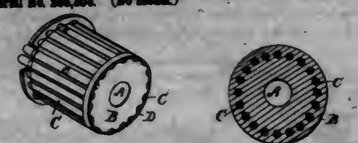


408,902.

of the web, such flanges hinged to the web by bolts at one end and secured by bolts passing through slots at the central and opposite ends of the flange, such sections having openings formed on each side of the hub upon the arms of the flange for admitting clamping-bolts, in combination with a pair of clamping-bolts, one on each side of the hub-section, means for adjusting one end of each flange-section, and clamping-bolts for drawing the flanges and pulley-sections together and securing the same at any desired point, substantially as shown and described.

3. A pulley comprising two sections, their edges abutting upon a central line, the web thereof having a central recess, the hub formed in two sections with squared shaft-opening, each section formed integral with a triangular flange set in a recess of the web, hinged by suitable bolts passing through the flanges at one corner thereof and secured at the upper central and opposite angle by bolts passing through longitudinal slots formed in such flange, clamping-bolts passing through the arms of the flanges on each side of the hub-sections, and means for drawing and locking the parts together, all combined substantially as shown and described.

408,903. WHIFFLETREE. WILLIAM J. BLACK, Alvord, Tex., assignor of two-thirds to John Boyett and C. K. Thomas, same place. Filed May 5, 1888. Serial No. 272,913. (No model.)



Claim.—A whiffletree comprising a front rod and a back rod or spring united together by welding, said whiffletree having its ends rounded to form shoulders a^2 and provided with hooks D, fitting upon the rounded ends and prevented from slipping inward by the shoulders a^2, and disks placed upon said rounded ends and retained thereon by swaging the latter, substantially as and for the purpose described.

408,904. WHIFFLETREE. WILLIAM J. BLACK, Alvord, Tex., assignor of two-thirds to John Boyett and C. K. Thomas, same place. Filed May 5, 1888. Serial No. 272,918. (No model.)

Claim.—A whiffletree comprising a front bar, a back rod or spring united to the front bar by welding, the ends of both said bar and rod being beat upon themselves and the parts welded together to construct an eye or opening, whereby both bar and rod are bent around the latter, substantially as shown in Fig. 4, a strengthening-piece placed between the front bar and the back rod or spring, and a casing secured to the back rod and adapted to hold the strengthening-piece in place, substantially as described.

408,905. COMMUTATOR. HARRY H. BLADES, Detroit, Mich., assignor to the Detroit Motor Company, same place. Filed Sept. 25, 1888. Serial No. 286,266. (No model.)

Claim.—1. A commutator consisting of the head B, of non-conducting material, and rods C, the head having the integral shoulder through which the rods are passed, said head and rods turned down to expose segment-faces *c*, and in connection therewith the band D, of insulating material, embracing the head and segments and dressed flush with the faces *c*, substantially as described.

2. The commutator consisting of the head B, segment-rods C *c*, and an annular recess formed on the end of the head B and rods C, and in connection therewith a band of insulating material adapted to fit the said recess and hold the rods from displacement, substantially as described.

408,906. INDICATOR FOR PIANOS OR ORGANS. LEVIN W. BLASIUS, Philadelphia, Pa. Filed Oct. 10, 1888. Serial No. 288,277. (No model.)

Claim.—1. In a piano, a scale permanently or securely attached thereto immediately above the keys and constituting a part of the instrument, and a movable part of the piano structure adapted to be moved for concealing or exposing said scale.

2. A piano provided with a scale and having a portion of its casing movable for concealing or exposing said scale.

3. A piano provided with a scale and having a pivoted curved portion of its outside casing immediately in front of the keys movable for concealing or exposing said scale.

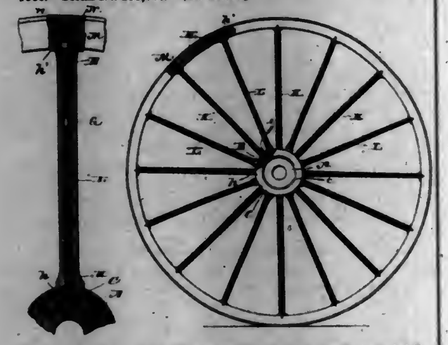
4. In a piano, the outside casing, A, having the key-slip B, in combination with the curved cover E, adapted to be moved forward or backward.

5. In a piano, the outside casing, A, having the key-slip B, in combination with the curved cover E, adapted to be moved backward and forward over the key-slip and pivoted at each end by plates F.

6. In a piano, the outside casing, A, having the key-slip B, having a scale, G, upon the front face, in combination with the curved cover E, adapted to be moved backward or forward over the key-slip.

403,907. SAFETY-GUIDE FOR RAILWAY-CARS. JOHN G. BLAU, Philadelphia, Pa. Filed Dec. 20, 1887. Serial No. 258,595. (No model.)

Claim.—1. The guide-block B, provided with the two diagonal braces *g g* and with the two flanges *a b*, the flange *a* being also provided with the lateral extension G, all substantially as set forth.



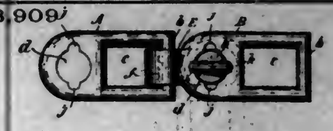
2. The guide-handle *f*, with its cross-block R, its two acute angles being blunted at *c c*, upon which the guide-block will rest, substantially as described.

3. The guide-holder N N, consisting of the plate *m*, having hooks *q q*, in combination with the horizontal handle or bar S, having the square socket E, and provided with the fastening-rivet and the lug *t*, all substantially as described.

4. The fish-tail reverse-plate A, having square-sided notch *x* in the center of its base-line, two short and square sides at right angles extending in fish-tail form, *y y*, and two square holes, *h h*, correspondingly opposite the prongs of the lock-plate, all substantially as set forth.

5. The lock-plate W, with its two extending prongs *v v*, its notched bevel *z*, in combination with the screw having the flat-faced round rim *e*, and the supplementary pin, all substantially as described.

403,908. WHEEL. JEROME BOLICK, Conover, N. C. Filed Jan. 8, 1889. Serial No. 295,729. (No model.)

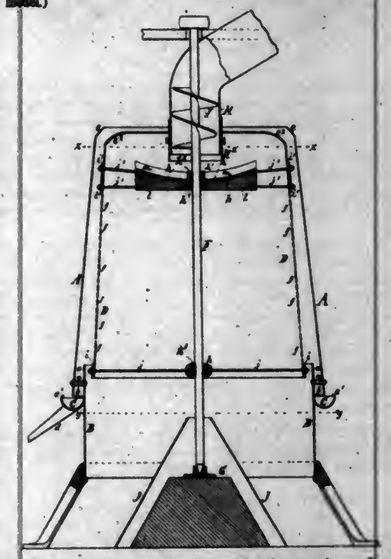


Claim.—1. In a wheel, the combination, with the hub and felly, of a central series of spokes provided with smooth tenons entering sockets in the hub and felly and the lateral series of spokes arranged on opposite sides of the central series and provided with screw-threaded tenons engaging the hub and felly, substantially as specified.

2. In a wheel, the combination, with the hub and felly, of the hollow spokes interiorly screw-threaded at their ends, the exteriorly-threaded tenons screwed in the inner ends of the spokes and engaging threaded sockets in the hub, the tubular tenons screwed in the outer ends of the spokes and provided with threaded bores, and the screw extending through apertures in the tire and engaging the threaded bores of the said tenons, substantially as specified.

3. In a wheel, the combination, with the hub, of the inclosing band or jacket having an inner section, C, extending beyond the line of the spokes and provided at its inner end with a sand-band, *e*, and an outer section overlapping the edges of the inner section, and provided with a flange, *d*, and the screws or pins engaging registering apertures in the overlapping edges of the sections, substantially as specified.

4. The herein-described tubular spoke provided with a series of strengthening-plugs, G G, in its bore, substantially as specified.



403,909. DRIVE-CHAIN. GEORGE G. F. BOSWELL, Indianapolis, Ind., assignor of two-fifths to Joseph R. Boswell and James F. Boswell, both of same place. Filed Jan. 2, 1889. Serial No. 295,133. (Model.)

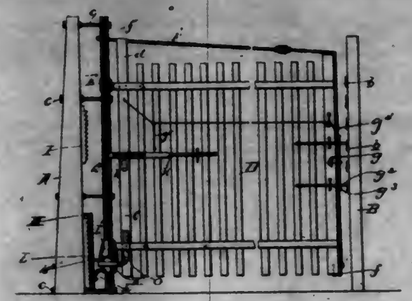
Claim.—1. In a drive-chain, the combination of two like links, each having a straight cylindrical bar at one end, a circular eye at the other end, and an intermediate opening adapted to receive the tooth of a sprocket-wheel, and a separate plate arranged to connect said links, having a hook adapted to engage the straight cylindrical bar of one of the links and a cylindrical boss adapted to engage the eye of the other link, and provided with retaining-lugs, said hook and boss having their axes at right angles to each other, both projecting from the same side of the plate and arranged substantially as shown and described, whereby one link, when connected with the hook on the plate, is held in place by the engagement of the next link with the boss on said plate, substantially as specified.

2. In a drive-chain, the link having bar *b*, the link having eye *d* and recesses *j j*, and the plate having hook *f*, boss *h*, and lugs *k k*, all combined and arranged to co-operate substantially as specified.

403,910. CENTRIFUGAL MACHINE FOR TREATING GRAIN, &c. JOHN BOYD, Baltimore, Md., assignor of one-eighth to William G. White, same place. Filed Jan. 12, 1889. Serial No. 296,187. (No model.)

Claim.—1. In a centrifugal machine for treating refuse substances—as, for instance, mash—so as to dry the grain and separate the solid and liquid portions, the combination of the outer imperforated stationary jacket or case open at top and bottom, the inner perforated revolving cylinder or cone open at top and bottom, and an armed distributing-plate at the upper part of the vertically and freely discharging inner cone, substantially as and for the purpose described.

2. In a centrifugal machine for treating refuse substances—as, for instance, mash—the combination of the outer stationary jacket or case, A, open at top and bottom, the trough C, inner perforated cylinder or cone, D, open at top and bottom, shaft F, distributing-plate *k* at the upper part of the vertically-discharging inner cone, skirting B, and chute-space *c*, formed by the outer jacket and the skirting, substantially as and for the purpose described.



3. In a centrifugal machine for treating refuse substances—as, for instance, mash—the combination of the skirting and its attached trough with the outer jacket, A, and the inner perforated revolving cylinder or cone, D, and armed distributing-plate *k* at upper part of the downwardly-discharging inner cone, substantially as and for the purpose described.

4. In a centrifugal machine for treating refuse substances—as, for instance, mash—the inner perforated cylinder or cone provided with spider-hubs *h h'*, united to the cylinder or cone and stayed by metal bands and screw-bolts, and one of said spider-hubs being formed with a distributing-plate, *k*, having curved arms, substantially as described.

5. In a centrifugal machine for treating refuse substances—as, for instance, mash—the combination of the feed-spout, a feed-regulating screw, a revolving shaft, an inner perforated cone or cylinder, a revolving armed distributing-plate at the upper part of the downwardly-discharging inner cone, and an outer stationary cylinder or jacket, substantially as and for the purpose described.

6. In a centrifugal machine for treating refuse substances—as, for instance, mash—the combination of an outer jacket, a revolving perforated cone open at both ends, and a revolving distributing-plate at the upper part of the downwardly-discharging cone for supplying the mash to the surface of the revolving perforated cylinder or cone, substantially as and for the purpose described.

403,911. GATE. STEPHEN A. D. BOSELL, Atlanta, Ind. Filed Mar. 13, 1888. Serial No. 266,975. (No model.)

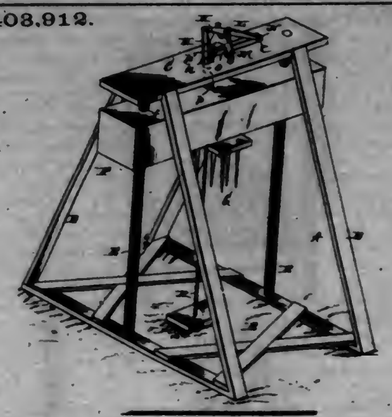
Claim.—1. The combination, with a post having a rod thereon, of a gate hinged on the rod and adapted to move vertically thereon, a rack-bar on the post, and a lever on the gate adapted to engage with said rack-bar, substantially as described.

2. The combination, with the post A, of the rod C, the gate hinged to the rod, a bearing below the hinges having a pawl pivoted thereon, a rack-bar on the post, a lever on the gate, and a rack-bar opposite said lever on the post, substantially as described.

3. The combination, with the post A and cylindrical rod C, of the gate movably supported on the rod, the vertically-moving bearing K on the rod, having a pawl pivoted thereon and an arm extending therefrom, the rack-bar L on the post, the yoke O on the gate clasping the bearing, and a lever on the gate for raising the same, substantially as described.

4. The combination, with the post A and the cylindrical rod C, of the gate hinged on the rod and adapted to be moved vertically, the lever H on the gate having an elongated slot therein, the rack-bar I on the post opposite the lever, the bearing K below the hinges having a pawl and arm thereon, the rack-bar L opposite the bearing, a guide in which the arm works, the yoke O on the gate clasping the bearing, and the latch on the front of the gate having a flexible connection with the rear, substantially as described.

5. The combination, with the rod C, of the gate hinged thereon, and a brace-rod, as F, extending from the bottom of the front of the gate to the upper end of the rod C, substantially as described.



6. The combination, with the post having a rod thereon, of a gate supported on the rod, a movable bearing on the rod below the gate-supporting hinges, a rack-bar on the post, and a pawl on the bearing engaging said rack-bar, substantially as described.

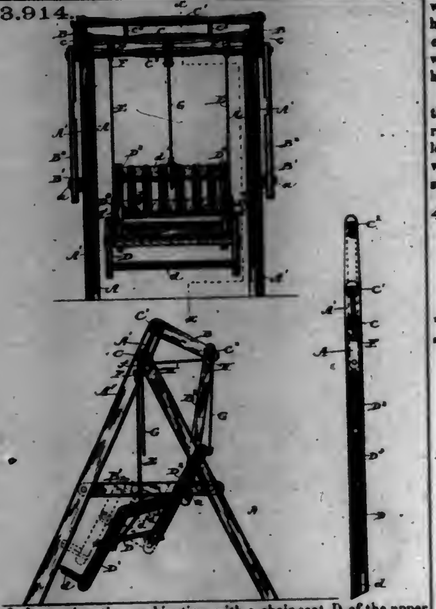
403,912. MOLE-TRAP. RANDOLPH H. BROWN, Coleman, Ga. Filed Feb. 28, 1888. Serial No. 301,443. (No model.)

Claim.—1. In a mole-trap, the combination of the frame having guide-bars, the weight carrying points and sliding on the guide-bars, the loops on the weight, the lever pivoted to the frame having one end engaged by the loop, the horizontal arm loosely resting on said frame and having shoulders or notches, one in engagement with the inclined lever, a stud or point on the frame engaging the other shoulder of the horizontal arm, and the trip-rod having teeth at one end adapted to engage the inner end of the horizontal arm by the upward movement thereof and the other end bearing on the surface of the mole-hill, substantially in the manner and for the purpose described.

2. In a mole-trap, the combination of the weight carrying the impaling-points and the coupling-loop, the inclined pivoted lever having its inner end engaged by the loop, the horizontal sliding arm having shoulders, one in engagement with the outer end of the lever, the stud or point engaging the other shoulder, and the trip-rod having teeth at one end adapted to engage the horizontal arm, its other end bearing on the surface of the mole-hill, arranged and operating substantially in the manner and for the purpose described.

403,912.

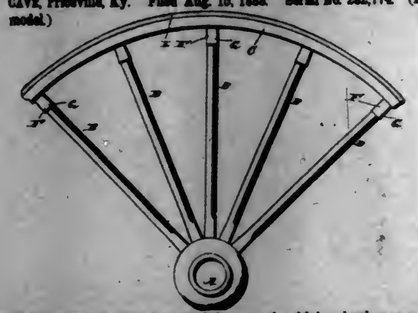
403,913. NECKTIE-FASTENER. WALTER B. BROWN, Bordentown, N. J. Filed Jan. 30, 1889. Serial No. 298,111. (No model.)



Claim.—1. The necktie A, having a band, B, provided with an elongated button-hole, C, at the back, in combination with the two independent stiffening-wires D, secured at their ends to said band, their bodies being curved outwardly and lying along the edges of said button-hole, whereby the tension of the band B will draw them toward each other, as and for the purpose set forth.

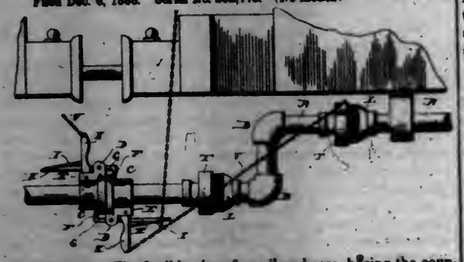
2. The necktie-band having a longitudinal button-hole therein, and the pliable stiffening-wires fitting in sheaths in the edges of the said button-hole and provided at their ends with eyes to receive stitching, substantially as specified.

403,914. SWING. JOHN CARMODY, Osborn, Ohio. Filed Aug. 7, 1888. Serial No. 282,300. (No model.)



Claim.—1. An improved article of manufacture, consisting of a folding swing-frame and a folding chair, the same being constructed of standards A and A', located one outside of the other upon each side of the frame, braces B', detachably connected to one of said standards, supplemental frame-pieces B and B², pivoted to the standards A', to each other, and the latter to the braces B', the pieces B² being on the outside of B and B', and B on the outside of A', and cross-pieces C, C', and C², forming the pivotal connection, as described, a seat, D, upper and lower side pieces, D' and D², in different vertical planes and pivoted to the seat, arms D², pivoted on the outside of D² and on the inside of D', and a single rope at either side connecting one of the cross-pieces with the seat, substantially as shown and described.

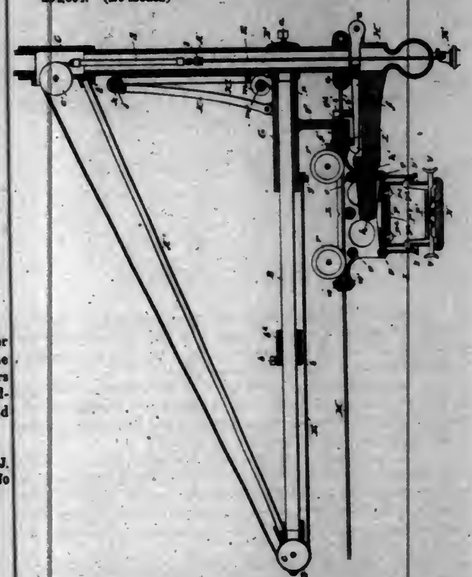
403,914.



2. In a swing, the combination, with a chair-seat, D, of the upper and lower side bars pivoted thereto in different vertical planes, the arms pivoted to the outside upper bars and to the inside lower bars and provided with slots, sheaves mounted in said slots, and suspending-ropes connected to the chair and passing through the slots and between the sheaves, substantially as described.

403,915. VEHICLE-WHEEL. ROBERT W. CAVE and THOMAS J. CAVE, Prisoville, Ky. Filed Aug. 15, 1888. Serial No. 282,774. (No model.)

Claim.—The herein-described improved vehicle-wheel, comprising the hub, the spokes, the spoke-sockets having short cylindrical tenons, and the metallic rim shrunk in place direct upon the spokes, and having recesses in its inner side registering with and accommodating the tenons of the spoke-sockets, substantially as set forth.



408,916. PIPE-COUPLING. JAMES I. COLLINS, Amsterdam, N. Y. Filed Dec. 6, 1888. Serial No. 292,773. (No model.)

Claim.—1. The flexible pipes for railroad-cars, having the coupling members C at their meeting ends, each member being provided with a flange, F, and the pairs of ears D E, in combination with the hooks G, adapted to engage said flanges and having arms H, and the covers K, pivoted between the ears E and having the openings through which the hook-arms extend, and thereby adapted to trip the said hooks, substantially as described.

2. In a pipe-coupling, the combination of the member C, having the flange F, the hook G, pivoted to said member and having the rearwardly-extending arm H, provided with the spring I, and the lever K, pivoted to the member and having the opening through which the arm H extends and with which the spring engages, substantially as described.

408,917. STORE-SERVICE APPARATUS. JAMES T. COWLEY, New York, N. Y., assignor, by mesne assignments, to the Lamson Consolidated Store Service Company, of New Jersey. Filed Apr. 13, 1887. Serial No. 234,691. (No model.)

Claim.—1. The combination, in a cash-carrier apparatus, of a vertical pendant, a horizontal guide supported thereby, a propelling-slide on said guide, provided with a cushioned carriage-striking arm, a jointed retractor for said slide, and a bumper or cushion, *p*, in rear of the slide, substantially as described.

2. In a cash-carrier apparatus, the slide mounted independent of the track-wire and provided with a carriage-striking arm extending to the track-wire and operated substantially as described, and an elastic cushion on said arm perforated to receive through it the track-wire and to be guided thereby, substantially as specified.

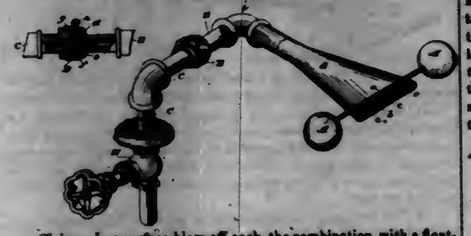
3. In a cash-carrier apparatus, the combination, with a vertical pendant having the track-wire secured to it, of an arm, I, rigidly secured to said pendant and carrying a guide for said wire, and an elastic frictional stop, a spring-actuated catch adjacent to this arm, adapted to engage with the carriage, a carriage-propelling device, and an operating-cord provided with a spring, S, and a stop for the said catch, substantially as described.

4. In a cash-carrier apparatus, the combination, with a supporting-bracket and a catch, of an elastic frictional cone independent of the track, adapted to enter between bearings of the carriage to arrest and prevent the rebound of the carriage on its way to be engaged by said catch, substantially as described.

5. In a cash-carrier apparatus, the combination, with the pendant A, the horizontal guide rigidly but adjustably secured to this pendant, a reciprocating carriage-propelling device, spring-actuated, as described, an arm, I, located beneath said horizontal arm, and provided with a spring-actuated catch, and a frictional conical carriage-holder, substantially as described.

6. The combination, of a store-service wheeled carriage having contiguous concave bearings independent of its wheels and a stop independent of the track, consisting of an elastic cone adapted to enter between said bearings, substantially as described.

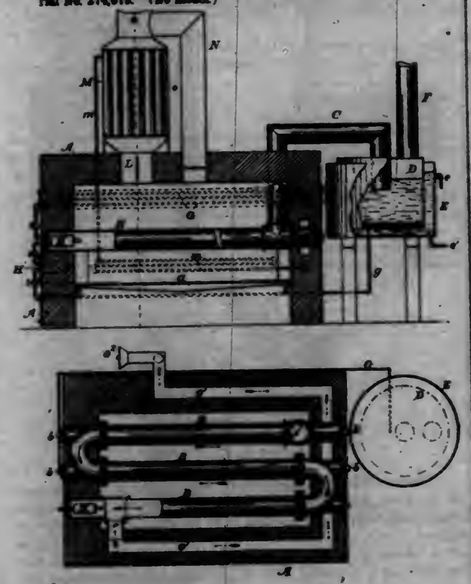
7. In a cash-carrier apparatus, a carriage consisting of an upper horizontally-perforated portion provided with convex perforated end extensions, suspending-wheels to sustain the carriage upon a track, and horizontal concaved rollers independent of the suspending-wheels and adapted to receive and engage with an anti-rebounding cone, substantially as described.



8. A cash-carrying carriage provided with convex perforated end extensions, recessed to engage with a locking-catch, the suspension-wheels, the horizontal rollers, and an inverted cup adapted to receive and have secured to it the cash-box, substantially as described.

9. A cash-box carriage formed of two vertically-divided halves and provided with suspension-wheels, the horizontal rollers, perforated end guides for the track-wire, a connecting-plate and its retaining-screws, and a spring-cushion between this plate and the top of an inverted cash-box holder, substantially as described.

408,918. DIE FOR HAMMERING SHEET METAL. ISAAC E. CRANE, Camden, Ohio. Filed Dec. 10, 1888. Serial No. 293,175. (No model.)

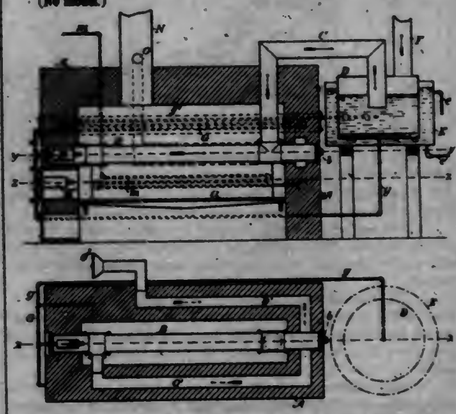


Claim.—An improvement in hammer-dies for the manufacture of polished sheet-iron, consisting in dressing the face of one or both of the hammer-dies into such degree of concavity when cold as will compensate for their unequal expansion when hot.

408,919. SURFACE BLOW-OFF. LOCKWOOD L. CRANE and WILLIAM H. PRINCE, Cleveland, Ohio; said Crane assignor to said Prince. Filed Dec. 4, 1888. Serial No. 292,694. (No model.)

Claim.—In a surface blow-off cock, the combination, with a floating escape-pipe provided with a fan-shaped opening, arranged as shown, at its floating end, and a conical-shaped bearing at its opposite end having a collar, said escape-pipe being provided with an angular formation intermediate between said mouth and conical bearing, of a discharge-pipe provided at its connecting end with a concave bearing and a nut fitting loosely on said collar and screw-threaded on the adjoining end of the discharge-pipe, said nut being provided with a set-screw adapted to engage with said discharge-pipe, substantially as set forth.

408,920. APPARATUS FOR THE MANUFACTURE OF GAS. GEORGE K. CROSWELL, Philadelphia, Pa., assignor, by mesne assignments, to the United States Gas and Fuel Company. Filed May 22, 1888. Serial No. 274,679. (No model.)



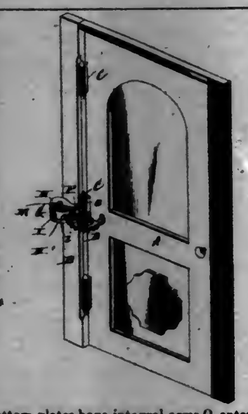
Claim.—1. In an apparatus for making gas, the combination of a furnace and a suitable number of retorts, an injector for introducing commingled superheated steam, hot air, or gas and oil into the retorts, a closed tank containing hydrocarbon oil at a temperature of from about 180° to below that of the gas emitted from the retorts, a pipe leading from the outlet end of the retorts into said closed tank and delivering the gas of the retorts into the oil in the said tank, and another pipe leading from the bottom of the closed tank back to the injectors to supply oil thereto, and a refrigerating apparatus surrounding the said tank, substantially as set forth.

2. In an apparatus for making gas, a furnace, and retorts in suitable number and arrangement therein, and an injector opening into the retorts and feeding commingled superheated steam, hot air, or gas and oil thereinto, a steam-boiler heated from the furnace, an auxiliary flue separately connecting the boiler-stack and retorts of the furnace, and valves for controlling communication between the retorts and such flue for utilizing the products of combustion or not, combined with a closed oil-tank, a pipe connecting the said tank and the gas-outlet of the retorts, and a refrigerating-chamber surrounding the oil-tank and maintaining the oil at from 180° Fahrenheit to a point below that of the incoming gas, substantially as described.

3. In an apparatus for making gas, the combination of a furnace and a suitable number of retorts, suitable means for introducing commingled steam, air, or gas and oil into the retorts, a closed tank containing hydrocarbon at a temperature of from about 180° to below that of the gas emitted from the retorts, a pipe leading from the outlet end of the retorts into said closed tank and delivering the gas of the retorts into the said tank, and another pipe for supplying the retorts with oil from the bottom of the said tank for mixture with the steam or like fluid, and a refrigerating apparatus surrounding the oil-tank, substantially as and for the purposes described.

408,921. PROCESS OF MANUFACTURING GAS. GEORGE K. CROSWELL, Philadelphia, Pa., assignor, by mesne assignments, to the United States Gas and Fuel Company. Filed May 22, 1888. Serial No. 274,680. (No model.)

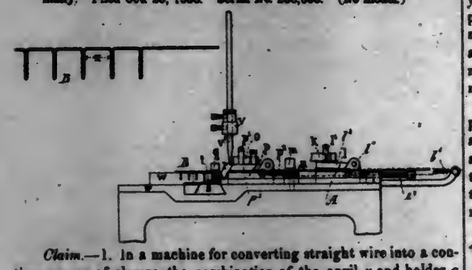
Claim.—1. The process herein described of manufacturing heating and illuminating gas, which consists in passing highly-heated gases formed by the admixture of steam, oil, and air directly from the retort through a body of crude petroleum maintained at a temperature above, say, 180° Fahrenheit and below that of the incoming gas by a suitable refrigerant, whereby the lighter hydrocarbons of the crude oil are combined with the outgoing gases and the by-products precipitated, substantially as described.



2. The process herein described of manufacturing heating and illuminating gas, which consists in passing highly-heated gases directly from the retort through a body of crude petroleum maintained at a temperature above, say, 180° Fahrenheit and below that of the incoming gas by a suitable refrigerant, whereby the lighter hydrocarbons of the crude oil are combined with the outgoing gases and the by-products precipitated, substantially as described.

408,922. DOOR-SPRING. JESSE W. DAVIS, Le Roy, Kans., assignor of two-thirds to Edwin B. Foster and John W. Leedy, same place. Filed Feb. 15, 1888. Serial No. 263,623. (No model.)

Claim.—1. The combination of the casing, a vertical arbor mounted therein, and a spiral spring and pinion on said arbor, with the segmental gear mounted on the pintle of the door-hinge and meshing with said pinion, substantially as described.

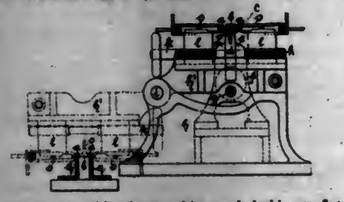


2. The hinge C, having its knuckle slotted, and the segmental gear D, secured to said hinge, in combination with the casing G,

403,922.

whose top and bottom plates have integral arms *O*, entering said slots and mounted on the pintle of the hinge, and the spring-actuated pinion N within said casing, meshing with said segmental gear, the whole operating substantially as described.

403,923. MACHINE FOR CONVERTING WIRE INTO A CONTINUOUS ROW OF CLAMPS. WILHELM DECKER, Mittweida, Saxony, Germany. Filed Oct. 23, 1888. Serial No. 288,893. (No model.)



Claim.—1. In a machine for converting straight wire into a continuous row of clamps, the combination of the anvil *r* and holder *q* with the sliding tongs *p* and reciprocating wire-bending rod *v'*, the holder *q* being above the anvil, substantially as described.

2. The combination, with the anvil *r*, holder *q*, sliding tongs *p*, wire-bending rod *v'*, and means for moving the tongs *p* to press the wire against the anvil *r*, of the sliding tongs *l*, substantially as described.

3. The combination, with the anvil *r*, holder *q*, sliding tongs *p*, wire-bending rod *v'*, and wire-holder *m n*, of sliding tongs *l*, for feeding the wire into the machine, and means for moving the tongs *p* to press the wire of the clamp against the anvil *r*, substantially as described.

4. In a machine for bending wire into continuous clamps, the sliding tongs *p*, for feeding wire, combined with the anvil *r* and holder *q*, and means for moving the anvil in a direction at right angles to the feed of the wire, and the holder *q*, movable at right angles to the motion of the anvil, substantially as described.

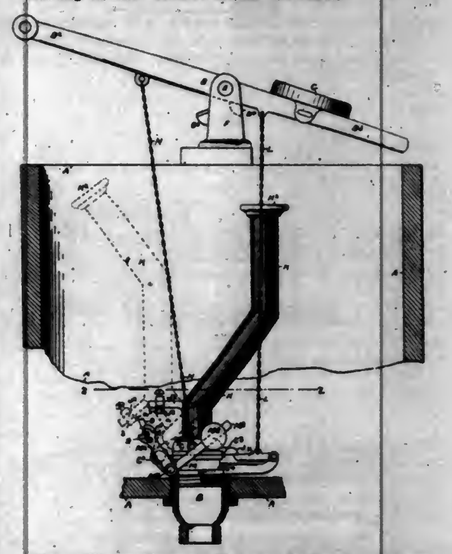
403,924. MACHINE FOR FASTENING CARD-CLOTHING TO FLATS. WILHELM DECKER, Mittweida, Saxony, Germany. Filed Oct. 26, 1888. Serial No. 289,084. (No model.)

Claim.—1. In a machine for attaching card-clothing to flats, the supports *l l* and tongs *o o*, carried thereby, and means, substantially as described, for moving them laterally, combined with the supports *n n*, having tongs *p p*, and means, substantially as described, for moving said tongs, whereby said clothing may be stretched and held, and with a carrier for holding a flat against the stretched clothing, substantially as specified.

2. The flat-carrier *d*, adapted to receive a flat, and means, substantially as described, for raising and lowering said carrier, combined with means, substantially as described, for holding card-clothing stretched above the flat to receive fastening for securing the clothing to the flat, as specified.

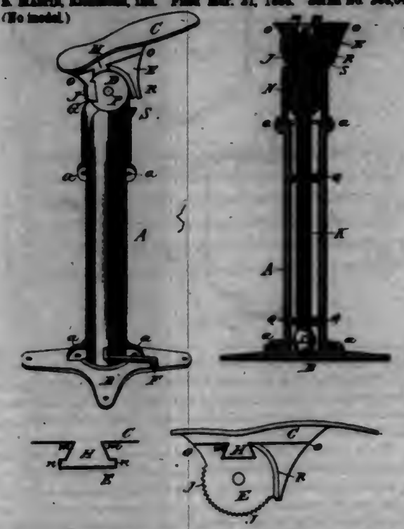
3. In a machine for securing card-clothing to flats, the supports *l l* and tongs *o o*, carried thereby, means, substantially as described, for moving them laterally, and the supports *n n* and tongs *p p*, carried thereby, and means, substantially as described, for moving them, whereby clothing may be stretched and supported, combined with the carrier *d*, adapted to hold a flat, and with means, substantially as described, for raising and lowering said carrier to contact the clothing, substantially as described.

4. The combination of the fixed frames *h* and pivoted frames *h'*, carried thereby, supports *l l*, tongs *o o*, supports *n n*, and tongs *p p*, and means, substantially as described, for moving said tongs to stretch clothing, and the anvils *q q*, to receive card-clothing carried by said tongs, all arranged substantially as herein shown and described.



403,925. VEHICLE-POLE TIP. NELSON R. DOAN, Stoughton, Wis. Filed Sept. 4, 1888. Serial No. 284,543. (No model.)

Claim.—1. The pole-tip B, having two or more pairs of lugs or spurs, *a a*, projecting from its under side, in combination with the neck-yoke C and the neck-yoke ring D, secured thereto, and having two projections, *d*, and contracted apertures *d' d'* formed therein and communicating with the main aperture of the ring, all constructed and arranged substantially as shown and described, whereby the said neck-yoke ring may be secured upon or removed from the pole, in the manner set forth.



2. The pole-tip B, having a series of pairs of lugs or spurs, *a a*, projecting from its under side, in combination with a neck-yoke, C, and a neck-yoke ring, D, secured thereto, and having projections *d d* and contracted apertures *d' d'* formed therein and communicating with the main aperture of the ring, all constructed and arranged substantially as shown, whereby the neck-yoke ring may be secured upon or removed from the pole, in the manner set forth.

403,926. OPERATING MECHANISM FOR VALVES OF WATER-CLOSET AND OTHER TANKS. PATRICK W. DOHERTY, Boston, Mass. Filed Aug. 22, 1888. Serial No. 283,472. (No model.)

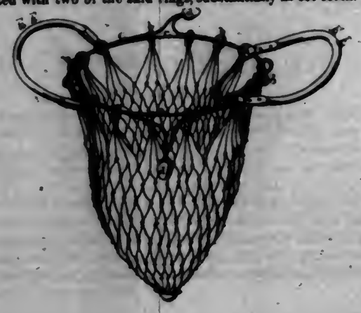
Claim.—The combination, with a tank for liquid, an outlet-pipe for the liquid, and an opening and closing valve to the outlet-pipe hinged at one side, of an operating-lever, D, fulcrumed on a stationary support, lines L N—such as chains—connected to it on opposite sides of its fulcrum, a lever, K, fulcrumed on a stationary support and having said line L connected to it, an abutment, J, of the valve or part moving with it for said lever K, an angular lever, M, fulcrumed at its angle on a stationary support and weighted at its arm M^2, and an abutment, J^2, of the valve or part moving with it for the arm M^3 of angular lever M, substantially as described, for the purposes specified.

403,927. LAST AND STAND. JAMES K. DOUGALL and CORNELIUS R. MANTH, Richmond, Ind. Filed Mar. 21, 1888. Serial No. 268,048. (No model.)

Claim.—1. The combination of head E, provided with notches J and beveled notch *m m*, last C, provided with beveled lug H, rod K, provided with head N, having corresponding notches to notches J, with eccentric L, provided with handle F, substantially as described and set forth.

2. The combination, in an iron-last stand, of a head provided with beveled notch *m m*, projections or shoulders O O, and detachable last C, provided with cleated lug H, with ears D D, substantially as described and set forth.

3. The combination of stand A, provided with guides Q Q, rod K, provided with notched head N, and eccentric L, provided with handle F, with last C, provided with lug H, substantially as described.

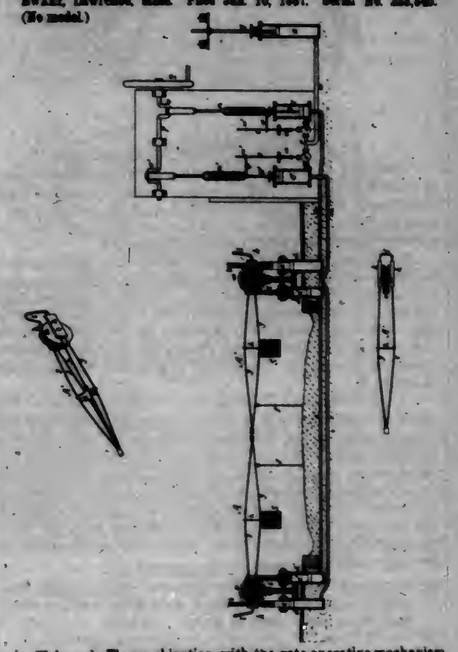


4. The combination of stand A, provided with ears D D, rod K, provided with notched head N, eccentric L, provided with handle F, and head E, provided with notches J, with last C, provided with lug H, as described and set forth.

5. The combination of stand A, rod K, eccentric L, and oscillating head E, as described, with detachable last C, provided with cleated lug H, as set forth.

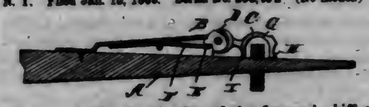
6. In combination with stand A, provided with guides Q Q, rod K, provided with notched head N, and eccentric L, provided with handle F, the oscillating head E, and detachable last C, dovetailed together by cleated notches *m m n n*, and cleated lug H, substantially as described and set forth.

403,928. COLLAPSIBLE HAND BAG OR SACK. FRANK EHRBIC, San Francisco, Cal. Filed Dec. 12, 1888. Serial No. 293,265. (No model.)



Claim.—A bag or sack provided at its open end with rings, a draw-string passing through the said rings, and with handles E, each connected with two of the said rings, substantially as set forth.

403,928.

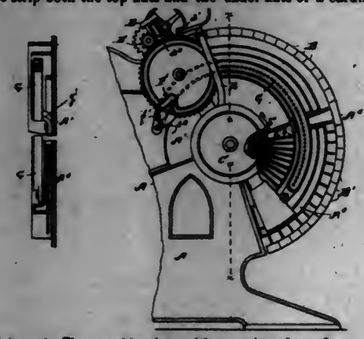


403,929. RAILWAY-GATE OPERATIVE MECHANISM. JOHN EWART, Lawrence, Mass. Filed Jan. 10, 1887. Serial No. 223,845. (No model.)

Claim.—1. The combination, with the gate operative mechanism, substantially as described, consisting of the gear *a*, its rack *b b'*, the pistons *c c'*, their barrels *d d'*, the connection-pipes *m m'*, and the barrels C C' and their pistons D D', having mechanism for actuating them (the said pistons,) as explained, of the apparatus, essentially as explained, for compensating for leakage or expansion of the fluid used in such gate operative mechanism, the said apparatus consisting of the cylinder *x*, weighted piston *y*, pipes *w* and *v*, stop-cocks *s s'*, buttons *t'*, springs *u*, and forked lever, arranged and applied essentially as represented.

2. The gate, substantially as described, composed of the four curved rods, their central connection, the junction pieces, and their connecting-bow, all being arranged essentially as represented.

403,930. WHIFFLETREE-HOOK. ADAM H. STRAHAN, Mohawk, N. Y. Filed Jan. 15, 1889. Serial No. 296,404. (No model.)



Claim.—1. The combination of the flattened whiffletree, the casing secured on the upper side of the same, the hook pivoted in the outer end of the casing having a notch, K, in its edge and provided with a flattened end, H, and a lip, I, both adapted to rest on the flat upper side of the whiffletree, and the spring secured in the casing and having its end engaging the notch in the edge of the hook, as set forth.

2. The combination of the casing, the hook pivoted therein and having the lip I and tongue J, and the spring secured in the casing and bearing on the hook, as specified.

403,931. STRIPPING MECHANISM FOR CARDING-ENGINES.

ALONZO FALLS, Lowell, Mass. Filed Jan. 25, 1888. Serial No. 267,568. (No model.)

Brief.—The changes set forth in the claims are made in the mangle-rack, cross-girt, and lifters, to enable a single stripping mechanism to strip both the top flats and the under flats of a carding-engine.

Claim.—1. The combination, with a series of top flats, a series of under flats, and a cross-girt arranged between one and the other of said series, of a stripping mechanism having a traverse-gear and a traverse-rack measuring the same angular distance as said cross-girt and all of said flats, as and for the purpose specified.

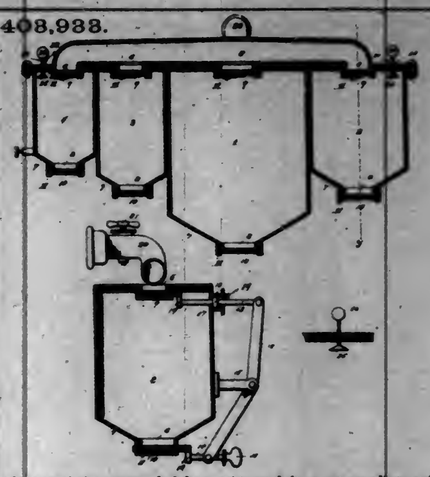
2. The combination of the frame having a cross-girt, a series of top flats arranged above said girt, a series of under flats arranged below said girt, all of said flats being of equal length with each other and each of said flats being longer than said cross-girt, and the stripping mechanism having lifters provided with inwardly-projecting pins, each of said pins being of a length less than the distance to which said flats project beyond said girt, as and for the purpose specified.

3. The combination of a frame and card sides, a series of top flats seated by their own gravity, a series of under flats seated by springs arranged outside of the card sides, the upper arches, the lower arches arranged outside of said springs and projecting laterally beyond said upper arches, and a stripping mechanism having traverse-pinions and traverse-racks arranged on opposite sides of said frame and parallel to each other, said racks being secured at their lower ends to said lower arches and being provided at their upper ends with brackets, and said brackets being secured to said upper arches, as and for the purpose specified.

403,932. PULLEY-BLOCK.

THOMAS B. FERRALL, Boston, Mass., assignor to the Boston and Lockport Block Company, of New Jersey. Filed Feb. 26, 1889. Serial No. 301,902. (No model.)

Claim.—1. In a double or multiple block, the head *c* and its lateral bars or saddle-pieces *c' c'*, and hook or eye *g g'*, journaled and loosely riveted to said head, combined with the bow-straps *d d'*, the block-body, and the spindle *e*, with its sheaves *f f*, substantially as and for the purpose set forth.



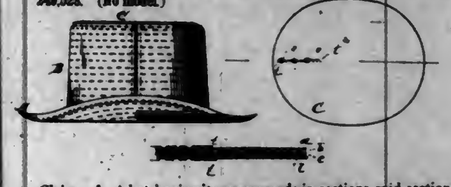
2. In a double or multiple block, the head *c*, and hook or eye *g g'*, loosely riveted to said head, the block-body having the bow-straps *d d'* suspended from the lateral bars or saddle-pieces *c' c'* of the head *c*, the spindle *e*, passing through the block-body, its sheaves, and bow straps, and the becket-strap *h*, suspended from the sheave-spindle and provided with the becket *i*, substantially as and for the purpose set forth.

403,933. FLUID-MEASURING APPARATUS.

WILLIAM H. FORBES, and JAMES GIBSON, Boston, Mass. Filed Jan. 28, 1888. Serial No. 267,859. (No model.)

Claim.—1. A measuring apparatus, substantially as described, consisting of a single continuous supply-conduit adapted to communicate with a source of supply, a series of vertical measuring-vessels

403,938.



of assorted sizes suspended from said conduit at intermediate points of the length thereof and each communicating directly with the conduit through a port in its upper end, a valve located within the vessel for opening and closing the inlet-port between the conduit and vessel, and another valve in the lower end of each vessel, substantially as and for the purpose described.

2. In a measuring apparatus, the combination of a vessel having inlet and outlet ports at diametrically opposite ends, and a lateral stuffing-box in the side thereof near the upper end, a reciprocating valve operating over each of the ports, a lever connected directly to the lower valve, and an endwise-movable rod, 13, connected to the lever and upper valve and having a packing and the fixed stops, substantially as and for the purpose described.

403,934. HAT.

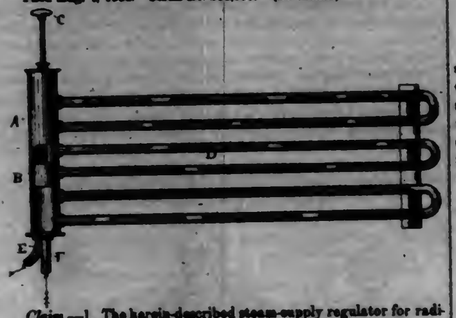
ANTON H. FRITSCH, Chicago, Ill., assignor of one-half to Valentin Mueller, same place. Filed Sept. 12, 1887. Serial No. 249,523. (No model.)

Claim.—1. A hat having its crown made in sections, said sections being united at their meeting edges and composed of several layers, each layer being of a different material, united together and provided with air-holes, said air-holes containing the thread used in uniting the several layers, as set forth.

2. A hat having its crown made in sections, said sections being united at their meeting edges and composed of several layers, the middle ones being millinet and pressed felt, united together and provided with air-holes, said air-holes containing the thread used in uniting the several layers, as set forth.

403,935. TOBACCO-PIPE.

ELIAS A. GROSS, Camden, N. J. Filed Jan. 29, 1889. Serial No. 297,979. (No model.)



Claim.—The bowl A and stub-stem B, the latter having a reduced inner male-threaded end, *b*, forming the shoulder *b'*, in combination with the stem C, tapering gradually from its outer to its inner end, and having the longitudinal central bore, O, said stem comprising an outer section, *c*, having a comparatively large cavity, S, in its outer end, for the purpose set forth, an internal screw-thread therein adapted to fit the thread on the reduced portion *b* of the stub-stem B, and a conical nicotine-chamber, *s*, in rear of said cavity, its apex communicating with said central bore, O, said section also having a reduced and externally-screw-threaded extension, D, at its inner end,

and an inner section, *c'*, having a comparatively small cavity, S', in its outer end, for the purpose set forth, an internal screw-thread therein adapted to fit the thread on the reduced extension, D, of the stem-section *c*, and a conical nicotine-chamber, *s'*, in rear of said cavity, its apex communicating with said central bore, O, said inner section having a mouth-piece at its inner end, the whole arranged and adapted as and for the purposes described.

403,936. STEAM-RADIATOR.

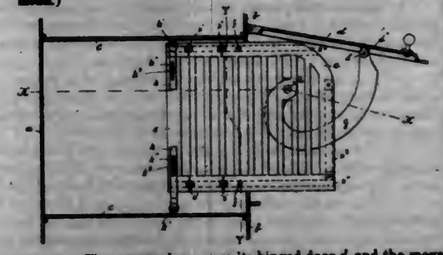
LEROY HALSEY, Battle Creek, Mich. Filed Aug. 4, 1888. Serial No. 281,996. (No model.)

Claim.—1. The herein-described steam-supply regulator for radiators, consisting of a closed cylinder with a supply and exhaust pipe at one end and a series of coils of pipe opening into the same throughout its length, and a plunger or piston-head sliding in the same past the pipe-orifices and opening and closing any desired portion of them at one time, substantially as shown and described.

2. The herein-described steam-supply regulator for radiators, consisting of an elongated steam chest or chamber having a series of coils of pipe opening into the same throughout its length, a plunger or valve sliding in the same past the pipe-orifices and obstructing the flow of steam through said chamber, and the exhaust and supply pipes both on the same side of said plunger, all substantially as shown and described.

403,937. THERMOSTAT.

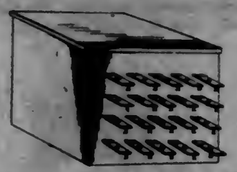
CHRISTIAN F. HILKER, Copenhagen, Denmark. Filed Dec. 20, 1888. Serial No. 294,977. (No model.) Patented in Denmark Apr. 20, 1886, No. 474, and in Norway Oct. 22, 1887, No. 734.



Claim.—1. A thermostat comprising a metallic hermetically-sealed chamber containing an expansive and contractile fluid, and having one or more of its walls constructed of spring metal having a portion thereof sprung out of its normal plane and adapted in operation to spring past such normal plane in both directions, substantially as described.

2. A thermostat comprising a flat disk-shaped chamber hermetically sealed, composed of a cup-shaped back and a flat front soldered together, the front being of spring metal, and having a portion thereof sprung out of its normal plane and adapted in operation to spring past the normal plane, substantially as described.

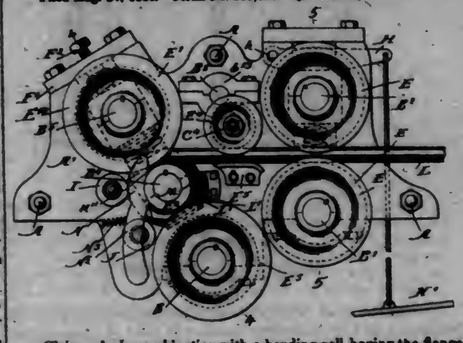
403,938. STOVE-OVEN.



PETER HOCHSTEIN, Jr., and GEORGE F. RIMELEY, Beverly, Mass. Filed Feb. 23, 1889. Serial No. 300,944. (No model.)

Claim.—The oven or box *c* and its hinged door *d*, and the movable plate or grating *e*, connected to said door, as described, and having longitudinal grooves *c' c'*, in combination with the anti-friction supporting-rollers *d' d'*, the adjustable side rollers, *k' k'*, and pins or pins and rolls *f f*, all arranged and combined substantially in a manner and for the purpose as specified.

403,939. COMBINED CABINET AND CUTTER'S SIZE-TICKET.



JOHN KELLER, New York, N. Y. Filed June 2, 1887. Serial No. 240,049. (No model.)

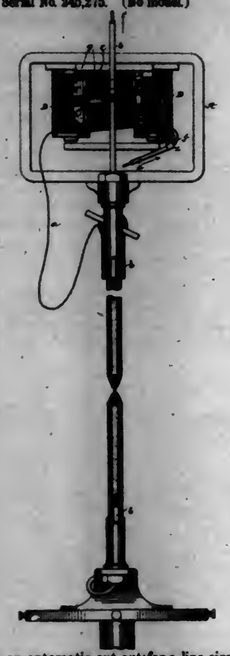
Claim.—The combination, with the cabinet provided with means, substantially as set forth, for holding the various ticket-strips in rolls, of the cutter's size-tickets formed in continuous strips in rolls, each of said strips having printed thereon at intervals one and the same size-number and being partially divided or severed on intervening lines, as set forth, the various strips in the cabinet constituting an orderly series of different numbers adapted for the cutter's use, substantially as described.

403,940. MACHINE FOR COILING SPIRAL SPRINGS.

JOHN W. KIRK, Chicago, Ill., assignor of one-half to F. M. Atkinson, same place. Filed Aug. 27, 1888. Serial No. 283,827. (No model.)

Claim.—1. In combination with a bending-roll having the flange E^{30}, the mandrel-roll having the flange E^{29}, said flanges having flat faces opposed to each other, the shaft of one of said rolls being longitudinally movable in its bearings to allow the flanges to separate, and a spring acting against such movable shaft to cause the flanges to approach, substantially as set forth.

2. In combination with the mandrel and the bending-roll and the pitch-producing device, the cam N, located beyond the mandrel, having the face n^{10}, as it extends around the mandrel in the direction of the rotation of the latter, sloping toward the vertical plane of the periphery of the bending-roll E', substantially as and for the purpose set forth.



3. In combination with the mandrel, the bending-roll E', and the pitch-producing device, the cam N, having the cam-face n^{10} to engage the end of the first coil, said face sloping toward the plane of the periphery of the bending-roll, its upper end being removed from the rear face of the flange E^{30} a distance as great as the sum of the thickness of the end of the rod and the deflection caused by the deflecting devices, and its lower end being removed from said plane a distance not more than half the deflection caused by the deflecting devices, substantially as and for the purpose set forth.

4. In combination with the mandrel, the bending-roll, and the deflecting devices, the cam N, pivoted to the frame and adapted to oscillate toward and from the mandrel, and having the cam-face n^{10} located and sloping, as described, and the end n^{11} facing the plane of the axes of the mandrel and bending-roll, whereby the end of the coiled spring in the course of its second revolution is forced to collide with it and rock the cam away from the mandrel, substantially as set forth.

5. The combination, substantially as and for the purpose set forth, of the two frame-brackets A' A', formed, respectively, symmetrical, the shafts journaled therein and reversible end for end and carrying their respective feeding and coiling rolls and intermeshing gears, and a pitch-controlling device securable on the outer face of either one of said frames, whereby the machine is adapted to coil either right or left spirals.

6. In a machine for coiling spirals, the primal-bending-roll and the mandrel having peripheral flanges with flat faces transverse to their axes and laterally opposed and opposite to each other, for the purpose of gripping and guiding the flat faces of the rod coiled into planes transverse to the axis of the coil, substantially as set forth.

408,941. AUTOMATIC CUT-OUT FOR ELECTRIC LAMPS. EDWARD R. KNOWLES, Brooklyn, N. Y., assignor to the Mutual Electric Manufacturing Company, of New York. Filed Mar. 23, 1886. Renewed July 25, 1887. Serial No. 245,275. (No model.)

Claim.—1. In an automatic cut-out for a line-circuit, the combination of a fixed electro-magnet wound with a coil of comparatively low resistance connected to the line-wire in a normally-open shunt, and a vibrating electro-magnet of comparatively high resistance having an exciting-bobbin connected to the line-wire in a normally-closed shunt, the vibrating magnet being pivoted in close proximity to the fixed magnet, whereby when strongly excited, the vibrating magnet will contact with and complete the circuit through the fixed magnet, as and for the purpose set forth.

2. In an automatic cut out for a line-circuit, the combination of a fixed electro-magnet wound with a coil of comparatively low resistance connected in a normally-open shunt at one end to the line-wire and having its other end free and projecting from the core but insulated therefrom, and a vibrating shunt electro-magnet having a bobbin of comparatively high resistance connected to the line-wire in a shunt around the lamp, said vibrating magnet being pivoted in close proximity to the fixed magnet, whereby, when the resistance of the arc is increased, the vibrating magnet will come in contact with the fixed magnet and complete the circuit through the same, as and for the purpose set forth.

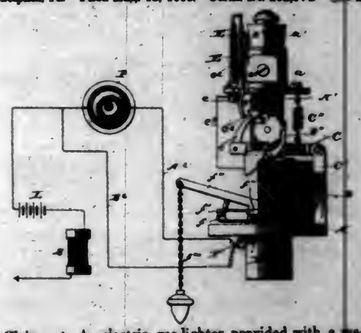
3. The combination of the fixed electro-magnet C, having one end of its wire *g* connected to the outgoing line, and the other end insulated and protruding from the pole at *v*, and the frame E, connected to the incoming line, with the vibrating shunt electro-magnet C' located in proximity to the fixed magnet and in electrical contact with the frame E, substantially as described.

4. A cut-out or protecting shunt for a line-circuit, comprising a fixed electro-magnet, C, wound with a coil of wire, *g*, of low resistance, one end of which passes through an aperture in the core at *v* and is insulated from the metal of said core, and the other end of which is connected with the line-wire at *y*, in combination with the vibrating magnet-C', and the bobbin *c*, passing around the core of said magnet and connected to the line at *x* and *y*, forming a loop or shunt of high resistance, substantially as set forth, for the purpose specified.

5. In an automatic cut-out for a line-circuit, the combination of a fixed electro-magnet wound with a coil of comparatively low resistance connected at each end to the line-wire in a normally-open shunt, and a vibrating electro-magnet pivoted in close proximity to the fixed magnet and encircled by a bobbin of comparatively high resistance connected to the incoming and outgoing line-wire at its respective ends, constituting a loop or shunt of comparatively high resistance across the arc, substantially as described.

408,942. METHOD OF REFINISHING RUBBER BLANKETS. FERDINAND H. KOCH, West Hoboken, N. J. Filed Oct. 23, 1888. Serial No. 288,963. (No specimens.)

Claim.—1. The herein-described method of refinishing rubber blankets, which consists in coating the worn surface of the blanket with a composition made up of varnish, gutta-percha, and white lead and oil, combined substantially in the proportions specified, in allowing the material so applied to dry, and in finally smoothing and polishing the surface, substantially as described.



2. The herein-described method of refinishing rubber blankets, which consists in first cleaning the surface of the blanket, in then applying a coat of a composition made up of varnish, gutta-percha, white lead, and oil, combined substantially in the proportions specified, in smoothing and polishing the coat after it has been allowed to dry, and in then applying a coat of a composition made up of white lead, Japan varnish, and oil, combined substantially in the proportions specified, in polishing the surface after it has dried, and in finally applying a coat of shellac varnish, substantially as described.

408,943. SAFETY ATTACHMENT FOR WATCHES. CHARLES G. KREBAUM, Havana, Ill. Filed Aug. 2, 1888. Serial No. 281,738. (No model.)

Claim.—The herein-described watch-protector, constructed of rubber or similar material and adapted to fit around the stem of a watch, and having a concave or hollowed top to provide a rim, *a'*, the latter having the outward-projecting guards a^2 to engage the side of the pocket, and the notches a^2, substantially as described.

408,944. ELECTRIC GAS-LIGHTER. JOSEPH H. LEHMAN, Philadelphia, Pa. Filed Aug. 13, 1888. Serial No. 282,574. (No model.)

Claim.—1. An electric gas-lighter provided with a magnet and electrodes operated by the magnet having two branch circuits leading from the magnet, each including circuit-controlling devices, one located at the burner and the other at a distance from the burner, substantially as described.

2. In an electric gas-lighter, the combination, with a magnet, of an armature therefor and a pawl connected to the armature operating to turn the cock and break the contact at the electrodes, substantially as described.

3. In an electric gas-lighter, the combination of a magnet, an armature therefor, a pawl carried thereby, a ratchet connected with the cock and operated by the pawl, and a movable electrode arranged to be struck by the pawl, substantially as described.

4. In an electric gas-lighter, the combination of a magnet, an armature therefor, a pawl having a notch on one side engaging the ratchet to operate the cock, and a projection upon the other side engaging the movable electrode, substantially as described.

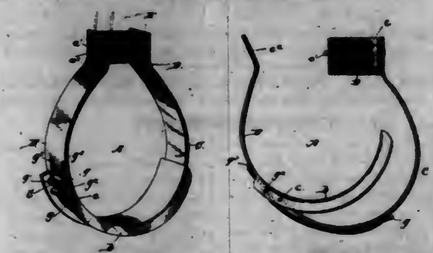
5. In an electric gas-lighter, the combination of a magnet, an armature operated thereby, a pawl, and a ratchet-wheel having teeth of varying sizes operated by said pawl, substantially as described.

6. In an electric gas-lighter, the combination of a pivoted movable electrode, a ratchet for moving the cock, and a pawl for operating both the pivoted electrode and cock, substantially as described.

7. In an electric gas-lighter, the combination of a pawl having a projection, a ratchet having teeth of varying sizes, and a movable electrode, the arrangement being such that the electrode is operated by the projection at each alternate movement of the ratchet, substantially as described.

8. In an electric gas-lighter, the combination of a magnet, an armature, a pawl carried thereby, a ratchet having teeth of varying depth, and a movable electrode operated by the pawl, the arrangement being such that the electrode is operated only when the pawl engages the shallow teeth, substantially as described.

9. In an electric gas-lighter, the combination of a magnet, an armature, a pawl and ratchet having teeth of varying lengths, and a holding-pawl having a series of notches engaging the ratchet, substantially as described.



10. In an electric gas-lighter, the combination of a magnet, an armature, a ratchet for moving the cock, a movable electrode, and a pawl arranged to move the ratchet at one impulse and to contact with the movable electrode to produce a series of sparks at the burner-tip, substantially as described.

11. In an electric gas-lighter, the combination of a magnet, an armature, a ratchet-wheel controlling the cock having teeth of different sizes, a movable electrode, and a pawl arranged to move the cock at each closure of the circuit through the magnet and to contact with the movable electrode to produce a series of sparks at each alternate closure, substantially as described.

12. In an electric gas-lighter, the combination, with a fixed electrode, of a movable electrode, a plate forming a spring, and a guide for the movable electrode, substantially as described.

13. In an electric gas-lighter, the combination, with a magnet, of connectors connected with the circuit, plates normally out of contact extending between the connectors, and a pendent lever arranged to close the plates and complete the circuit, substantially as described.

408,945. STIRRUP. EDGAR A. LEONARD and GEORGE W. SHERTS, Karle, Ohio. Filed Oct. 12, 1888. Serial No. 287,897. (No model.)

Claim.—1. The combination, in a stirrup, of the inner section designed to be attached to the stirrup-strap, and the outer section pivoted to the inner one at or near its lower free end and having its lower end extended across the bottom of the stirrup, whereby the foot will be carried out of the stirrup when the outer section turns on its pivot, and a spring to hold the outer section normally vertical or closed, substantially as described.

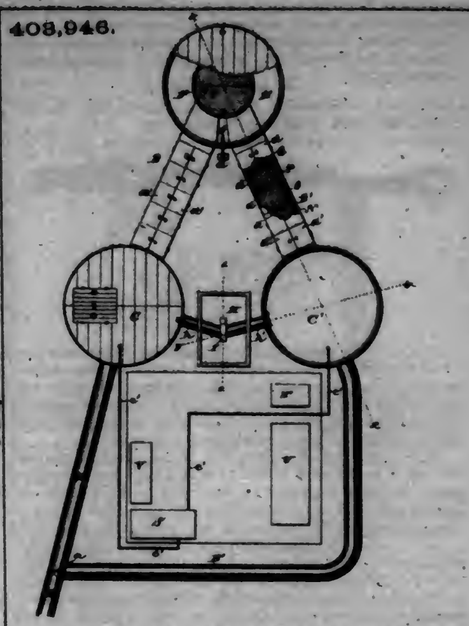
2. In a stirrup, the combination of the inner section attached to the stirrup-strap and the bracket attached to the upper end of said section below the attachment of the stirrup-strap and guarding the same, with the outer section of the stirrup pivoted intermediate of its ends to the inner section, whereby its lower portion will lie under the foot, and the spring to hold the outer section normally vertical or closed, substantially as described.

3. In a stirrup, the combination, with the inner section, C, the bracket D, and the block E, of the pivoted outer section, B, having the depending edge flanges, *b*, adjacent to its lower end, the transverse rod pivoting the lower end of the section C in and between said flanges, and the spring forcing the said outer section upward upon its pivot after said section has been depressed.

4. In a stirrup, the combination, with the inner stirrup-section, C, the bracket D, the block E, for the attachment of the stirrup-strap F, and the rod *e*, passing through said block and having the journal *e'* outside of said bracket, of the outer stirrup-section, B, having the opening e^2 for engagement upon said journal, and the spring forcing said outer section upward, substantially as specified.

5. The herein-described stirrup, composed of the outer section, B, provided with the depending edge flanges, *b*, and the opening e^2 near its upper end, the inner section, C, pivoted to the outer section between said flanges at its lower end, the bracket D, secured to the upper end of the inner section, the block E, the rod *e*, passing through said block and having the journal *e'* at its free end, and the wire spring G, with its loop bearing on the section C, and the coils *g'* near its ends, surrounding the transverse bar g^2, having its ends journaled in the flanges *b*, substantially as specified.

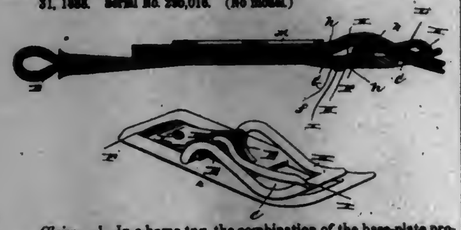
408,946. APPARATUS FOR TREATING SEWAGE. OLOF R. MEYER and CHARLES H. WEBB, Milwaukee, Wis. Filed Oct. 5, 1888. Serial No. 287,241. (No model.)



Claim.—1. The combination, in sewage apparatus, of a settling-chamber into which the sewage is discharged, and a conduit having open ends and closed sides leading laterally out of the side of said settling-chamber, above the bottom thereof, and divided by transverse screens into compartments which are filled with suitable filtering material, said conduit having movable sections, whereby the filtering material in each compartment may be renewed without disturbing that in the other compartments, substantially as and for the purposes set forth.

2. The combination, in sewage apparatus, of two settling-chambers connected by branches with the sewer-main, a gate arranged to direct the sewage into either branch and exclude it from the other, or direct it into both branches at the same time, and conduits leading laterally out from the sides of each settling-chamber, above the bottom thereof, and divided by upright screens into compartments which are filled with suitable filtering material, substantially as and for the purposes set forth.

3. The combination, in sewage apparatus, of two settling-chambers connected by branches with the sewer-main, a valve or gate at the junction of said branches with the main, arranged to divert the sewage into either branch and cut it off from the other, a separate elevator-well somewhat deeper than said settling-chambers, provided with hoisting apparatus, a conduit leading from the bottom of each settling-chamber into said well, downwardly-inclined filtering-conduits leading laterally out from the sides of said settling-chambers, above the bottoms thereof, and divided transversely by upright screens into compartments which are supplied with filtering material, and a well into which said filtering-conduits discharge, substantially as and for the purposes set forth.



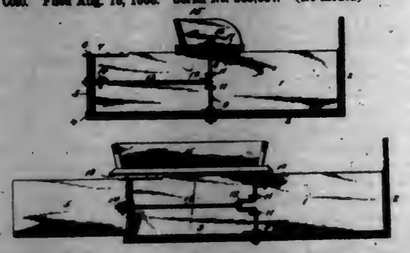
4. The combination, in sewage apparatus, of a settling-chamber into which the sewage is discharged, a downwardly-inclined filtering-conduit leading laterally out from the side of said chamber, above the bottom thereof, and provided with upright screens between which is interposed filtering material, a well provided with a cage having closed sides and horizontal screens between which is interposed filtering and deodorizing material and upon which said conduit discharges, means for removing the sediment from said settling-chamber and means for removing the water from said well, substantially as and for the purposes set forth.

5. The combination, in sewage apparatus, of two or more settling-chambers connected by branches with the sewer-main, a gate or valve arranged to close either branch and open the other, an elevator-well somewhat deeper than said settling-chambers and provided with hoisting apparatus and communicating through openings with the lowest parts of the settling-chambers, the bottoms of which are inclined downwardly toward said openings, cut-offs arranged to open and close the openings from the settling-chambers into the elevator-well, filtering-conduits leading laterally out of the sides of said chambers and divided by upright screens into compartments which are filled with

filtering material, movable sections in said conduits, whereby access is had to said screens and filtering material, and a well into which said conduits open at their discharging ends, substantially as and for the purposes set forth.

408,947. HAME-TUG. ELI B. MINER, Knoxville, Tenn. Filed Dec 31, 1888. Serial No. 296,016. (No model.)

Claim.—1. In a hame-tug, the combination of the base-plate provided with an opening, C, and having lugs E E adjacent to the said opening, and the buckle connected pivotally to the bar in rear of the lugs and arranged over the opening and having its tongue-bar engaged with the lugs or projections and adapted to be engaged by a strap passing through the opening, substantially as specified.



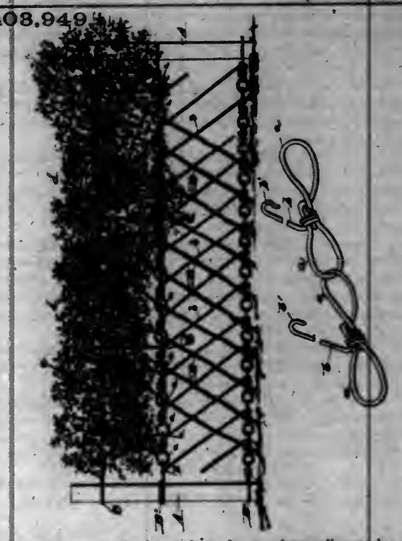
2. In a hame-tug, the combination of the base-plate provided with lugs or projections E E, the loop secured to the base-plate adjacent to the lugs or projections, and the buckle having its tongue-bar engaged in the said loop and bearing against the said lugs or projections and adapted to be engaged by a strap, substantially as specified.

3. In a hame-tug, the combination of the base-plate provided with a pocket, G, and the lugs or projections E E in rear of the pocket, the loop H, secured by a rivet or pin to the base-plate and fitting at its free ends in the said pocket, and the buckle having its tongue-bar engaged in the closed end of the loop and bearing against the said lugs or projections in position to be engaged by a strap, substantially as specified.

4. In a hame-tug, the combination of the base-plate provided at its rear end with an opening, C, lugs or projections E E in front of said opening, the channel F in front of the lugs, and the pocket G, the loop fitting at its free ends in the pocket and provided with apertures which register with an aperture in the base-plate and are engaged by a pin or rivet, and the buckle having its tongue-bar engaged in the loop and bearing against the lugs or projections in position to be engaged by a strap, substantially as specified.

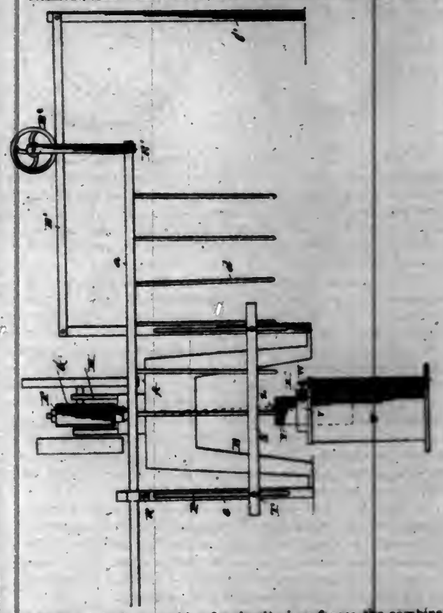
5. A hame-tug consisting of the base-plate provided at its front end with an eye, B, and having the opening C, and the lugs or projections E E, recess F, having opening *f*, the loop H, seated in the recess and connected by rivet I, and at its rear end the buckle mounted in the loop and having its tongue-bar engaged with the lugs or projections E, and its tongue extending between the same, and the strap extending through the opening C and engaged with the buckle, substantially as specified.

408,948. CARRIAGE-BODY. CHARLES J. MIDGLEY, Colorado Springs, Colo. Filed Aug. 18, 1888. Serial No. 283,067. (No model.)



Claim.—1. The combination, with the sides and bottom of a vehicle, of the end-gate 5, the rod 8, mounted in bearings 9 and 10 and having the crank portion 12, seat 15, the rod 13, and the eye 14, substantially as specified.

2. The combination, with a vehicle having the bearings 9 and 10, of the rod 8, staples 11, for holding the same, intermediate crank portion, 12, the rod 13, the eye 14, the end-gate 5, seat 15, and plate 17, substantially as specified.



408,949. HEDGE. PHARES M. MIELER, Hagerstown, Md. Filed Nov. 12, 1888. Serial No. 290,591. (No model.)

Claim.—The combination, in a hedge, of the upright posts A A, the chain-rails B' B'', formed of loops *a a*, the diagonal braces *b*, formed integral with the chain-sections of the lower rail and hooked to the

upper rail between the loops thereof, a top loop-rail, *c*, and vertical tie-rods c^3, all constructed and adapted for joint operation, as specified.

408,950. FENCE-RIVETING MACHINE. WILLIAM W. MCCALLIP, Columbus, Ohio. Filed Mar. 16, 1889. Serial No. 303,585. (No model.)

Claim.—1. In a machine for riveting iron fences, the combination of the hammer, the die arranged out of vertical alignment therewith, the guide-frame to support one end of the fence bar or rail, and the traveling carrier to support the other end thereof, substantially as described.

2. The combination, in an iron-fence-riveting machine, with the hammer, of the supporting-frame having the arm or bracket R, for the purpose set forth, the guide-bars S, vertically adjustable on said frame, and the die, substantially as described.

3. The combination, with the hammer, of the block U, arranged below the same, the die-receiver supported in the block, and the die fitted adjustably in a recess in the upper end of the receiver, substantially as described.

4. The block U, having the vertical recess and collar X, with set-

screw W, the die-receiver having the spindles in said opening or recess and engaged by the set-screw, and the die fitted in the recess in the upper end of the receiver, all in combination, substantially as described.

5. The rail *c* and the bars or rods *d*, with one end secured thereto, said rods being inclined from opposite directions from the center to the ends of the rail, whereby the latter will be arched when the bars *d* are parallel, substantially as described.

6. The hammer, the die below the same, the supporting-frame having the arm or bracket R, the guide-bars S, secured to the said frame, the horizontal rail E', the grooved wheel adapted to travel on said rail, and the carrier suspended from the axis of said wheel, all in combination, substantially as described.

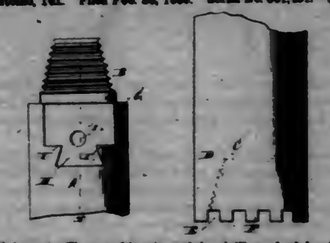
7. The combination, with the anvil having a dovetailed recess, of the slide or die fitting in said recess and having an opening or recess in its upper face, and a fastening-screw, substantially as set forth.

8. The combination of the hammer, the anvil having a dovetailed recess, the transversely-adjustable die having a recess in its upper face, and means for suspending and carrying the fence-rail transversely under the hammer and for guiding the pickets, substantially as set forth.

408,951. SEWING-MACHINE TAKE-UP. J. FRENIAN MCKENNEY, Baltimore, Md. Filed Aug. 30, 1886. Serial No. 212,168. (No model.)

Claim.—1. In a sewing-machine embracing a head having a front face provided with a vertical slot, *m*, a needle-bar, and a shuttle, the combination therewith of the take-up, consisting of two forks, *k*, attached to the needle-bar and each provided with a thread-eye, and a plate, G, having at the top and front an outwardly-curved edge, *h*, forming, substantially, the arc of a circle whose lower portion terminates at the broadest part of the plate and having below said broadest part an inward curve, h^3, said plate extending lengthwise of the vertical slot and having position between the said two thread-eye forks, as set forth.

2. In a sewing-machine, the combination, with the needle-bar and shuttle, of a take-up, one part thereof consisting of two forks, *k*, each provided with a thread-eye, and another part consisting of a plate, G, having at one end a front outwardly-curved edge, *h*, forming, substantially, the arc of a circle, one portion of which terminates at the broadest part of the plate and having an inward curve, h^3, said plate extending vertically and having position between the said two thread-eye forks, one of said parts being movable and the other stationary, as set forth.



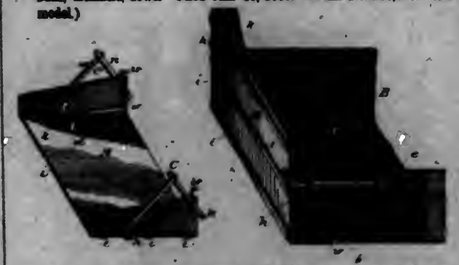
3. In a sewing-machine, the stitch-forming mechanism thereof, in combination with a take-up, one part thereof consisting of two thread-eyes and another part consisting of a plate between said thread-eyes, said plate having a cam-shaped outer edge curving inwardly both above and below its broadest part, one of said parts being movable and the other stationary, substantially as set forth.

4. In a sewing-machine, the stitch-forming mechanism thereof, in combination with a take-up, one part thereof consisting of two thread-eyes and another part consisting of a plate having at one end an outwardly-curved inclined edge, forming, substantially, the arc of a circle, one portion of which terminates at the broadest part of the plate and having an inward curve, said plate extending vertically and having position between the said thread-eyes, one of the said parts being movable and the other stationary, substantially as set forth.

5. In a sewing-machine, the head and stitch-forming mechanism thereof, the needle-bar of said stitch-forming mechanism, and two thread-eyes carried by said needle-bar, in combination with a stationary take-up plate located vertically between said thread-eyes, said plate having its outer edge curved or cam-shaped, the upper portion of said edge being curved downwardly and outwardly and terminating at the broadest part of said plate, and the lower portion of said edge curving from the broadest part of the plate downwardly and inwardly, substantially as set forth.

6. In a sewing-machine, the head and stitch-forming mechanism thereof, the needle-bar of said stitch-forming mechanism, and a take-up consisting of two thread-eyes carried by said needle-bar and of a stationary plate extending vertically between said thread-eyes, said plate having its outer edge cam-shaped and curving inwardly both above and below its broadest part, in combination with a stationary thread-eye on the sewing-machine head, through which the thread passes before passing through said thread-eyes on the needle-bar, said stationary thread-eye being located at or below the extreme downward limit of travel of said thread-eyes on the needle-bar, substantially as set forth.

408,952. DRILLING-TOOL FOR WELLS. HIRAM H. MCLANE, San Antonio, Tex. Filed Feb. 28, 1889. Serial No. 301,431. (No model.)



Claim.—1. The combination of the drill or shaft having a screw-threaded portion at its upper end, the drill-rod having a screw-threaded socket to receive the same and an annular notched flange below said socket, and a toothed key, adapted to be secured adjustably to the drill, engaging the said notched flange, substantially as and for the purpose set forth.

2. The combination of the drill or shaft having a screw-threaded portion at its upper end, the drill-rod having a correspondingly-threaded socket surrounded by a notched flange, a toothed key adapted to be secured adjustably to the drill, wedges adapted to be fitted at the sides of the said key, and a plate or block adapted to retain the said teeth and wedges in position, substantially as set forth.

3. The combination of the drill or shaft having a screw-threaded portion at its upper end and a recess adjacent thereto and provided with a transverse perforation extending from the bottom of said recess to the opposite side, a toothed key having shoulders formed on opposite sides thereof, wedges adapted to be fitted at the sides of said key, a shoulder block or plate adapted to retain said key and wedges in the said recess, a bolt adapted to secure said plate in position, and the drill-rod having at its lower end a screw-threaded socket surrounded by a notched flange, the whole combined and arranged substantially as and for the purpose set forth.

408,953. SHOVELING-BOARD FOR WAGONS. JOHNSON H. NEBLIN, Atlantic, Iowa. Filed Jan. 18, 1889. Serial No. 296,776. (No model.)

Claim.—1. The shoveling-board A, the jointed supports C, pivoted at one end to the outside of the sides of the shoveling-board and at the other end to the block *a*, the support *d*, pivotally connected to the shoveling-board and wagon-box, the wagon-box, the block *a*, firmly secured to the wagon-box and being provided with the catch *e*, all combined and arranged substantially as described.

2. The shoveling-board having pivoted to it the supports C and *d*, and having secured to it the hooked strap-bolt *w*, in combination with the wagon-box having secured to it the lug *b*, and block *a*, provided with the catch *e*, substantially as set forth.

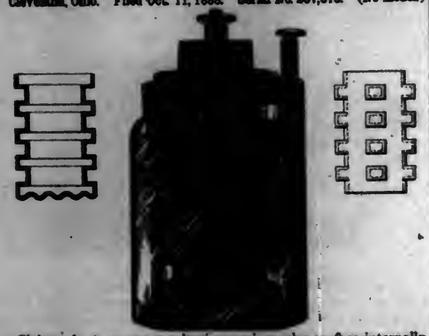
408,954. STOPPER AND FASTENER FOR BOTTLES, JARS, &c. CHARLES T. HENTTINGALE, Binghamton, N. Y. Filed Mar. 2, 1889. Serial No. 302,017. (No model.)

Claim.—1. In a bottle-stopper, the combination, with the cap having an annular rim on its under side and provided with a surrounding annular flange, of a link secured transversely across the upper side of said cap and having its ends projecting beyond the edges of the latter, substantially as set forth.

2. The combination, with the cap or stopper provided with longitudinal parallel grooves in its upper side, of the link secured in said grooves and extending beyond the edges of the said cap, substantially as set forth.

408,954.

3. The combination, with the cap or stopper having longitudinal parallel grooves in its upper side, of the link secured in the said grooves and a top plate arranged over the said link, substantially as set forth.



4. The combination, with the cap or stopper having projecting loops at diametrically-opposite points, of the hinge-plate and the clasp secured to the mouth of a jar or bottle, the said cap or stopper being connected permanently to the hinge-plate by means of one of its projecting loops, substantially as set forth.

5. The combination, with the cap or stopper having a link secured to its upper side and projecting at both ends, so as to form loops at diametrically-opposite points of said cap, of the hinge-plate and the clasp secured to diametrically-opposite sides of the mouth of the bottle or jar, the said cap being permanently connected to said hinge-plate by one of the loops or its projecting link, the other end of said link being adapted to engage the catch or clasp, substantially as set forth.

6. The combination, with the ring or collar secured upon the neck of a jar or bottle and provided with diametrically-opposite loops or recesses, of the hinge-plate and the spring-clasp seated in said loops or recesses and having notches or shoulders engaging the neck-ring to retain them therein, substantially as set forth.

7. The herein-described improved stopper and fastening device, the same comprising the cap, the link secured transversely to the upper side of the same and having projecting ends, and the hinge-plate and spring-clasp secured to diametrically-opposite sides of the mouth of a jar or bottle by means of a ring or collar, having loops or recesses to engage notches in the said hinge-plate and clasp, the said cap or cover being permanently connected with the hinge-plate by means of one of the projecting ends of the link secured to its upper side, the opposite end of said link being adapted to engage the spring-clasp, substantially as herein set forth.

408,955. POROUS CUP FOR BATTERIES. CLARENCE B. NOBLE, Cleveland, Ohio. Filed Oct. 11, 1888. Serial No. 287,810. (No model.)

Claim.—1. A porous cup having an irregular surface internally, externally, and on its bottom, substantially as set forth.

2. In a battery, the combination, with a jar, of a porous cup having irregularities projecting at right angles to the vertical axis of the cup and adapted to separate the battery elements and produce a medium for the process of osmose, substantially as set forth.

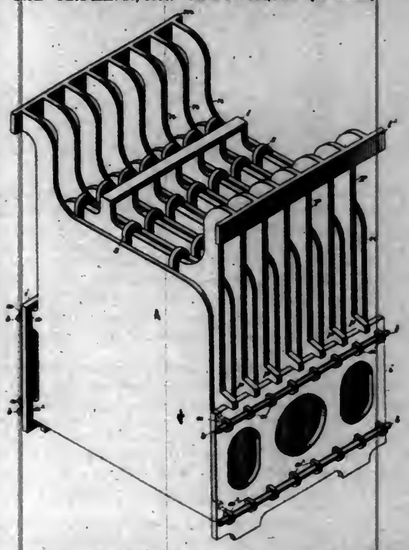
3. The combination, with a galvanic battery, of a porous cup having a non-regular surface on both its sides and bottom, within and without, substantially as set forth.

4. The combination, with a battery, of a porous cup having sides and bottom of the same thickness throughout, the said sides and bottom being of irregular shape for presenting an enlarged area of surface to the elements within and without the porous cup, substantially as set forth.

5. The combination, with a galvanic battery, of a porous cup with walls having irregularities running around the vertical axis of the cup, substantially as set forth.

6. The combination, with a galvanic battery, of a porous cup having its sides formed irregularly around the vertical axis of the cup, substantially as set forth.

7. The combination, with a galvanic battery, of a porous cup having sides of equal thickness throughout, the said sides being shaped irregularly and running around or at right angles to the vertical axis of the cup, inside and outside, substantially as set forth.

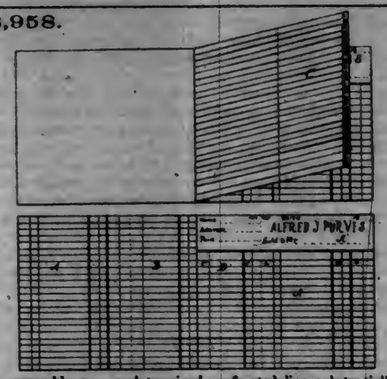


408,956. BUNG. FRIEDRICH PETTER and LUDWIG MATHESIUS, Dessau, Anhalt, Germany. Filed Feb. 27, 1889. Serial No. 301,221. (No model.)

Claim.—1. The combination of elastic block G with head A, having ports *l*, and with head B, having grooves *n*, and with screw-rod *b* and nut M, substantially as specified.

2. The combination of elastic block G with perforated head A, grooved head B, screw-rod *b*, having flange S, and with nut M, having flange *m*, substantially as specified.

408,957. SECONDARY BATTERY. JOHN R. PRICE, Wellaston Heights, Mass., assignor to The Electrical Accumulator Company, of New York. Filed Mar. 30, 1888. Serial No. 304,845. (No model.)



Claim.—1. In a secondary battery, the combination of two elements or electrodes, an inclosing-cell therefor, an electrolytic liquid, and means for supporting both electrodes free from the bottom of the cell, consisting of boards or strips of insulating material having one or more rows of perforations, perforated projections from opposite edges of one element located in said perforations, a removable rod for locking said projections in position, and a series of projections upon the complementary element supported by said board or strip, substantially as described.

2. In a secondary battery, the combination of two elements, each consisting of a series of plates interleaved with each other, a board of insulating material forming a support for said elements, a series of projections from opposite edges of one of said elements resting upon the edge of said board, and a series of perforated projections from the other element extending through perforations in said board, and one or more rods located in said perforated projections to removably fix said element in position, substantially as described.

408,958. ACCOUNT-BOOK. ALFRED J. PURVIS, Utica, N. Y. Filed June 4, 1884. Serial No. 133,732. (No model.)

Claim.—As an improved article of manufacture, an account-book provided with an index on a part of the leaves, each of the remaining leaves having on one margin a numbered stub provided with blanks for names of customers, residence, &c., and ruled vertical columns and horizontal lines for the dates and for dollars and cents and for items, and also having a printed bill-head on the same page, which is correspondingly ruled and numbered, said stub and bill-head

408,958.

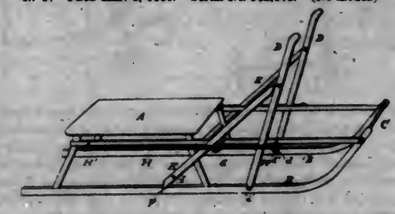
being separable on a predetermined perforated line, substantially as described, and for the purposes set forth.

408,959. BREECH-LOADING FIRE-ARM. JOHN H. REDFIELD and SAMUEL H. REDFIELD, Linkville, Oreg. Filed Oct. 2, 1888. Serial No. 287,002. (No model.)

Claim.—1. The combination, in a breech-loading gun, of the case having the vertical guideway G at the rear of the breech of the barrel, the breech-block having its front and rear sides parallel and adapted to move in the vertical way G, the upper end of said block being rounded and the front side thereof being provided with the vertical recess, the pin or bolt M, secured in the lock-case and engaging said recess, the guard-lever pivoted to the lock-case, and the link connecting the same to the breech-block, for the purpose set forth, substantially as described.

2. The combination, in a breech-loading gun, of the lock-case, the vertical guideway G in rear of the breech of the barrel, the pin or bolt M, arranged transversely in the front side of the guideway, the breech-block fitted in the guideway G and having its front and rear sides parallel, said breech-block having its upper side rounded, provided in its front side with the vertical transverse notch U, engaging pin or bolt M, and having the vertical recess V on one side communicating with said notch, the extractor-arm pivoted on the pin or bolt M and having the rearward-extending cam at its lower end working in recess V, the guard-lever pivoted to the lock-case, and the link connecting the guard-lever to the breech-block, substantially as described.

3. The combination of the lock-case having the vertical guideway G, the vertically-reciprocating breech-block arranged in the said guideway, provided with the ears D', and having the slot or recess U in its front face, the pivotal pin M, seated in the lock-case and engaging the slot or recess U, the guard-lever pivoted to the lock-case and having the ears E', and the link C', having one end pivoted in said ears E' and the other end pivoted in the ears D', substantially as described.



4. The combination, in a breech-loading fire-arm, of the lock-case, the breech-block guided therein, the guard-lever pivoted to the lock-case and having the shoulder L', the link connecting the said lever to the breech-block, and the pivoted swinging hammer-block carrying the hammer and trigger and having the arm K', engaging the shoulder L' of the guard-lever, substantially as described.

5. The combination, in a breech-loading gun, of the lock-case, the movable breech-block guided therein, the pivoted guard-lever connected to the breech-block and having the shoulder L', and the pivoted hammer-block carrying the hammer and trigger and trigger-spring and having the arm K', adapted to engage the shoulder L' of the guard-lever, for the purpose set forth, substantially as described.

6. The combination, in a breech-loading fire-arm, of the lock-case having the vertical guideway G, the recess I, the opening H, and the partition K between the recess and the guideway, the pin or bolt M, arranged transversely in the front side of the guideway, the extractor-arm pivoted on said pin or bolt and having the cam on its lower end, the breech-block fitted in the guideway having its upper side rounded, provided on its front side with the vertical recess U, engaging the pin or bolt M, and having the recess V on one side engaging a cam of the extractor-arm, the guard-lever having its front end pivoted to the lock-case and provided with the shoulder L', the link connecting said rod or lever to the breech-block, for the purpose set forth, the hammer-block arranged in the recess I and having its rear end pivoted, said hammer-block having its front end provided with the arm K', engaging the shoulder L', and the hammer, trigger, and spring secured to and carried by the hammer-block, the hammer being adapted to move upward and downward in the opening H, substantially as described.

7. In a fire-arm, the combination of the lock-case, the vertically-movable breech-block guided therein and having the transverse vertical recess, the upper end of the breech-block being rounded, the pivotal pin or bolt in the recess, and the guard-lever and connections between the same and the breech-block, substantially as described.

408,960. SLED-PROPELLER. FREDERICK ROBBIN, Rochester, N. Y. Filed Mar. 6, 1889. Serial No. 302,073. (No model.)

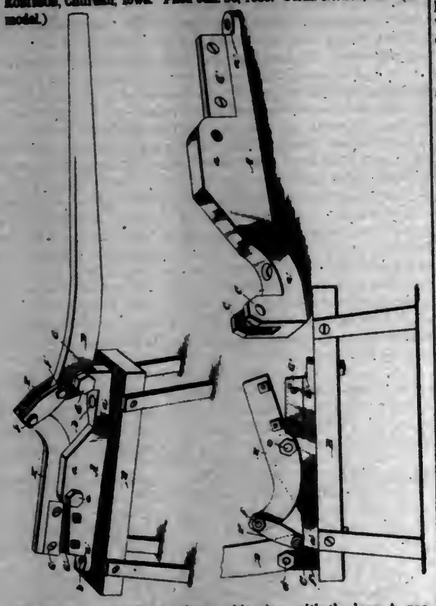
Claim.—1. In a propelling device for vehicles, the combination, with the push-bar arranged at an angle to the surface of the ground and movable in the direction of its length to propel the vehicle, of a support for the bar, with which it co-operates at the commencement of its stroke, substantially as described.

2. In a propelling device for vehicles, the combination, with the hand-lever, of the push-bar pivoted thereto, arranged at an angle to the surface of the ground and movable in the direction of its length to propel the vehicle, and a support with which said bar co-operates at the commencement of its stroke, substantially as described.

3. In a propelling device for vehicles, the combination, with the hand-levers arranged on opposite sides of the vehicle, of the push-bars pivoted thereto, arranged at an angle to the ground and movable in the direction of their length, and supports with which said bars co-operate at the commencement of the stroke, substantially as described.

4. In a vehicle-propeller, the combination, with the push-bar arranged at an angle to the ground and movable in the direction of its length, of the laterally-projecting pin thereon, and the rail or surface arranged above said pin for preventing vertical movement, substantially as described.

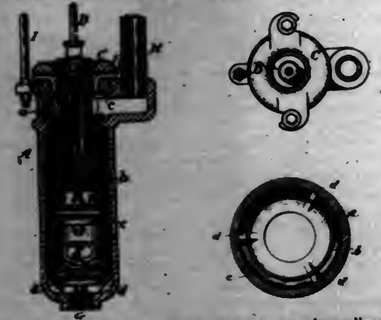
5. In a vehicle-propeller, the combination, with the hand-levers, of the push-bars pivoted thereto, and the guard-rails between which and the vehicle-body the push-bars operate, substantially as described.



6. In a vehicle-propeller, the combination, with the hand-levers, of the push-bars pivoted thereto, and the projections arranged between said levers and bars, with which they both co-operate, substantially as described.

7. In a vehicle-propeller, the combination, with the hand-levers, of the push-bar pivoted thereto, the stops arranged forward of the levers, and the projections between the levers and bars, substantially as described.

8. In a vehicle-propeller, the combination, with an operating-lever and a push-bar, of the loop secured to the bar, the hinge-pin passing through the loop having eyes at the end, and the bolt passing through said eyes, substantially as described.

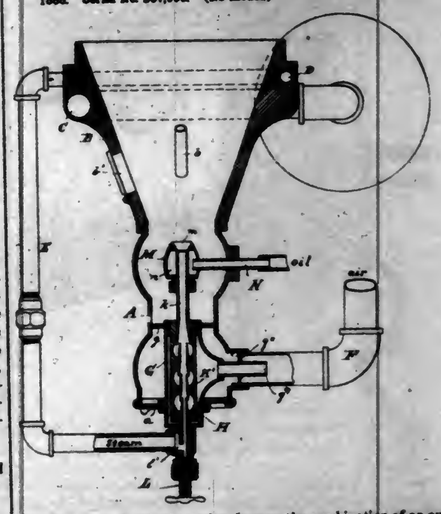


9. In a vehicle-propeller, the combination, with an operating-lever having the recess in its side, of the push-bar having the hinge-pin passing through said loop and secured to the lever, substantially as described.

403,961. SHEARS FOR CUTTING METAL BOLTS. WILLIAM ROBINSON, Churdan, Iowa. Filed Jan. 26, 1889. Serial No. 297,716. (No model.)

Claim.—In metal-shears, the combination, with the base A, provided with the intermediate elevated portion, *e*, carrying a stationary knife, G', and the depressed perforated portions *a' a'*, near the extremities of the base, of the blade-carrying lever E, fulcrumed to the elevated portion of the base below the level of the upper edge of the stationary knife and curved upwardly toward its rear end over the depressed rear end of the base, the operating-lever D, fulcrumed to the base beneath the upwardly-curved end of the blade-carrying lever, and the links connecting the extremities of the upwardly-curved portion of the blade-carrying lever to the shorter arm of the operating-lever, whereby an upward thrust is imparted to the end of the blade-carrying lever, substantially as specified.

403,962. PUMP. SAMUEL T. RUSSELL, Springfield, Ohio. Filed Nov. 30, 1887. Serial No. 256,575. (No model.)



Claim.—1. In a force-pump, a barrel having two inwardly-projecting flanges at its upper end and radial self-centering cleats in its bottom end adapted to center and support a lining-cylinder and also to support a removable valve, in combination with said lining-cylinder and removable valve, a piston, a rod, D, a valve, F, a non-elastic removable ring seated on the uppermost of the flanges at the upper extremity of the barrel, a gasket formed to embrace the inner and upper sides of said ring, and means for securing said gasket in position.

2. In a force-pump, a piston and a barrel having a flange at its upper extremity extending toward but not into contact with said piston, in combination with a non-elastic ring removably seated on said flange, a gasket conforming in shape to the upper and inner sides of said ring, and having its skirt of substantially the same length as the thickness of said ring, and adapted to be pressed into contact with the piston-cylinder by the water in the barrel, and its top portion extending over upon the top of the barrel, a cap resting on said top portion of the gasket and having its outer edge substantially flush with the outer edge of said top portion, and means for securing said cap in position.

3. In a force-pump, a piston, a valve, F, a rod, D, a barrel formed with a flange at its top extending toward but not into contact with said piston, and also with radial self-centering cleats in its lower extremity adapted to serve both to center and support a lining-cylinder inserted within said barrel and also to support a removable valve, and the said lining-cylinder and removable valve, in combination with a non-elastic ring removably seated on the flange at the top of the barrel, a gasket conforming in shape to the upper and inner sides of said ring, and having its skirt of substantially the same length as the thickness of said ring, and adapted to be pressed into contact with the piston by the water in the barrel, a cap adapted to rest on the upper or horizontal portion of said gasket and having its outer edge substantially flush with the outer edge thereof, and means for securing said cap in position.

403,963. HYDROCARBON-BURNER AND COMBINED SUPERHEATER. EDWARD SHALLOW, Philadelphia, Pa., assignor, by mesne assignments, to the United States Gas and Fuel Company. Filed Oct. 13, 1886. Serial No. 287,990. (No model.)

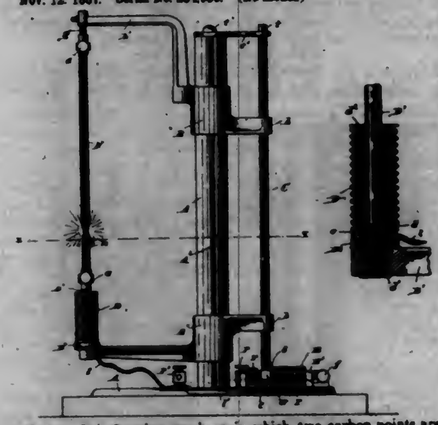
Claim.—1. In a hydrocarbon-burner, the combination of an outer casing, an inner casing provided with a series of graduated nozzles and means for supplying air and steam thereto, a circular annular chamber having an exit-orifice and surrounding the outer nozzle, and means for supplying oil thereto, substantially as described.

2. In a hydrocarbon-burner, the combination, with the casing having a series of graduated nozzles and means for supplying air and steam thereto, of a circular annular chamber having an exit-orifice and surrounding the outer nozzle, and means for supplying oil thereto, substantially as described.

3. In a hydrocarbon-burner, the combination of the casing provided with a perforated plate containing a series of graduated nozzles and means for supplying air and steam thereto, a circular annular chamber having an exit-orifice and surrounding the outer nozzle, and means for supplying oil thereto, substantially as described.

4. In a hydrocarbon-burner, the combination of an outer casing, an inner casing provided with a perforated plate containing a series of graduated nozzles and means for supplying air and steam thereto, a circular annular chamber having an exit-orifice and surrounding the outer nozzle, and means for supplying oil thereto, substantially as described.

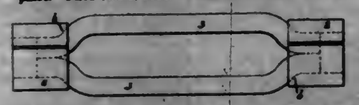
5. In a hydrocarbon-burner, the combination, with the inner casing having a perforated plate containing a series of graduated nozzles, of means for supplying air and steam thereto, a circular annular chamber having an exit-orifice and surrounding the outer nozzle, and means for supplying oil thereto, substantially as described.



6. In a hydrocarbon-burner, the combination of a superheater provided with encircling superheating-coils and means for supplying thereto the material to be superheated, an outer casing, an inner casing provided with a series of graduated nozzles and means for supplying air and steam thereto, a circular annular chamber having an exit-orifice and surrounding the outer nozzle, and means for supplying oil thereto, substantially as described.

7. In a hydrocarbon-burner, the combination of a superheater provided with encircling superheating-coils and means for supplying thereto the material to be superheated, an outer casing, an inner casing provided with a perforated plate containing a series of graduated nozzles, means for supplying air and steam thereto, a circular annular chamber having an exit-orifice and surrounding the outer nozzle, and means for supplying oil thereto, substantially as described.

8. In a hydrocarbon-burner, the combination, with the casing having a perforated plate containing a series of graduated nozzles, and an annular oil-chamber connected thereto, as described, of the steam-supply pipe, and a regulating-valve connected to the perforated plate, whereby the flow of steam to the series of nozzles and the oil-supply to the combustion-chamber may be regulated, substantially as described.



9. In a hydrocarbon-burner, the combination, with the outer casing, an inner casing having a perforated plate containing a series of graduated nozzles, and an annular oil-chamber connected thereto, as described, of the steam-supply pipe, a regulating-valve connected to the perforated plate, whereby the flow of steam to the series of graduated nozzles and the oil-supply to the combustion-chamber may be regulated, and an air-supply pipe communicating with the interior of the inner casing, substantially as described.

403,964. ARC LAMP. WILLIAM L. SILVEY, Cincinnati, Ohio. Filed Nov. 12, 1887. Serial No. 254,959. (No model.)

Claim.—In a focusing arc lamp in which two carbon points are fed toward each other simultaneously, the combination of a differential screw with a ratchet-wheel capable of being turned in one direction only by the operation of a single electro-magnet whose coils are in a derived circuit around the arc, the armature of the electro-magnet pivoted on the differential screw and having a pawl attached to one end for turning the ratchet-wheel, the other end having a spring-mounted circuit-breaker attached to it for the purpose of controlling the actions of the electro-magnets, a single electric circuit performing the entire operation of feeding the positive carbon point downward and the negative carbon upward, as specified.

403,965. ART OF MAKING TURN-BUCKLES. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Co., (Limited,) same place. Filed Oct. 3, 1888. Serial No. 287,508. (No model.)

Claim.—1. An improvement in the manufacture of turn-buckles, which consists in banding together the ends of strap-pieces and welding and shaping the parts of the blank so constituted to form the buckle, substantially as and for the purposes described.

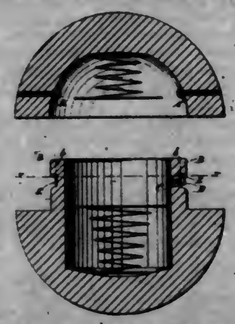
2. An improvement in the manufacture of turn-buckles, which consists in shaping strap-pieces 3 3 into substantially the shape shown in Fig. 1 of the drawings, banding together the ends of the strap-pieces, and welding and shaping the parts of the blank so constituted to form the buckle, substantially as and for the purposes described.

3. An improvement in the art of making turn-buckles, which consists in encircling the ends of strap-pieces with bands and subjecting the ends of the blank to end pressure in suitable dies, whereby the bands are firmly welded to the straps and the ends of the blank are compressed and shaped, substantially as and for the purposes described.

4. An improvement in the art of making turn-buckles, which consists in encircling the ends of strap-pieces with bands and subjecting the ends of the bands and straps to end pressure in suitable dies, whereby the bands are forced on and firmly welded to the straps and the ends of the blank are compressed and shaped, substantially as and for the purposes described.

403,966. RESPIRATOR. HENRY SMITH, Columbus, Ohio, assignor of one-half to M. L. Seddens, same place. Filed Mar. 30, 1888. Serial No. 268,973. (No model.)

Claim.—1. In a respirator, the combination, with the main body of the inhaling-cup F, provided with a projection, F', and a perforated bottom plate, and a removable perforated cap, F'', applied to the outer end of the cup.



2. In a respirator, the combination, with the main body, of an exhaling-chamber, G, provided with an outwardly-opening valve, G', and removable perforated caps G'' and G'''.

3. In a respirator, the combination, with the front plate having a bent upper end, exhaling chambers or cups mounted in the bent portion of the plate, and an inhaling-cup mounted in the upright portion.

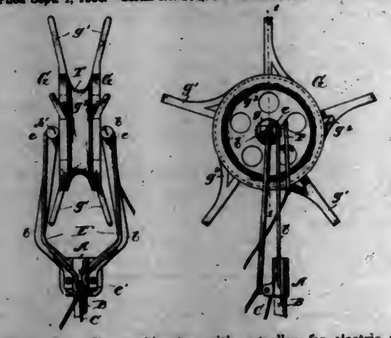
4. In combination with a rigid front plate, as C, the wire frame D, provided with arms D' D', to keep the plate C away the proper distance, and also having its ends D'' D'' separated, as shown, and a flexible covering.

5. The combination, with the frame D, having separated ends D'' D'', of a rigid front plate and a flexible cover.

403,967. CASH-CARRIER. SAMUEL H. SOUTH, Jr., Brighton, County of Sussex, England, assignor to William Stickney Lamson, Windham, N. H. Filed Feb. 25, 1889. Serial No. 301,110. (No model.)

Claim.—1. A cash-carrier in two sections, one provided with an annular projection having a groove and with a band secured within said groove and the other with radially-adjustable screws A, substantially as set forth.

2. The combination, with the section of a cash-carrier having an annular projection and groove therein, of a band confined within said groove at separated points and bowed out from the surface of the groove between said points, substantially as set forth.



403,968. NUT-LOCK. JULIUS G. STRADER, Powelton, W. Va., assignor of two-thirds to William N. Page and David T. Evans, same place. Filed Feb. 2, 1889. Serial No. 298,476. (No model.)

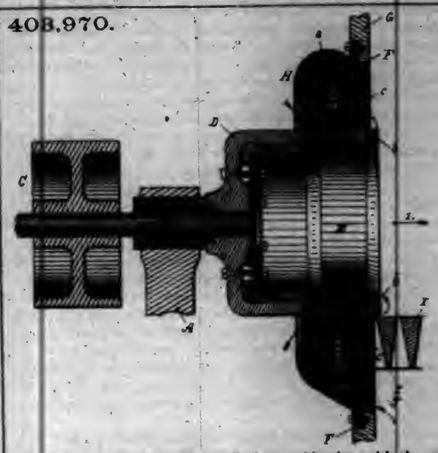
Claim.—1. The combination, substantially as hereinbefore set forth, of the rail, the fish-plate having a lateral extension, the bolt and nut for securing the fish-plate to the rail, the washer lying against the vertical face of the fish-plate and having a recess in its lower rear face, the key having an arm adapted to fit said recess, and an outer arm arranged on the outside of the plate or washer and engaging with the nut.

2. The combination, substantially as hereinbefore set forth, of the rail, the fish-plate having an inclined lateral extension, the plate or washer arranged against the vertical wall of the fish-plate and extending to its lateral extension and provided with a recess in its lower rear face, the bolt and nut for securing together the rail, the fish-plate, and the plate or washer, and the key consisting of two arms separated as described and joined at one end, one of said arms being inclined or beveled on its lower face, the other of said arms being raised slightly above the lower face of the other arm and provided with a lug, lip, or nose on its outer side to engage with the plate or washer.

403,969. TROLLEY FOR ELECTRIC RAILWAYS. THOMAS STREAT, Richmond, Va., assignor to himself and Edward Whitlock, same place. Filed Sept. 1, 1888. Serial No. 284,317. (No model.)

Claim.—1. The combination, with a trolley for electric railways, of revoluble guard-arms arranged on opposite sides of said trolley, substantially as and for the purposes specified.

2. The combination, with a trolley for electric railways, of revoluble guard-arms contructed of a conductive material and arranged on opposite sides of said trolley, substantially as and for the purposes specified.

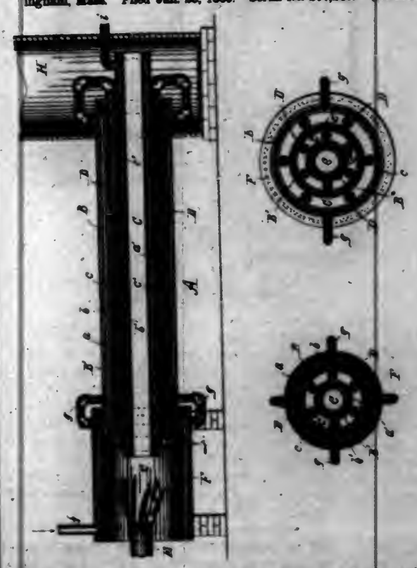


3. The combination, with a trolley for electric railways, of revoluble guard-arms arranged on opposite sides of the trolley, and a lock to lock said arms against rotation in one direction, substantially as and for the purposes specified.

4. The combination, with the trolley T, of the wheels G, having radial arms and provided with an annular recess for the reception of the flanges of the trolley, and a locking device to lock said wheels against rotation in one direction, substantially as and for the purposes specified.

5. The combination, with the trolley T, provided with the contact-faces *t t'*, of the guard-wheels G, provided with a recess, g^6, and radial arms g', substantially as and for the purposes specified.

6. The combination of the trolley T, the guard-wheels G, recessed to receive the flanges of the trolley, the ratchets G', connected with said wheels, and the pawls P, connected with the trolley-support, substantially as and for the purposes specified.

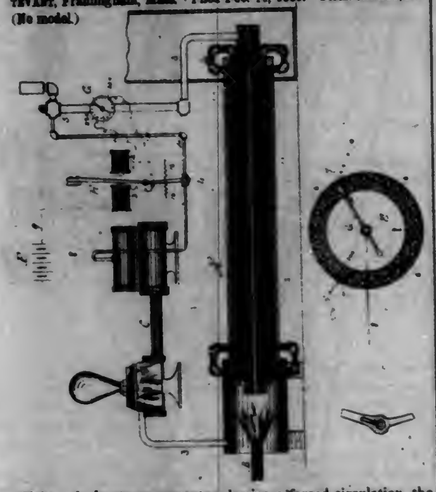


403,970. ATTRITION-MILL. THOMAS L. STURTEVANT, Framingham, and MILTON G. DAVIS, Somerville, Mass. Filed July 30, 1886. Renewed July 23, 1888. Serial No. 280,796. (No model.)

Claim.—1. In an attrition-mill, the combination, with the mill-casing and the rotary head, of an air-conveyer, as described, having the central opening, *b*, fitted directly to the grinding-chamber for external air-supply thereto, the circular lateral discharge-aperture *c*, also connecting with said grinding-chamber, and the tubular duct *a*, discharging by its port J within the mill-casing below the screen-bars, substantially as herein described.

2. The rotary head D, the mill-casing G, provided with the aperture F, and the screens I I, combined with the air-conveyer H, having a central external aperture, *b*, fitted directly to the grinding-chamber, the interior circular duct, *c*, leading from said chamber, the passage *a*, and outlet J, substantially as specified.

403,971. STEAM-GENERATOR. THOMAS L. STURTEVANT, Framingham, Mass. Filed Jan. 23, 1889. Serial No. 297,240. (No model.)



Claim.—1. A steam-producing element composed of a series of double-tube sections, as described, nested one within the other and with spaces between each two adjacent tube-sections, a series of pipes located within said spaces and contiguous to any two adjacent sections, a fluid-inlet supply in one of the tube-sections, and a steam-outlet discharge in a second, and co-operating double-tube section with means for heating, substantially as specified.

2. A steam-generating element composed of two or more double-tube sections concentrically disposed one within the other, a series of supports formed by a number of pipes between two adjacent sections and contiguous to the latter, said pipes interconnecting adjacent tube-

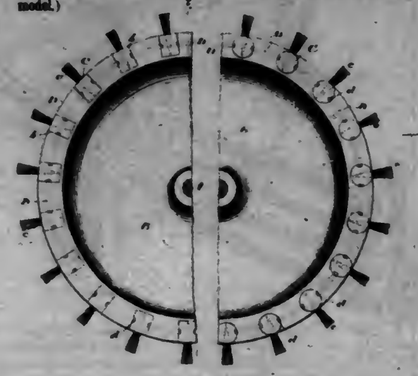
sections, combined with a combustion-chamber, as described, and a fluid-inlet supply and steam-discharge from different tube-sections of the element, as and for purposes herein set forth.

3. In combination with the vaporizing element A, composed of the sections B B', formed by the tubes *a b a' b'* and the longitudinal connecting-pipes D D', contiguous to two adjacent tube-sections, a combustion-chamber, F, of short double tubes secured to the element and intercommunicating therewith by pipes *g g*, the lamp E, stack H, inlet supply-pipe *f*, and steam-discharge *i*, substantially as described.

403,972. APPARATUS FOR AUTOMATICALLY REGULATING TEMPERATURE OF STEAM-GENERATING TUBES. THOMAS L. STURTEVANT, Framingham, Mass. Filed Feb. 11, 1889. Serial No. 299,449. (No model.)

Claim.—1. In steam-generators having a forced circulation, the combination, with a generator of such class and a suitable heating agency, of water-forcing apparatus, a thermostat controlled by the steam temperature within said generator, and electro-magnetic apparatus connected with and operated by said thermostat to regulate the steam delivered to the fluid-forcing apparatus, whereby the supply of water delivered serves to control the temperature of the tubes composing the generator, substantially as herein set forth.

2. In steam-generators provided with a forced circulation, the combination, with a generator of such class, a suitable heating agency, the liquid-forcing apparatus, and the main steam-discharge 5, of a thermostat connected with the latter interiorly and proximate to the generator at a point between the generator and the source to be supplied, whereby the amount of liquid admitted within the generator is to be varied to suit the intensity of the heating agency, substantially as herein described.



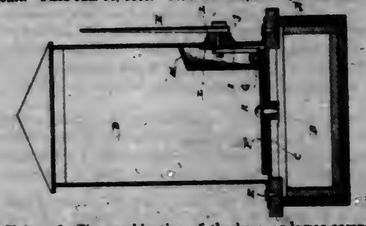
3. In combination with steam-generators having a forced circulation, a heating agency, liquid-forcing apparatus, and steam-discharge pipe, a valve located in a branch of said discharge-pipe and being between the steam-generating system and the source of supply to permit the continuous operation of the generator by alternately decreasing and increasing the supply of steam to the supply-pump, all substantially as set forth.

4. The combination, with a steam-generator having a forced circulation, water-forcing apparatus, and the feed-valve L, of a thermostat and the electro-magnetic apparatus actuated thereby and electrically united with said thermostat and with said valve L to control the movements of the pump and regulate the temperature of the steam-producing tubes, substantially as specified.

5. The steam-generator of the class herein described, its heating agency B, and the liquid-forcing apparatus C, combined with the steam-valve L, the thermometer G, regulated by the steam temperature within the generator, the lever-rod H, and means—namely, the electro-magnetic apparatus uniting said lever and the thermometer—whereby to control the forcing apparatus, as and for purposes described.

6. In combination with a steam-generator, A, having a forced circulation, its heating agency B, the liquid-forcing apparatus C, the valve L, and the thermostat D, which electrically controls the latter, the electro-magnets 12 13, the lever H, actuated thereby, and the terminals 7 7, changeable in the graduated dial-plate E to limit the temperature of the steam-producing tubes, as herein set forth and described.

403,973. COTTON-GIN BRUSH. WARNER M. SWANN and RICHARD T. SWANN, Dallas, Tex. Filed Jan. 7, 1889. Serial No. 295,693. (No model.)



Claim.—1. The combination, substantially as hereinbefore set forth, of the heads B, having circular slots *b*, the longitudinal slotted circular brush-sticks, and the brushes or bristles therein.

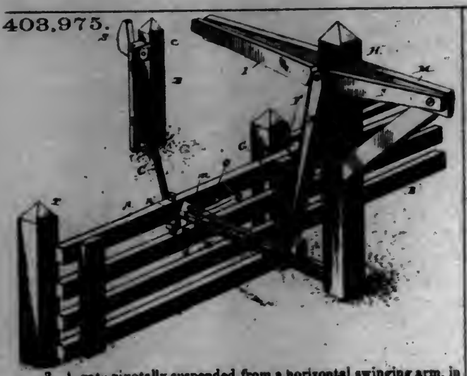
2. The combination, substantially as hereinbefore set forth, of the slotted heads, the longitudinally-slotted brush-sticks, carrying brushes or bristles and having the side slots therein, and the interposed slats D, secured thereto.

3. The improved cotton-gin brush hereinbefore described, consisting of the combination of a central shaft, slotted heads mounted thereon, slotted brush-sticks connecting the heads, brushes secured in the sticks, and slats closing the spaces between the sticks, these members being and operating in combination substantially as hereinbefore set forth.

403,974. FLOUR BIN AND SIFTER. JOSEPH H. THOMAS, Alliance, Ohio. Filed Jan. 31, 1889. Serial No. 298,213. (No model.)

Claim.—1. The combination of the base or lower compartment having a screen-top, the upper compartment removably secured on the base, the agitating-screen centrally pivoted on the upper side of the screen-top, and a driving-shaft mounted horizontally in the side of the upper compartment and connected with the agitator, as set forth.

2. The combination of the base having a screen-top, the compartment D, secured on the base, the horizontal agitator pivoted on the upper side of the screen-top and having a vertical loop, G, on its upper side, the horizontal rock-shaft journaled in the side of the compartment and having an operating-lever at its outer end, and a crank-arm depending from the inner end of the said shaft and provided with a horizontal pin at its lower end engaging the loop G, as set forth.



3. The combination of the compartment D, the rock-shaft journaled in the side of the compartment and having an operating-lever on its outer end, the horizontal agitator, the crank-arm on the rock-shaft connected with the agitator, and the cap secured within the compartment and extending over the end of the rock-shaft and the crank-arm, as set forth.

403,975. GATE. WILLIAM R. WHITE, Hooga, Ill. Filed May 8, 1888. Serial No. 273,183. (No model.)

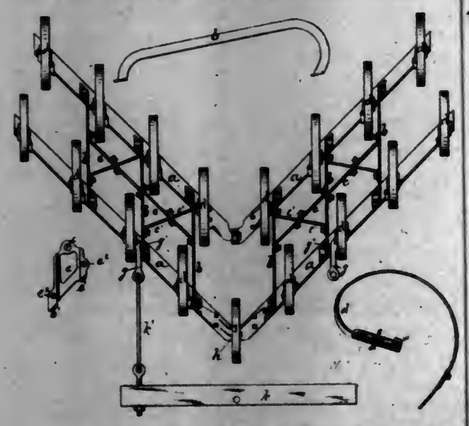
Claim.—1. A gate suspended from the outer end of a horizontal swinging arm, constituting the sole support of the gate, in combination with a guide to maintain the gate in line with the gate-posts during its swinging movements, substantially as described.

2. A gate arranged in substantial line with a fence pivotally suspended from a horizontal swinging arm, in combination with a guide supported at one end by the gate and at the other by the fence, and arranged to direct the position of the gate on its pivot during its swinging movements, substantially as described.

408,975.

3. A gate pivotally suspended from a horizontal swinging arm, in combination with a pivoted guide-rod, E, an eye through which it slides, and stops to limit the lateral movements of the rod, substantially as described.

4. In combination with a gate having an endwise movement, a lever pivoted to one side of the gate and its free end engaging with a guide on the gate, said lever being provided with locking-shoulders to lock the gate in its open and closed positions, substantially as described.



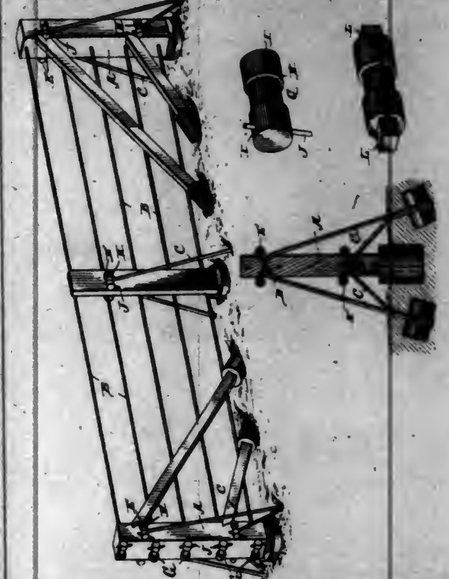
5. In combination with a gate having an endwise movement, a gravitating lever pivoted at one side of the gate and engaging with a guide on the gate and having opposed shoulders *m m*, which respectively lock the gate in its open and its closed positions, substantially as described.

6 In combination with a gate having an endwise movement, a gravitating lever pivoted at one side of the gate and engaging with a guide on the gate and having opposed shoulders *m m*, which respectively lock the gate in its open and its closed positions, and an operating-handle adapted to lift the lever to unlock and to move the gate, substantially as described.

7. In combination with a gate having an endwise movement, a gravitating lever, L, pivoted at one side of the gate and slotted at its upper end to engage with a guide carried by the gate, the slot being at its upper end divided by a tongue, Q, and terminating in seats *n'*, and an operating-lever for moving the lever L, substantially as described.

8. In combination with a gate having an endwise movement, a lever pivoted to one side of the gate and having its free end provided with a locking-shoulder adapted to engage with a guide carried by the gate, whereby the gate is locked, substantially as described.

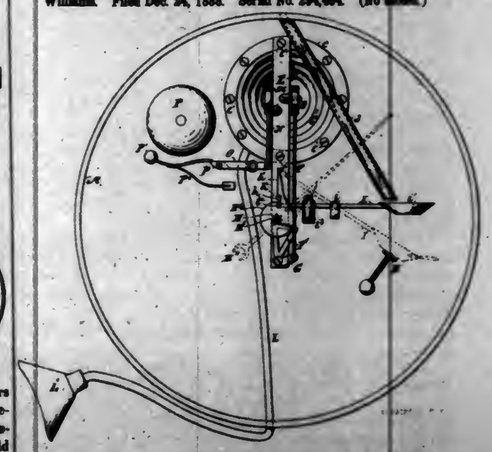
408,976. SPRING-TOOTHED HARROW. HARRY WIARD, Syracuse, N. Y. Filed Jan. 16, 1888. Serial No. 260,900. (No model.)



Claim.—1. In a spring-tooth harrow having a tooth bar or bars inclined in two directions to the line of draft, the combination therewith of a spring-tooth the shank of which is twisted, as herein described, to fit the double inclination of said bar, the tooth being held securely in position by a cap without interposing anything between the bar and tooth, as set forth.

2. The clip *g*, having the arm *g'* and eye therein combined with it for connecting the draw-bar with the harrow, constructed and arranged substantially in the manner and for the purposes herein specified.

3. The combination of the arm *g'* with the standard of the connecting-bar *b* and bar *a*, as and for the purposes specified.



408,977. FENCE. LEWIS F. WICKERS and BARNEY C. WICKARD, Lebanon, Ind. Filed Mar. 13, 1888. Serial No. 268,171. (No model.)

Claim.—1. The combination of the post having transverse openings, buried anchors on opposite sides of the post, the stay-wires having their intermediate portions wrapped around the buried anchors and their ends passing through the transverse openings in the posts, and the stretching drums or cylinders secured to the ends of the stay-wires, as set forth.

2. In a fence-post, the anchors on opposite sides of the posts, the stay-wires having their intermediate portions wrapped around the anchors, and the stretching drums or cylinders secured to the ends of the stay-wires and connected to the fence-post at the top and bottom, respectively, as set forth.

408,978. COIN-RELEASED SPIROMETER. PERCY G. WILLIAMS and ALFRED W. ROOVERS, Brooklyn, N. Y.; said Roovers assignor to said Williams. Filed Dec. 24, 1888. Serial No. 294,464. (No model.)

Claim.—1. The combination of a motor constructed to be operated by lung-power, an index operated thereby, and a coin-operated

lock for said index, comprising a plate having a radial notch and a stop, substantially as specified.

2. The combination of a motor constructed to be operated by lung-power, an index operated thereby, a locking-plate connected to said index, having a radial notch and as top in line with said notch, and a coin-operated lever engaging with said plate, said lever being operated by the weight of a coin, substantially as specified.

3. The combination of a motor constructed to be operated by lung-power, an index operated thereby, a locking-plate connected to said index provided with a radial notch and a radial arm having a stop-shoulder in line with the notch, and a coin-operated lever, substantially as specified.

4. The combination of a motor constructed to be operated by lung-power, an index operated thereby, a lock for said index comprising a notched plate having a stop and a lever operated by the weight of a coin, and a bell operated by said motor, substantially as specified.

5. The combination, with the diaphragm C', of the lever D, segment-lever G, shaft H, locking-plate H^2, having a stop, a lever, I, having an adjustable weight, a coin-receptacle, and an ejector, substantially as specified.

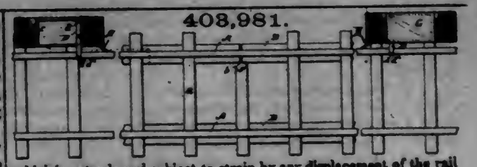
408,979. LOOM-SHUTTLE. FREDERICK E. WRIGHT, Rochester, N. Y., assignor to the Steam Gauge and Lantern Company, same place. Filed Mar. 26, 1888. Serial No. 268,476. (No model.)

Claim.—1. The combination, with the shuttle-body having sockets for the bobbin-journals and provided on its front side with a projecting horizontal guide-frame, E, of a movable gate covering said guide-frame and attached to the shuttle-body by pivots arranged lengthwise of the shuttle, substantially as set forth.

2. The combination, with the shuttle-body provided with sockets for the bobbin-journals and having a projecting guide-frame, E, provided with guide-rollers *f f*, of a movable gate covering said sockets and guide-rollers, substantially as set forth.

3. The combination, with the shuttle-body provided with sockets for the bobbin-journals and having a guide-frame, E, of a movable gate attached to the shuttle-body, a depressed guard, M, formed on the under side of the shuttle-body, and a raised guard, N, formed on the movable gate, substantially as set forth.

408,980. ANVIL-SHEARS FOR CUTTING METAL. WILLIAM H. ADAMS, Franklin, La., assignor of one-half to Independence Alpha, same place. Filed Mar. 11, 1889. Serial No. 302,957. (No model.)



Claim.—1. Shears for cutting metal having a stationary cutter-bar, one end of said bar being extended to form an arm at an obtuse angle to the cutter, said arm having an adjustable guide-bar pivoted to its side and a lever to its end, the other end of the bar having a movable cutter pivoted thereto, and a link connecting the other end of the movable cutter and the lever, as set forth.

2. The combination, with a stationary cutter-bar having a pin in its center adapted to be held in an anvil, of an arm extending at an obtuse angle downward from the end of the bar, a lever pivoted to the end of the arm, and an adjustable guide-bar secured to the side of the arm and bent outward and extending parallel thereto, the opposite end of the stationary cutter-bar bent upon itself, forming a pivotal bearing for one end of the movable cutter-bar, the opposite end of the movable cutter connected to the lever by a link, as set forth.

408,981. RAILROAD DANGER-SIGNAL. FRANCIS ALLEN, Kansas City, Kans. Filed Dec. 31, 1888. Serial No. 295,095. (No model.)

Claim.—1. In a danger-signal for railways, the combination, with a housing, of a vertically-yielding and horizontally-swinging arm pivoted at one end in said housing and adapted to be locked to said housing in operative position and carrying a signal, and the arm-actuating wire connected to the arm and to the rail or rail-support along

408,981.

which it extends and subject to strain by any displacement of the rail or its support, substantially as set forth.

2. In a danger-signal for railways, the combination, with a movable signal, of a wire connected with the signal and secured to and concealed beneath the rail and subject to strain by any displacement of the rail, substantially as set forth.

3. The combination of a movable signal and a wire leading therefrom across a bridge, uprights O and M, a lever, N, fulcrumed to the upright O, a pulley pivoted on the upright M, the cylinder P, a piston within the cylinder having its end connected to one end of the lever N, and branch pipes communicating with said cylinder and leading to different parts of the bridge, the said wire passing around the pulley upon the upright M and connected to the opposite end of said lever, substantially as set forth.

4. The combination of the box provided with an opening at the side, the horizontally-swinging arm pivoted in the box and adapted to be swung through the side opening, the box-cover, the spring engaged with the cover and the swinging arm, and the arm-operating wire, substantially as set forth.

5. The combination of the box provided with an opening at the side, a recess in the bottom of the opening, the horizontally-swinging arm pivoted in the box and adapted to swing through the side opening, the box-cover, the spring engaged with the cover and the swinging arm, and the arm-operating wire, substantially as set forth.

6. The combination of the box provided with an opening at the side, the horizontally-swinging arm pivoted in the box and adapted to swing through the side opening, a signal-light support secured to turn with the arm and the box-cover, the spring engaged with the cover and the swinging arm, and the arm-operating wire, substantially as set forth.

408,982. LAST. ELIPHAS W. ARNOLD and GEORGE W. OSGOOD, Weymouth, Mass. Filed Dec. 14, 1888. Serial No. 293,554. (No model.)

Claim.—The body *a* of the last, its block *b*, and a fastening device to unite them, combined with a flexible connection attached to the body and to the block and extended through an eye of the fastening device, to operate substantially as described.

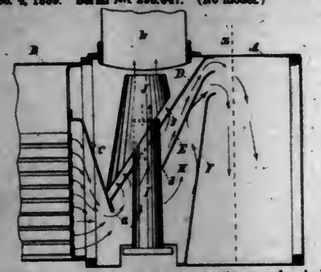
408,983. BRAKE-LEVER. GEORGE W. BARNUM, Philippi, W. Va. Filed Jan. 24, 1889. Serial No. 297,493. (No model.)

Claim.—1. The combination of a shaft having oppositely-toothed ratchet-wheels and the lever and shifting dog for operating said ratchets, with the locking ratchet-wheel and its locking-plate having a curved slot, and the rod and its operating devices connected to said lever and engaging the slot in said plate, for the purpose and substantially as specified.

2. The combination of the shaft, the ratchets thereon, the oper-

ating-lever and its adjustable dog for said ratchets, and the locking-ratchet and curved slotted locking-plate thereof, with the brake-bar and the connections between the said shaft and bar, substantially as described.

3. The combination of the shaft and its operating devices, with a locking-ratchet on said shaft, the toothed plate engaging said ratchet having a curved slot concentric to said shaft, and the devices engaging said plate, all substantially as described.

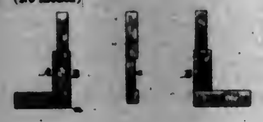


4. The combination of the brake-bar, its brake-shoes, and sprocket-wheel, with the shaft, its opposite ratchet-wheels and operating-lever engaging said ratchets, and the locking ratchet and plate, the sprocket-wheel on said shaft, and the chain connecting said sprocket-wheel with the wheel on the brake-bar, substantially as set forth.

5. The combination of the shaft, the opposite toothed ratchet-wheels thereon, the lever carrying a shifting dog, and the devices for shifting said dog mounted on the lever, with the locking-ratchet, its locking-plate having a curved slot concentric to said shaft, and the catch-block playing in said slot, and the rod mounted on said lever engaging said block, and the connecting devices between said rod and lever, whereby the plate is shifted simultaneously with the shifting of the dog, substantially as set forth.

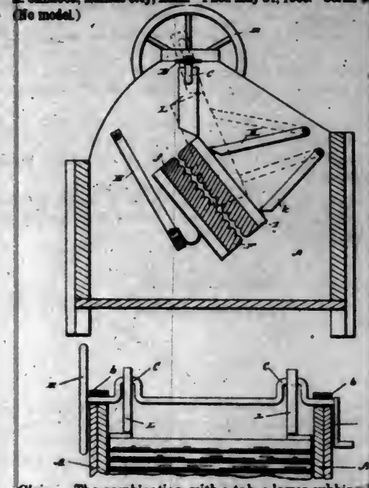
6. The combination of the brake-bar, the brake-shoes and sprocket-wheel on said bar, with the shaft, the sprocket-wheel thereon, the chain connecting said sprocket-wheels, the opposite toothed ratchets on said shaft, the lever, the shifting dog pivoted on said lever adapted to engage either of said ratchets, the locking-ratchet, its slotted locking-plate, and the devices, substantially as described, attached to said lever, whereby the locking plate and dog may be shifted simultaneously, substantially as and for the purpose specified.

7. The combination of the frame, the shaft journaled therein, the oppositely-toothed ratchets thereon, the bifurcated lever and shifting dog engaging said ratchets, and the locking-ratchet and toothed, curved, and slotted plate for locking said ratchet, with the crank-iron on said lever, the link connecting said iron and the shifting dog, and the link, rod, and block connecting said iron and the slotted plate, whereby the dog and plate are operated together, substantially as and for the purpose specified.



403,984. SPARK-ARRESTER. JOSHUA R. BARNES, Springfield, Ill. Filed Feb. 4, 1889. Serial No. 298,647. (No model.)

Claim.—1. In the smoke-box of a locomotive or other boiler provided with a partition-deflector, F, a baffling-plate, C, screen S, and deflector D, the three latter parts connected together and having positional reference to the deflector F, as herein described, the combination, with said parts, of an inclined deflector so interposed between the screen and the deflecting-partition F as to form with the screen and the deflector D a passage adapted to conduct the sparks and cinders that roll or slide up the face of the screen into the ash-bin, the interposed deflector being also adapted to intercept and conduct into the ash-bin the sparks and cinders that rebound from the partition-deflector, substantially as and for the purpose herein set forth.



2. In the smoke-box of a locomotive or other boiler provided with an inclined screen adapted to arrest the sparks and cinders, and so located that the exhaust-pipes project vertically through its central part, the combination, with said screen, of a petticoat-pipe having its base sloped so as to coincide with the inclination of the screen and located slightly above it, substantially as shown, and for the purpose herein set forth.

403,985. SINKER-BAR FOR STRAIGHT-KNITTING MACHINES. FRANK E. BUSIEL, Laconia, N. H., assignor of two-thirds to John T. Busiel and Charles A. Busiel, both of same place. Filed Sept. 17, 1888. Serial No. 285,562. (No model.)

Claim.—In a knitting-machine, the combination of a sinker-bar provided with a series of vertical grooves and a longitudinal dovetailed groove cut in its front side, with a series of sinkers mounted in said vertical grooves and provided each with a dovetailed notch in its front edge, and a dovetailed locking-bar fitted to and movable endwise in the longitudinal groove of said sinker-bar and in the notches in said sinkers to firmly hold them in position and prevent any movement endwise or transversely thereof.

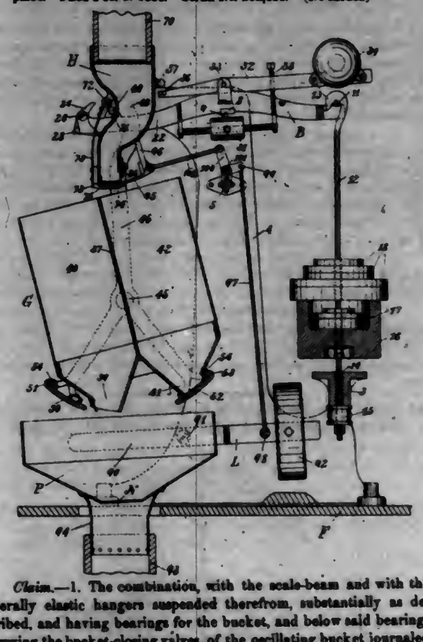
403,986. WASHING-MACHINE. JOHN W. CALHOON and JOHN W. A. CALHOON, Kansas City, Kans. Filed May 21, 1888. Serial No. 274,008. (No model.)

Claim.—The combination, with a tub, a lower rubbing-board pivotally secured in the tub, a cross-frame rigidly secured in the tub, and spring-arms secured to and projecting from said frame for supporting the lower rubbing-board, of an upper rubbing-board suspended in the tub over the lower rubbing-board, a crank-shaft journaled over the tub, hangers connecting the crank-shaft and the upper edge of the upper rubbing-board, and pivoted arms connecting said upper board and tub, whereby the board is swung by the rotation of the crank-shaft in an irregular curved path, substantially as set forth.

403,987. PULLEY. CHESTER W. CLARK and THERON D. KEASEY, Mishawaka, Ind., assignors to the Keasey Pulley Company, same place. Filed Feb. 17, 1888. Serial No. 264,372. (No model.)

Claim.—1. In a split pulley, the combination of the half-hubs provided with semicircular flanges, the separable flanges, the spokes, and the bolts *d d*, arranged between the spokes, substantially as set forth.

2. In a split pulley, the combination of the half-hubs provided with the semicircular flanges, the separable flanges, the spokes, the clamping-bolts, the segmental rim, and the bolts *A'* near the outer ends of the spokes, substantially as set forth.



3. In a split pulley, the combination, with the spokes and the rim provided with the L-shaped seats, of the clamps *A*, having their outer ends seated in said seats and their inner ends secured to the spokes, substantially as set forth.

4. In a split pulley, the combination, with the spokes having their outer ends dovetailed, of the rim provided with segments having their flat faces in contact and provided with dovetailed seats for the ends of the spokes, substantially as set forth.

5. In a split pulley, the combination, with the spokes having their ends dovetailed upon one edge and the rim provided with correspondingly-shaped dovetailed seats for the ends of the spokes and with L-shaped recesses, of the clamps arranged upon the straight edges of the spokes with their L-shaped ends projecting from that edge of the spoke which is opposite to the dovetail-shaped part, substantially as set forth.

6. In a split pulley, the combination, with the segmental rim provided with L-shaped seats for the clamps, of the spokes having their outer ends seated in the rim, the clamps having their outer ends in the L-shaped seats, and the bolts *A'*, engaging with the spokes and the clamps, substantially as set forth.

403,988. AUTOMATIC GRAIN-SCALES. CHARLES H. COOLEY, Hartford, Conn., assignor to The Pratt & Whitney Company, same place. Filed Feb. 3, 1888. Serial No. 262,880. (No model.)

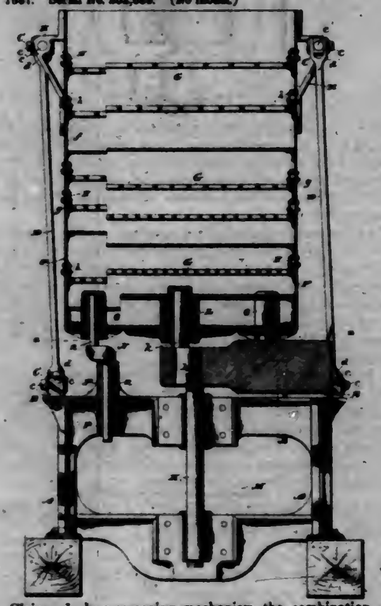
Claim.—1. The combination, with the scale-beam and with the laterally elastic hangers suspended therefrom, substantially as described, and having bearings for the bucket, and below said bearings carrying the bucket-closing valves, of the oscillating bucket journaled in said bearings and limited in its oscillating movement by abutments on said valves, all substantially as described.

2. The combination, with the hangers 44 46, of the bucket journaled therein and having spouts 39 41, valves 50 52, fixed to said hangers and arranged to close said spouts alternately, and the abutments 51 53 on the outer edges of said valves, respectively, substantially as described.

3. The combination and arrangement, with the grain-discharging hopper H, having its spout cut away on one side thereof at 83, of the vertically-adjustable plate 84 and the cut-off valve constructed and arranged to pass horizontally under said spout and plate from the side opposite of said plate 84, all substantially as described, and for the purpose specified.

4. The combination, with the hopper-spout, of the main valve 76, the supplemental valve 74, and the flexible apron 88, affixed to valve 76 and protecting the edge of valve 74, all substantially as described.

5. The combination, in a grain-weighing machine, of a grain-bucket, a chute for conveying grain thereto, a swinging cut-off valve arranged to swing under said chute to partially cut off the flow of grain to the bucket, a scale-beam carrying the bucket and operatively connected to open said cut-off valve on the rising of said beam, a swinging regulator-valve arranged to swing under said chute oppositely to said cut-off valve and to partially cut off the flow of grain to said bucket, and a vertically-movable regulator-hopper below said bucket and receiving the grain therefrom, said regulator-hopper being operatively connected to actuate said regulator-valve, whereby the two valves, acting together, operate to entirely cut off the flow of grain to the bucket, all substantially as described.



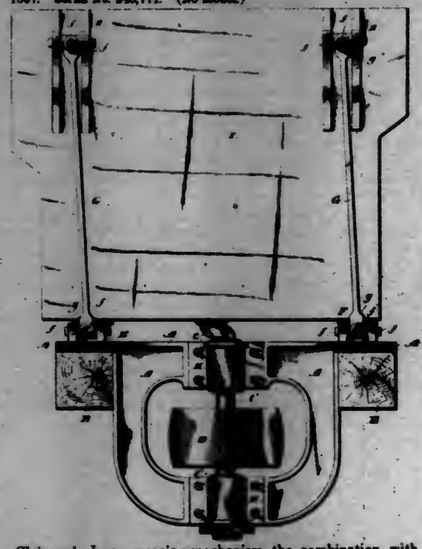
6. The combination, in an automatic grain-weigher, of the scale-beam, a grain-bucket suspended therefrom, a main weight suspended from said beam, the supplemental weight, the grain-chute above said bucket, the two cut-off valves constructed and arranged to swing one under the other and both under said chute, said valves being operatively connected to be opened from and on the rising of said beam, the regulator-valve constructed and arranged to swing under said chute oppositely to the first cut-off valve, and a vertically-movable regulator-hopper under said bucket and counterbalanced to normally open said regulator-valve, said hopper being operatively connected to close said regulator-valve on the downward movement of the hopper, and the whole being organized and coacting, as set forth, to close said regulator-valve before the supplemental weight is lifted and with the second cut-off valve standing open, all substantially as described.

7. The combination, with the spout of hopper H, of the oscillating cut-off valve 76 and the regulator-valve 95, both valves being suspended, substantially as described, and arranged to meet below said spout, the two valves being operated independently, all substantially as described.

8. The combination, with the spout of hopper H, of the cut-off valve 76 and the regulator-valve 95, both arranged to be moved toward each other under said spout, and the valve 74, arranged to be moved under both of the said valves 76 and 95, substantially as described.

9. The combination, with the vertically-movable double-chambered oscillating grain-bucket suspended, substantially as described, by hangers from knife-edges and provided with a stud or catch, 110, the whole being arranged to swing on its supporting knife-edges, of the stop-latch pivoted to the frame of the machine and having the notches 115 and 117, whereby the swaying movement of the bucket and hangers due to the discharge of one load carries the same over to and locks them substantially in the normal position due to the major part of the other load, substantially as described.

403,989. SCREENING MECHANISM. BECKLEY R. COXE and SAMUEL SALMON, Drifton, Pa.; said Salmon assignor to said Coxe. Filed Mar. 20, 1887. Serial No. 232,339. (No model.)



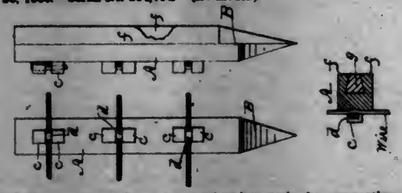
Claim.—1. In a screening mechanism, the combination, with a supporting-base and a screen-holding frame, of supporting solid bars having universal-joint connections with said base, and also with said frame at or near the top of the latter, and an actuating-crank connected with said frame to impart a circular motion thereto, substantially as and for the purpose specified.

2. In a screening mechanism, the combination, with a supporting-base and a screen-holding frame, of a series of supporting solid bars having at their lower ends universal-joint connections with said base and at their upper ends universal-joint connections with said frame, an actuating-crank for imparting a circular motion to said frame, and one or more parallel cranks for steadying said frame and limiting its motion, substantially as and for the purpose shown.

3. As an improvement in screening mechanism, the combination of the screen-frame, a screen having at its side edges upward-turned flanges, a clamping-plate which is adapted to have one of its ends engage with one of the flanged edges of such screen and to have its opposite end in engagement with the side of the screen-frame, and a bolt that passes through the frame side and through said clamping-

plate at a point between the ends of the latter and operates to draw the same firmly against the flanged edge of said screen, substantially as and for the purpose described.

403,990. SCREENING MECHANISM. ROXLEY B. COXE and SAMUEL SALMON, Drifton, Pa.; said Salmon assignor to said Coxe. Filed June 9, 1887. Serial No. 240,771. (No model.)

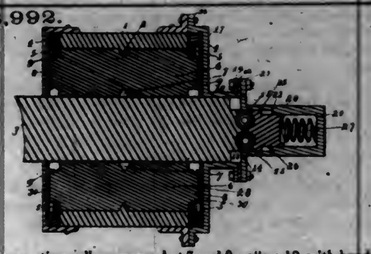


Claim.—1. In a screening mechanism, the combination, with a supporting-base, of a screen-holding frame provided with horizontal circular guides, vertically-journaled rollers supported by said base and engaging said guides, and a crank engaging said frame and serving to impart circular movements thereto, substantially as and for the purpose specified.

2. In a screening mechanism, the combination, with a supporting-base, of a screen-holding frame provided with horizontal circular recesses, the walls of which serve as guides, vertically-journaled rollers arranged within said recesses and of lesser diameter than the latter, supporting-bars jointed at their lower ends to said base and at their upper ends to said frame, and crank engaging said frame and serving to impart circular movements thereto, substantially as and for the purpose set forth.

3. In a screening mechanism, the combination, with the supporting-base A, of the screen-holding frame I, having the horizontal circular guides or recesses *i*, the vertically-journaled rollers L within said recesses, the supporting-bars G, universally jointed at their lower ends to said base and at their upper ends to said frame, and the vertical shaft C, having the crank *c* engaging the bottom of said frame, substantially as and for the purpose described.

408,991. FENCE-POST. WILLIAM CRAIG, Percy, Iowa. Filed Dec 26, 1888. Serial No. 294,704. (No model.)



Claim.—A metal fence-post having integral wire supporting and fastening devices on one side and a wooden bar on the opposite side to which wooden boards can be nailed and the nails clinched, in the manner set forth.

408,992. JOURNAL-BOX. JOHN CURTIS, Denver, Colo., assignor to the Curtis Anti-Friction Roller Bearing Company, same place. Filed July 28, 1888. Serial No. 280,970. (No model.)

Claim.—1. The combination of the case or box having interior rib, 2, the supporting-rollers having grooves 7 in their bodies and end heads with grooves 9, the rollers 10, with heads having ribs 12, and the end rings having grooves 5, substantially as set forth.

2. A journal-bearing comprising the case or box having interior

rib, 2, supporting-rollers grooved at 7 and 9, rollers 10, with heads having ribs 12, end rings having grooves 5, a cap secured to the case and surrounding the end of the body of the main shaft, a thimble, 20, secured to the cap, a bearing-block, 25, with an angled shank, 26, within the thimble, and a spring therein acting upon the end of the shank, substantially as set forth.

3. A journal-bearing comprising an outer case with an internal rib, supporting-rollers with grooves fitting upon and meshing with such rib, supplementary or spacing rollers maintaining the supporting-rollers in a position away from each other, end rings maintaining such supplementary or spacing rollers in operative position, an end or cap, a thimble secured to such cap, and a spring-bearing for the end of the main shaft in such thimble, substantially as set forth.

4. The combination of the case 1, with rib 2, rollers 6 having grooves 7 and grooved heads 8, rollers 10, having ribbed heads 11, and end rings, 4, with internal grooves, 5, substantially as set forth.

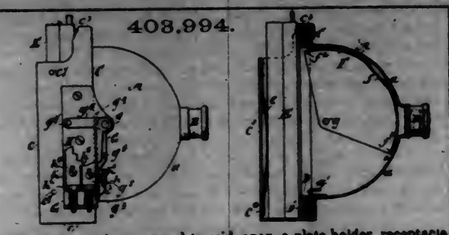
5. A journal-bearing comprising the case, the supporting and the spacing rollers, of the cap steps or bends 16 17 18 19, thimble 20, with square or angled cavity 24, shaft 3, with reduced portion 13, bearing-block 25, ball-bearings 15, and spring 27, substantially as set forth.

403,993. UMBRELLA OR PARASOL. WILLIAM B. DURKEE, Philadelphia, Pa. Filed Dec. 18, 1888. Serial No. 293,960. (No model.)

Claim.—1. A parasol or umbrella having the lining attached at the top immovably to the stick and at points nearer the bottom to the ribs or cover, and intermediately detached from both ribs and cover.

2. A parasol or umbrella lining attached at the top immovably to the stick and nearer the bottom to the ribs or cover, having the intermediate portion at all points of less width than the corresponding portion of the cover.

3. In an umbrella or parasol, an interior canopy having its convexity toward the handle formed by a lining having its gores of less width in its upper parts than the gores of the cover, said lining-gores having their upper extremities turned upward toward the top notch and attached to a channeled ring, substantially as described.



4. In an umbrella or parasol, the combination of a lining covering the stretcher-joint of the rib with a stretcher longer than the distance between the top of the rib and the stretcher-joint.

5. In an umbrella or parasol, the combination of a channeled ring between the top notch and top spring with a lining forming a canopy having the convexity toward the handle attached to said ring and exerting a downward pull thereon.

408,994. PHOTOGRAPHIC CAMERA. JAMES H. FORD, New York, N. Y., and MAX JURNICK, Jersey City, N. J.; said Jurnick assignor to said Ford. Filed May 26, 1888. Serial No. 275,027. (No model.)

Claim.—1. In a photographic camera, the combination of the following elements: a hollow spherical shell having a slightly-depressed portion near its apex, a lens secured to said apex, a plate-holder receptacle secured to the base of said shell, and a shutter in the form of a segment of a hollow sphere, having an opening at its apex and pivotally mounted to rock within said shell, substantially as described.

2. In a photographic camera, the combination of the following elements: a hollow spherical shell having a slightly-depressed portion

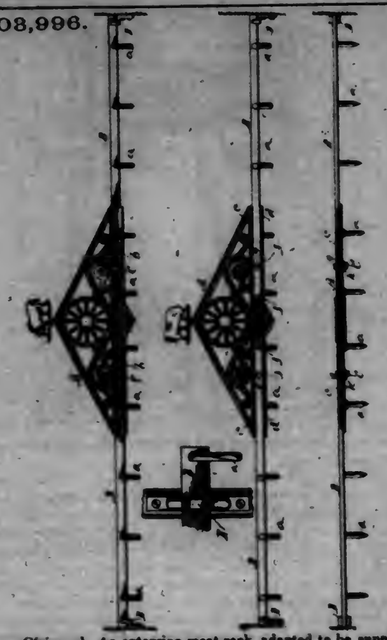
near its apex, a lens secured to said apex, a plate-holder receptacle secured to the base of said shell, a shutter in the form of a segment of a hollow sphere, having an opening at its apex and pivotally mounted to rock within said shell, one pivot being secured to said shutter, and provided with a coil-spring and hand-crank, said spring to actuate the shutter in one direction, and the said hand-crank controlled by detents for turning said shutter in the other direction for setting, substantially as described.

3. In a photographic camera, the combination of a dome-shaped shell provided with a lens and a plate-holder receptacle, a shutter in the form of a spherical segment working on pivots loosely within said shell, the latter having an annular depressed portion at a suitable distance from its apex to form a close-fitting connection with the shutter around the inner surface of the shell adjacent to the opening to the lens for excluding light, a coil-spring for actuating the shutter, a brake bearing against a pivot secured to the shutter for controlling its motion, a tripping device consisting of two spring-actuated detents adapted to engage with the extremity of a lever secured to said pivot, one of said detents having a shoulder bearing on the other detent, whereby an instantaneous or prolonged exposure is obtained by manipulating a single detent, and stops for limiting the motion of the shutter in both directions, substantially as described.

4. In combination with a photographic camera, substantially as described, the tripping device H, comprising two spring-actuated sliding detents, *h h'*, provided with hand-pieces, the detent *h* having a shoulder engaging the other detent, whereby the motion of the shutter may be made partial or complete by the manipulation of a single detent, substantially as described.

403,995. COIN-OPERATED FINGER-PULL. WILLARD H. GILMAN, Boston, assignor to William S. Reed, Leominster, Mass. Filed June 9, 1888. Serial No. 276,698. (No model.)

Claim.—1. As an improvement in coin-operated finger-pulls, the spring-pressed drum having a ratchet, the coin-chute, the locking lever or dog engaging said ratchet at one end, its other end being projected through an aperture of said chute, and the flexible pull secured to said drum, substantially as described.



2. As an improvement in coin-operated finger-pulls, the combination of the fixed shaft, the spring-pressed drum rotatively mounted thereon, the ratchet secured to said drum, the coin-chute, the lever or dog having one end extending into said chute, and the flexible pull having a handled end, substantially as described.

3. As an improvement in coin-operated finger-pulls, the combination of the spring-pressed drum, its shaft, the ratchet, the coin-chute, the lever or dog engaging said ratchet, the toothed arm secured to said drum, the weighted lever engaging said arm and having a lug or projection, and the flexible pull, substantially as described.

4. As an improvement in coin-operated finger-pulls, the combination of the spring-pressed drum, its shaft, the ratchet secured to said drum, the coin-chute, the lever or dog engaging said ratchet and having one end projecting into said chute, the toothed arm, the weighted lever engaging said arm and having a lug or projection projecting beneath said chute, and the flexible pull, substantially as described.

5. In a coin-operated finger-pull, the combination of the spring-pressed drum having a ratchet, the coin-chute, the lever or dog engaging said ratchet, the flexible pull secured to said drum, the slide through which said pull is passed, and the guides therefor, substantially as described.

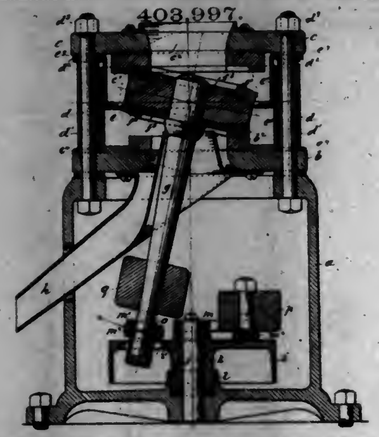
408,996. MEAT-RACK. CHARLES A. GLOECKLER, Pittsburg, Pa. Filed Aug. 10, 1888. Serial No. 282,542. (No model.)

Claim.—1. An extension meat-rack adapted to be supported at its outer ends, said rack being composed of a center bar having longitudinally-extending slots therein, of two adjustable and extensible end bars having bolt-holes, and of guide and fastening bolts extending through said slots in the center bar entering said bolt-holes in the end bars, said center and end bars being each provided with meat-hooks, substantially as set forth.

2. An extension meat-rack adapted to be supported at its outer ends, said rack being composed of a center bar having longitudinally-extending slots therein and flanges projecting at substantially right angles from its edges, of two adjustable and extensible end bars at opposite ends of said center bar and in line therewith, said end bars fitting and sliding between said projecting flanges and provided with bolt-holes, said center and end bars being each provided with meat-hooks, and of guide and fastening bolts passing through said slots in the center bar and entering said holes in said end bars, substantially as set forth.

3. An extension meat-rack adapted to be supported at its outer ends, said rack being composed of a center bar having longitudinally-extending slots therein and flanges projecting at substantially right angles from its edges, of two adjustable and extensible end bars at opposite ends of said center bar and in line therewith, the inner ends of said end bars fitting and sliding between said projecting flanges, said center and end bars being each provided with meat-hooks, and of guide and fastening bolts passing through said slots in said center bar and entering said holes in said end bars, in combination with stationary supporting-brackets having notches therein, in which the outer ends of said end bars rest, substantially as set forth.

408,997. CRUSHING OR GRINDING MILL. EDWIN C. GRIFFIN, Brooklyn, assignor to the Griffin Manufacturing Company, New York, N. Y. Filed June 1, 1888. Serial No. 275,730. (No model.)



Claim.—1. In a crushing or grinding mill, the combination, with a gyrating runner or head having crushing-surfaces upon its upper and lower faces, of an upper and lower stationary crushing-disk, substantially as described.

2. In a crushing or grinding mill, the combination, with a gyrating runner or head having crushing-rings upon its upper and lower faces, of upper and lower stationary crushing-disks, substantially as described.

3. In a crushing or grinding mill, the combination of the upper and lower crushing-disks with the intermediate gyrating runner or head provided with depressions and crushing-rings upon its upper and lower faces, substantially as and for the purpose described.

4. In a crushing or grinding mill, the combination of the upper annularly-recessed crushing-disk, the lower plane-surfaced crushing-disk, and the intermediate gyrating runner or head provided with

403,997.

depressions and crushing-rings upon its upper and lower faces, substantially as described.

5. In a crushing or grinding mill, the combination of the upper and lower crushing-disks, the gyrating arm or stem passing through the latter, and the gyrating head provided with crushing-surfaces upon its upper and lower faces and adapted to be removed from said arm or stem and reversed, substantially as and for the purpose described.

6. In a crushing or grinding mill, the combination, with the casing, the top plate, and the upper stationary crushing-disk formed with the central feed-entrance, and the bottom plate and the lower stationary crushing-disk formed with the central discharge-aperture, of the gyrating crushing-head mounted between said upper and lower crushing-disks, substantially as described.

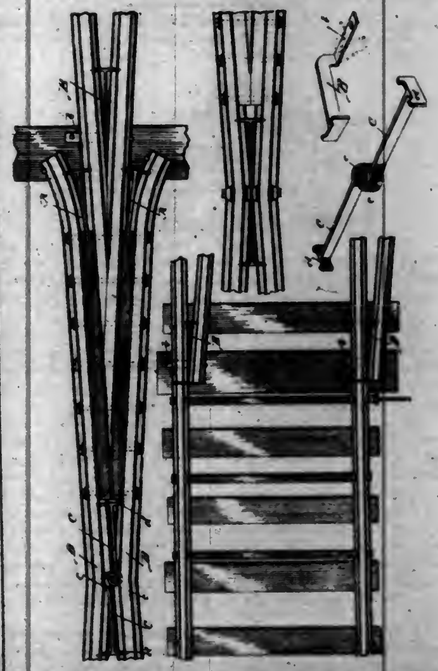
7. In a crushing or grinding mill, the combination of an upper and lower stationary crushing-disk, a drive-pulley concentric with said stationary disks, a runner or head having crushing-surfaces upon its upper and lower faces, and an arm or stem pivotally connected at an eccentric point of said pulley and operating to impart a gyrating motion to said runner or head as arranged between the stationary disks, substantially as described.

8. In a grinding or crushing mill, the combination of an upper and lower crushing-disk, a drive-pulley journaled concentric therewith, a runner or head having crushing-surfaces upon its upper and lower faces, an arm or stem pivotally connected at an eccentric point of said drive-pulley and having radial play at the same point, and means for forcing said stem outward, substantially as described.

9. In a grinding or crushing mill, the combination of an upper and a lower crushing-disk, a drive-pulley journaled concentric therewith, a runner or head having crushing-surfaces upon its upper and lower faces, an arm or stem pivotally connected at an eccentric point of said drive-pulley and having radial play at the same point, and a weight connected to said arm or stem to force it outwardly by centrifugal force, substantially as described.

10. In a crushing or grinding mill, the combination of an upper and lower crushing-disk, a drive-pulley journaled concentric therewith, a runner or head having crushing-surfaces upon its upper and lower faces, an arm or stem pivotally connected at its end at an eccentric point of said pulley and having radial play at the same point, a series of connected levers mounted upon said pulleys, and a weight attached to the end of the stem or arm at or near the point of its pivotal attachment, substantially as described.

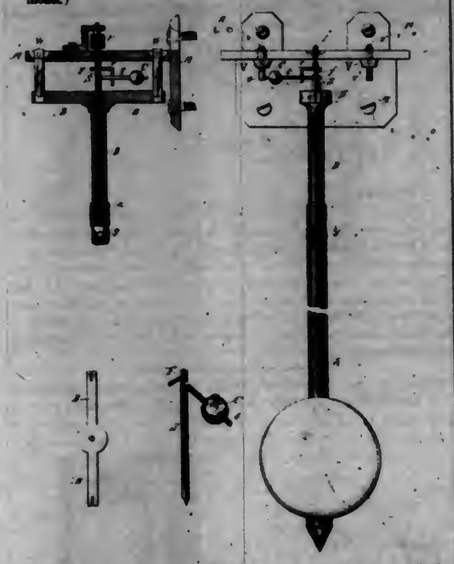
11. In a crushing or grinding mill, the combination of the stationary crushing-disks, an intermediate gyrating runner or head having an arm or stem, a drive-pulley journaled concentric with the said head and having a radial slot for the free passage and play of the lower end of said arm or stem, a lever fulcrumed concentric with said pulley, levers pivoted at their ends at diametrically-opposite points on the face of said pulley and arranged parallel with the central lever, one of said levers having a weight secured at its middle, a weight secured to the lower end of the arm or stem of the gyrating head, and links connecting the middle lever to the opposite ends of the levers which are parallel therewith, substantially as described.



12. In a crushing or grinding mill, the combination of the centrally-open upper and lower crushing-disks, the gyrating runner or head having crushing-surfaces upon its upper and lower faces, an arm or stem passing through the central opening of the lower crushing-disk, a drive-pulley journaled concentric with said crushing-disks and having a radial slot for the free passage and play of the arm or stem, a lever fulcrumed at its middle concentric with said pulley, a lever pivoted at one end at an eccentric point of the pulley near its periphery and having a weight secured to its middle, a link connecting the free end of said lever with the corresponding end of the central lever, a lever pivoted to said pulley at a diametrically-opposite point to the other lever and having a partly-spherical recess in its middle, a spherical bearing or step fitted in said recess, and a link pivotally connecting the free end of this lever and the end of the central lever, substantially as described.

13. In a crushing or grinding mill, the combination of a cylindrical casing, a top and bottom plate provided with central apertures forming, respectively, the feed and discharge apertures, crushing-disks secured to the inner sides of the top and bottom plates and having central apertures, a gyrating runner or head having crushing-surfaces upon its upper and lower faces and having an arm or stem projecting through the central apertures of the bottom plate and its crushing-disk, and a discharge-spout secured around the discharge-aperture and provided with an inverted-funnel-shaped flange surrounding the said arm or stem and projecting above the lower crushing-disk, substantially as described.

14. In a crushing or grinding mill, the combination of a top plate and a bottom plate having crushing-disks secured upon their inner sides, a gyrating runner or head having crushing-surfaces upon its upper and lower faces and playing between and upon said crushing-disks, bolts passing through and connecting said plates and provided with nuts and enlarged heads, sleeves surrounding said bolts, and removable washers fitted upon said bolts between the upper ends of the sleeves and the under side of the top plate, substantially as and for the purpose set forth.



15. In a crushing or grinding mill, the combination of a top plate and a bottom plate having crushing-disks upon their inner sides, an intermediate gyratory crushing runner or head, bolts connecting the top and bottom plates and provided with nuts and enlarged heads, a casing consisting of cylindrical flanged shells fitted upon the bolts and telescoping at their meeting ends, sleeves surrounding the bolts and separating the top and bottom plates, and washers removably placed upon the bolts between the upper ends of the sleeves and the perforated flanges of the shells, substantially as and for the purpose set forth.

403,998. FOOT-GUARD. THOMAS A. GRIFFIN, Chicago, Ill. Filed Jan. 31, 1889. Serial No. 298,160. (No model.)

Claim.—A foot-guard for railway, consisting of a T-shaped piece of metal, its head being adapted to fit between the rails and having its stem bent at the end to a hook shape, whereby it is adapted to engage with another guard of similar shape, substantially as described.

403,999. GRAVITY CLOCK-ESCAPEMENT. FERDINAND GUDSORPH, Portland, Oreg. Filed Sept. 7, 1888. Serial No. 284,811. (No model.)

Claim.—1. In a gravity-escapement and in combination with the pendulum and the motor thereof, a revolving arm deriving motion from the motor, and means, as the pins *r r'*, for intermittently arresting the motion of the said arm, substantially as described.

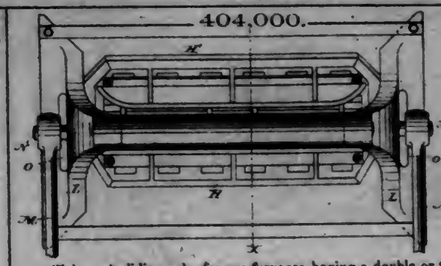
2. In a gravity-escapement and in combination with the motor and pendulum thereof, a revolving arm connected to the pendulum and driven by the motor, and means, as the pins *r r'*, for intermittently arresting said arm, substantially as described.

3. In a gravity-escapement and in combination with the motor and pendulum thereof, an arm connected to the pendulum and driven by the motor, and means, as the pins *r r'* and wires *n n o*, for making and breaking an electrical circuit, substantially as described.

4. In a gravity-escapement and in combination with the pendulum and motor thereof, a revolving arm deriving motion from the motor, and means, as the pins *r r'*, for intermittently arresting the motion of said arm, substantially as described.

5. In a gravity-escapement and in combination with the motor and pendulum thereof, a revolving shaft stepped in the pendulum, an arm mounted on said shaft, a carrier acting on the arm and connected with the motor, and means, as the pins *r r'*, for intermittently arresting said arm, substantially as described.

6. In a gravity-escapement and in combination with the motor and pendulum thereof, a pinion, *p*, meshing with the motor, a shaft driven by said pinion, a carrier revolved by said shaft, a revolving arm, *l*, connected with the pendulum and revolved by the carrier, and means, as the pins *r r'*, for intermittently arresting said arm, substantially as described.



7. In a gravity-escapement and in combination with the motor thereof, a pendulum having a tube at its upper end, a shaft revolving in said tube, an arm attached to said shaft, a carrier connecting said arm with the motor, and means, as the pins *r r'*, for intermittently arresting the motion of the arm and shaft, substantially as described.

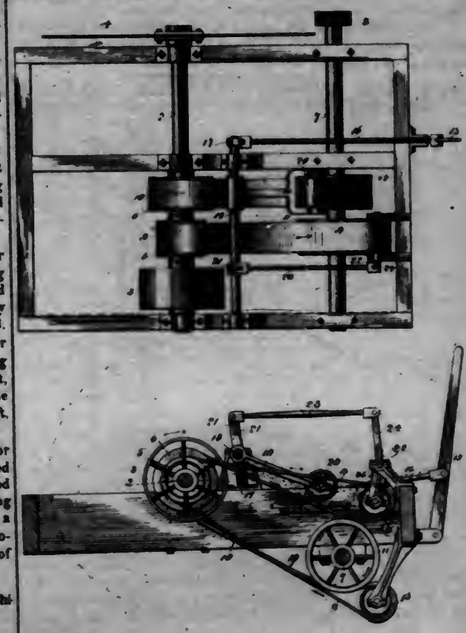
8. In a gravity-escapement and in combination with the motor thereof, a pendulum having a tube at its upper end, a shaft carrying an arm and revolving in said tube, a pivot-rest supporting said shaft, a carrier connected with the motor and driving the shaft, and the pins *r r'*, for intermittently arresting said revolving arm and shaft, substantially as described.

9. In a gravity-escapement and in combination with the motor thereof, a vertical shaft connected with the motor, a carrier connected with said shaft, a cross-head, B, having suspension-springs *f*, connected to a suitable support, a tube, D, beneath the cross-head, a revolving shaft, S, working in said tube, an arm, *l*, carried by said shaft, a weight, C, adjustable on said arm, the pins *r r'*, for arresting the motion of the arm, and the pendulum-rod *k*, connected to the bottom of the tube, substantially as described.

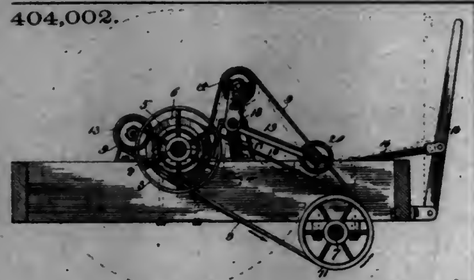
404,000. ORE-ROASTING FURNACE. ISAAC R. HANNOUR, Chicago, Ill. Filed Oct. 1, 1888. Serial No. 286,965. (No model.)

404,000.

Claim.—A sliding rake for ore-furnaces, having a double or two faced swinging head, each face being provided with suitable teeth, the said head being pivotally connected to the rake-body, rake-rods connected to the said swinging head outside the center, around which it swings, and stops, substantially as described, to limit the extent of swing of the head to bring one or the other of the rake-faces in working contact with the ore, substantially as and for the purpose set forth.



404,001. COMBINATION-TOOL. ELMER E. HEACOCK, STRAUB, KANS. Filed Jan. 4, 1889. Serial No. 295,449. (No model.)

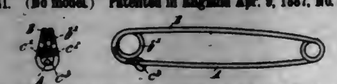


Claim.—The combination-tool herein described, the same consisting of a bar, C, a stationary head, A, attached at one end of the bar, the extended end of said head being fashioned into a wrench-jaw and its opposite end provided with a hammer-face and a tack or nail claw, a movable jaw, B, provided upon its lower face with extensions F and F', as described, the spring E, having one of its ends attached to the extension F and its free end provided with a pin to engage holes formed in the lower face of the bar C, the stop D upon the bar C, to limit the movement of the movable jaw, and the tube-wrench J, formed in the end of the bar C, substantially as shown and described.

404,002. SAW MILL FEED-WORKS. HOWARD P. HEACOCK, Missoula, Mont. Filed Jan. 21, 1889. Serial No. 296,957. (No model.)

Claim.—1. The combination, in a saw-mill, of two belts driven from the saw-arbor and running over pulleys on a shaft of the feed-

404,002.

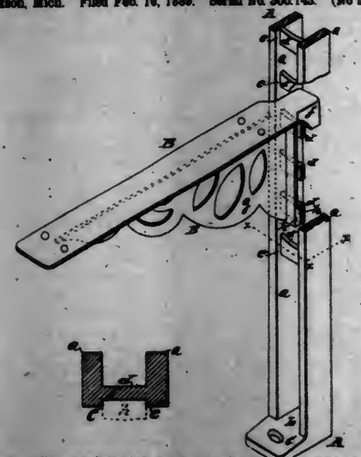


works, one of said belts having the same side in contact with both pulleys over which it runs, and the other belt having its opposite sides in contact with its respective pulleys, and a tightener adapted to operate alternately on said belts, substantially as described.

2. The combination of a pulley on the saw-arbor, a pulley on the feed-shaft, a belt running from one pulley to the other, a tightener-pulley acting on said belt, a second pulley on the saw-arbor and upon the feed-shaft, idler-pulleys on each side of one of the two pulleys last named, one of said idlers being movable and acting as a tightener, a belt passing over said idlers, and the pulleys on the saw-arbor and the feed-shaft, as described, and mechanism connecting the movable idler with the first-named tightener-pulley and adapted to cause them to alternately tighten their respective belts, substantially as described.

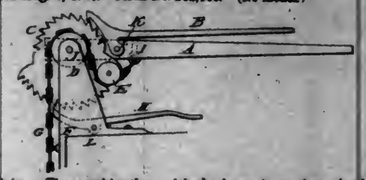
3. The combination of pulleys 6 and 12 and belt 10, pulleys 5 and 11, idlers 13 and 14, and belt 9, said belts being combined with a tightener consisting of lever 15, rod 16, arm 17, rock-shaft 18, arm 19, and pulley 20, arm 21, rod 23, arm 24, rock-shaft 22, and arm 25, carrying the idler 14, substantially as described.

404,003. SAFETY-PIN. GEORGE W. HERBERT, Birmingham, County of Warwick, and Samuel Guinery, Epsom, County of Surrey, England; said Guinery assignor to said Herbert. Filed Feb. 2, 1888. Serial No. 262,741. (No model.) Patented in England Apr. 9, 1887, No. 5,243.



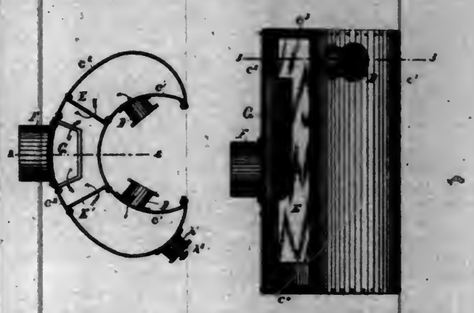
Claim.—1. In combination, the arm A, the arm B, the loop c^3, and the partition b', said partition being a coiled continuation of the arm B, substantially as described.

2. In combination, the arm A and the arm B, bent to form first the partition b', and then continued to form the loop c^3.



3. In combination, the arms A B, the partition, and the loop c^3, said loop being formed of the wire coiled back and forth from side to side of the partition, substantially as described.

404,004. ADJUSTABLE SHELF-BRACKET. ASSEL N. HOVEY, Jackson, Mich. Filed Feb. 16, 1889. Serial No. 300,143. (No model.)



Claim.—The combination of the standard A A, composed of the side pieces, *a a*, and cross-pieces *d*, said cross-pieces being set somewhat back from the front of said standard to form the shoulders *e e*, and the shelf-supporting arm B B, provided with the hook *f*, and a brace adapted to pass between the side pieces, *a a*, and rest against the cross-pieces *d*, substantially as shown and described.

404,005. CAR-BRAKE. ANOS M. KENDALL, Sioux City, Iowa. Filed Aug. 6, 1888. Serial No. 282,106. (No model.)

Claim.—The combination, with the lever A, ratchet-wheel C, and grooved pulley D, all being attached to shaft J with loose bearings, so as to revolve independent of each other, of pawl B, rubber spring K, grooved pulley E, attached by loose bearings to ratchet-wheel C, chain G, secured to lever A, supported by uprights F F, together with pawl H, the mechanism so arranged that by the lever being raised the slack of the chain and brake are taken up, and by a downward pressure of the lever increased power is produced to set brake, substantially as described, and herein set forth.

404,006. HEATING-FURNACE. THEODORE KRUSE, Indianapolis, Ind. Filed June 29, 1888. Serial No. 278,597. (No model.)

Claim.—In a heating-furnace, the combination, with the circular combustion-chamber B, of the crescent-shaped radiator C, located at the rear of and extending around but a portion of the circumference of said combustion-chamber, as shown, and having the two transverse dividing-partitions E E', extending from the top of the radiator only a portion of its length, as set forth, flues connecting the radiator and combustion-chamber, and the smoke-box G, located centrally between the partitions and open at its top and closed at the bottom and having an outlet-opening in communication with its interior, substantially as described, and for the purpose set forth.

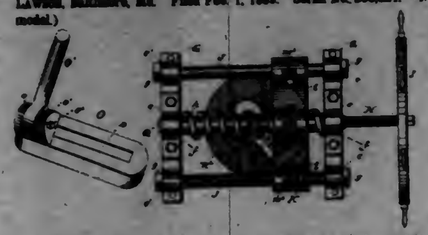
404,007. FOLDING GATE. DANIEL R. LADD, Schenectady, N. Y. Filed Feb. 1, 1889. Serial No. 298,827. (No model.)

Claim.—1. In combination with a post, the folding gate comprising bars A A' B B', hinged at their ends, and the slats pivotally secured at their ends to the bars.

2. In a gate, the combination, with bars A A' B B', grooved as shown, of slats seated at their ends in the grooves and pivotally attached to the bars and hinges connecting the bars.

3. In a gate, the combination, with the bars, of the slotted slats secured thereto and the hinges connecting the bars.

4. In combination with a post, a gate comprising bars A A' B B', one of which, A, is secured to the post, hinges connecting the bars, and slats pivotally connected at their ends to the bars.



5. In a gate, the combination, with the bars A A' B B', two of which, A' and B, have their ends beveled, as shown, of the slats pivotally connected to the bars.

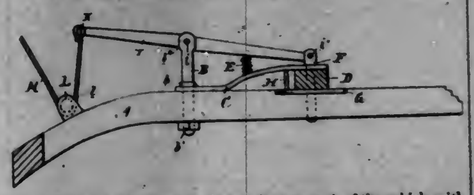
6. In a gate, the combination, with the post and the bars A A' B B', one of which, B', extends beneath the end of bar A, of hinges

connecting the bars, belts or fastenings for securing the bar to the post, and slats pivotally connected to the bars.

7. In a folding gate, the combination, with the bars A' B, of the hinge C, comprising two parts abutting squarely along their meeting edges.

404,008. STEERING APPARATUS. HENRY LAWSON and ALBERT LAWSON, Baltimore, Md. Filed Feb. 1, 1889. Serial No. 298,821. (No model.)

Claim.—1. In a steering apparatus, the combination, with a threaded steering-wheel shaft and a nut traveling thereon, of a slotted link adapted to receive a projection on the rudder-cap and a hinged connection between said link and the nut, as described.



2. In a steering apparatus, the combination, with a threaded steering-wheel shaft and a nut traveling thereon, of a slotted link adapted to receive a projection on the rudder-cap and a hinged connection between said link and the nut, said link and nut being adapted to be reversibly connected, in the manner and for the purpose specified.

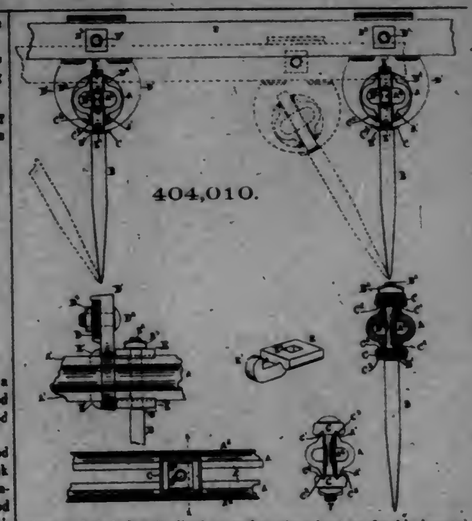
3. In a steering apparatus, the combination, with a threaded steering-wheel shaft and a nut traveling thereon provided with vertical openings, of a slotted link adapted to receive a projection on the rudder-cap and a pin pivoted to said link and adapted to enter either of the openings in the nut, as described.

4. In a steering apparatus, the combination, with the threaded steering-wheel shaft, the yoke G, secured to a housing, E, said yoke having bearings for said shaft, the guide-rods J J, having bearings in said yokes, the nut K, having a central threaded opening, *k*, and the openings *l' l*, of the link O, slotted to receive a projection on the rudder-cap, and the pin O', adapted to enter either of the openings *l*, as described.

5. In a steering apparatus, the combination, with the threaded steering-wheel shaft and a nut traveling thereon, of a rudder-cap provided with an angular projection, a link slotted to receive the latter, a connection between said link and the nut, a housing around said rudder-cap, and a brace secured to the housing and to the projection of the rudder-cap over the link to hold the latter in place, as described.

404,009. HORSE-DETACHER. FRANK LEBHART, Brazil, Ind. Filed Feb. 9, 1889. Serial No. 299,337. (No model.)

Claim.—1. The combination of the tongue A of the vehicle with the whiffletree D, the hasp C, the bolt F, upon which the whiffletree vibrates, the lever I to withdraw the bolt F, the standard B, supporting the lever I, the spring K, the pulley L, and the strap M, connected to the lever I and passing under the pulley L, substantially as and for the purposes described.

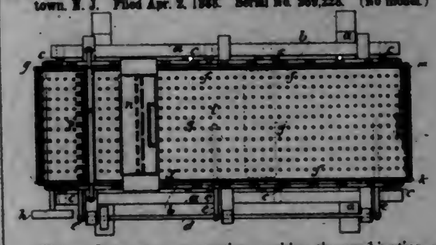


2. The combination of the tongue A of a vehicle with the hasp C, the whiffletree D, the bolt F, the standard B, the lever I, the spring E, the pulley L, the strap M, and the studs H, substantially as and for the purposes described.

404,010. HARROW. JAMES MARSHALL and FRANKLIN M. NEEDHAM, Rockford, Ill. Filed Aug. 17, 1888. Serial No. 282,905. (No model.)

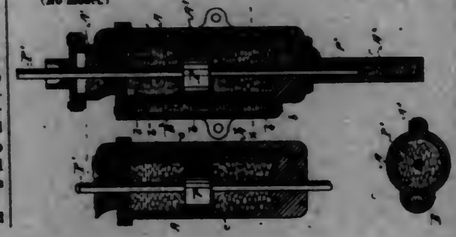
Claim.—1. A harrow-beam consisting of two bars of metal secured together by means of teeth threaded at their upper ends or bolts transversely inserted between said bars, clamps having parallel grooves in their inner faces and openings therethrough adapted to engage with and secure said bars and teeth or bolts together, and nuts applied to said teeth or bolts to secure the herein-named parts together into a rigid whole.

2. In combination, two bars of iron having, preferably, beveled



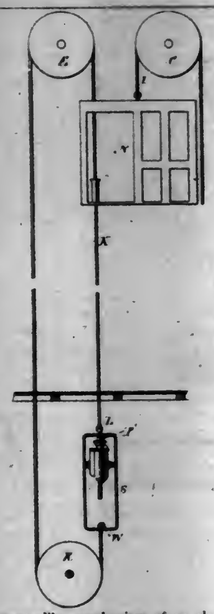
404,010.

edges and their longitudinal central portions bent preferably in semi-cylindrical form, any suitable number of harrow-teeth inserted between said bars, each having a horizontal shoulder thereon at any desired distance below the top of the same and the upper portion thereof cylindrical in form and threaded to receive a nut, clamps having parallel grooves in their inner faces adapted to receive the edges of said bars and the outer sides of said grooves being inclined toward the center of said clamps sufficiently to draw said bars into close contact with the harrow-teeth, and nuts for drawing said clamps together substantially as described, and for the purpose specified.



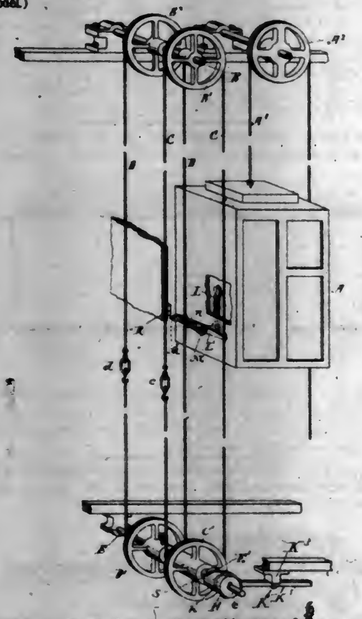
3. In combination, the herein-described two-part harrow-beam secured together by means of harrow-teeth inserted between the two parts composing the same, clamps and nuts, as shown, the cross-beams, the hangers secured to and depending from said cross-beams and having horizontal circular openings in the lower portions of the same to admit said two-part harrow-beams, and hook-lugs connecting with the latter and extending through and engaging with said hangers and forming with them oscillating bearings, by which said two-part harrow-beams are supported and in which they may be operated, substantially as described, and for the purpose set forth.

404,011. ORE-CONCENTRATOR. WALTER MCDERMOTT, Morristown, N. J. Filed Apr. 2, 1888. Serial No. 269,223. (No model.)



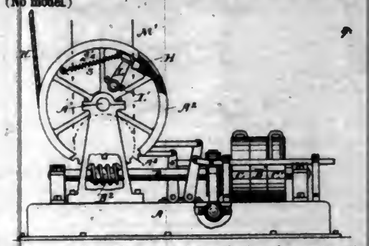
Claim.—In an ore-concentrating machine, the combination, with the water-distributer, of an endless traveling belt presenting a smooth surface in the lines of the water-jets and ore-retaining pockets between them, substantially as described.

404,012. ELEVATOR-CONTROLLING MECHANISM. WILLIAM R. NICKERSON, Cambridge, Mass. Filed Feb. 6, 1889. Serial No. 299,190. (No model.)



404,012.

Claim.—In the controlling mechanism of an elevator, the combination of the controlling-rope K and piston P with the cylinder A, having the passage-way B and the openings *b b*, substantially as and for the purpose set forth.

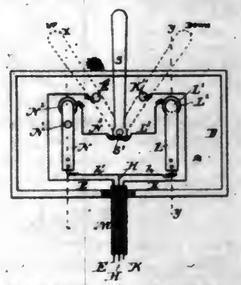


404,013. CONTROLLER FOR ELEVATORS. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Feb. 11, 1889. Serial No. 299,467. (No model.)

Claim.—1. In an elevator, the combination of the carriage A, hoisting-rope A', ropes D and C, lever L', having the rope D attached to it on one side of its pivotal point and the rope C attached on the other side of said pivotal point, and the pulleys B' and B, with the pulleys D' and C, one of which is rigidly attached to the shaft E and the other loosely mounted upon said shaft and adapted by a rotary movement relative to the first to increase and diminish the axial distance between them, the shaft E, and a system of levers to convey the axial longitudinal movement of the loosely-mounted pulley to the controlling mechanism of the hoisting apparatus, substantially as and for the purpose set forth.

2. In an elevator-controlling device, the combination of the hand-lever L, controlling-lever M, rod M', and lever M², having a stud, M³, and the lever L', with the stop R, affixed to the well-room of the elevator, substantially as and for the purpose set forth.

404,014. SLACK-ROPE STOP FOR ELEVATORS. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Feb. 15, 1889. Serial No. 299,956. (No model.)



Claim.—1. In an elevator hoisting device, the combination of the winding-drum A², rigidly fixed to its shaft, and hoisting-rope H, with a movable rope-end coupling and retractor S, said end coupling having a transmitting mechanism adapted to operate the belt-shipping device, substantially as and for the purpose set forth.

2. In an elevator hoisting-device, the combination of the winding-drum A², rigidly fixed to its shaft, and hoisting-rope H, with the spring-retractor S, and a transmitting mechanism adapted to set a pawl or other clutch device in working connection with the controlling device of the elevator, substantially as and for the purpose set forth.

3. In an elevator hoisting device, the combination of the winding-drum A² and rope H with the arm or hook L, spring S, rocker-shaft L', pawl L², pinion K, gear K', shaft K², and hand-rope wheel M, substantially as and for the purpose set forth.

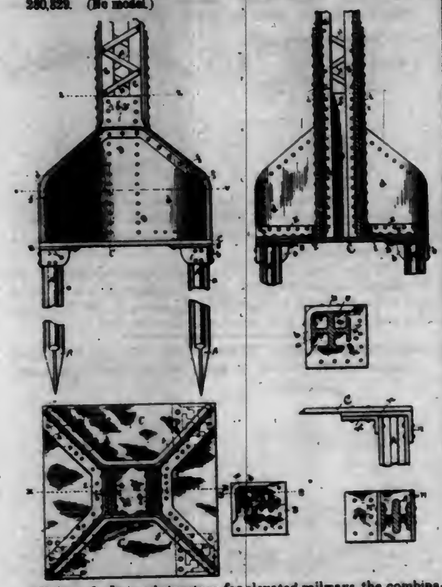
404,015. ELECTRICAL SWITCH FOR ELEVATORS. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Feb. 28, 1889. Serial No. 301,505. (No model.)

Claim.—1. In an electric device for controlling the motion of an elevator-carriage, the combination of a series of cam-pieces on the walls of the elevator-well disposed with reference to the various landings and adapted to act upon a circuit-breaking device within the carriage and cause the carriage to automatically stop at said landings and so remain until the circuit has been manually re-established, with electrical circuits having terminals within the carriage connected to said circuit-breaking device, and an electric device adapted to actuate the controlling mechanism of the hoisting-engine, substantially as and for the purpose set forth.

2. In an electric device for controlling the motion of an elevator-carriage, the combination of the cams P P and a circuit-breaking device, as described, with an electric bridge adapted to re-establish the electric circuit at the option of the attendant when said circuit has been automatically broken at a landing by a fixed cam-piece, substantially as described, and for the purpose set forth.

3. In an electric device for controlling the motion of an elevator-carriage, the combination of the switch S, posts E⁴ K', contact-points N² L², contact-plates N L, and the several connecting and circuit wires, with an electric device, substantially as and for the purpose set forth.

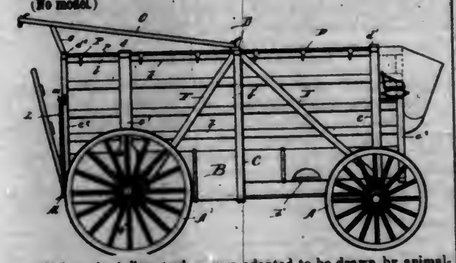
404,016. NUT-CRACKER. HENRY M. QUACKENBOSS, Herkimer, N. Y. Filed Nov. 19, 1888. Serial No. 291,280. (No model.)



Claim.—1. A nut-cracker consisting of two levers connected at one end and of substantially cylindrical form in cross-section in the jaw portions, whereby the sides of the jaws are caused to project beyond the bearing-faces, and thus to guard the fingers against injury.

2. A nut-cracker consisting of two levers jointed one to the other, each lever having a serrated jaw portion the serrated face of which is narrower than the body of the jaw, whereby the projecting sides of the jaws serve to hold the fingers away from the serrations.

404,016.



404,017. SUBSTRUCTURE FOR ELEVATED RAILWAYS. STILLMAN W. ROBINSON, Columbus, Ohio. Filed July 23, 1888. Serial No. 280,829. (No model.)

Claim.—1. In a substructure for elevated railways, the combination, with three or more piles having caps *b*, of a base-plate secured to caps and piles and a superstructure-supporting column supported on said base-plate, substantially as and for the purpose specified.

2. The combination, with three or more piles, A, having flanged caps *b*, to which they are secured, of base-plate C, secured upon said caps, a superstructure-supporting column supported upon said base-plate and plates D, and angle-bars secured to said base-plate and column, substantially as and for the purpose specified.

404,018. LIVE-STOCK WAGON. MADISON D. SHIPMAN and WALTER S. REYNOLDS, De Kalb, Ill. Filed Aug. 4, 1888. Serial No. 282,016. (No model.)

Claim.—1. A live-stock wagon adapted to be drawn by animal-power, of a size adequate to hold two animals and provided with stanchions for both said animals, such stanchions being located one at the front and one midway of the wagon, but upon the same side thereof, whereby the animals are confined with their heads to the front and their bodies at an angle to the line of the wagon, substantially as specified.

2. A live-stock wagon provided at one side with stanchions for two animals and a guard for positioning the front animal, substantially as specified.

3. A live-stock wagon adapted to be drawn by animal-power, having a stanchion for confining an animal at one side of the front end of the wagon and a driver's seat abreast of said stanchion, substantially as set forth.

4. A live-stock wagon having an elevated floor at its forward portion and a depressed floor at its rear portion and a stanchion for confining an animal upon each of such floor portions, substantially as set forth.

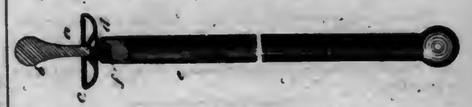
5. In a live-stock wagon, a depressed floor portion, E', secured to the under side of a straight or unbent rear axle, in combination with such axle, substantially as set forth.

6. A live-stock wagon the cage whereof embodies the diagonal braces F, extending from the axles, respectively, to the top center of the wagon, substantially as and for the purpose specified.

7. In a live-stock wagon, a cattle-stanchion consisting of a stationary bar and a movable bar, the latter connected by a connection pivoted to it and the stationary part, substantially as set forth.

8. In a live-stock wagon, a cattle-stanchion having a movable side, in combination with the slotted top brace, the floor-stop, and the pivotal connection to the stationary side, substantially as specified.

9. In a live-stock wagon, a cattle-guard, J, in combination with the cattle-stanchion K K', and connected to the movable part of the latter, substantially as specified.



10. The combination, with a live-stock wagon, of an end-gate fastening consisting of the rod hinged to one side of the wagon and having a tightening-nut at its free end, and a hook carried upon the other side of the wagon and adapted to receive such free end of the rod, and provided with a projection or bend adapted to act with the nut to confine the rod in the hook, substantially as specified.

11. A live-stock wagon having a top pole, O, projecting from the rear and adapted to sustain a slaughtered animal, substantially as set forth.

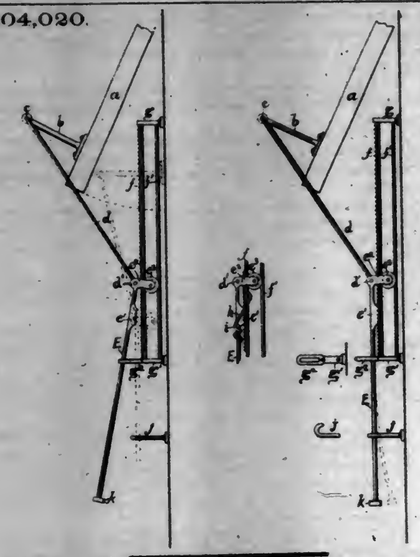
12. A live-stock wagon having meat-hooks pivoted along the top rail and adapted to be swung over said rail when not in use, substantially as specified.

13. A live-stock wagon provided with an animal-holding device—such as a stanchion—at its forward end, and also with another stanchion adapted to hold an animal in its rear portion and capable of being moved out of the way when putting in or removing animals from the forward portion, substantially as specified.

404,019. PESSARY. ALFRED W. SPERRY, Hartford, Conn. Filed Nov. 24, 1888. Serial No. 291,756. (No model.)

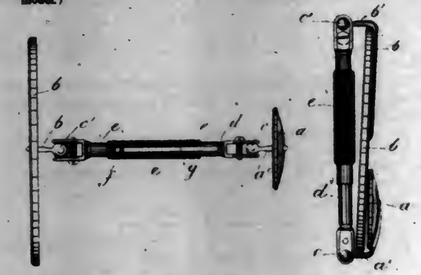
Claim.—As a new article of manufacture, a pessary consisting of a stem with an enlarged head rising from the center of a cup-shaped base, which has a concavity in its bottom, said concavity having a dependent screw-threaded stem, and a handle with a rounded end in which is a threaded socket adapted to engage the screw-threaded stem, substantially as specified.

404,020. TRANSOM-LIFTER. JAMES K. SPRAGUE, Chicago, Ill. Filed Nov. 30, 1888. Serial No. 292,244. (No model.)



Claim.—1. In a transom-lifter, the combination, with the connecting-rod *d*, of the lever E, provided with roller e^3 and tracks for the same, and teeth *e'*, and fixed teeth to receive and hold said movable teeth, substantially as specified.

2. In a transom-lifter, the combination, with the spring locking-lever E, provided with guide-roller and guide-slot and teeth *e*, of the tracks for said roller, and fixed rack for said teeth, and connecting-rod *d*, substantially as specified.

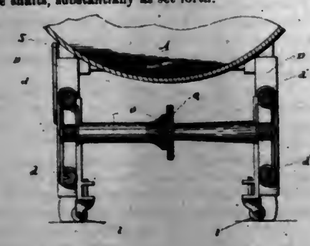


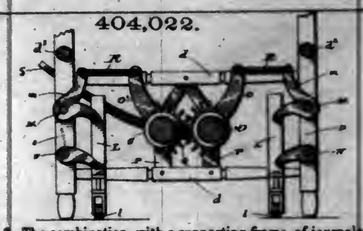
3. In a transom-lifter, the combination, with the elastic and toothed lever E, connecting-rod *d*, and roller e^3 on said lever, of the tracks for said roller, fixed rack for said teeth, and locking device for said lever, substantially as specified.

4. In a transom-lifter, the combination, with the right-angled and toothed lever E, provided with roller and connecting-rod *d*, and locking-spring *h*, of the tracks for said roller, fixed teeth to interlock with those of the rod E, and guide for said lever, substantially as specified.

404,020.

404,021. DENTAL MIRROR. EDWIN A. TICE, London, County of Middlesex, England. Filed Dec. 1, 1888. Serial No. 292,422. (No model.)

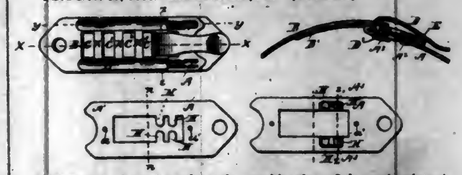




Claim.—In combination, the tube *c*, the tube *d*, fitted to slide within the same, the said tubes having bifurcated ends with adjusting-screws, mirrors having angular extensions *a' b'*, and spherical bearings *c c'*, held between the bifurcated ends of the tubes, substantially as described.

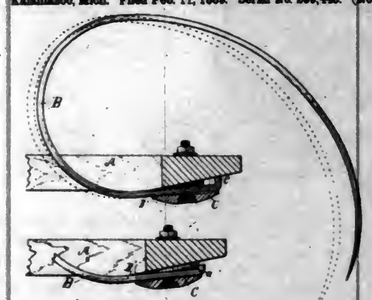
404,022. CASTER-FRAME FOR TUBS, &c. WILLIAM E. WASHBURN, Kansas City, Mo. Filed Dec. 14, 1887. Serial No. 257,915. (No model.)

Claim.—1. The combination, with a supporting-frame, of journaled shafts having intermeshing gears, a lever for operating said shafts, auxiliary supports provided with casters, and connections between the shafts and auxiliary supports, substantially as set forth.



2. The combination, with a supporting-frame, of journaled shafts carrying intermeshing gears, an operating-lever secured to one of said shafts, arms on said shafts, auxiliary supports provided with casters, angle-levers pivoted to the posts of the frame and connected with the auxiliary supports, and rods connecting the angle-levers and the arms on the shafts, substantially as set forth.

3. The combination, with a supporting-frame, of journaled shafts carrying intermeshing gears, an operating-lever secured to one of said shafts, a keeper for said lever, arms on the shafts, angle-levers, and rods connecting them with the arms, auxiliary legs provided with casters pivotally connected with the angle-levers, and arms connecting the auxiliary legs with the posts of the machine-frame, substantially as set forth.



404,023. SHOE-CLASP. GEORGE A. WELD, Winchester, Mass. Filed Nov. 19, 1888. Serial No. 291,272. (No model.)

Claim.—1. In a shoe-clasp, the combination of the main plate A, having inwardly-folded ears H H and depressions A^3 A^3, adapted to be doubled onto itself, with the tongue D, substantially as described, and for the purpose set forth.

2. In a shoe-clasp, the attachment-plate B, having depressed ribs B' B', adapted to rest upon the sides of the clasp-plate A A' and to hold the cross-bars K K K above the spring-plate E, with the spring-plate E and clasp-plate A A', substantially as described.

404,024. HARROW-TOOTH HOLDER. MALCOLM B. WILLIAMS, Kalamazoo, Mich. Filed Feb. 11, 1889. Serial No. 299,443. (No model.)

Claim.—1. The combination of a harrow-beam having an inclined recess, a curved harrow-tooth having a straight shank, a bearing-point for the shank to rest upon between said shank and the inclined recess, and a clip-plate binding said shank to the beam, substantially as set forth.

2. The combination of a harrow-beam having the inclined recess, a curved harrow-tooth having a straight shank, and an inclined or wedge-shaped block between the shank of the tooth and the incline of the recess, substantially as set forth.

404,025. CHECK-ROW CORN-PLANTER. WILBUR M. WILLIAMS, Holden, Mo. Filed Oct. 24, 1888. Serial No. 289,049. (No model.)

Claim.—1. In a check-rower mechanism, the combination, with two sets of oppositely-disposed ratchet-teeth actuated by the planter-wheel, of a toothed ring interposed between the said sets of ratchet-teeth, means for throwing the toothed ring into engagement with either set of ratchet-teeth, the feed mechanism, and means for communicating the motion of the toothed ring to the feed mechanism, substantially as set forth.

2. The combination, with the feed mechanism and the ground-wheel of the planter, of two circular series of ratchet-teeth secured to the ground-wheel and concentric therewith, and a cam-carrying ring for operating the feed mechanism, the cam-carrying ring being loosely

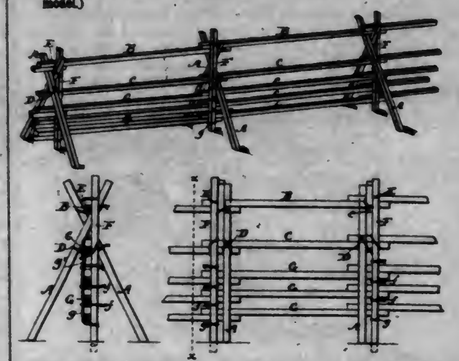
404,025.

mounted between the said series of ratchet-teeth and having interlocking ratchet-teeth on its opposite edges, substantially as set forth.

3. The combination, with the feed mechanism, the ground-wheel of the planter, and operating devices connecting the ground-wheel and feed mechanism, of a pair of rising and falling markers, an inclined guideway, a slide seated in said guideway, flexible connections between the slide and the markers, and a holding and releasing device in connection with the slide and feed mechanism for operating the slide, and hence the markers, simultaneously with the dropping of the corn, substantially as set forth.

4. The combination, with the feed mechanism, the ground-wheel of the planter, and operating devices connecting the ground-wheel with the feed mechanism, of a pair of rising and falling markers, a guideway, a slide seated in the guideway, connections between the slide and markers, a spring-actuated latch to hold the slide, and a latch-operating lever in engagement with the spring-latch and with the feed mechanism, substantially as set forth.

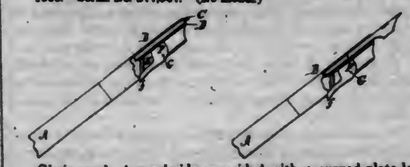
5. The combination, with the feed-bar and the ground-wheel adapted to actuate the feed-bar, of a guideway, a slide seated in the guideway, a pair of rising and falling markers connected with the slide, a spring-actuated latch, a latch-operating lever in engagement with the feed-bar, and a guide located in the path of the latch-operating lever to throw it out of engagement with the feed-bar as it reaches the end of its stroke, substantially as set forth.



6. The combination, with the feed mechanism, the rotary cam and its support, the rising and falling markers, and the slide connected with the markers, of the toothed plate between which the cam-support is mounted and the springs for holding the cam-support in normal engagement with one of the toothed plates, substantially as set forth.

7. The combination, with the feed mechanism, the rotary cam-support, the rising and falling markers, and the slide connected with the markers, of the side-actuating arm on the cam-support, substantially as set forth.

8. The combination, with the rotary cam-support and the circular series of teeth between which it is mounted, of the pawl pivoted to an arm on the periphery of the cam-support, the said pawl carrying a claw-bar adapted to engage one of the series of teeth when the pawl is rocked forward, substantially as set forth.



9. The combination, with the rotary cam-support and the series of teeth between which it is mounted, of the pawl pivoted to an arm on the periphery of the cam-support, the said pawl carrying a spring-actuated claw-bar adapted to engage one of the series of teeth, and a spring to hold the pawl normally tilted away from the arm to which it is pivoted, substantially as set forth.

404,026. FENCE. WILLIAM R. ARNETT and CALVIN W. ARNETT, Fairmont, W. Va. Filed Mar. 16, 1889. Serial No. 303,507. (No model.)

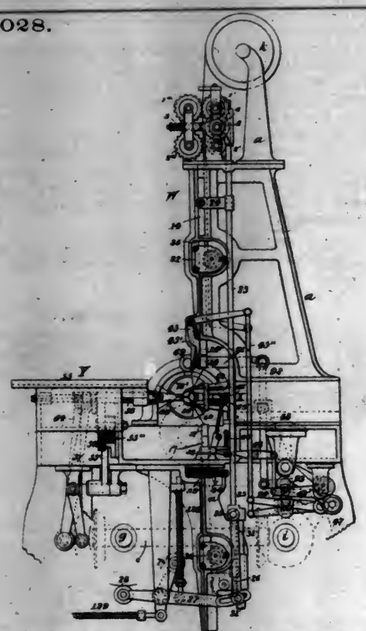
Claim.—As an improvement in fences, the combination of the cross-stakes A, the under crotch-rails, C, the upper crotch-rails, B, the lashings E, surrounding the ends of the rails B and of the stakes A, the two vertical binder-posts F between the crossed stakes of one panel of fence, the rails G, and the rail-supporting wire *g*, having its lower end fastened to the post F and its upper end encircling the under crotch-rails, C, and said binder-post opposite said rails, substantially as shown and described.

404,027. PEN-HOLDER. GEORGE W. BALDWIN, Schaghticoke, N. Y., assignor of one-half to George H. Stevenson, same place. Filed June 19, 1888. Serial No. 277,567. (No model.)

Claim.—1. A pen-holder provided with a curved plate loosely secured within the tube, and a cam, whereby a pen may be clamped between the curved plate and the tube by means of the cam, as set forth.

2. A pen-holder provided with two curved plates loosely secured within the tube, and a cam, said plates being of different curves, as set forth.

3. A pen-holder provided with two curved slotted plates, a pin passing through the slots and secured to the tube, and a cam-clamp operating to secure a pen in the holder, as set forth.



404,028. BOTTLE-WIRING MACHINE. ANDREW CAMPBELL, Brooklyn, assignor, by mesne assignments, to The H. B. Abbott Machine Company, New York, N. Y. Filed Oct. 1, 1888. Serial No. 286,905. (No model.)

Claim.—1. In a bottle-wiring machine, the combination, with a double set of wire-feeding wheels, of two sets of reciprocating wire-guides and a primary twister which unites the two wires between the upper and lower pairs of guides, substantially as set forth.

2. In a bottle-wiring machine, the combination, with two sets of wire-feeders for the wires driven at different rates of speed, of two sets of reciprocating wire-guides which move at different rates of speed, and a primary twister which unites the wires between the upper and lower pairs of guides, substantially as set forth.

3. In a bottle-wiring machine, the combination, with feeders which feed the two wires, of upper and lower reciprocating guides

404,028.

through which the wires pass longitudinally, said guides being axially aligned, wire-cutters for severing the wires at the upper guides, and a twister which unites the wires exposed by the separation of the upper and lower guides, substantially as set forth.

4. In a bottle-wiring machine, the combination, with the wire-feeders, of the reciprocating upper wire-guides and the guide-tubes which lead the wires from the feeders into the guides.

5. The combination, with the upper guide for the wire provided with a cutter-slide and its spring, of the elbow-lever having one arm arranged in the path of the projecting end of said slide, and the rod, lever, and cam which actuates said elbow-lever, substantially as set forth.

6. The combination, with reciprocating guides for the wires, of the primary twister for uniting the same between the upper and lower guides, said twister consisting of the tubular shaft rotating concentrically about the guides, the elbow-lever 41, mounted on said shaft, the twisting-blades 42, carried by said lever, the spring which actuates said blades, and the cam and lever whereby the blades are retracted, substantially as set forth.

7. The combination, with the shaft 38, the elbow-lever 41 carried thereby, the twisting-blades 42, carried by said lever, the spring which actuates said blades, the pinion 39 on said shaft, the wheel 127, gearing with said pinion, the pinion 126, ratcheted to wheel 127, the rack that drives the pinion 126, the lever 43, which retracts the twister-blades, provided with a keeper-notch to engage the arm of the elbow-lever 41, and the cam which actuates the lever 43, substantially as set forth.

8. The combination, with the upper guide, 14, and lower guide, 17, of the rod 23, connected to the upper guide, the connecting-rod 26, coupling said rod to the cam-lever, said cam-lever, the cam which actuates said lever, the rack 31, connected with rod 23, the rack 29 on the guide 17, and the toothed wheel 30, rotatively mounted in the frame and gearing on its opposite sides with the said racks 29 and 31, whereby the upper and lower guides are moved simultaneously in opposite directions.

9. The combination, with the two wire-guides forming a pair, arranged side by side and provided with racks, of the two connected pinions 33 and 33', of different diameters, gearing with the respective racks on the guides, whereby the movement of one guide of the pair imparts to the other guide a movement in the same direction, but at a different rate of speed.

10. In a bottle-wiring machine, the lower wire-guides, each provided with a clamp for the wire, substantially as set forth.

11. The combination, with the lower wire-guide, 17, provided with a longitudinal passage for the wire, of the clamp-jaw 18, arranged to bear on the wire, its spring 19, the loose pin 20, and the other lower wire-guide, 17', provided with a cam-like projection, 22, arranged to stand under said pin 20 when the two guides stand at the same elevation, substantially as set forth.

12. The combination, with the pair of wire-guides, each guide being provided with a rack on its face, of the frame 32, embracing said guides, the connected pinions 33 33', frictionally mounted in said frame and gearing with the respective racks, said pinions having different diameters, and the machine-frame a, loosely embracing said frame 32, so as to permit the guides to carry the frame and pinions a limited distance, substantially as set forth.

13. The combination, with the wire-feeding wheels 1 1', provided with gears 13 13', respectively, said gears having different diameters, of the rack 6, the wheel 5, gearing therewith, the shaft 4, the wheel 8 on said shaft, provided with a pawl, 9, the sleeve 11 on the shaft 4, the gears 12 12', fixed on said sleeve and gearing, respectively, with said gears 13 13', and the ratchet-wheel 10, fixed on said sleeve 11 and engaged by said pawl, substantially as set forth.

14. In a bottle-wiring machine, the device for placing or applying the band about the neck of the bottle, consisting of a reciprocating carriage, a pair of forked placing-fingers, 50 50, mounted in sliding bearings in said carriage and provided with a spring, 51, and a shoulder, 49', a pair of forked fingers, 52 52, fulcrumed on short levers 53 53, pivoted on the carriage, the said short levers having their tails arranged in the path of the shoulder 49', a spring arranged between the tails of the fingers 52, and the retracting-springs 54 54, all arranged to operate substantially as set forth.

15. The combination, with the wire-guides and the primary twister which form the wire band, the axis of said guides being at right angles to the axis of the bottle in the machine, of clamps for holding the bottle while it is being wired, the band-placer X, adapted to place the formed band about the bottle-neck, and a secondary twister arranged opposite the band-placer, which closes the band about the bottle-neck, substantially as set forth.

16. A twister for closing the band, consisting of a rotating tubular shaft, 58, two jaws, 60 and 60', hinged to the end of said shaft and provided with teeth, as described, to embrace the wires, and one of said jaws provided with a tooth which takes between the wires, the slide-rod 61 in shaft 58, and the device attached to rod 61 for actuating said jaws, said device comprising a spreader between the jaws and rollers or blocks 63 63', bearing on the exterior faces of the respective jaws and connected to said slide-rod, substantially as set forth.

17. In a bottle-wiring machine, a support and holder for the bottle, consisting of a reciprocating slide mounted on the machine-frame, a bearing-clamp which embraces the body of the bottle elastically, and a reciprocating carriage mounted in the machine-frame and bearing a clamp that embraces the bottle-neck elastically, said carriage being capable of movement to a limited extent independent of each other, whereby the bottle-neck is moved through the neck-clamp by the body-clamp, as and for the purposes set forth.

18. The combination, with the reciprocating carriage 100, of the reciprocating carriage 116, the rod 101, secured to the carriage 100, provided with collars 117 and 117' and playing through a lug on the carriage 116, said lug being arranged between said collars, the spring-actuated clamp mounted on carriage 100, and the spring-actuated clamp for the bottle-neck mounted on the carriage 116, substantially as set forth.

19. The combination, with the carriage 100, of the lateral jaws 106 106', pivoted thereon, the sliding jaw 106", the shaft 107', the wheel 107, fixed thereon, the links 108 108', coupled at one end to the respective jaws 106 106' and at the other end to the wheel 107, the disk 110, carried by the wheel 107, the link 108", coupling the jaw 106" to said disk, and the spring 111, which sets the jaws of the clamp, substantially as set forth.

20. The combination, with the carriage 116, the jaws 118, mounted thereon, the connected knuckle-levers which actuate said jaws simultaneously, the arm 119', connected with one of said levers and coupled to the rod 120, the said rod, and the spring 121 thereon, which closes said jaws, substantially as set forth.

21. The combination, with the carriage 100, the jaws of the clamp thereon, the gear-wheel 107, the links connecting said wheel with the jaws, the spring that closes the jaws, and the mechanism which opens the jaws, consisting of the long pinion 112, rotatively mounted in the frame and gearing with wheel 107, the segment-rack gearing with said pinion, the lever 114, and the operating-cam, substantially as set forth.

22. The combination, with the cam 113, the lever 114, the rack 115, the long pinion 112, gearing with said rack, its shaft 112', provided with a crank, 112", the carriage 116, the jaws of the neck-clamp mounted therein and their knuckle-levers, the slide-rod 120, coupled to the knuckle-levers and provided with a pin, 120', and the spring on rod 120, whereby, when the carriage 116 is drawn back, the pin 120' may be engaged by crank 112" for releasing the clamp, as set forth.

23. In a bottle-wiring machine, the combination, with a clamp that holds the bottle and a movable carriage on which said clamp is mounted, of pushers on said carriage and elastically embracing the neck of the bottle, said pushers being adapted and arranged to push the strands of the wire up over the fillet on the bottle, as set forth.

24. The combination, in a bottle-wiring machine, of a movable holder for the bottle, carrying forked pushers to engage the radial branches or strands of wire, said pushers elastically embracing the bottle-neck, and the movable crown or crown-twister serving as an abutment to stop the movement of the bottle while the said pushers are in action, as set forth.

25. The combination, with the carriage 116 and the neck-clamp mounted thereon, of the pushers 122, hinged to the jaws of the neck-clamp and provided with suitable springs, 122', substantially as set forth.

26. The combination, with the carriage 116 and the neck-clamp mounted thereon, of the spring-supported guide 123, mounted on said carriage.

27. In a bottle-wiring machine, the means for gathering the wires over the cork and to the center of the same, said means consisting of the casing, as 73, having a face-plate with slots to receive and guide the wires, which stands near the end of the cork, pushers, as 122, which push the wires up over the fillet and into said slots, and vibrating gatherers, as 75, which play in said slots and bunch the gathered wires at the center of the cork, all combined substantially as set forth.

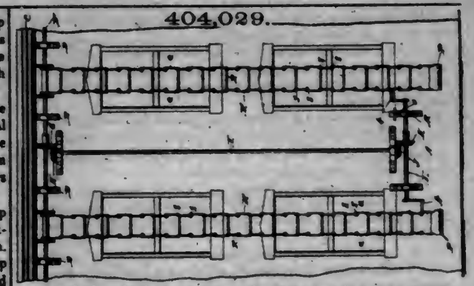
28. The combination, with the rotatively-mounted casing, as 73, having radial slots in its face-plate to receive the wires, of the vibrating gatherers that play in said slots, the movable twisting-jaws in said casing that clamp on the wires, and the movable cutters that sever the twist, also mounted in said casing, substantially as set forth.

29. The crown-twister having its shaft mounted to rotate in swinging arms, whereby a lateral motion may be imparted to said twister in order to flatten the twist upon the cork.

30. The combination, with the casing 73, having a radially-slotted face-plate, of the gatherers 75, arranged to play in said slots and provided with gear-teeth at their pivoted ends, the tubular shaft of the casing, the slide-bar 76, arranged within said shaft and having a rack or racks on its inner end engaging the teeth on the gatherers, the spring which retracts the gatherers, and the cam and lever which actuate said gatherers through the bar 76, substantially as set forth.

31. The combination, with the bar 69, mounted loosely in suitable bearings, and the bearing-brackets 70, fixed to said bar, of the shaft 71, mounted rotatively in said bearings and provided with a pinion, 84, the casing 73 on the end of said shaft 71, the rocking lever 91, whereby said casing is moved or swung laterally, the lever 72, coupled to bar 69, whereby endwise movement is imparted to the casing, and the sector 85, gearing with pinion 84, substantially as set forth.

32. The combination, with the slotted shaft, as 58, of the secondary twister and the twisting-jaws hinged thereon, the jaw-actuating slide-rod, as 61, within said shaft, the slide 65', pinned thereto and sliding on shaft 58, the operating-slide 67, mounted on slide 65', and the cushion-spring 67', whereby the jaws of the twister are made to clamp the wires elastically, for the purpose set forth.

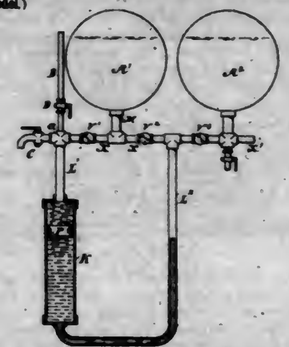


33. In a bottle-wiring machine, the combination, with two pairs of movable wire-guides which separate and thus expose the middle portions of the wires, in which the uniting-twists are formed, of mechanism, substantially as described, for actuating said guides, a primary twister which forms simultaneously the two uniting-twists in the wires between the ends of said guides, and mechanism, substantially as described, for actuating said twister.

34. In a bottle-wiring machine, the combination, with two pairs of movable wire-guides which separate and expose the middle parts of the wires by their movement thereon, of mechanism, substantially as described, for actuating said guides, a twister for simultaneously forming two twists in the exposed portions of the wires, said twister comprising two united blades adapted to embrace the wires and rotating about the latter, and mechanism, substantially as described, for actuating said twister, as set forth.

404,029. FIRE-ESCAPE. FREEMAN D. CHANDLER, Friendship, N. Y. Filed Jan. 31, 1888. Serial No. 262,945. (No model.)

Claim.—1. In a fire-escape, the combination of the horizontal main shaft, flexible ladders arranged to be wound upon drums on said shaft, a horizontal operating-shaft at the base of the building, a



counter-shaft and miter-gear connecting the operating-shaft with the main shaft, and a hand-screw arranged in one of the bearings of the operating-shaft and adapted to press against the latter, so as to form a brake or lock, substantially as and for the purpose set forth.

2. In a fire-escape, the flexible ladder consisting of a single strip or band of sheet metal, having struck-up portions wound around the intermediate cross-bars thus formed, and constituting the rungs of the ladder, substantially as herein set forth.

404,030. APPARATUS FOR ELEVATING WATER. NATHANIEL A. COMSTOCK, Brooklyn, N. Y. Filed Aug. 23, 1888. Serial No. 283,559. (No model.)

Claim.—1. The combination, with a supply-pipe, B, of a pipe, X, in communication with the pipe B and comprised in a distributing system for buildings, two reflow check-valves in the pipe X, a compressed-air chamber in communication with the pipe X between said reflow check-valves, a receiver for water connected with the pipe X at two points, said valves being located between such connections, a third check-valve beyond said connections, and a pressure-exerting device in said receiver, substantially as and for the purpose specified.

2. The combination, with a supply-pipe, B, of a pipe, X, in communication with the pipe B and comprised in a distributing system for buildings, two reflow check-valves in the pipe X, a compressed-air chamber in communication with the pipe X between said reflow check-valves, a receiver for water connected with the pipe X at two points, said valves being located between such connections, a third reflow check-valve in the pipe X beyond the two valves first named, a second compressed-air chamber beyond the third reflow check-valve, and a pressure-exerting device in said receiver, substantially as and for the purpose specified.

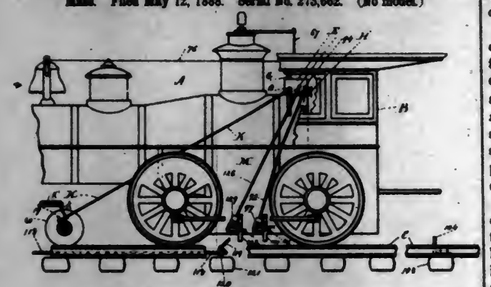
404,031. TRUCK-BEAM FOR RAILWAY-CARS. JOHN COUP, New York, N. Y. Filed Mar. 4, 1887. Renewed Mar. 30, 1889. Serial No. 305,499. (No model.)

Claim.—1. A draft-beam for railway-cars, made in swinging sections and extending throughout the entire length of a car, and to which the car-body is attached, substantially as described.

2. A draft-beam for railway-cars, made in sections pivotally con

nected and having recesses or chambers at their outer ends to support a draw-bar, substantially as described.

3. A draft-beam for railway-cars, made in sections and provided with a recess in each outer end, and a pin or stud in the rear of said recess, in combination with a suitable draw-bar and buffer, substantially as described.



4. A draft-beam for railway-cars, made in sections and each section provided with a transverse recess or groove in its upper surface, in combination with a bolt having an elongated head adapted to slide in said groove, substantially as described.

5. A draft-beam for railway-cars, having recesses in the outer ends and a projecting pin or stud, in combination with a draw-bar having a chamber in its rear end, a spring, and a buffer, substantially as described.

6. A draft-beam for railway-cars, made in sections pivotally connected and secured to king-bolts which engage with the trucks, in combination with a car-body connected to the beam and adapted to swing laterally at its ends, substantially as described.

7. A draft-beam for railway-cars provided with transverse curved recesses or grooves on its upper surface, in combination with a car-body connected to said beam by headed bolts engaging with said grooves and to the center of the beam by a fixed bolt on which the body oscillates, substantially as described.

404,032. DEVICE FOR INDICATING AND RECORDING THE SPEED, &c., OF RAILROAD-TRAINS. HERBERT L. CURRIER, Lynn, Mass. Filed May 12, 1888. Serial No. 273,662. (No model.)

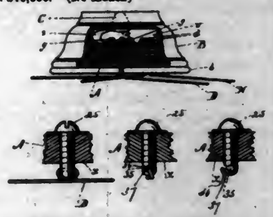
Claim.—1. The combination of a record-slip, actuating mechanism therefor connected with an axle of the train, a shaft provided with two gear-wheels, a horizontally-sliding rod provided with a rack at one end which is engaged by one of said gear-wheels and with a pencil-holder at the opposite end for carrying a pencil to inscribe said record-slip, a centrifugal governor comprising upper and lower inter-sliding tubes, arms hinged thereto and balls on said arms, the upper tube being provided with a cap having an interior chamber and the lower tube with a pinion, a vertical rod extending through said tubes and provided with a collet on its upper part within said chamber and with a rack at its lower end which engages the other of said gear-wheels, and mechanism for actuating said pinion connected with an axle of the train.

2. The combination of a record-slip, actuating mechanism therefor connected with an axle of the train, a shaft provided with two gear-wheels, a horizontally-sliding rod provided with a rack at one end which is engaged by one of said gear-wheels and with a pencil-holder at the opposite end for carrying a pencil to inscribe said record-slip, a centrifugal governor comprising upper and lower intersliding tubes, arms hinged thereto and balls on said arms, the upper tube being provided with a cap having an interior chamber and the lower tube with a pinion, a vertical rod extending through said tubes and provided with a collet on its upper part within said chamber and with a rack at its lower end which engages the other of said gear-wheels, mechanism for actuating said pinion connected with an axle of the train, an indicator, and a rack on the upper end of said vertical rod and engaging a pinion of the indicator for actuating the index-finger thereof.

3. In a device of the character described, the combination of a case, a record-slip within said case, mechanism actuated by a wheel of the train for moving said slip, a clock hinged to said case, the main shaft or arbor and sleeve thereof being extended and journaled in said case, two disks disposed, respectively, on said shaft and sleeve and provided with type-numerals on their peripheries, a track provided with a fixed vertically-arranged bar, and adjunctive mechanism on the train adapted to engage said bar and cause said disks to be forced against the slip and their numerals imprinted thereon, substantially as specified.

4. In a device of the character described, the combination of a locomotive, a track, a case, a record-slip within said case, mechanism actuated by a wheel on the locomotive for moving said slip, a clock hinged to said case and having its main shaft and sleeve journaled therein, two disks provided with type-numerals on their peripheries and respectively secured to said shaft and sleeve, a horizontal lever pivoted in said case, a curved elastic lever connecting said horizontal lever and shaft, a bell-crank lever pivoted to said locomotive, a vertically-arranged rod connecting said bell-crank lever with said horizontal lever, and a bar secured to the track in position to engage an arm of said bell-crank lever as the train passes over the same, substantially as set forth.

5. In a device of the character described, the combination of a case, a record-slip within said case, feed-rolls for said slip, mechanism actuated by a wheel of the train for rotating said rolls, a pencil disposed within said case, a track, a crossing-gate for said track, mechanism operated by said gate, whereby a bar is thrown into a vertical position on said track when the gate is lowered, and adjunctive mechanism on the locomotive adapted to be tripped by said bar and cause said pencil to indent said slip, substantially as specified.



6. In a device of the character described, the combination of a case, a record-slip within said case, feed-rolls for said slip, mechanism for actuating said feed-rolls driven by a wheel on the train, a pencil, a horizontal lever pivoted in said case, a curved elastic lever connecting said horizontal lever and pencil, a bell-crank lever pivoted to the locomotive, an inclined rod connecting said horizontal lever and bell-crank lever, a track, a crossing-gate, and mechanism operated by the gate to throw a bar upward on said track when the gate is lowered in position to engage said bell-crank lever and cause the pencil to indent the slip as the train passes the gate, substantially as set forth.

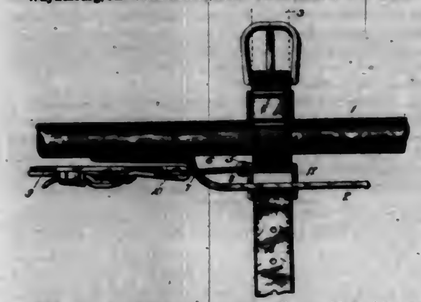
7. In a device of the character described, the combination of a case, a record-slip within said case, feed-rolls for said slip, mechanism for actuating said feed-rolls driven by a wheel of the train, a pencil disposed within said case, a track, a crossing-gate operated by a crank, a rod disposed horizontally on said track, a lever pivoted to said crank and rod, a bell-crank lever pivoted to a tie and to the outer end of said rod, so that an arm thereof will project above the track when said gate is lowered, and mechanism disposed on the locomotive in position to be tripped by said bell-crank lever as the train passes and cause said pencil to indent said slip, substantially as specified.

8. The combination, with a railway-vehicle, of a time-recorder comprising a record-slip, mechanism actuated by a wheel of the vehicle for moving said slip, a disk provided with type-numerals indicating hours adapted to print on said slip, a disk provided with type-numerals indicating minutes, also adapted to print on said slip, a clock for rotating said disks, a fixed bar projecting from the road-bed, and mechanism on the train adapted to be tripped by said bar for causing said disk to imprint said slip.

9. In a device of the character described, the combination of a record-slip, a pencil adapted to mark or indent said slip, mechanism actuated by a wheel of the train for moving said slip, a crossing-gate, a bar connected with said gate and adapted to be thrown into position to engage mechanism on the train inclosing said gate, and adjunctive mechanism on the train adapted to engage said bar as the train passes it and cause said pencil to indent said slip, substantially as set forth.

404,033. PUSH-BUTTON. HERBERT L. CURRIER, Lynn, Mass., assignor to himself and Albert H. Breed, same place. Filed July 12, 1888. Serial No. 279,699. (No model.)

Claim.—1. The combination of an insulating block or body provided with a recess or chamber in its under side, a metallic plate on the upper side of said body, a metallic spring, also on the upper side thereof, a cap surrounding said body, a push-button in said cap for forcing said spring into contact with the plate, and screws passing through said plate and spring, respectively, and through said body into the chamber in the under side thereof, said screws being provided with hooks at their lower ends within said chamber for the conducting-wires.



2. The combination of an insulating block or body, a metallic plate on the upper side thereof, a metallic spring, also on the upper side thereof, a cap surrounding said body, a push-button in said cap for forcing said spring into contact with the plate, and screws passing through said plate and spring, respectively, and through said body, said screws being provided at their lower ends with hooks which are entirely within the circumference of said body.

404,034. FRAME FOR HOLDING COPYING-PLATES. ALBERT R. DICK, Chicago, Ill. Filed Oct. 11, 1887. Serial No. 252,004. (No model.)

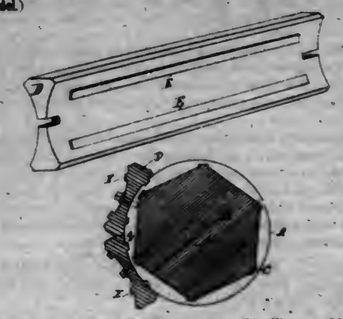
Claim.—The frame A, frame B, having the groove *a*, copying-plate I, fasteners C, and ears E, in combination with the pins *c c'*, spring-plate F, and base G, for securing the copying-plate in position for use, substantially as described.

404,035. HOLDBACK FOR VEHICLES. ROLAND F. DULANY, Waynesburg, Pa. Filed Feb. 28, 1889. Serial No. 301,464. (No model.)

Claim.—1. In a holdback, a pair of thills provided with prongs upon their under surface, in combination with a back-strap terminating in loops for receiving the thills and provided with rearward strap-loops having a double-eyed metallic coupling, and a holdback-strap or breeching terminating in opposite loops and connected with one of the eyes of the coupling, substantially as specified.

2. The shaft 1, having the prong 2, in combination with the back-strap 3, terminating in the thill-receiving loops 4, having the end loops, 5, the metallic couplings 6, having the opposite eyes, 7 and 8, the latter connected with the loops 5 and the former passing over the prong 2, and the holdback-strap 9, having the opposite loops 10, connected with the eyes 7, substantially as specified.

404,036. CARD-SETTING-MACHINE REST. NATHAN C. ROTH, Smithfield, R. I., assignor of one-half to J. & J. Murdock, Leicester, Mass. Filed Mar. 25, 1889. Serial No. 304,645. (No model.)



Claim.—1. In a card-setting machine, the combination, with the rest and its supporting-frame, of a supplemental adjustable rest adapted to present new points of wear for the wires which are supported thereon when the second bend is being made, substantially as set forth.

2. In a card-setting machine, the combination, with the rest adjustable back and forth on its supporting-frame, of a supplemental rest-blade adjustable laterally or endwise and means for securing the same to the rest, substantially as and for the purpose stated.

3. In a card-setting machine, the combination, with the rest adjustable back and forth on its supporting-frame and means for securing it in place, of a supplemental rest-blade movable laterally or endwise on said rest and wedge pieces and holding-screws for securing said supplemental rest in place, substantially as shown and described.

404,037. CONCAVE FOR HULLING-CYLINDERS. WILLIAM R. FIFE, Cincinnati, Ohio, assignor to the National Cotton Seed Oil and Huller Company, Memphis, Tenn. Filed Apr. 11, 1887. Serial No. 234,362. (No model.)

Claim.—1. A stave for the concave of hulling-machines, consisting of the part D, concave upon both sides and having the ribs E projecting from the concave parts upon opposite sides.

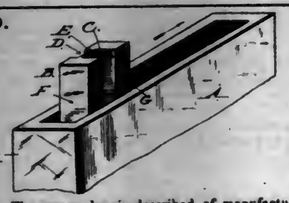
2. The combination, in a hulling-machine, of the hulling-cylinder, the end housings, A, and the staves D, said staves being concaved upon both faces and having the integral ribs E projecting from the opposite concaves and secured upon the housings, substantially as hereinbefore set forth.

3. The staves D for hulling-cylinders, concave upon both faces and having the ribs E arranged opposite each other upon both concave surfaces, substantially as set forth.

404,038. DOOR-CHECK. THOMAS K. HANNBERRY, Norton, Kans. Filed July 12, 1888. Serial No. 279,696. (No model.)

Claim.—A combined door check and buffer consisting of a lever adapted to be pivoted centrally to a door and normally lie horizontally along the door out of contact with the floor, and having its lower portion curved and serrated and capable of engaging the floor and its upper portion straight and provided with a lateral projection, serving as a handle and a buffer, substantially as described.

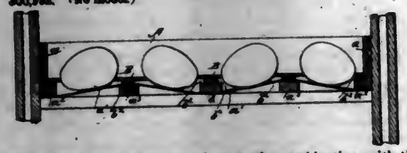
404,039. UMBRELLA. CHARLES W. HARRIS, Hartford, Conn. Filed Oct. 6, 1888. Serial No. 287,367. (No model.)



Claim.—1. As a new article of manufacture, an umbrella consisting of a stick, a frame the ribs of which are swelled near their ends and perforated at the swelled part, and a cover attached to the frame by metallic fastenings, each consisting of an enlarged head and a solid shank, which shank passes through the opening in the rib and is headed over on the side opposite from the enlarged head to cause the head to hold the cover close to the top of the swelled part of the rib, substantially as specified.

2. As a new article of manufacture, an umbrella consisting of a stick, a frame the ribs of which are swelled near their end and perforated at their swelled part, and a cover attached to the frame by metallic fastenings with oblong heads, their longer diameter being in the direction of the length of the ribs, the shanks of the fastenings passing through the perforations and headed over on the under side to cause the oblong heads to bite the cover between the fastenings and the swelled upper face of the rib, substantially as specified, and for the purpose set forth.

404,040. PROCESS OF MANUFACTURING ARTIFICIAL STONE. WILLIAM R. HAYNES and SAMUEL R. REAGEN, Denver, Colo. Filed Oct. 24, 1888. Serial No. 289,029. (No model.)

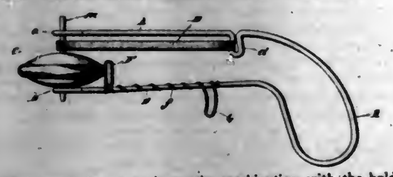


404,040.

Claim.—1. The process herein described of manufacturing artificial stone, consisting, essentially, in tamping on edge or end charges of coarse and fine material, the coarse material being on one side and the fine material being on the other side, substantially as herein described.

2. The process herein described of manufacturing artificial stone, consisting, essentially, in discharging into a suitable mold charges of coarse and fine material, so that the coarse material occupies one side of the mold and the fine material the opposite side, tamping said materials on edge or end, so that they may be caused to unite, advancing the mold longitudinally, then adding fresh charges, and finally tamping said charges, substantially as herein described.

404,041. **EGG-TRAY FOR INCUBATORS.** JOHN W. HILE, Valley Falls, Kans. Filed July 19, 1887. Renewed Feb. 23, 1889. Serial No. 300,982. (No model.)

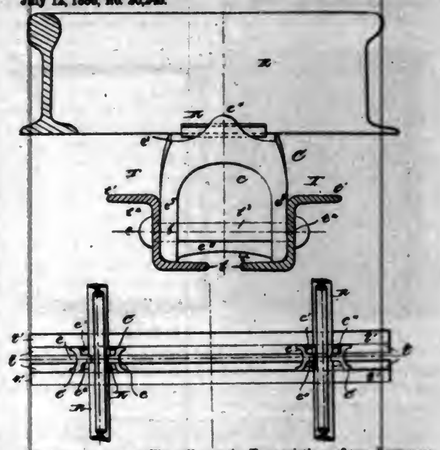


Claim.—1. In an incubator-drawer, the combination, with the side walls, *a*, and cross-strips a^2 a^3, of the fabric *a'*, passed alternately under and over said cross-bars, substantially as and for the purpose described.

2. The combination of an incubator-drawer having inclined surfaces upon which the eggs are supported, and a division-board having egg-shaped openings into which the eggs are fitted and held in an inclined position, substantially as described.

3. The combination of an incubator-drawer having cross-strips a^2 a^3, and canvas bottom *a'*, passed alternately under and over the said strips, and the division-board B, having egg-shaped openings and supported to slide upon the strips a^2, substantially as herein shown and described.

404,042. **TOP-SPINNER.** FREDERICK L. JOHNSON, Wallingford, Conn. Filed Nov. 23, 1888. Serial No. 291,632. (No model.)

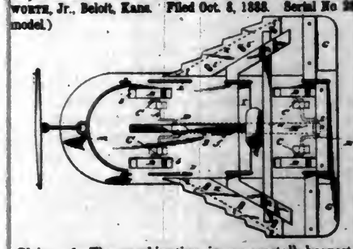


Claim.—1. In a top-spinner, the combination, with the holder comprising the two jaws *a* and *b* and the elastic secured at one end to the holder and adapted to have its other end wound around the shank of the top between the said two jaws, of the stop, the trigger, and the spring extended between and connecting the stop with the trigger, substantially as and for the purpose described.

2. The combination, with the holder having jaws, as *a* and *b*, to receive the shank of the top, of the elastic, as D, secured at one end to the holder and adapted to have its other end wound on the shank of the top between the two jaws, whereby when the top is released the reaction of the said elastic will spin the same, substantially as described.

3. The combination of the holder having approximately parallel arms and having jaws at the ends of the arms, the elastic D, adapted to be wound on said shank between the said jaws secured at one end to a projection of one of the arms, and the spring *f*, mounted on the other arm, the stop F at one end of the spring and the trigger G at the other end, substantially as specified.

4. The herein shown and described top holder and spinner, composed of a single wire bent to form the arms A and B, the jaws *a* and *b*, the handle H, and the projection *d*, the wire bent to form the stop F, the spring *f*, and the trigger G, and mounted on the arm B, and the elastic D, secured to the projection *d*, substantially as set forth.

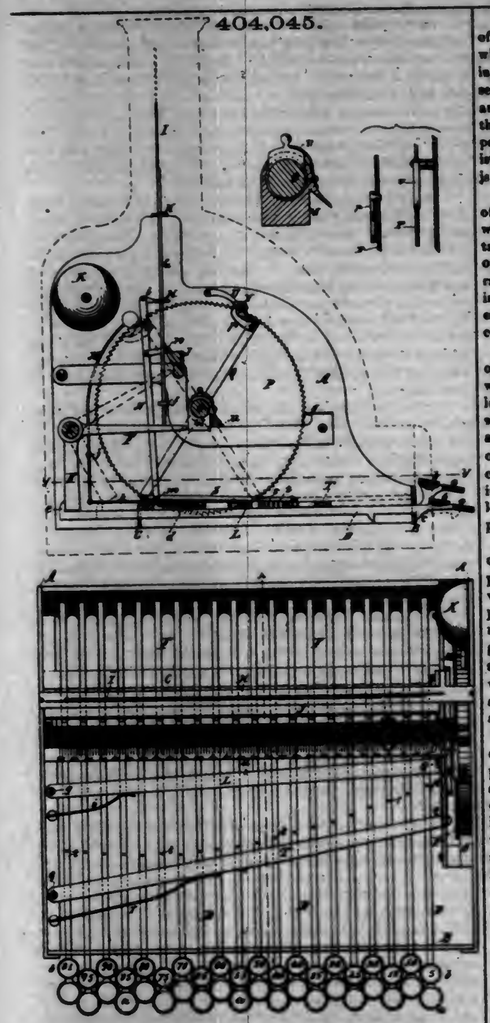


404,043. **METALLIC SLEEPER FOR RAILROADS.** FERDAN KOLSRAT, Brussels, Belgium. Filed Nov. 23, 1886. Serial No. 291,624. (No model.) Patented in Belgium Dec. 5, 1885, No. 71,103; in France Jan. 5, 1886, No. 173,806; in England Mar. 16, 1886, No. 3,666, and in Italy July 12, 1886, No. 20,943.

Claim.—1. A metallic railway-tie, T, consisting of two bars composed of a vertical web, and flanges *t t'*, projecting at right angles thereto in opposite directions, and a chair, C, interposed between said bars and bolted to the vertical web thereof, said chair being provided with lugs or horns c^4 for the reception of the rail-foot, substantially as and for the purposes specified.

2. A metallic railway-tie, T, consisting of two bars composed of a vertical web, and flanges *t t'*, projecting at right angles thereto in opposite directions, and a chair, C, interposed between said bars and bolted to the web thereof, said chair having open sides and top, a web, c^3, connecting the front and rear walls, and lugs or horns c^4, for the rail-foot, substantially as and for the purposes specified.

404,044. **STALK-FODDER HARVESTER.** HENDERSON F. LONGWORTH, Jr., Beloit, Kans. Filed Oct. 8, 1888. Serial No. 287,406. (No model.)



Claim.—1. The combination, in a cornstalk-harvester having a vertically-adjustable sled-runner frame, of the hinged detachable wings, the cutting-blades adjustably applied to the hinged detachable wings, the side guards, L, the keepers *h*, and a locking-bar, H, substantially as specified.

2. The combination, in a cornstalk-harvester having a sled-runner frame with slots *b* vertically through it, of the hinged detachable wings, the cutting-blades adjustably applied to the wings, the side guards, L, the keepers *h*, the locking-bar H, the double-cranked axles journaled beneath the frame, wheels applied on said axles and adapted to move in the slots of the frame, the bar E, having a slot, *e'*, and connecting the front and rear axles at their cranked portions, the hand-lever loosely entering the slot in the connecting-bar and pivoted to the main frame, the raised frame F, and engaging devices for the lever arranged on said frame F, substantially as specified.

404,045. **CASH INDICATOR AND REGISTER.** MARCUS U. LOREE, Miamisburg, assignor to the National Cash Register Company, Dayton, Ohio. Filed Mar. 16, 1888. Serial No. 267,205. (No model.)

Claim.—1. In a cash register and indicator, the combination, with a series of horizontally-reciprocating keys of fixed values, of a series of vertically-reciprocating tablet-rods carrying indicating-tablets and a series of bell-cranks actuated by said keys and engaging with said tablet-rods, whereby upon operating any one of said keys its corresponding tablet-rod is elevated to expose its tablet to view, substantially as described.

404,045.

2. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of vertically-reciprocating tablet-rods provided with projections and carrying indicating-tablets, a supporting-wing, and a series of bell-cranks actuated by said keys and engaging with the tablet-rods, whereby upon operating any one of said keys its corresponding tablet-rod is elevated and its tablet held exposed to view, substantially as described.

3. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of bell-cranks pivoted on a horizontal shaft at the rear of the machine, with their vertical arms engaging with the rear ends of the keys, a series of vertically-reciprocating tablet-rods provided with projections and resting at their lower ends on the horizontal arms of said bell-cranks and carrying at their upper ends indicating-tablets, and a supporting-wing, whereby upon operating any one of said keys its corresponding tablet-rod is elevated and its tablet held exposed to view, substantially as described.

4. In a cash register and indicator, the combination, with a series of horizontally-reciprocating keys of fixed values and a registering-wheel provided with a ratchet, of a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, and a pawl actuated by said bar and engaging with the ratchet on the registering-wheel, whereby upon operating any one of said keys its value is registered on said registering-wheel, substantially as described.

5. In a cash register and indicator, the combination, with a series of horizontally-reciprocating keys of fixed values and a registering-wheel provided with a ratchet, of a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, and a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, whereby upon operating any one of said keys its value is registered on said registering-wheel, substantially as described.

6. In a cash register and indicator, the combination, with a series of horizontally-reciprocating keys of fixed values and a registering-wheel provided with a ratchet, of a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a pawl actuated by said bar and engaging with the ratchet on the registering-wheel, and a stop arranged to engage with said pawl to positively lock the registering-wheel at the completion of the stroke of said pawl, substantially as described.

7. In a cash register and indicator, the combination, with a series of horizontally-reciprocating keys of fixed values and a registering-wheel provided with a ratchet, of a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, and a stop arranged to engage with said pawl to positively lock the registering-wheel at the completion of the stroke of said pawl, substantially as described.

8. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a pawl actuated by said bar and engaging with the ratchet on the registering-wheel, a horizontal screw-shaft secured to the axis of the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof, and a registering-bar along which said pointer travels, substantially as and for the purpose described.

9. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a registering-wheel provided with a ratchet, a horizontally-vibrating bar pivoted at one side of the keys and extending transversely across the same, a series of projections on said keys arranged to engage said bar and vibrate it to different degrees, a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, a horizontal screw-shaft secured to the axis of the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof, and a registering-bar along which said pointer travels, substantially as and for the purpose set forth.

10. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said vibrating bar, a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, a horizontal screw-shaft secured to the axis of the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof, and a registering-bar along which said pointer travels, substantially as and for the purpose described.

11. In a cash register and indicator, the combination of a series horizontally-reciprocating keys of fixed values, a series of tablet-rods and indicating-tablets operated thereby, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, and a pawl actuated by said bar and engaging with the ratchet on the registering-wheel, whereby upon operating any one of said keys its corresponding tablet is exposed to view and its value registered on said registering-wheel, substantially as described.

12. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of vertically-reciprocating tablet-rods operated thereby and provided with projections and carrying indicating-tablets, a supporting-wing, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, and a pawl actuated by said bar and engaging with the ratchet on the registering-wheel, whereby upon operating any key its value is registered on the registering-wheel and

its corresponding tablet-rod is elevated and its tablet held exposed to view, substantially as described.

13. In a cash-register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of vertically-reciprocating tablet-rods carrying indicating-tablets, a series of bell-cranks actuated by said keys and engaging with said tablet-rods, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, and a pawl actuated by said bar and engaging with the ratchet on the registering-wheel, whereby upon operating any key its corresponding tablet is exposed to view and its value registered on the registering-wheel, substantially as described.

14. In a cash-register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of bell-cranks pivoted on a horizontal shaft at the rear of the machine with their vertical arms engaging with the rear ends of the keys, a series of vertically-reciprocating tablet-rods provided with projections and resting at their lower ends on the horizontal arms of said bell-cranks and carrying at their upper ends indicating-tablets, a supporting-wing, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, and a pawl actuated by said bar and engaging with the ratchet on the registering-wheel, whereby upon operating any key its value is registered on the registering-wheel and its corresponding tablet-rod is elevated and its tablet held exposed to view, substantially as described.

15. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of tablet-rods and indicating-tablets operated thereby, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, and a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, whereby upon operating any one of said keys its corresponding tablet is exposed to view and its value registered on said registering-wheel, substantially as described.

16. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of vertically-reciprocating tablet-rods operated thereby and provided with projections and carrying indicating-tablets, a supporting-wing, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, and a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, whereby upon operating any key its value is registered on the registering-wheel and its corresponding tablet-rod is elevated and its tablet held exposed to view, substantially as described.

17. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of vertically-reciprocating tablet-rods carrying indicating-tablets, a series of bell-cranks actuated by said keys and engaging with said tablet-rods, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, and a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, whereby upon operating any key its corresponding tablet is exposed to view and its value registered on the registering-wheel, substantially as described.

18. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of bell-cranks pivoted on a horizontal shaft at the rear of the machine, with their vertical arms engaging with the rear ends of the keys, a series of vertically-reciprocating tablet-rods provided with projections and resting at their lower ends on the horizontal arms of said bell-cranks and carrying at their upper ends indicating-tablets, a supporting-wing, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, and a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, whereby upon operating any key its value is registered on the registering-wheel and its corresponding tablet-rod is elevated and its tablet held exposed to view, substantially as described.

19. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of tablet-rods and tablets operated thereby, a registering-wheel provided with a ratchet, a horizontally-vibrating bar arranged transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a pawl actuated by said bar and engaging with the ratchet on the registering-wheel, and a stop arranged to engage with said pawl to positively lock the registering-wheel at the completion of the stroke of said pawl, substantially as described.

20. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of tablet-rods and tablets operated thereby, a registering-wheel provided with a ratchet, a horizontally-vibrating bar arranged transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, and a stop arranged to engage with said pawl to positively lock the registering-wheel at the completion of the stroke of said pawl, substantially as described.

21. In a cash register and indicator, the combination of a series of horizontal reciprocating keys of fixed values, a series of tablet-rods and indicating-tablets operated thereby, a registering-wheel provided with a ratchet, a horizontally-vibrating bar pivoted at one side of the keys and extending transversely across the same, a series of projections on said keys arranged to engage said bar and vibrate it to different degrees, a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, a horizontal screw-shaft secured to the axis of the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof, and a registering-bar along which said pointer travels, substantially as and for the purpose described.

22. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of tablet-rods and tablets operated thereby, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a pawl actuated by said bar and engaging with the ratchet on the registering-wheel, a horizontal screw-shaft secured to the axis of the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof, and a registering-bar along which said pointer travels, substantially as and for the purpose described.

23. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of tablet-rods and tablets operated thereby, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, a horizontal screw-shaft secured to the axis of the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof and a registering-bar along which said pointer travels, substantially as and for the purpose described.

24. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of vertically-reciprocating tablet-rods carrying indicating-tablets, a series of bell-cranks actuated by said keys and engaging with said tablet-rods, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, a pawl carried by said carrier and engaging with the ratchet on the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof, and a registering-bar along which said pointer travels, substantially as and for the purpose described.

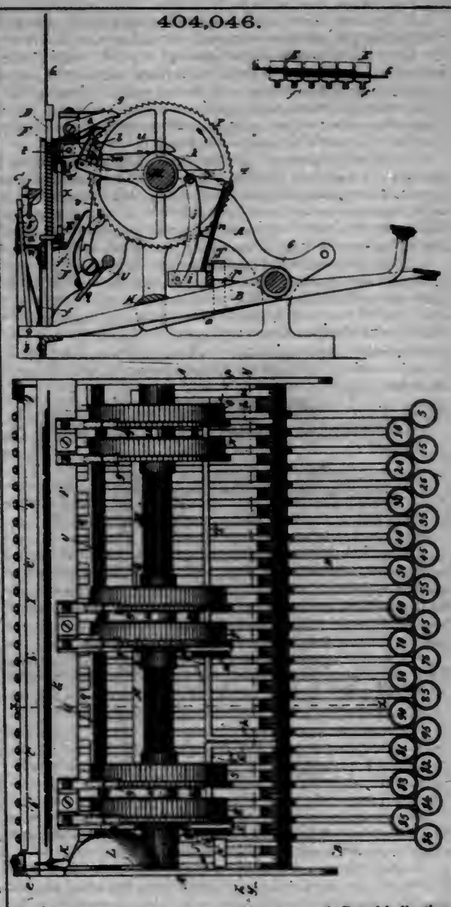
25. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of bell-cranks pivoted on a horizontal shaft at the rear of the machine, with their vertical arms engaging with the rear ends of the keys, a series of tablet-rods provided with projections and resting at their lower ends on the horizontal arms of said bell-cranks and carrying at their upper ends indicating-tablets, a supporting-wing, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, a horizontal screw-shaft secured to the axis of the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof, and a registering-bar along which said pointer travels, substantially as and for the purpose described.

ranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, a horizontal screw-shaft secured to the axis of the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof, and a registering-bar along which said pointer travels, substantially as and for the purpose described.

26. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of bell-cranks pivoted on a horizontal shaft at the rear of the machine, with their vertical arms engaging with the rear ends of the keys, a series of tablet-rods provided with projections and resting at their lower ends on the horizontal arms of said bell-cranks and carrying at their upper ends indicating-tablets, a supporting-wing, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a resetting-spring for said bar, a series of projections on said keys at varying distances from said bar and arranged to engage therewith, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and connected to said bar, a pawl carried by said carrier and engaging with the ratchet on the registering-wheel, a stop arranged to engage with said pawl to positively lock the registering-wheel at the completion of the stroke of said pawl, a horizontal screw-shaft secured to the axis of the registering-wheel and revolving therewith, a pointer on said shaft and engaging with the thread thereof, a registering-bar along which said pointer travels, a second horizontally-vibrating bar extending transversely across the keys, a resetting-spring for said bar, a second series of projections on said keys arranged to engage with said bar, a gong, and a gong-hammer actuated by said bar, substantially as and for the purpose described.

27. In a cash register and indicator, the combination, with a series of horizontally-reciprocating keys of fixed values and a registering-wheel provided with a ratchet, of a horizontally-vibrating bar pivoted at one side of the keys and extending transversely across the same, a series of projections on said keys arranged to engage said bar and vibrate the same to different degrees, and a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, whereby upon operating any one of said keys its value is registered on said registering-wheel, substantially as described.

28. In a cash register and indicator, the combination, with a series of horizontally-reciprocating keys of fixed values and a registering-wheel provided with a ratchet, of a horizontally-vibrating bar pivoted at one side of the keys and extending transversely across the same, a series of projections on said keys arranged to engage said bar and actuate it to different degrees, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and actuated by said vibrating bar, and a pawl carried by said pawl-carrier and engaging with the ratchet of said wheel, whereby upon operating any one of said keys its value is registered on said registering-wheel, substantially as described.



29. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of tablet-rods and indicating-tablets operated thereby, a registering-wheel provided with a ratchet, a horizontally-vibrating bar extending transversely across said keys, a series of projections on said keys arranged to engage said bar and vibrate the same to different degrees, and a pawl actuated by said bar and engaging with the ratchet of the registering-wheel, whereby upon operating any one of said keys its indicating-tablet is exposed to view and its value is registered on said registering-wheel, substantially as described.

30. In a cash register and indicator, the combination of a series of horizontally-reciprocating keys of fixed values, a series of tablet-rods and indicating-tablets operated thereby, a registering-wheel provided with a ratchet, a horizontally-vibrating bar pivoted at one side of said keys and extending transversely across the same, a series of projections on said keys arranged to engage said bar and vibrate it to different degrees, a vibrating pawl-carrier pivoted on the axis of the registering-wheel and actuated by said vibrating bar, and a pawl carried by said carrier and engaging with the ratchet of the registering-wheel, substantially as and for the purpose described.

404,046. CASH INDICATOR AND REGISTER. MANFRED U. LOEBE, Miamisburg, and CHARLES D. GRIMES, Dayton, assignors to the National Cash Register Company, Dayton, Ohio. Filed June 4, 1888. Serial No. 276,972. (No model.)

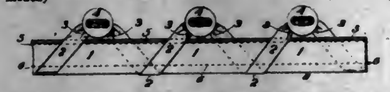
Claim.—1. In a cash register and indicator, the combination, with the registering-wheel P and the supplemental registering-wheel Q, of the interposed pivoted arm *u*, carrying the dog *v*, arranged to engage with the ratchet of the wheel Q, and a stud, *w*, projecting laterally from the wheel P and adapted to engage with and raise the arm *u* and cause its dog *v* to turn the wheel Q one number for each complete revolution of the wheel P, substantially as described.

2. In a cash register and indicator, the combination, with the ten-cent-registering wheel P and the five-cent-registering wheel N, of

the pivoted operating-keys B, carrying tablet-rods D and indicating-tablets G, inclined bar T, actuated by said keys, vibrating dog-carrier *k*, provided with a dog, *l*, engaging with the ratchet of the wheel P and connected to the bar T by a link, *j*, and the five-cent bar U, provided with projections *q*, engaged by the odd-numbered keys and carrying the dog *r*, engaging with the ratchet of the wheel N, substantially as described.

3. In a cash register and indicator, the combination, with the keys B, carrying the tablet-rods D and tablets G, and inclined bar T, of the registering-wheel P, vibrating dog-carrier *k*, provided with a dog, *l*, engaging with the ratchet of the wheel P and connected to the bar T by a link, *j*, and the coiled spring *n*, connected at its upper end to the forward end of the dog-carrier *k* and at its lower end to the bar T, substantially as described.

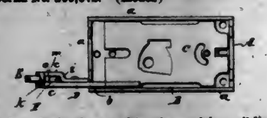
4. The combination of the keys B, carrying tablet-rods D and indicating-tablets G, the inclined bar T, the registering-wheel P and its supplemental registering-wheel Q, the registering-wheel N and its supplemental registering-wheel O, the vibrating dog-carrier *k*, provided with a dog, *l*, for actuating the wheel P, and connected to the bar T by a link, *j*, the five-cent bar U, actuated by the odd-numbered keys and provided with a dog, *r*, for actuating the wheel N, and a pivoted arm, *u*, interposed between each of the wheels N and P and its adjacent supplemental registering-wheel and carrying a dog, *v*, arranged to engage the ratchet of the supplemental wheel, and a stud or projection on each of the wheels N and P, arranged to engage and raise the arm *u* to cause its dog *v* to turn the adjacent supplemental registering-wheel, substantially as and for the purpose described.



5. In a cash register and indicator, the combination, with the operating-keys B, the vibrating frame H, and the inclined bar T, of the upwardly-extending arm *p*, secured to the side arm of the frame H and projecting over the end of the bar T, substantially as and for the purpose described.

6. In a cash register and indicator, the combination, with the operating-keys B, registering mechanism actuated thereby, the vibrating frame H, the pivoted wing I, provided with the flange *d'*, and actuated by the vibrating frame H, through the medium of suitable tripping mechanism, of the arms V, pivoted to the rear ends of the keys, extending upward through guides, and provided on their inner faces with notches arranged to engage with the flange *d'* on the wing I, substantially as and for the purpose described.

7. In a cash register and indicator, the combination, with the operating-keys, registering mechanism actuated thereby, a series of tablet-rods and indicating-tablets, one for each key and carried thereby, and a projection on each tablet-rod, of a series of stops arranged to engage with the projections on the tablet-rods to prevent the operation of two or more keys simultaneously, substantially as described.

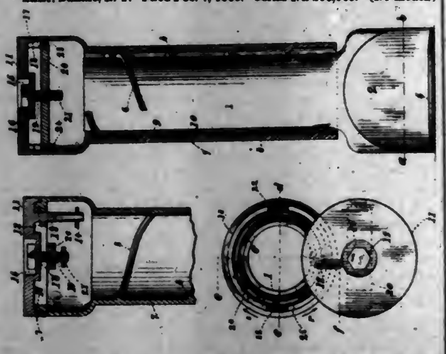


8. In a cash register and indicator, the combination, with the operating-keys, registering mechanism actuated thereby, a series of tablet-rods and indicating-tablets, one for each key and carried thereby, and a projection on each tablet-rod, of a series of pendent stops pivoted above said projections and arranged to be displaced by said projections to permit the operation of a single key and to be locked thereby to prevent the simultaneous operation of two or more keys, substantially as described.

404,047. METHOD OF MAKING BUTTON-STRIPS. HENRY W. LYON, Bridgeport, Conn. Filed Dec. 19, 1888. Serial No. 294,064. (No model.)

Claim.—The method of making button-strips for attachment to corsets or other garments, the same consisting in winding a continuous tape around a strip of webbing or the like, threading said tape through the successive buttons at the front edge of said strip, and finally sewing the tape to the strip by rows of stitching through the front and rear edges of said strip, substantially as set forth.

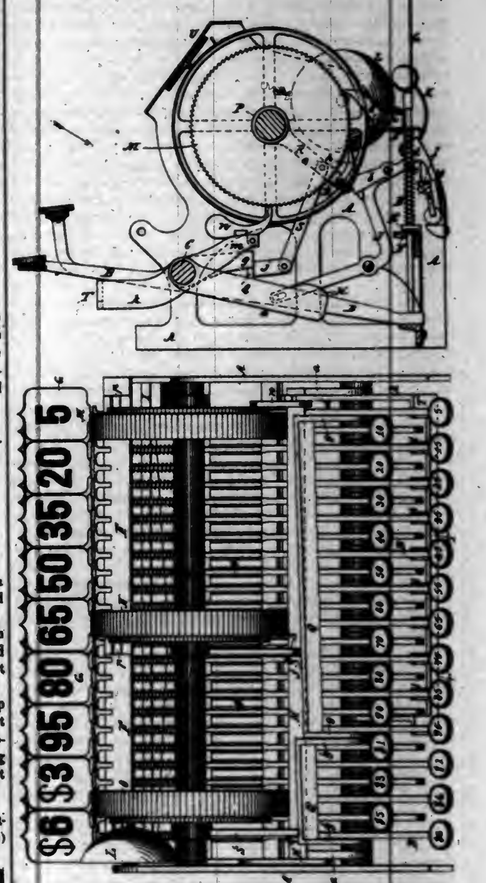
404,048. LOCK. FRANK W. MIX, New Britain, Conn. Filed Mar. 31, 1888. Serial No. 269,072. (Model.)



Claim.—1. In a lock, the combination, with a sliding bolt, of a latch pivoted to and projecting beyond the outer end of the bolt and wholly supported thereby, substantially as set forth.

2. In a lock, the combination, with a sliding bolt having an open slot formed in its outer end, of a yielding latch pivoted within said slot and located wholly outside the lock-casing, substantially as set forth.

3. In a lock, the combination, with a sliding bolt having a stop formed thereon, of a latch pivoted to and carried by the sliding bolt and arranged to project beyond its outer end, said latch being provided with a projection that engages a stop on the bolt for limiting its outward movement and a spring for forcing the latch to the limit of its outward movement, substantially as set forth.



404,049. STOP-COCK BOX. ALEXANDER ORMSBY and HENRY EBERHART, Buffalo, N. Y. Filed Feb. 7, 1889. Serial No. 298,965. (No model.)

Claim.—1. In a stop-cock box, a cover pivoted thereto by an inside vertical hinge or screw-bolt passing through the cover and through a holding-bar and having a pin, 21, at the bottom, in combination with a flange, 23, having openings 22, and lugs 24 25 in the top of the box, for the purposes described.

2. The combination of a vertically-pivoted cover, 11, a depression, 15, in the cover, a bolt, 19, passing through a hole in the depression 15, a holding-bar, 20, through which the bolt 19 passes, a pin, 21, through the lower end of the bolt 19, and an inwardly-projecting flange, 23, having openings 22, and lugs 24 25, for the purposes described.

404,050. CASH INDICATOR AND REGISTER. JOHN H. PATTERSON, Dayton, Ohio, assignor to the National Cash Register Company, same place. Filed June 1, 1888. Serial No. 275,765. (No model.)

Claim.—1. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, a bar extending transversely across said keys and arranged to be actuated to different degrees by the operation of different keys, connecting mechanism between said bar and the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated to the same degree by all of said keys, and connecting mechanism between said five-cent bar and the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

2. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a bar extending transversely across said keys and arranged to be actuated to different degrees by the operation of different keys, a dog actuated by said bar and engaging with the ratchet of the ten-cent wheel, a five-cent bar extending transversely across and arranged to be actuated to the same degree by all of said keys, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

3. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, a vertically-vibrating bar extending transversely across said keys and arranged to be actuated to different degrees by the operation of different keys, connecting mechanism between said bar and the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated to the same degree by all of said keys, and connecting mechanism between said five-cent bar and the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

4. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a vertically-vibrating bar extending transversely across said keys and arranged to be actuated to different degrees by the operation of different keys, a dog actuated by said bar and engaging with the ratchet of the ten-cent wheel, a five-cent bar extending transversely across and arranged to be actuated to the same degree by all of said keys, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

5. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, a bar extending transversely across said keys and actuated thereby, the portions of said bar with which the different keys engage being arranged at different distances from said keys, connecting mechanism between said bar and the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated by all of said keys, and connecting mechanism between said five-cent bar and the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

6. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a bar extending transversely across said keys and actuated thereby, the portions of said bar with which the different keys engage being arranged at different distances from said keys, a dog actuated by said bar and engaging with the ratchet of the ten-cent wheel, a five-cent bar extending transversely across and arranged to be actuated by all of said keys, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

7. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, a bar extending transversely across and inclined relatively to the plane of said keys, connecting mechanism between said bar and ten-cent-registering wheel, a five-cent bar extending transversely across and actuated by all of said keys, and connecting mechanism between said five-cent bar and five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

8. In a cash register and indicator, the combination of a series of operating-keys indicating odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a bar extending transversely across and inclined relatively to the plane of said keys, a dog actuated by said bar and engaging with the ratchet of the ten-cent-registering wheel, a five-cent bar extending transversely across and actuated by all of said keys, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent-registering wheel, whereby upon operating any one of said keys the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

9. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, a bar extending transversely across said keys and arranged to be actuated to different degrees by the different odd-numbered keys and to different degrees by the different even-numbered keys, but to the same degree by each odd-numbered key and the next lower even-numbered key, connecting mechanism between said bar and the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated by each of the odd-numbered keys, and connecting mechanism between said five-cent bar and the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

10. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a bar extending transversely across said keys and arranged to be actuated to different degrees by the different odd-numbered keys and to different degrees by the different even-numbered keys, but to the same degree by each odd-numbered key and the next lower even-numbered key, a dog actuated by said bar and engaging with the ratchet of the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated by each of the odd-numbered keys, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent-registering wheels, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

11. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, a vertically-vibrating bar extending transversely across said keys and arranged to be actuated to different degrees by the different odd-numbered keys and to different degrees by the different even-numbered keys, but to the same degree by each odd-numbered key and the lower even-numbered key, connecting mechanism between said bar and the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated by each of the odd-numbered keys, and connecting mechanism between said five-cent bar and five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

12. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a vertically-vibrating bar extending transversely across said keys and arranged to be actuated to different degrees by the different odd-numbered keys and to different degrees by the different even-numbered keys, but to the same degree by each odd-numbered key and the next lower even-numbered key, a dog actuated by said bar and engaging with the ratchet of the ten-cent wheel, a five-cent bar extending transversely across and arranged to be actuated by each odd-numbered key, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

13. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, a bar extending transversely across said keys and actuated thereby, the portions of said bar with which the different odd-numbered keys engage being arranged at different distances from said odd-numbered keys and the portions with which the different even-numbered keys engage being arranged at different distances from said even-numbered keys, but the portions with which each odd-numbered key and the next lower even-numbered key engage being arranged at the same distance from said keys, connecting mechanism between said bar and the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated by each of the odd-numbered keys, and connecting mechanism between said five-cent bar and the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

14. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a bar extending transversely across said keys and actuated thereby, the portions of said bar with which the different odd-numbered keys engage being arranged at

different distances from said odd-numbered keys and the portions with which the different even-numbered keys engage being arranged at different distances from said even-numbered keys, but the portions with which each odd-numbered key and the next lower even-numbered key engage being arranged at the same distance from said keys, a dog actuated by said bar and engaging with the ratchet of the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated by each of the odd-numbered keys, and a dog actuated by said bar and engaging with the ratchet of the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

15. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, a bar extending transversely across and inclined relatively to the plane of said keys and arranged to be actuated to different degrees by the different odd-numbered keys and to different degrees by the different even-numbered keys, but to the same degree by each odd-numbered key and the next lower even-numbered key, connecting mechanism between said bar and the ten-cent-registering wheel, a five-cent bar extending transversely across and actuated by each odd-numbered key, and connecting mechanism between said five-cent bar and the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

16. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a bar extending transversely across and inclined relatively to the plane of said keys and arranged to be actuated to different degrees by the different odd-numbered keys and to different degrees by the different even-numbered keys, but to the same degree by each odd-numbered key and the next lower even-numbered key, a dog actuated by said bar and engaging with the ratchet of the ten-cent-registering wheel, a five-cent bar extending transversely across and actuated by each of the odd-numbered keys, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent-registering wheel, whereby upon operating an even-numbered key its value is registered on the ten-cent wheel, and whereby upon operating an odd-numbered key the tens of its value are registered on the ten-cent wheel and the five on the five-cent wheel, substantially as described.

17. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a series of tablet-rods and indicating-tablets actuated by said keys, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a bar extending transversely across said keys and arranged to be actuated to different degrees by the different odd-numbered keys and to different degrees by the different even-numbered keys, but to the same degree by each odd-numbered key and the next lower even-numbered key, a dog actuated by said bar and engaging with the ratchet of the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated by each of the odd-numbered keys, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent-registering wheel, substantially as and for the purpose described.

18. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a series of tablet-rods and indicating-tablets actuated by said keys, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a vertically-vibrating bar extending transversely across said key and arranged to be actuated to different degrees by the different odd-numbered keys and to different degrees by the different even-numbered keys, but to the same degree by each odd-numbered key and the next lower even-numbered key, a dog actuated by said bar and engaging with the ratchet of the ten-cent wheel, a five-cent bar extending transversely across and arranged to be actuated by each odd-numbered key, and a dog actuated by said bar and engaging with the ratchet of the ten-cent wheel, a five-cent bar extending transversely across and arranged to be actuated by each of the odd-numbered keys, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent-registering wheel, substantially as and for the purpose described.

19. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a series of tablet-rods and indicating-tablets actuated by said keys, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a bar extending transversely across said keys and actuated thereby, the portions of said bar with which the different odd-numbered keys engage being arranged at different distances from said odd-numbered keys and the portions with which the different even-numbered keys engage being arranged at different distances from said even-numbered keys, but the portions with which each odd-numbered key and the next lower even-numbered key engage being arranged at the same distance from said keys, a dog actuated by said bar and engaging with the ratchet of the ten-cent-registering wheel, a five-cent bar extending transversely across and arranged to be actuated by each odd-numbered key, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent-registering wheel, substantially as and for the purpose described.

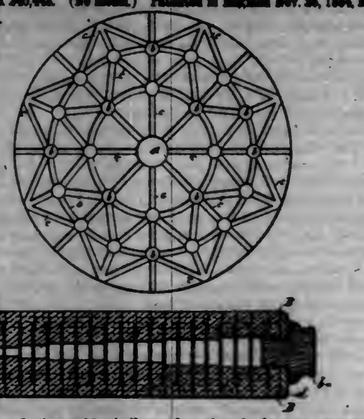
20. In a cash register and indicator, the combination of a series of operating-keys indicating even and odd multiples of five above the first power, a series of tablet-rods and indicating-tablets actuated by said keys, a ten-cent-registering wheel and a five-cent-registering wheel, each provided with a ratchet, a bar extending transversely across and inclined relatively to the plane of said keys and arranged to be actuated to different degrees by the different odd-numbered keys and to different degrees by the different even-numbered keys, but to the same degree by each odd-numbered key and the next lower even-numbered key, a dog actuated by said bar and engaging with the ratchet of the ten-cent-registering wheel, a five-cent bar extending transversely across and actuated by each of the odd-numbered keys, and a dog actuated by said five-cent bar and engaging with the ratchet of the five-cent-registering wheel, substantially as and for the purpose described.

404,051. SHEARS. HENRY PATTISON, Windsor, Nova Scotia, Canada. Filed June 26, 1888. Serial No. 278,294. (Model.)

Claim.—1. In a shears of the character described, the combination of the following instrumentalities, to wit: a lower cutting-blade provided with a handle and with an auxiliary blade standing at an angle thereto, the cutting-edges of said blades being continuous, a stop secured to said lower blade, an upper blade provided with two continuous cutting-edges standing at angles to each other and respectively adapted to work in conjunction with the cutting-edges of the lower and auxiliary blades, and a gage secured to said upper blade, said handles being pivoted together, substantially as set forth.

2. In a shears, a pivoted bar, as J, carried by a blade of said shears, said bar being adapted to act gravitatively to project a portion thereof past the cutting-edge of the blade on which it is mounted, whereby it may serve as a stop for the article being cut, substantially as described.

3. A plate, as H, provided with a slot, as 14, a bar, as J, pivoted to said plate, and a stop, as 15, for said bar, in combination with the blade of a shears, and a screw, as *g*, for securing said plate to said blade, substantially as set forth.

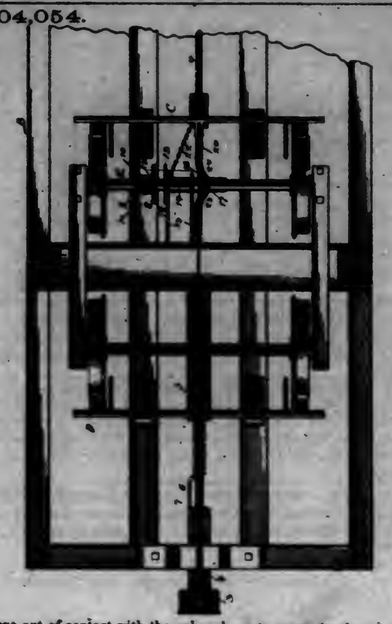


4. In a shears, the handle A, provided with the blade D, having the cutting-edge *v* and auxiliary blade *x*, having the cutting-edge *v*, said cutting-edges being continuous, the handle B, provided with the blade C, having the cutting-edge *t* and inclined cutting-edge *f*, said cutting-edges being continuous, the gage K, adjustably mounted on the blade C, the pivoted bar J, adjustably mounted on the blade D, and a stop for said bar, said handles being pivotally connected, and all being combined and arranged to operate substantially as described.

404,052. GAS-STOVE. WILLIAM H. PIER, London, England. Filed Nov. 9, 1888. Serial No. 290,344. (No model.) Patented in England Dec. 24, 1887, No. 17,707.

Claim.—In a gas stove or heater, the combination, with the casing A, adapted to be fitted upon a gas-burner and provided with the circular series of inlet-apertures D, and the drum A', open at both ends, supported within and concentric with said casing, providing the air-space C therebetween, of the plate F, supported on the rim of said casing and provided with the series of upwardly-ranging outlet-apertures F', and the series of vertical pins G, and the wire netting or gauze H, arranged between the casing A and the lower outer edge of said plate, substantially as shown and described.

404,053. CARTRIDGE FOR ORDNANCE. George Greer, Chipping-Campden, County of Gloucester, England. Filed June 6, 1887. Serial No. 240,443. (No model.) Patented in England Nov. 26, 1884, No. 15,548.



Claim.—1. A cartridge built up of a series of cakes of compressed gunpowder or other propelling composition or material, the said cakes having one large central orifice or perforation in combination with numerous smaller perforations, the said cakes having also projections and recesses formed on their faces, whereby when placed together face to face they shall interlock, not only to prevent any sliding or twisting motion of the said cakes in respect of each other, but also to bring the said small perforations in all the cakes composing the cartridge into continuous lines, as shown and described.

2. A cartridge built of a series of cakes of compressed propelling material, each having a large central orifice and sundry smaller ones, the adjacent cakes having projections and recesses whereby they shall interlock and insure the proper alignment of these smaller orifices, said cakes also having their central parts made thinner than the remaining parts, all substantially as shown and described.

3. Cakes of compressed explosive material having numerous longitudinal perforations *a b* through their thickness, and having interlocking projections and recesses in their surfaces, as set forth, and having numerous grooves or channels *c* on their flat sides connecting the perforations *a* and *b*, all arranged face to face and combined to form a cartridge, substantially as and for the purposes set forth.

404,054. CAR-BRAKE. George R. Gates, Thornton, assignor to himself and John H. Young, Chicago, Ill. Filed Feb. 7, 1888. Serial No. 299,050. (No model.)

Claim.—1. The combination of a friction-disk connected with an axle of a car-truck, a sliding tube or sleeve carrying a second friction-disk and supported in bearings which hold the sleeve out of contact with the axle, and a lever for moving the sleeve in its bearings, substantially as and for the purpose specified.

2. The combination of a friction-disk connected with an axle of a car-truck, a sliding tube or sleeve carrying a second friction-disk and supported in bearings which hold the sleeve out of contact with the axle, a lever for moving the sleeve in its bearings, and a sliding rod for operating the lever, substantially as and for the purpose specified.

3. The combination of a friction-disk connected with an axle of a car-truck, a sliding tube or sleeve carrying a second friction-disk and supported in bearings which hold the sleeve out of contact with the axle, a lever for moving the sleeve in its bearings, a sliding rod for operating the lever, and a draw-bar provided with a pin or projection to engage with the sliding rod, substantially as and for the purpose specified.

4. In combination with the brakes of a car-truck, a friction-disk on one of the axles of the truck, a second friction-disk on a sleeve supported in bearings independent of the axle and which hold the sleeve out of contact with the axle, a lever to move the sleeve, and a sliding rod to operate the lever, substantially as and for the purpose specified.

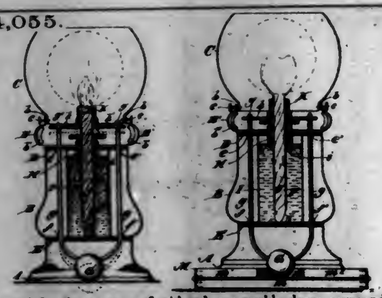
5. In combination with the brakes of a car-truck, a friction-disk on one of the axles of the truck, a second friction-disk on a sleeve supported in bearings independent of the axle and which hold the sleeve out of contact with the axle, a lever for moving the sleeve, a sliding rod to operate the lever, and a pin or projection on the draw-bar to engage with the sliding rod, substantially as and for the purpose specified.

6. In combination with the axle of a car-truck, a friction wheel or disk connected with and rotating with such axle, a sliding sleeve or windlass supported in bearings independent of the axle and carrying a friction disk or wheel adapted to be brought into contact with said wheel or disk which is connected with the axle, whereby the windlass or sleeve can be rotated, substantially as and for the purpose specified.

7. In combination with one of the axles of a car-truck, a friction wheel or disk secured to a sleeve which encircles the axle and is provided with slots, a collar which surrounds the sleeve, and set-screws which pass through the collar and the slots in the sleeve and hold the same upon the axle, whereby the sleeve can have a limited longitudinal movement upon the axle, substantially as and for the purpose specified.

8. In combination with one of the axles of a car-truck, a friction wheel or disk secured to a sleeve which encircles the axle and is provided with slots, a collar which surrounds the sleeve, set-screws which pass through the collar and the slots in the sleeve and hold the same upon the axle, and a spring between the friction wheel or disk and collar, substantially as and for the purpose specified.

9. In combination with the brakes of a car-truck, a friction-disk on one of the axles of the truck, a second friction-disk on a sleeve supported in bearings independent of the axle and which hold the sleeve out of contact with the axle, a lever to move the sleeve, a sliding rod to operate the lever, and a chain connected at one end to the sleeve or windlass and at the other end with a brake-lever, substantially as and for the purposes specified.

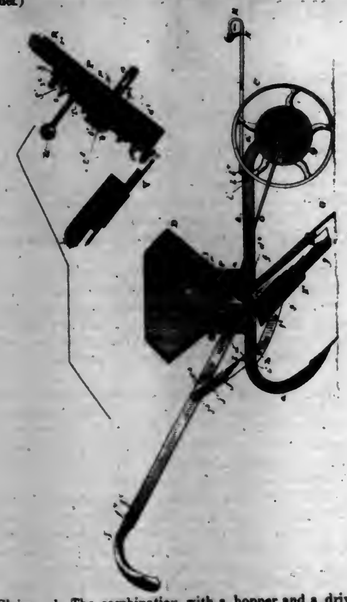


10. The combination of a friction-disk connected with an axle of a car-truck, a sliding windlass or sleeve carrying a second friction-disk and supported in bearings independent of the axle, and a washer on the axle between the two friction-disks, substantially as and for the purposes specified.

404,055. LAMP-EXTINGUISHER. Otto Reichma, Memphis, Tenn., assignor to George R. Dorian and Frederick A. Wittich, both of same place. Filed Apr. 11, 1888. Serial No. 270,231. (No model.)

Claim.—1. A lamp having a vertically-moving ball extending through the bottom thereof, in combination with a sleeve vertically movable over the upper end of the wick-tube, and a connection between said ball and said sleeve for causing the said sleeve to extinguish the lamp when the latter is set down on a plane surface, substantially as set forth.

2. A ball, G, and curved rod *g*, connected therewith, in combination with a casing, B, partitions D E, attached to said casing and



404,055.

perforated for the passage of said rod, a movable sleeve surrounding the upper end of the wick-tube, and arms *k K*, extending outward from said sleeve to engage hooks *g* on the ends of said curved rod, said ball being vertically movable through the base of said casing, substantially as set forth.

3. A lamp having a sleeve movable over the upper part of the wick-tube, a ball movable through the base of the lamp-casing, and connecting devices between said sleeve and said weight, whereby the former moves with the latter, in combination with a support having a recess to allow the downward motion of said ball, substantially as set forth.

404,056. COMBINED COTTON, CORN, AND SORGHUM PLANTER. JAMES D. SCHOFIELD, Rogers, Tex., assignor to the Fremont Cultivator Company, Bellevue, Ohio. Filed Jan. 3, 1889. Serial No. 295,296. (No model.)

Claim.—1. The combination, with a hopper and a driving-shaft projecting therein, of a disk loosely mounted on the end of the shaft and adapted to be locked to the hopper, and a second disk corresponding to and disposed within a recess formed in the first disk, said second disk being rigidly connected with the shaft and adapted to be locked to the first disk, substantially as and for the purpose set forth.

2. In a planter of the class described, the combination, with a driving-shaft, of a disk mounted thereon, and a second disk corresponding to and disposed within a recess formed in the first disk and provided with a diametrical slot, a key disposed in a transverse elongated slot in the shaft and seated in the disk-slot to prevent movement of said disk independent of the shaft, and a nut screwed upon the shaft against the second disk to retain the key in place, both the disks being adapted to be locked together, substantially as set forth.

3. In a planter of the class described, the combination of a disk adapted to be locked stationary and having a circular flange conforming in contour to the periphery thereof, and having a recess provided with an opening, and a second disk corresponding and adapted to be disposed in the recess of the former disk and provided with approximately-semicircular feed-notches at its periphery adapted to coincide with the opening in the first-mentioned disk, substantially as and for the purpose set forth.

4. In a planter of the class described, the combination, with a hopper having an adjustable slide in its rear wall and with a driving-shaft projecting through the front wall at right angles thereto, of a cotton-disk loosely mounted upon the shaft and provided with a feed-opening and with a series of upright teeth near its periphery, said disk being adapted to be locked to the hopper with its feed-opening coinciding with a feed-groove in the front wall of the hopper, and a corn-disk rigidly mounted on the shaft and provided at its periphery with feed notches adapted to coincide with the feed-opening in the cotton-disk, said corn-disk being adapted to be locked to the cotton-disk, substantially as and for the purpose set forth.

5. In a planter of the class described, the combination of a cotton-disk adapted to be locked stationary and provided with a circular flange conforming in contour to the periphery thereof and forming a central recess having a feed-opening, a corn-disk corresponding to and disposed within said recess and provided at its periphery with approximately-semicircular feed-notches adapted to coincide with the feed-opening in the cotton-disk, and a cut-off comprising a plate secured to the cotton-disk opposite the feed-opening and provided with perforations, and bristles secured in said perforations and forming a brush adapted to bear upon the top edge of the corn-disk, substantially as and for the purpose set forth.

6. In a planter of the class described, the combination, with a hopper and a driving-shaft extending therein, of a cotton-disk loosely mounted upon said shaft and adapted to be locked to the hopper when corn is to be planted, and a corn-disk rigidly mounted upon the shaft and adapted to be locked to the cotton-disk by an elongated thumb-screw to adapt the machine for planting cotton, said thumb-screw acting as a stirrer for the seed, substantially as and for the purpose set forth.

7. In a planter of the class described, the combination, with a hopper provided with a bearing-plate embedded in the front wall thereof and having an arm, and a driving-shaft having its upper end bearing in said plate, of a cotton-disk loosely mounted on the shaft and bearing against said plate, and adapted to be locked against rotation by a screw engaging a perforation in the disk and a coincident screw-threaded perforation in the arm of the bearing-plate, and a disk rigidly connected with the shaft and adapted to be locked to the cotton-disk by said screw through a perforation in the corn-disk and a coincident screw-threaded perforation in the cotton-disk, substantially as and for the purpose set forth.

8. In a planter of the class described, the combination of a cotton-disk provided upon its surface with a circular flange conforming in contour thereto, said disk being provided with a feed-opening between the flange and its center and adapted to be locked against rotation, and a corn-disk corresponding to and disposed within the recess formed by said flange and provided with semicircular feed-notches in its periphery adapted to coincide with the feed-opening in the cotton-disk, said flange forming a wall for the open edges of the feed-notches, substantially as and for the purpose set forth.

9. In a planter of the class described, the combination, with the frame, a hopper mounted thereon and provided in its rear wall with a feed-opening at one side its lateral center, and a driving-shaft projecting within the hopper directly above said feed-opening, of a drill disposed below said feed-opening and located at the lateral center of the planter, substantially as and for the purpose set forth.

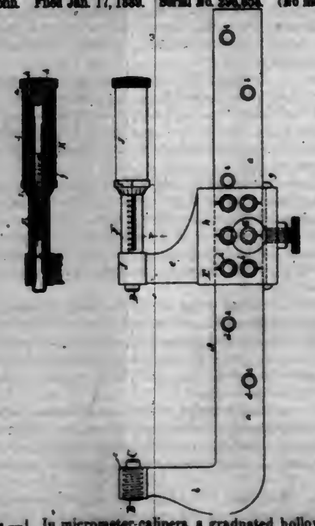
10. In a planter of the class described, the combination, with a hopper, carrying-wheel, and axle, of a driving-shaft journaled at one end in the hopper and carrying planting-disks and at the other end in a laterally-adjustable block mounted upon the axle, a gear-wheel provided with a central angular perforation mounted upon the corresponding lower portion of the shaft and longitudinally adjustable thereon, a disk secured centrally to the carrying-wheel and provided with concentric rows of teeth adapted to mesh with the gear-wheel, and a key adapted to be passed through a perforation in the axle at the outer edge of the block to lock the gear-wheel in engagement with the disk, substantially as and for the purpose set forth.

11. In a planter of the class described, the combination, with the hopper, carrying-wheel, and shaft, of a two-part driving-shaft having one end journaled in said hopper and carrying planting-disks and at its lower end in a laterally-adjustable block mounted upon the axle and adapted to be locked thereon in adjusted position, the lower portion of said shaft being angular, a gear-wheel having a central perforation corresponding to said angular portion of the shaft and mounted thereon, and a disk centrally secured to the carrying-wheel and provided with a series of concentric grooves each of which is crossed by equidistant transverse ribs forming teeth adapted to mesh with the gear-wheel, substantially as and for the purpose set forth.

12. In a planter of the class described, the combination, with the frame, of an adjustable drill carrying an opener-plow at its lower end, said drill being pivotally mounted upon a transverse rod, and upwardly and rearwardly extending strips secured to the foot of the drill and provided with elongated slots at their rear ends embracing a second transverse rod, and nuts adapted to bind against said strips to lock the drill in adjusted position, substantially as and for the purpose set forth.

13. In a planter of the class described, the combination, with the frame the beams of which are connected by a front and rear transverse rod, of a drill carrying an opener-plow and pivotally mounted upon the former, the bearing portion of said drill extending across the space between the frame-beams, upwardly and rearwardly extending strips for bracing and adjusting the drill and plow secured at their forward ends to the foot of the drill and provided with elongated slots at their free ends engaged by the rear transverse rod, and nuts disposed on the latter adapted to be screwed against the strips to retain the plow in adjusted position, substantially as and for the purpose set forth.

14. The herein-described drill, comprising the front wall having the opener-plow secured at the foot thereof, the tube consisting of a curved metal plate having its side edges secured to the front wall, the lower end of said plate being cut vertically and horizontally, and the wings formed thereby curved outwardly to form mold-boards, substantially as and for the purpose set forth.



15. In a planter of the class described, the combination, with the frame comprising the horizontal beams having the downturned front ends, of a bail pivoted to the beams in the rear of said ends and formed with outwardly-projecting shoulders adapted to engage the upper edges of said ends to prevent the bail from falling below a horizontal plane, substantially as set forth.

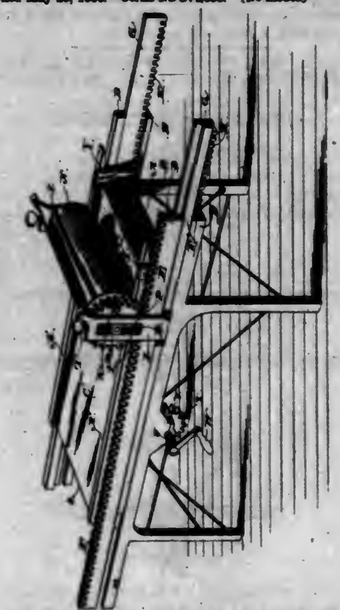
16. In a planter of the class described, the combination, with the beams of the frame having the downturned front ends, of a bail provided with outturned ends bearing in perforations in the beams and keys passed through perforations in the ends of the bail, said bail being formed with outwardly-projecting shoulders adapted to rest upon the upper edge of the downturned beam-ends to retain the bail in horizontal position, substantially as set forth.

17. In a planter of the class described, the combination, with the beams of the frame having the downturned ends, of a bail having its ends pivoted to said beams and provided with outwardly-projecting shoulders adapted to engage the upper edges of the downturned beam ends to retain the bail in horizontal position, the sides of said bail curving inwardly and terminating in an upturned hook, and a forwardly-inclined link pivoted in the end of the hook, substantially as and for the purpose set forth.

18. In a planter of the class described, the combination of the frame comprising two rearwardly-divergent beams having the downturned front ends carrying the axle and the downwardly and inwardly curved adjustable rear ends carrying coverer-plows, and the adjustable handles pivoted to said beams, substantially as and for the purpose set forth.

404,057. MICROMETER-CALIPERS. MORRIS F. SMITH, New Haven, Conn. Filed Jan. 17, 1889. Serial No. 296,854. (No model.)

Claim.—1. In micrometer-calipers, a graduated hollow cylinder secured to the sliding arm and having an enlarged screw-threaded upper portion, in combination with an internally-threaded sleeve mating with the screw portion of the hollow cylinder and carrying an adjustable caliper-point which fits the bore of the hollow cylinder, substantially as described.



2. In micrometer-calipers, the graduated split part F, provided with the conical screw K, and having an enlarged threaded part, *j*, adapted to receive the threaded sleeve J, in combination with the threaded sleeve J, carrying a graduated part, I, and the part L, as shown and described.

3. In a micrometer-screw, a hollow graduated cylinder, the upper portion of which is enlarged and screw-threaded both internally and externally and split, in combination with an interiorly-threaded sleeve mating with the outer thread of the cylinder and carrying an adjustable caliper-point which fits the bore of the hollow cylinder, and an exteriorly-threaded bushing mating with the interior thread of the hollow cylinder, substantially as described.

4. In a micrometer-screw, a hollow cylinder secured to the movable arm and having the upper portion enlarged and screw-threaded internally and externally and split, in combination with an internally-threaded sleeve mating with the exterior thread of the hollow cylinder and carrying a perforated cap and an adjustable caliper-point, and an externally-threaded bushing mating with the interior thread of the split cylinder and provided with depressions registering with the perforations in the cap, substantially as described.

5. In micrometer-calipers, a rigid beam carrying the anvil and having a series of perforations, in combination with a sliding arm carrying a micrometer-screw and provided with a sliding box which fits the beam and has a series of perforations, each of which may be made to register with a corresponding perforation in the beam, and a pin which fits the perforation, substantially as described.

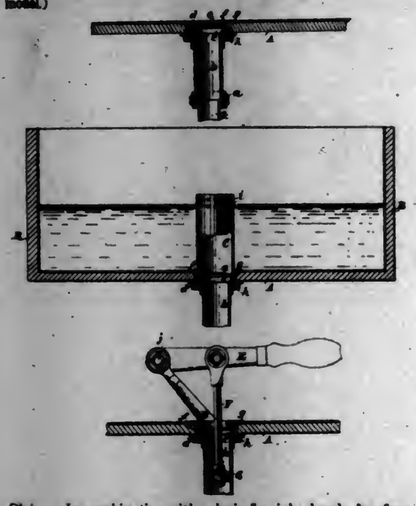
404,058. PRINTING-MACHINE. HARRY L. SNOW, Rosseville, Wis. Filed May 25, 1888. Serial No. 274,338. (No model.)

Claim.—1. The combination of the bed having the rack-bar F and the guide-bars D, with the slide-bars arranged in the guide-bars and having the racks H, the standards secured to the slide-bars, the impression-cylinder journaled in the said standards and having the spur-wheel engaging the rack F, and the operating-shaft having the wheels X, engaging the racks H, for the purpose set forth, substantially as described.

2. The combination of the bed or frame having the longitudinal guide-bars provided with grooves in their adjacent faces, the slide-bars guided between said guide-bars and having flanges fitting in the grooves thereof, the lower flanges being provided with teeth or racks, a shaft journaled transversely under the bed or frame, and pinions upon said shaft extending through slots or openings in the guide-bars and meshing with the racks upon the slide-bars, substantially as set forth.

3. The combination of the bed or frame having the longitudinal rack-bar F on its upper side, the guide-bars D D, arranged in pairs at each side of the frame, and standards Z at one end of the latter, the tympan-frame pivoted to said standards and having rearward-projecting arms, the rack-bars sliding longitudinally between the guide-bars, the standards secured to said sliding rack-bars and having vertical slots, the impression-cylinder journaled in boxes vertically adjustable in said slots, springs forcing the said cylinder in a downward direction, a shaft journaled transversely under the bed or frame and having an operating-crank, pinions upon said shaft meshing with the longitudinally-sliding rack-bars, and a gear-wheel upon the cylinder-shaft meshing with the longitudinal rack-bar upon the upper side of the bed or frame, substantially as and for the purpose set forth.

4. The printing-press comprising the bed having the rack-bar F and guide-bars D on its sides and the standards Y at one end, the slide-bars arranged in the guide-bars and having the racks H, the standards I, secured to the slide-bars, the impression-cylinder journaled in the standards I and having the spur-wheel engaging the rack, the tympan-frame pivoted at one end to the standards Y, and the operating-shafts having the wheels X, engaging racks on the slide-bars, substantially as set forth.

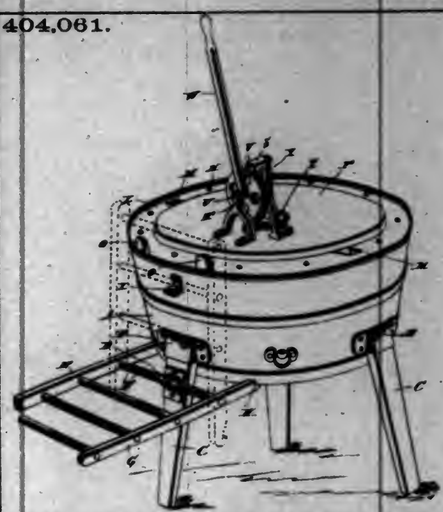


404,059. COVER FOR FRUIT-JARS. GUSTAV STAIB, Tompkinsville, N. Y. Filed Apr. 5, 1889. Serial No. 306,099. (No model.)

Claim.—1. The combination of perforated cover *a* with the bail *b*, disk *c*, and perforated cam *d*, the bail being secured to the disk and passing through the perforated cam, substantially as specified.

2. The combination of perforated cover *a* with the bail *b*, disk *c*, and perforated cam *d*, the cam *d* having handle d^3, that is provided with a beveled edge, substantially as specified.

404,060. DRAIN FOR SINKS, WASH-BOWLS, &c. FRANCIS A. STRATER, Boston, Mass. Filed June 12, 1888. Serial No. 277,014. (No model.)



Claim.—In combination with a drain for sinks, bowls, &c., formed to perform the function of a pump-barrel, a removable stand secured to the drain, a lever pivoted to said stand, and a piston reciprocated by means of said lever, the drain being adapted to have a stand-pipe secured thereto after the removal of said stand, substantially as and for the purposes set forth.

404,061. WASHING-MACHINE. JOHN C. THOMAS, Jamestown, N. Y. Filed Oct. 31, 1888. Serial No. 289,627. (No model.)

Claim.—1. The combination of the tub, the supporting-legs therefor, the loop D, secured on one of said legs, the bench having

one of its rounds inserted loosely through said loop and the ends of its side bars projecting under the tub, and the spring-catch secured to the side of the tub and adapted to engage one of the rounds of the bench, as set forth.

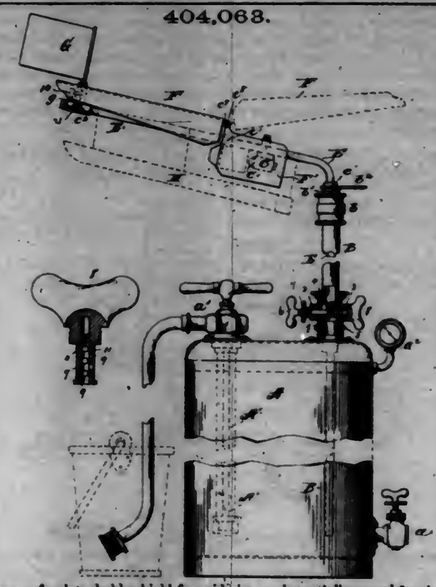
2. The combination of the tub, the internal lid-supporting ring secured to the upper edge of the tub and having shallow recesses K in its upper side at diametrically-opposite points, the ring L, secured on the upper side of the lid-supporting ring and provided in its inner edge with the notches M, registering with the recesses K, but smaller than said recesses, so that a portion of the said ring projects over the recess, and the lid provided at diametrically-opposite points with the plates R, projecting beyond its edge and adapted to pass through the notches M into the recesses K and engage under the projecting portions of the ring L, as specified.

404,062. METHOD OF ORNAMENTING CLOTH. ABRAHAM VERNON, New York, N. Y. Filed Oct. 12, 1888. Serial No. 287,941. (Specimens.)

Claim.—The herein-described improvement in the method of ornamenting material for desk-edging, consisting in the employment of cloth and in interposing between and pasting to the same and the plate a layer of some soft inelastic material—such as wood pulp—whereby the cloth is adapted to receive an impression of a figure or ornamentation, substantially as described.

404,063. REGENERATIVE BURNER. ROUSBRIDGE WALLWORK and ARTHUR C. WELLS, Manchester, County of Lancaster, England. Filed Sept. 14, 1888. Serial No. 285,382. (No model.) Patented in Belgium Apr. 24, 1888, No. 81,537.

Claim.—1. The herein-described regenerative burner, comprising an injector and a multitubular regenerator having its tubes connected in series and arranged in a projection of the plane on one side of and in proximity to the injector-nozzle, said injector being connected with the terminal of the multitubular regenerator, substantially as and for the purposes specified.



2. The herein-described regenerative burner, comprising an injector, a combining-cone arranged in front of the injector, and a multitubular regenerator having its tubes connected in series and arranged in a projection of the plane on one side of and in proximity to the injector-nozzle and combining-cone, said injector being connected with the terminal of the multitubular regenerator, substantially as and for the purposes specified.

3. The combination, with a burner for volatile combustible liquids, having its outlet-passage in a horizontal plane, of horizontal regenerative pipes arranged above and extending beyond said outlet-passage, said pipes being connected in series, the initial thereof communicating with a supply-pipe and the terminal with the burner, substantially as and for the purposes specified.

4. The combination, with a burner for volatile combustible liquids, having its outlet-passage in a horizontal plane, and horizontal regenerative pipes arranged above and extending beyond said outlet-passage, of a shield for said pipes, substantially as and for the purposes specified.

5. The combination, with a burner for volatile combustible liquids, having its outlet-passage in a horizontal plane, and horizontal regenerative pipes arranged above and extending beyond said outlet-passage, of a detachably-hinged shield for said pipes, substantially as and for the purposes specified.

404,063.

6. The combination, with a burner for volatile combustible liquids having its outlet-passage in a horizontal plane, and horizontal regenerative pipes arranged above and extending beyond said outlet-passage, of a detachably-hinged shield for said pipes, substantially as and for the purposes specified.

7. The herein-described burner for volatile combustible liquids, comprising the burner proper, having its outlet-passage in a horizontal plane, and horizontal regenerative pipes arranged above and projecting beyond the outlet-passage, said pipes being connected in series, the initial communicating with the supply of liquid and the terminal with the outlet-passage, a shield for said pipes, and a shield for the burner, substantially as and for the purpose specified.

8. The herein-described burner for volatile combustible liquids, comprising the burner proper, provided with a horizontal discharge-nozzle, a mixing-cone, D, arranged in front of said nozzle, and regenerative pipes arranged above and projecting beyond the nozzle and cone, and a shield inclosing the top and sides of the cone and burner, as well as one end of said burner, substantially as and for the purposes specified.

9. The herein-described burner for volatile combustible liquids, comprising the burner proper, provided with a horizontal discharge-nozzle, a mixing-cone, D, arranged in front of said nozzle, and regenerative pipes arranged above and projecting beyond the nozzle and cone, and a shield hinged to and inclosing the top and sides of the cone and burner, as well as one end of said burner, substantially as and for the purposes specified.

10. The herein-described burner for volatile combustible liquids, comprising the burner proper, provided with a horizontal discharge-nozzle, a mixing-cone, D, arranged in front of said nozzle, and regenerative pipes arranged above and projecting beyond the nozzle and cone, and a detachably-hinged shield inclosing the top and sides of the cone and burner, as well as one end of said burner, substantially as and for the purposes specified.

11. The combination, with a revoluble burner, of a directing-vane to maintain the burner in the direction of air-currents, substantially as described.

12. The combination, with a revoluble burner the tip or nozzle whereof lies in a horizontal plane, of a directing-vane to maintain the burner in the direction of air-currents, substantially as described.

13. The combination, with a revoluble burner the tip or nozzle whereof lies in a horizontal plane, of a horizontal shield arranged above the tip or nozzle and extending beyond the same, and a directing-vane, substantially as and for the purposes specified.

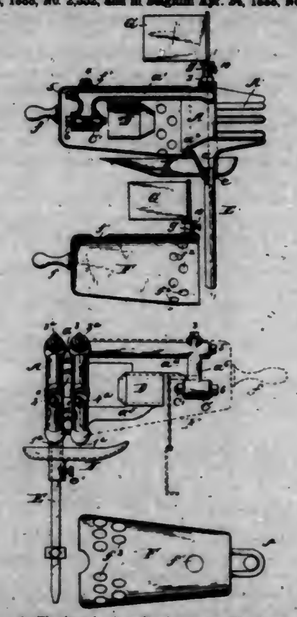
14. In an apparatus for illumination with combustible volatile liquids, the combination, with the supply-pipe for the liquid, of a horizontal burner revoluble on said supply-pipe and regenerative pipes connected with the supply-pipe and burner, substantially as and for the purposes specified.

15. In an apparatus for illumination with combustible volatile liquids, the combination, with the supply-pipe, a horizontal revoluble burner, and regenerative pipes connected with the burner and supply-pipe, of a directing-vane to maintain the burner in the direction of air-currents, substantially as and for the purposes specified.

16. In an apparatus for illumination with combustible volatile liquids, the combination, with the supply-pipe, a horizontal revoluble burner, and horizontal regenerative pipes extending beyond the burner above the plane of the flame and parallel therewith, of a shield arranged above said pipes and a wind-vane at the outer end of the pipes and shield, substantially as and for the purposes specified.

17. In an apparatus for illumination with combustible volatile liquids, the combination, with a forcing apparatus for the combustible liquid and the distributing-pipe of said apparatus, of a horizontal burner revoluble on said distributing-pipe and a wind-vane connected therewith, substantially as and for the purposes specified.

18. In an apparatus for illumination with combustible volatile liquids, the combination, with a forcing apparatus for the combustible liquid and the distributing-pipe of said apparatus, of a horizontal burner revoluble on said pipe, regenerative pipes connected with the burner and distributing-pipe, and a wind-vane to hold the burner in the direction of the wind, substantially as and for the purposes specified.



19. In an apparatus for illumination with combustible volatile liquids, the combination, with a forcing apparatus for the combustible liquid and the distributing-pipe of said apparatus, of a horizontal burner revoluble on said pipe, regenerative pipes connected with the burner and distributing-pipe and arranged in proximity to the burner-flame, a shield for said pipes and flame, and a wind-vane to hold the burner in the direction of the wind, substantially as and for the purposes specified.

20. The combination, with the burner C and the nozzle C', constructed substantially as described, of the screw-plug 24, provided with a recess, d^4, in which the open rear end of the nozzle is seated, substantially as and for the purposes specified.

21. The combination, with the mixing-cone D, of the burner C, the injector-nozzle C', connected therewith and provided with ports c^4, and the foraminous cylinder c^5, arranged within the nozzle, substantially as and for the purposes specified.

22. The combination, with the burner C, the injector-nozzle C', connected therewith and provided with ports c^4, and the foraminous cylinder c^5, arranged within the nozzle, of the screw-plug 24, provided with a seat, d^4, for the open end of said nozzle, substantially as and for the purposes specified.

404,064. REGENERATIVE BURNER. ROUSBRIDGE WALLWORK and ARTHUR C. WELLS, Manchester, County of Lancaster, England. Filed Sept. 14, 1888. Serial No. 285,383. (No model.) Patented in England Feb. 16, 1888, No. 2,352, and in Belgium Apr. 24, 1888, No. 81,537.

Claim.—1. The herein-described regenerative burner, comprising a converter or regenerator consisting of an endless tube of annular or parallelogrammatic form and having one or more convolutions, heater-ribs having the form of teeth or bars projecting forwardly

from one side of the converter on lines substantially parallel with the axis thereof, and an injector in communication with the converter and arranged axially in rear thereof, substantially as and for the purposes specified.

2. The herein-described regenerative burner, comprising a converter or regenerator consisting of an endless tube of annular or parallelogrammatic form and having one or more convolutions, hollow heater-ribs in communication with and projecting forwardly from the converter on lines substantially parallel with the axis thereof, and an injector in communication with the converter and arranged axially in rear thereof, substantially, as and for the purposes specified.

3. The herein-described regenerative burner, comprising a converter or regenerator consisting of an endless tube of annular or parallelogrammatic form and having one or more convolutions, an injector in communication therewith, a combining-cone in front of the injector and in the axial plane of the converter, said converter being arranged relatively to the cone so as to admit air freely into the open rear end of the cone around the injector-nozzle, in combination with a shield or casing inclosing the injector and cone, and the connection between said injector and the regenerator, substantially as and for the purposes specified.

4. The herein-described regenerative burner, comprising a converter or regenerator consisting of an endless tube of annular or parallelogrammatic form and having one or more convolutions, and an injector in communication therewith and consisting of an injector-nozzle and a combining-cone in front thereof, both in rear and in the axial plane of the converter, said injector being arranged relatively to the cone to admit air freely into the open rear end of the cone around the injector-nozzle, in combination with a shield or casing inclosing the injector and cone, and the connection between said injector and converter, said shield being provided with air-ports at a point intermediate of the combining-cone and converter, substantially as and for the purposes specified.

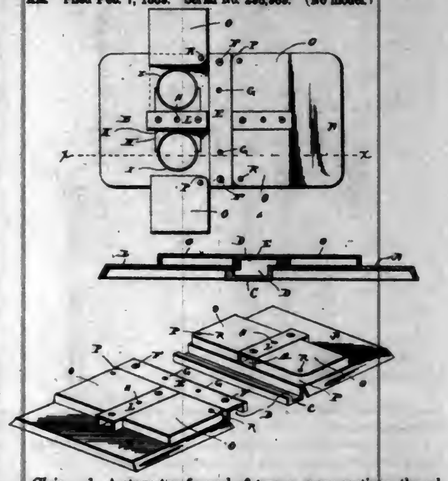
5. The herein-described regenerative burner, comprising a converter or regenerator consisting of an endless tube of annular or parallelogrammatic form and having one or more convolutions terminating in a rectilinear branch, an injector connected to the rear end of said branch in the axial plane of the converter, a combining-cone supported from said branch in front of the injector, and a removable shield or casing inclosing the injector and converter branch, said shield being provided with air-ports at a point intermediate of the converter and combining-cone, substantially as and for the purposes specified.

6. The herein-described regenerative burner, comprising a converter or regenerator consisting of an endless tube of annular or parallelogrammatic form, having one or more convolutions, an injector in communication therewith and in the axial plane thereof, and a pivot upon which said burner revolves, substantially as and for the purposes specified.

7. The herein-described regenerative burner, comprising a converter or regenerator consisting of an endless tube of annular parallelogrammatic form and having one or more convolutions, an injector in communication therewith and arranged in the axial plane thereof, a pivot upon which the burner revolves, and a wind-vane, substantially as and for the purposes specified.

8. The herein-described regenerative burner, comprising a regenerator consisting of an endless tube of annular or parallelogrammatic form, having one or more convolutions, an injector in communication with and in the axial plane of the converter, and a pivot upon which said parts revolve, in combination with a shield or casing, F, and a wind-vane, substantially as and for the purposes specified.

9. The herein-described regenerative burner, comprising a converter or regenerator of annular or parallelogrammatic form and having one or more convolutions, said converter having a rectilinear initial and terminal branch substantially at right angles to each other, an injector connected with the terminal branch, a supply-pipe, and a pivotal connection between the supply-pipe and initial rectilinear branch, substantially as and for the purposes specified.



10. The herein-described regenerative burner, comprising a converter or regenerator of annular or parallelogrammatic form and having one or more convolutions, said converter having a rectilinear initial and terminal branch substantially at right angles to each other, an injector connected with the terminal branch, a supply-pipe, and a pivotal connection between the supply-pipe and initial rectilinear branch, and a directing or wind vane, substantially as and for the purposes specified.

11. The combination, with the burner having one or more regenerators, A, the supply-pipe E, and the dish H, of the chimney H', substantially as and for the purposes specified.

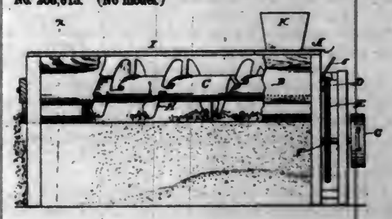
12. The combination, with the burner, constructed substantially as described, and the pivot-pipe E, provided with a collar, *e*, of the dish H, secured to said pipe between the collar *e* and the burner, substantially as and for the purposes specified.

13. A regenerative vapor-burner consisting, essentially, of a regenerator constructed of an endless tube of annular or parallelogrammatic form and having one or more convolutions, an open-ended more or less conical burner-tube arranged in the axial plane of and some distance from the regenerator, and an injector arranged with its discharge-nozzle in the axial plane of and some distance from the larger open end of the burner-tube, substantially as and for the purposes specified.

404,065. STOVE-TOP. WILLIAM H. WOOLDRIDGE, Birmingham, Ala. Filed Feb. 7, 1889. Serial No. 299,069. (No model.)

Claim.—1. A stove-top formed of two or more sections, the adjacent edges of which are provided with oppositely-offset portions, as C E, the offset of one section being adapted to take over and register with that of the other, and the two conjointly forming an air-space, D, substantially as specified.

2. A stove-top formed of two or more sections, the adjacent edges of which are provided with oppositely-offset portions, as C E, formed with perforations, as G, the offset of one section being adapted to take over and rest upon that of the other, and the two conjointly forming an air-space, D, substantially as specified.



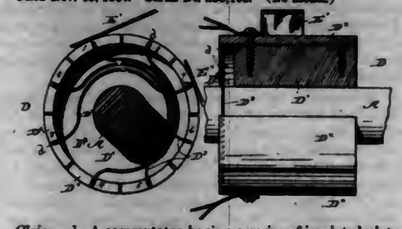
3. The stove-top having the openings I and the offsets or cleats arranged at right angles to each other, and the covers O, pivoted on the stove-top at their outer proximate corners, and thereby adapted to be swung over the openings or swung outward therefrom and extended beyond the sides of the stove-top, substantially as described.

4. The stove-top having the transverse offset on its upper side and the openings H, the bridge-plates adapted to fit in said openings, circular openings being formed in the ends of openings H and in the sides of the bridge-plate, the latter having the offsets or cleats L on their upper sides arranged at right angles to the offset on the stove-top, and the covers O, pivoted on the stove-top at their inner proximate corners, whereby said covers may be swung inward over the openings or swung outward and extended beyond the sides of the stove-top, and whereby the cleats or offsets constitute stops to limit the movement of the covers, substantially as described.

5. A center or bridge piece for stove-tops, provided on its upper side with a longitudinal hollow brace extending beyond its ends and adapted to support the same, substantially as herein described.

6. A stove-top provided with braces on its upper side, in combination with swinging covers arranged to be flush or level with said braces, substantially as set forth.

404,066. COTTON-SEED SEPARATOR. JAMES S. REESE, Hartwell, Ohio, assignor, by mesne assignments, to the National Cotton Seed Oil and Huller Company, Memphis, Tenn. Filed May 29, 1886. Serial No. 203,613. (No model.)



Claim.—1. In a cotton-seed separator, the combination, substantially as set forth, of the shaft C, the flights H, secured thereon upon different but parallel spiral lines, and the inclosing perforated case, within which the separator-shaft is mounted to revolve.

2. The combination, substantially as specified, of the case B, perforated at bottom, and U-shaped in cross-section, as shown, and the revolving separator and conveyer consisting of the shaft C and spirally-arranged flights H.

3. The combination of the supporting-frame A, the U-shaped perforated case having a discharge-opening at one end and the opposite end and top closed, the revolving separator-shaft having flights arranged as shown, and suitable gearing to revolve said shaft at a high speed, for the purpose set forth.

404,067. ELECTRIC MOTOR. WARREN S. BELDING, Chicago, Ill., assignor to the Belding Motor and Manufacturing Company, same place. Filed Nov. 15, 1887. Serial No. 255,192. (No model.)

Claim.—1. A commutator having a series of insulated plates, D^3, an annular recess, D^4, and wires D^5 in said recess and connecting said plates into groups, substantially as shown and described.

2. A commutator having a series of insulated plates, D^3, an annular recess, D^4, wires D^5 in said recess and connecting said plates into groups, and said recess D^4 filled with wax or other insulating material, substantially as shown, and for the purposes described.

3. A commutator having a series of insulated plates, D^3, an annular recess, D^4, and wires D^5 in said recess, said commutator-plates having recesses or slots *d* at their ends, and the ends of said wires being secured in said recesses or slots *d*, substantially as shown and described.

4. A commutator having a series of insulated plates, D^3, an annular recess, D^4, and wires D^5 in said recess, said commutator-plates having recesses or slots *d* at their ends, and said wires being secured in said recesses or slots *d*, and said recess D^4 being filled with wax or other insulating material, substantially as shown, and for the purposes described.

5. In an electric motor, a plurality of armature-sections connected with the plates of the commutator, and a commutator having an annular recess, D^4, and wires D^5 in said recess and connecting the commutator-sections into groups, whereby each armature-section is brought into communication with each brush more than once during each rotation of the commutator, substantially as shown and described.

6. In an electric motor, a plurality of armature-sections connected with the plates of the commutator and a commutator having an annular recess, D^4, and wires D^5, and an insulating material in said recess, said wires connecting the commutator-sections into groups, whereby each armature-section is brought into communication with each brush more than once during each rotation of the commutator, substantially as shown and described.

7. In an electric motor, a plurality of armature-sections connected in parallel, a commutator having a recess, D^4, wires D^5 in said recess and connecting the commutator-plates into groups, and two brushes held in contact with commutator-plates whose connections lead to armature-poles of opposite polarity, substantially as shown and described.

8. In an electric motor, a plurality of armature-sections connected in parallel, a commutator having a recess, D^4, wires D^5, and an insulating material in said recess, said wires connecting the commutator-plates into groups, and two brushes held in contact with commutator-plates whose connections lead to armature-poles of opposite polarity, substantially as shown and described.

404,068. DYNAMO. WARREN S. BELDING, Chicago, Ill., assignor to the Belding Motor and Manufacturing Company, same place. Filed Feb. 2, 1888. Serial No. 262,786. (No model.)

Claim.—1. An armature divided into bobbin-spaces and poles which are respectively equidistant and equal in dimensions, and each of which poles has a hole extending into or through it perpendicularly to the plane of the armature, whereby the exposed surface of the pole remains relatively large, while its mass is relatively small, substantially as and for the purposes herein specified.

2. An armature divided into bobbin-spaces and poles which are respectively equidistant and of equal dimensions, said poles being provided with outward extensions, into or through which extend holes perpendicularly to the plane of the armature, substantially as and for the purposes herein specified.

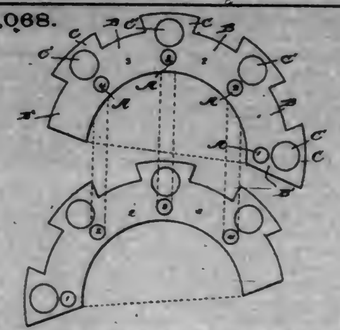
3. An armature consisting of alternate metal and insulation blanks and divided into bobbin-spaces and poles which are respectively equidistant and equal in dimensions, and each of which poles has a hole extending into or through it perpendicularly to the plane of the armature, whereby the exposed surface of the pole remains relatively large, while its mass is relatively small, substantially as and for the purposes herein specified.

4. An armature consisting of alternate metal and insulation blanks and divided into bobbin-spaces and poles which are respectively equidistant and of equal dimensions, said poles being provided with outward extensions, into or through which extend holes perpendicularly to the plane of the armature, substantially as and for the purposes herein specified.

5. An armature composed of two or more interlocking sections, said sections being composed of sheet-blanks each of which is a segment of a circle and divided into bobbin-spaces and poles which are respectively equal in dimensions and equidistant from each other and located unsymmetrically on said blank, so that there is a bobbin-space at one end of the blank and a pole at the other end, substantially as and for the purposes herein specified.

6. An armature composed of two or more interlocking sections, said sections being composed of sheet-blanks each constituting a segment of a circle and divided into bobbin-spaces and poles which are respectively equal in dimensions and equidistant from each other and located unsymmetrically on said blank, so that there is a bobbin-space at one end of the blank and a pole at the other end, each of said poles having formed in it a hole, substantially as and for the purposes herein specified.

7. An armature composed of two or more interlocking sections, said sections being composed of sheet-blanks each of which is a segment of a circle and divided into bobbin-spaces and poles which are respectively equal in dimensions and equidistant from each other and located unsymmetrically on said blank, so that there is a bobbin-space at one end of the blank and a pole at the other end, and said poles having each an outward extension, substantially as and for the purposes herein specified.



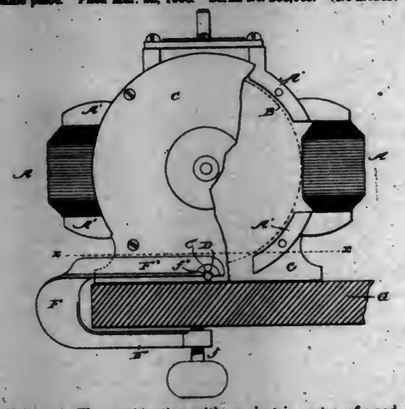
8. An armature composed of two or more interlocking sections, said sections being composed of sheet-blanks each of which is a segment of a circle and divided into bobbin-spaces and poles which are respectively equal in dimensions and equidistant from each other and located unsymmetrically on said blank, so that there is a bobbin-space at one end of the blank and a pole at the other end, and said poles having each an outward extension, and each such extension having formed in it a hole, substantially as and for the purposes herein specified.

9. An armature composed of two or more interlocking sections, said sections being composed of metal sheet-blanks M and insulation-blanks I, each of which is divided into bobbin-spaces and poles which are respectively equal in dimensions and equidistant from each other and located unsymmetrically on said blank, so that there is a bobbin-space at one end of the blank and a pole at the other end, substantially as and for the purposes herein specified.

10. An armature divided into bobbin-spaces and poles which are respectively equidistant and equal in dimensions, and each of which poles has a hole extending through it perpendicularly to the plane of the armature, and spiders S', located at each side of the armature, bolts T, extending through said holes and the spiders, and a shaft, S, extending through said spiders, substantially as described.

11. The combination, with an armature having holes extending through the armature between the bobbin-spaces B B, of a shaft, S, a spider, S', located on said shaft at each side of the armature and having bushings S^4, extending into said holes, and bolts T, extending

404,068.

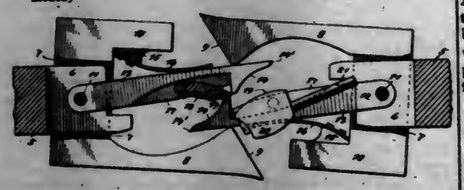


through said holes and bushings and the arms of the spiders, substantially as and for the purposes specified.

12. The combination, with an armature divided into bobbin-spaces and poles which are respectively equidistant and equal in dimensions and having holes A and C extending through the armature between the bobbin-spaces perpendicularly to the plane of the armature, of a shaft, S, a spider, S', located on said shaft at each side of the armature, and bolts T, extending through one of the spider-arms and the armature and threaded into the opposite spider-arm, substantially as and for the purposes herein set forth.

13. The combination, with an armature having holes A and C extending through the armature between the bobbin-spaces B B, of a shaft, S, a spider, S', located on said shaft at each side of the armature and having bushings S^4 extending into said holes, and bolts T, extending through one of the arms of said spider and the bushing thereon and through one of said holes and threaded into the opposite bushing and spider-arm, substantially as shown and described.

14. The combination, with an armature composed of two or more interlocking sections, said sections being composed of sheet-blanks each of which is a segment of a circle and divided into bobbin-spaces and poles which are respectively equal in dimensions and equidistant from each other and located unsymmetrically on said blank, so that there is a bobbin-space at one end of the blank and a pole at the other end, of spiders applied to the sides of said armature, and a shaft extending through the center or axis of said armature and said spiders, substantially as shown and described.



404,069. CLAMP FOR ELECTRIC MOTORS. WARREN S. BELDEN, Chicago, Ill., assignor to the Belding Motor and Manufacturing Company, same place. Filed Mar. 22, 1888. Serial No. 268,065. (No model.)

Claim.—1. The combination, with an electric motor, of a rod, D, extending through the lower portion of the frame of the motor, the ends of said rod projecting at each side of the frame, and a clamp, F, to engage the ends of said rod D and a table, substantially as shown and described.

2. The combination, with an electric motor having the field-magnets A A' and plates C C, secured to said magnets, substantially as described, of a rod, D, extending horizontally through said plates C C and having its ends projecting from said plates, and a clamp, F, to engage said rod D and a table, substantially as shown and described.

404,070. CAR-COUPLING. LEWIS W. BREWSTER and ROBERT SWIFT, Palmyra, Tenn. Filed Mar. 6, 1889. Serial No. 302,067. (No model.)

Claim.—1. An apparatus for coupling and uncoupling cars, consisting of a bumper, a horizontally-swinging frame mounted on the bumper parallel therewith and having a coupling-hook guard-arm, a horizontally-swinging coupling-hook located within the horizontally-swinging frame and parallel with the guard-arm, a spring acting on the coupling-hook to hold it toward the guard-arm, a cam-plate pivoted to the coupling-hook with a projecting arm, and a shaft mounted on a car with a hand-wheel at its upper end and a chain at its lower end connected to the projecting arm on the cam-plate, substantially as shown and described.

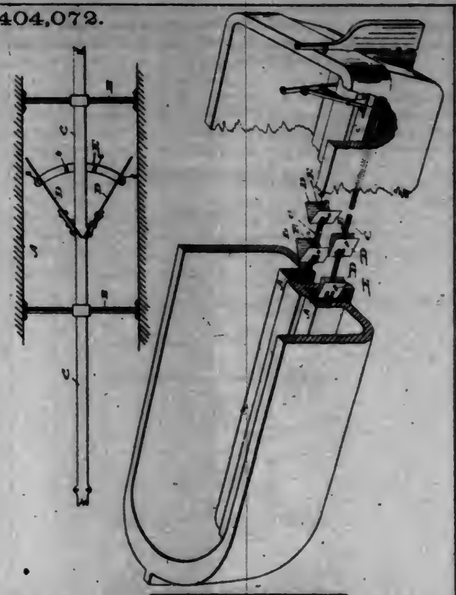
2. In an apparatus for coupling and uncoupling cars, a horizontally-swinging frame with a coupling-hook guard-arm, a horizontally-swinging coupling-hook located within the horizontally-swinging frame and parallel with the guard-arm, a spring acting on the coupling-hook to hold it toward the guard-arm, a cam-plate pivoted to the coupling-hook, and mechanism on the car for operating the cam-plate, substantially as specified.

3. In an apparatus for coupling and uncoupling cars, the extended portion 3, shaped as a draw-head and serving as a bumper and having the depending bracket 5, a horizontally-swinging frame pivoted to the bracket 5 and consisting of the coupling-hook guard-arm 8 with the inwardly-beveled end 9, the cross-piece 7, and the short arm 10, the horizontally-swinging coupling-hook 13, located between the arms 8 and 10 and parallel thereto and having the inwardly-beveled face 14 at its outer end opposite the beveled end 9 of arm 8, and the spring 16, mounted on arm 10 and holding the coupling-hook 13 toward arm 8, substantially as specified.

4. An apparatus for coupling and uncoupling cars, consisting of the draw-head and bumper 3, with the depending bracket 5, the horizontally-swinging frame pivoted to bracket 5 and consisting of the coupling-hook guard-arm 8, with inwardly-beveled outer end 9, the cross-piece 7, and short arm 10, the horizontally-swinging coupling-hook 13, located within the horizontally-swinging frame parallel with arm 8 and formed with the point 14' and the inwardly-beveled face 14 at its outer end, the shelf 17, the cam-plate 18, with curved face 19, pivoted on the shelf 17 at the forward part of hook 13 and having the flange 20 engaging the latter and the rearwardly-projecting arm 21, and a vertical shaft, 23, mounted on a car, with a hand-wheel, 25, at its upper end and a chain, 22, at its lower end connecting with the arm 21 of the cam-plate 18, substantially as specified.

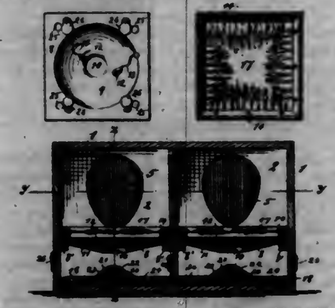
404,071. END-GATE FOR VEHICLES. THEODORE B. BURR, Harlan, Iowa. Filed Dec. 31, 1888. Serial No. 295,002. (No model.)

Claim.—1. The combination, with a vehicle-body, a transverse plate attached to the bottom of the body at the end, provided with a gudgeon at each extremity, and a recess in the outer face near one end and a keeper, 13, spanning said recess, of an end-gate, strap-hinges attached to the said end-gate having a bearing upon the said gudgeons, jointed supporting-bars connecting the body and the end-gate, stops or ears secured to the side-boards of the body adapted to limit the forward and rearward throw of the supporting-bars, and a hinge, 18, secured to the outer face of the end-gate having a detachable bearing upon the keeper of the transverse body-bar, all combined for operation substantially as shown and described.



2. The combination, with a vehicle-body, of an end-gate detachably hinged thereto at its lower edge and jointed supporting-bars sliding one upon the other at their pivotal point and pivoted at their outer ends to the body and end-gate, respectively, substantially as set forth.

3. The combination, with the body having bar 10, and wear-plates 19, provided on their lower edges with front and rear stops 20 21, of the end-gate having downwardly-projecting straps or projections engaging said bar to rock thereon, and the jointed supporting bars, the sections *a'* of which are pivoted to the wear-plate and provided with a slot, 23, the sections *a* being hinged to the end-gate and provided with pivots extending through slots 23, substantially as set forth.



404,072. PROPELLER FOR CANAL-BOATS, &c. ALBERT DUBROWN, Hemlock, Ontario, Canada. Filed June 17, 1886. Renewed Oct. 10, 1888. Serial No. 287,783. (No model.)

Claim.—As a means for propelling vessels, open inverted troughs A, located on each side of the keel and extending from stem to stern, in combination with a reciprocating rod or shaft, C, journaled within each of the troughs, a series of valves or wings, D, hinged to each of the shafts, and a curved bar, E, secured to each shaft, passed through said valves, and provided with stops *e* upon opposite sides of the valves, substantially as shown and described, and for the purpose specified.

404,072.

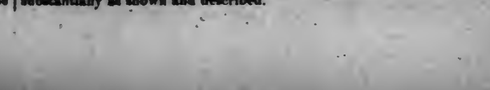
404,073. HEN'S NEST. EBENEZER BUTTERICK, Brooklyn, N. Y. Filed Dec. 14, 1888. Serial No. 293,567. (No model.)

Claim.—1. In a hen's nest, a concave shelf provided with an opening and an artificial nest-egg or nest-eggs loosely attached to the shelf by a connection, so as to permit the egg or eggs to rest and roll on the shelf, substantially as described.

2. In a hen's nest, a concave shelf with an opening, a frame with a sheet of light fabric loosely mounted thereon beneath the shelf, and a vertical yielding projection below the opening in the shelf and supporting the center of the sheet of light fabric, substantially as described.

3. In a hen's nest, a concave shelf provided with an opening and one or more artificial nest-eggs loosely attached thereto by a connection to rest and roll on the shelf, in combination with a frame having mounted thereon hay or other suitable nest-forming material projecting over the shelf, substantially as described.

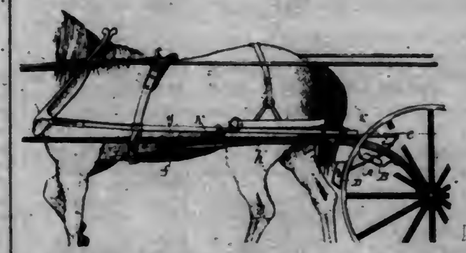
4. In a hen's nest, a concave shelf having an opening and one or more artificial eggs loosely connected to the shelf, a frame located above the shelf and having mounted thereon hay or other suitable nest-forming material projecting over the shelf, a flexible sheet of light fabric loosely mounted beneath the shelf, and a vertical yielding projection below the opening in the shelf and supporting the center of the flexible sheet of light fabric, substantially as described.



5. In a hen's nest, the frame 14, consisting of strips 15, secured together by pins 16, and hay or straw, 17, clamped between the strips 15 and projecting inwardly in the frame 14, substantially as described.

6. In a hen's nest, the shelf 8, having the concave portion 9, with a roughened surface, the central opening, 10, the artificial nest-eggs 12, resting on shelf 8 and connected thereto by cords 13, and the ventilating-holes 25, with pivoted covers 26, substantially as described.

7. In a hen's nest, the frame 18, having the inwardly-beveled edges 19, and the light flexible fabric 20, loosely mounted on the frame 18, in combination with the spiral spring 23, having the oval top piece, 22, supporting the center of the flexible fabric 20, substantially as described.



8. A hen's nest consisting of a casing, 1, formed with the receptacle 3, having cleats 8' on its sides, a door, 6, ventilating-holes 25, with pivoted covers 26, located in the side of the receptacle 3 below the cleats 8' and in the lower part of the door 6, a covered passage-way, 4, and a partition, 2, with opening 5, between the receptacle 3 and passage-way 4, in combination with a shelf, 8, resting on cleats 8' and having the concave portion 9, with roughened surface, the central opening, 10, the artificial nest-eggs 12, loosely connected by cords 13 to the top of shelf 8, and the ventilating-holes 25, with pivoted covers 26, a frame, 14, resting on shelf 8 and having hay or straw, 17, projecting over the latter, a frame, 18, with beveled edges 19, located in the bottom of the receptacle 3 beneath shelf 8, with a flexible fabric, 20, loosely connected thereto, and a spiral spring, 23, secured to bottom of receptacle 3 and having an oval top piece, 22, located below the opening 10 and supporting the fabric 20, substantially as described.

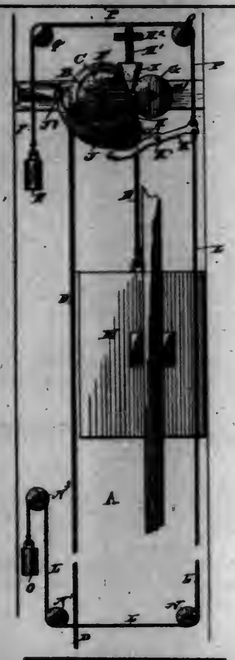
404,074. VETERINARY INSTRUMENT. BENJAMIN CHAMPLIN, Cortland, Ill. Filed Feb. 19, 1889. Serial No. 300,408. (No model.)

Claim.—An improved surgical instrument, consisting of a lance provided with a rounded head having shoulders projecting beyond the sides of the lance, substantially as specified.

404,075. AUTOMATIC BRAKE FOR VEHICLES. LEANDER B. CLARK, Alta, Iowa. Filed Aug. 13, 1888. Serial No. 282,604. (No model.)

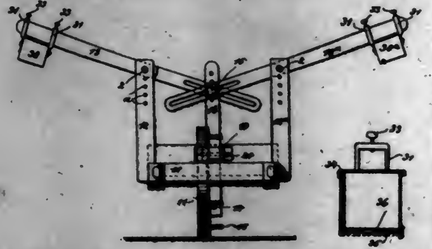
Claim.—An automatic brake device for vehicles, comprising a rock-shaft, A, having arms C and brake-shoes on its free ends, springs *i*, and harness holdback-straps, in combination with shafts having holdback-irons *f*, and anti-friction pulleys *g*, to operate substantially as shown and described.

404,076. BRAKE FOR DUMB-WAITERS. HUGH DONOHUE, New York, N. Y. Filed Feb. 15, 1888. Serial No. 300,012. (No model.)



Claim.—1. The combination, with two aligning wheels, one of which is secured on a shaft to be controlled, of a brake-shoe held below one of said wheels, and a pin provided with a wedge supported on the free end of the brake-shoe to extend between said wheels, substantially as shown and described.

2. In a dumb-waiter, the combination, with a main shaft supporting the carriage-pulley, of a brake-wheel secured on the said shaft, a second wheel held in line with the said brake-wheel, a pin provided with a wedge and held between the said two pulleys, and a brake-shoe adapted to engage the said brake-wheel and supporting the said pin, substantially as shown and described.



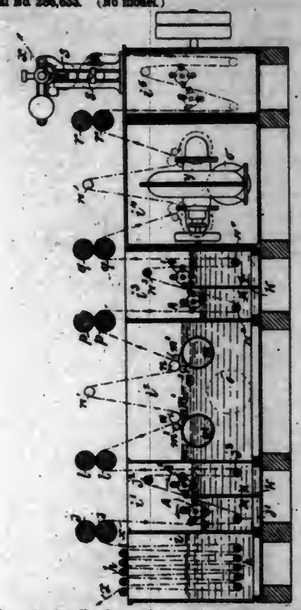
3. In a dumb-waiter, the combination, with a main shaft supporting the carriage-pulley, of a brake-wheel secured on the said shaft, a second wheel held in line with the said brake-wheel, a pin provided with a wedge and held between the said two pulleys, a brake-shoe adapted to engage the said brake-wheel and supporting the said pin, and a lever operating on the said brake-shoe and under the control of the operator, substantially as shown and described.

4. In a dumb-waiter, the combination, with a main shaft supporting the carriage-pulley, of a brake-wheel secured on the said shaft, a second wheel held in line with the said brake-wheel, a pin provided with a wedge and held between the said two pulleys, a brake-shoe adapted to engage the said brake-wheel and supporting the said pin, a lever operating on the said brake-shoe, and weighted ropes connected with the said lever to counterbalance and operate the same, substantially as shown and described.

404,076.

404,077. POISON-DISTRIBUTER. FRED EATON, Conway, N. H. Filed Mar. 8, 1889. Serial No. 302,495. (No model.)

Claim.—1. The combination, with a frame and the supporting-standards, of the vibrating levers pivoted to the standards, boxes provided with perforated bottoms attached to the outer ends of the lever-arms, and a vertically-reciprocating slide attached to the inner ends of the levers and operating the same, substantially as described.

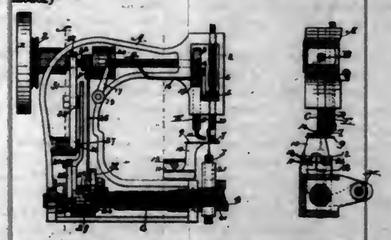


2. In a poison-distributer, the combination, with an operating-lever, of a box having a perforated bottom and laterally adjustable along the lever, and binding-straps for securing the box to the lever, substantially as shown and described.

3. In a poison-distributer, the combination, with a frame and a carrying-wheel journaled within the same, said wheel having a series of laterally-projecting pins upon one side arranged near its edge, of the upright standards attached to each side of the frame, the vibrating lever pivoted to the uprights, a vertically-reciprocating slide having a projection upon its lower end adapted to engage with the pins on the wheel, the upper end of said slide being adjustably secured to the inner ends of the vibrating lever, and the boxes having perforated bottoms secured to the outer ends of the lever, substantially as shown and described.

4. In a poison-distributer, the box 30, provided with strap 31 and set-screw 33, perforated bottom 36, and hinged bottom 35, all arranged and adapted to operate substantially as and for the purpose described.

5. The combination, with a pair of boxes, of vertically-vibrating levers upon which the boxes are supported, a vertically-reciprocating slide to which the levers are connected, a carrier-wheel provided with laterally-extending pins, and a pin or projection carried by the slide and extending into the path of the carrier-wheel projections, as and for the purpose stated.

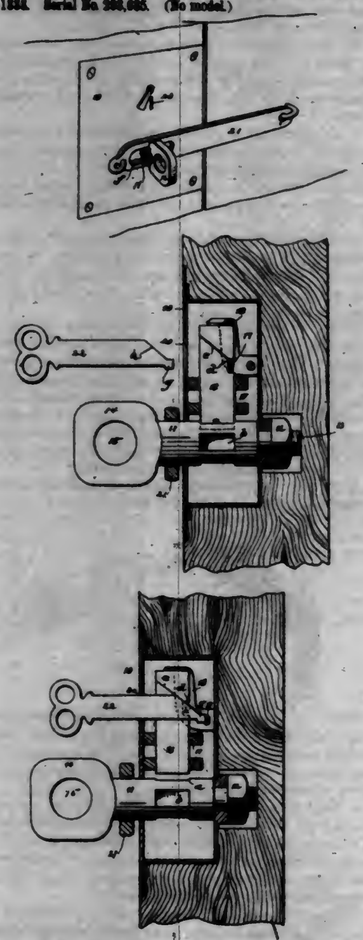


404,078. APPARATUS FOR WASHING TEXTILE FABRICS. JAS. B. FARMER, Salford, County of Lancaster, England. Filed Sept. 22, 1888. Serial No. 286,633. (No model.)

Claim.—1. A roller for washing and cleansing textile fabrics, consisting of disks mounted to rotate on a transverse shaft in a receptacle containing liquid, series of links or arms swiveled to the faces of said disks, and cylindrical vessels open at one side mounted on said links or arms and adapted as the shaft is revolved to dip up the liquid and project it upon the face of the fabric, substantially as shown and described.

2. In apparatus for washing and cleansing textile fabrics, the combination, with a tank divided into a series of sections containing liquid, series of guide-rollers for the fabric mounted to rotate in and upon said tank, series of perforated cylinders mounted to rotate in said tank and over which the fabric passes from and to the guide-rollers, and a series of squeezing-rollers through which the fabric passes to and from the guide-rollers, of a series of rollers consisting of disks mounted to rotate on transverse shafts in said tank, arms swiveled on said disks, and cylindrical vessels open at one side mounted on said arms adapted to raise the liquid and discharge it upon the faces of the fabric, and means for rotating said rollers and cylinders, substantially as shown and described, for the purposes set forth.

404,079. WAX-THREAD SEWING-MACHINE. WILLIAM FIELDER, North Adams, Mass. Filed Apr. 23, 1888. Serial No. 272,122. (No model.)

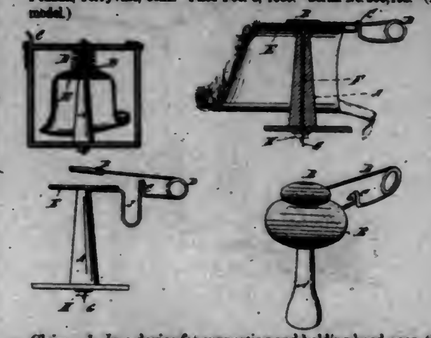


Claim.—1. In a sewing-machine, the combination of a driving-shaft, B, provided with a triangular cam, 37, a vibratile arm, 31, pivoted on a stationary stud, 34, and provided with a forked end which spans said cam, and with a slotted opening, 33, having a wrist-pin, 35, adjustably secured therein, a rock-shaft, G, having at its outer end a frame, 21, in which the needle-bar I is fitted to reciprocate, and near its inner end an arm, 22, provided with a curved slot formed concentrically to said rock-shaft, a slotted arm, 27, adjustably fitted on the arm 22, and provided with a binding-screw, 30, by which the arms 22 and 27 are adjustably secured together, and a needle-bar, I, and its attached needle, the wrist-pin 35 being fitted to engage in the slot of the arm 27, to produce a synchronous movement of the arms 27 and 31, as and for the purpose herein specified.

2. The combination of the frame A, provided with a dovetailed lug, 12, a throat-plate post, 10, provided with a split flange and with a clamping-screw, whereby said post is fitted to be adjustably attached to said lug, and a needle attached to an operating mechanism which is adjustable lengthwise of the machine, as and for the purpose herein specified.

3. In a sewing-machine, the combination of the frame A, provided with snugs 25, and a rock-shaft, G, having an arm, 22, detachably secured thereto, said arm having a lateral projection, 24, which is fitted to engage in said snugs, and thereby preventing said rock-shaft from shifting endwise when said arm is secured thereto, as and for the purpose herein specified.

404,080. LOCK. HALLER C. FROST, Farmington, Cal. Filed Dec. 15, 1888. Serial No. 293,685. (No model.)



Claim.—1. The combination, with a casing having a key-hole therein and a revoluble staple formed with recesses, of a locking-bar arranged for engaging the recesses of the staple and provided with an inclined shoulder opposite the key-hole of the casing, substantially as described.

2. The combination, with a staple furnished with recesses, of a locking-bar formed with a side recess and an inclined shoulder and springs arranged in connection with the locking-bar, substantially as described.

3. The combination, with a revoluble and recessed staple, of the locking-bar 16, having the inclined shoulder *e* and recess *d*, the springs 18 and 19, engaging the bolt, and the key 22, having the inclined end *h* and nose *g*, substantially as herein shown and described.

404,081. DEVICE FOR HOLDING HEAD-GEAR. DEMILLIA M. FULLER, Terryville, Conn. Filed Feb. 8, 1889. Serial No. 299,192. (No model.)

Claim.—1. In a device for supporting and holding head-gear, the combination of a standard having a disk on its top, and a movable disk supported on a spring-arm, and a catch attachable to the spring-arm and arranged to engage with the spring-arm and to hold the two disks together.

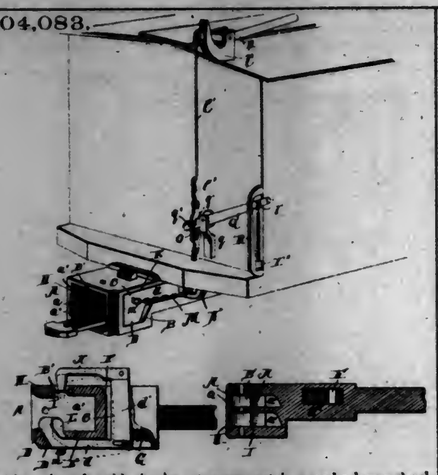
2. In a device for supporting and holding head-gear, the combination of the standard A, having the disk E on its top, the disk B, supported on the spring-arm D, attached to the standard, and so bent at C as to form a hook and engage that part of the spring-arm which supports the disk B.

3. In a device for supporting and holding head-gear, the combination of the standard A, exterior disk, B, and a wire supporting the exterior disk, B, and forming the catch C and spring D, and extending through the standard A and having its projecting end provided with a screw-thread, G, and a nut, H.

4. In a device for supporting and holding head-gear, the combination, with the standard A and interior disk, E, attached thereto, of an elastic wire supporting the movable exterior disk, B, and formed with the catch C, arranged to hold the two disks together, and with the offset at J, for the purpose and substantially in the manner described.

404,082. BREECH-LOADING FIRE-ARM. EDGAR HARRISON, New Bond Street, County of Middlesex, England. Filed Sept. 8, 1888. Serial No. 284,870. (No model.)

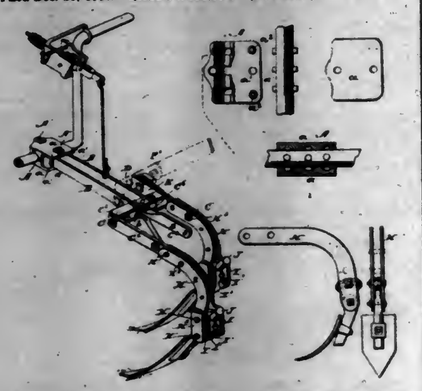
Claim.—1. The combination, in a breech-loading fire-arm having a housing and a barrel that is pivoted thereto and swings downwardly as the breech opens upwardly, of an extractor having a leg extending along below the barrel and notched on its under side, the mainspring and hammer, and the lever A B, the forward end of which is adapted to take the notched leg and the rear end to be acted upon by the movement of the mainspring, there being a projection, E, at one side of the lever A B that comes into contact with the housing as the breech is opened to disconnect the lever from the notched leg, substantially as specified.



2. The combination, with the breech-loading fire-arm having a hinged barrel, of the ejector having a notched leg, D, in combination with the lever A B, having a projection, E, within a recess, F, and the hammer I, and mainspring receiving an endwise movement when the firing takes place, so as to act upon the portion B of the lever and cause the part to engage the leg D of the ejector, substantially as set forth.

404,088. CAR-COUPLING. ADAM HARTER, Apple Creek, Ohio. Filed Mar. 13, 1888. Serial No. 302,069. (No model.)

Claim.—1. In a car-coupling, the combination of the hollow draw-head having a stationary jaw, H, the swinging jaw pivoted in the draw-head, the trigger connected to the swinging jaw and arranged adjacent to the stationary jaw, as described, and means to operate the swinging jaw, substantially as specified.



2. In a car-coupling, the combination, with the draw-head provided with a stationary jaw, H, the swinging jaw mounted in the draw-head and provided with a trigger, K, which is arranged at its free end close to the stationary jaw, the chain connected to the swinging jaw and provided with a slotted link, the upper operating-lever connected to the free end of the said chain, and the lower operating-lever fitting in the slotted link and operating at its outer

404,083.

end in a slotted guide having an upper notch, *r*, and a lower shoulder, *r'*, to engage the free end of the lever, substantially as specified.

404,084. CULTIVATOR. CHARLES R. HARTMAN, Vincennes, Ind. Filed Dec. 23, 1887. Serial No. 258,839. (No model.)

Claim.—1. In a cultivator, a beam-coupling having upper and lower plates rigidly united at one end, having fender-support E and beam C at such end and movable at their opposite ends toward each other, whereby they may be clamped against intermediate parts and the drag-bars fitted at their ends between the said plates, substantially as set forth.

2. In a cultivator, the drag-bars and hoes, combined with the beam-coupling having upper and lower plates and having the fender-bar E and beam C cast integral therewith, and a beam, C^3, substantially as and for the purposes specified.

3. The combination of the fender bar or support, the connection F, consisting of plate F', having mortise f' and serrations f^2, and the plate F^3, having serrations f^3 and a mortise, f^4, the fender-stem fitted in said mortises, and the clamping-bolt, substantially as set forth.

4. A fender-connection, substantially as described, comprising two plates, one having serrations and provided with a mortise in which the fender-stem will fit snugly so that part thereof will project laterally beyond the said plate and the other plate having serrations to engage those of the first and provided with a mortise into which the side of the fender-stem fits, such mortise being larger than the mortise of the first plate, whereby to permit a limited adjustment of the fender-stem, substantially as set forth.

5. In a cultivator, the standard having side bars or cheeks, H^2, combined with the shovel-stem held adjustably between said cheeks, and interlocking ratchets whereby the said stem may be held in any suitable adjustment, the cheeks H^2 being movable apart, whereby the ratchets may be disengaged when it is desired to vary the adjustment of the shovel-stem, substantially as set forth.

6. In combination with the standard H, the inner plates, I' I', having the grooves *i*, the ratchets i^2, the studs i^4, and the slots i^5, and the outer plates, I I, having the ratchets i^2, the sockets i^3, the openings i^7, and the pairs of plates having between them the recesses I^3, and the bolts K, for clamping the shovel-stem between the plates, substantially as shown and described, and for the purpose specified.

7. In combination with the plates I I I' I', constructed on their meeting faces with interlocking ratchets, the side bars or cheeks, H^2, and the shovel-stem held between plates I' I', substantially as and for the purpose specified.

8. The combination of the standard having side plates or cheeks, the plates I I', supported between said cheeks and having interlocking ratchets, and the shovel-stem held between plates I', one of such plates I I' having pivot-studs to enter sockets in the other, substantially as set forth.

9. In a cultivator, substantially as described, the combination of the plates I' I', having their inner faces constructed to receive and hold the shovel-stem and having their outer faces formed with ratchets, and outer plates held to said plates I' I' and having their inner faces formed with ratchets arranged to engage those of the said plates I', substantially as set forth.

10. The combination, with the standard and tooth-stem, of an inner plate, I', having grooves to receive such stem, a slot or slots, i^5, and ratchets to engage corresponding ratchets of a plate, I, or equivalent device or devices, combined with bolts K, substantially as set forth.

11. In a cultivator or other similar implement, a standard having side bars or cheeks, combined with a tooth-connection comprising plates operating pivotally and provided with slot or slots, and ratchets between such side bars or cheeks, joints being provided for the insertion of a bifurcated spreader or equivalent device, substantially as set forth.

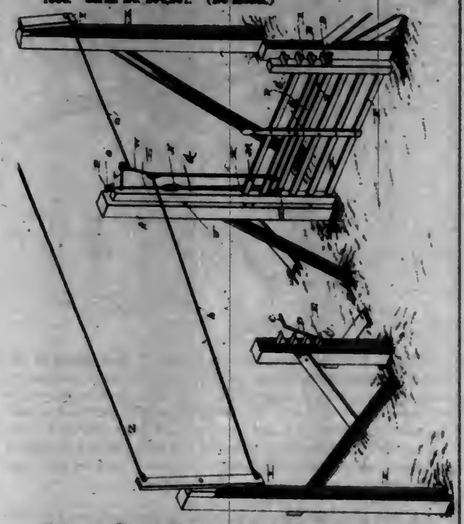
12. The combination, with the cultivator-stem, of the inner plates, I', having grooves to receive the same and provided on their outer sides at their ends with serrations, and the outer plates, I, having serrations to engage those of the inner plates, I', and clamping-bolts, substantially as set forth.

13. In a cultivator, substantially as described, the combination, with the beam-coupling provided at its inner end with the feeder-bar or support formed integral with and arranged in the same horizontal plane with the beam-coupling, of the drag-bars pivoted at their rear ends to the beam-coupling, the drag-bars being provided at such end with outwardly-extended eye formations, whereby the drag-bars may be arranged close together at their rear ends and the necessary width for secure fastening be provided at such end, substantially as set forth.

404,085. CULTIVATOR. CHARLES R. HARTMAN, Vincennes, Ind. Filed Nov. 7, 1888. Serial No. 290,157. (No model.)

Claim.—1. An improved attachment for cultivators, plows, and the like, consisting of the cheeks, the foot-piece pivoted between the said cheeks and having ratchets arranged to engage, the spreader-spring operating between said cheeks, and the clamping or connecting bolt, substantially as set forth.

2. In an attachment, substantially as described, for cultivators, plows, and the like, the combination, with the cheek-plates and the foot-piece pivoted between such cheek-plates, of a spring whereby to force such cheek-plates apart, and a clamping or connecting bolt by which to hold said cheek-plates against the action of the spring, all substantially as and for the purposes specified.

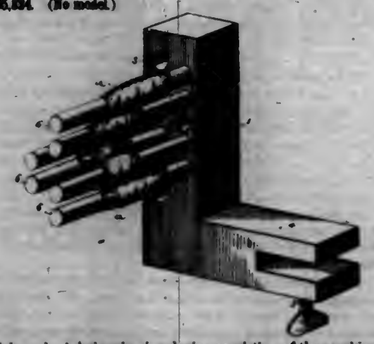


3. The combination of the cheeks having serrations *b*, the foot-piece pivoted between the cheeks and having serrations c^2 and opening F, the spring fitted in opening E and bearing between the cheeks, and the clamping or connection bolts, substantially as set forth.

4. The improved attachment herein described, comprising the cheeks B, having openings *c'* and serrations or teeth *b*, the foot-piece having ratchets c^2, slot c^3, and studs *c*, and the clamping or connection bolt, substantially as herein described.

5. In an attachment, substantially as described, the combination of the beam, the cheeks provided at their lower ends with ratchets and pivoted above such ratchets to the beam, the foot-piece pivoted above such ratchets to the cheeks and provided below its pivot with ratchets, and the clamping-bolt, substantially as set forth.

6. The improved attachment herein described, consisting of the cheeks having openings *c'* and serrations *b*, the foot-piece having socket H at its lower end, provided near its upper end with studs *c* to enter openings *c'*, and provided below such studs with openings E' and with ratchets c^2 and slot c^3, the spring fitted in opening E' and bearing between the cheeks, and the clamping or connecting bolt, substantially as set forth.

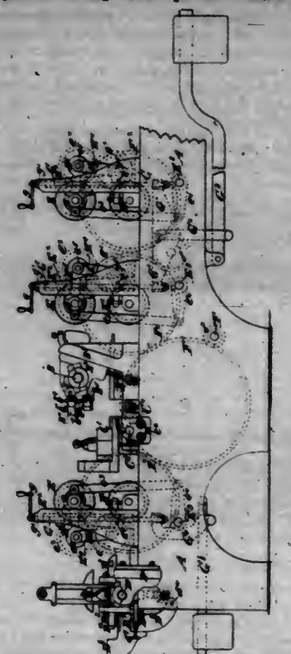


404,086. GATE. JAMES M. HAWLEY, Olin, Ill. Filed Dec. 21, 1888. Serial No. 294,261. (No model.)

Claim.—1. The combination of the latch-post having a series of catches, the gate, mechanism for adjusting the gate vertically, the latch pivoted thereon and adapted to engage one of said catches, mechanism for releasing the latch, and a vertically-disposed spring secured to the post and bearing on the gate, as set forth.

2. The combination of the posts A X X, the gate supported by the post A and having one end bar provided with an arm, V, the levers pivoted to the upper ends of the posts X X, connecting-rods extending between the upper ends of the said levers, the latch on the gate, the jointed connecting-rod extending between the arm V and the latch, the rod extending from the lower end of one of the levers to the end of the arm V, and the rod extending from the lower end of the other lever to the joint of the jointed connecting-rod, as specified.

404,087. HAIR-CRIMPING DEVICE. NICOLAS HEILNER and CHARLES L. LEITZ, New York, N. Y. Filed Jan. 9, 1889. Serial No. 295,834. (No model.)



Claim.—1. A hair-crimping device consisting of the combination of a block and pegs carried thereby and arranged in two alternating parallel rows, substantially as described.

2. A hair-crimping device consisting of a perforated block and removable pegs adapted to be inserted into the perforations in the block, and around and between which the hair is laid, substantially as set forth.

3. A hair-crimping device consisting of the combination of a block provided with perforations 2 and 3 and adapted to be secured to a table, the alternating pegs 6, and a pin or hook, 7, substantially as set forth.

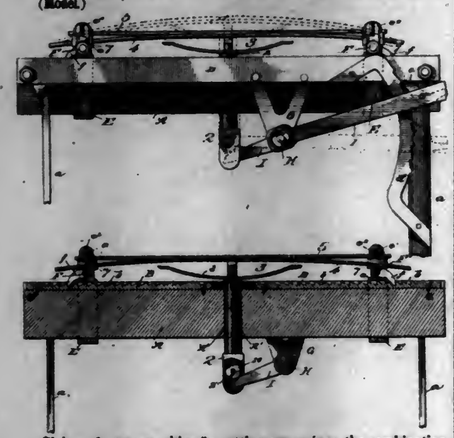
404,088. WOOD-PLANING MACHINE. ALFRED B. HUTCHINSON, Brooklyn, N. Y., assignor to the Glen Cove Machine Company, (Limited,) same place. Filed Aug. 13, 1887. Serial No. 246,230. (No model.)

Claim.—1. The combination, with the main frame, of the cutter-head frame therein having the shoes or cams d^4, the cross-bar or yoke D^3, having downwardly-extending arms pivoted to the main frame, and having the pockets d^5, the holder D^4 for the bar or mouth-piece, having its ends fitting said pockets and provided with adjusting-screws extending through the bottoms of the pockets and resting on said shoes or cams, and the bar or mouth-piece D^5, supported on the said holder and laterally adjustable thereon, substantially as herein described.

2. The combination, with a main frame, of an upper cutter-head bed, B', a bar, C^3, side cutter-head frames supported upon said bar, boxes C^5, in which said bar is supported near its ends, which boxes are bolted to the cutter-head bed B', and adjusting-screws c^9 between the main frame and said boxes for vertically adjusting the said boxes, substantially as specified.

3. The combination, with the upper cutter-head boxes and brackets or projections thereon, of a presser-bar holder secured upon said brackets so as to be laterally adjustable and extending beyond said brackets, a presser-bar and chip-breaker secured to said holder and having projections which extend outward under the brackets, and adjusting-screws between the projecting ends of the holder and the bar and chip-breaker, and arranged on the outer sides of the brackets, substantially as herein described.

4. The combination, with the lower cutter-head and its bar or mouth-piece adjustable toward and from the cutter-head and also adjustable vertically, of a yoke or cross-bar having downwardly-extending arms which are pivoted to the main frame below the cutter-head and on which the bar or mouth-piece is supported and adjustable, and an extension-table separate from the bar or mouth-piece and secured to the yoke or cross-bar and its arms, substantially as herein described.



5. The combination, with the feed-rolls and the expansion-gears whereby they are connected, and the roll-stand, of a bracket, E^4, having a pivotal connection with the roll-stand and carrying the bearing for both the upper and lower gear-shafts or gears, and a swinging link, E^5, pivoted concentric with the upper roll and connected with the top of said bracket, substantially as specified.

6. The combination, with the feed-rolls, the expansion-gears whereby they are connected, and the roll-stand, of the bracket E^4, forming the bearing for both the upper and lower gear-shafts or gears, and having its end portion below the bearing extending inward toward the rolls and pivoted to the stand, and the swinging link E^5, pivoted

concentrically with the upper roll and supporting the upper end of the bracket, substantially as herein described.

7. The combination, with an upper presser-roll, of a roll-stand, an upper roll-box sliding on said roll-stand, a weight, connections between the said weight and the roll-box whereby motion is transmitted from one to the other, and an adjusting-screw journaled in the roll-stand and shouldered to prevent its lengthwise movement in one direction, said screw being directly engaged with the roll-box, whereby the roll-box and the weight may both be operated by the screw at one operation, substantially as specified.

404,089. **MACHINE FOR SETTING CAR-SPRINGS.** JAMES B. ILLINGSWORTH, Monroe, La. Filed Feb. 27, 1888. Serial No. 265,961. (Model.)

Claim.—1. In a machine for setting car-springs, the combination, with the beam or frame, and yokes arranged on the beam to hold the ends of the springs, of a vertically-movable spindle adapted to operate through the center of the beam, and adapted to bear against the central portions of the springs, and means for raising the spindle, substantially as shown and described.

2. A machine for setting car-springs, comprising a central beam, adjustable yokes arranged near the ends thereof, said yokes adapted to hold the ends of the springs being operated on, means for holding said yokes in adjusted positions, a vertically-movable spindle operating in the beam centrally between the yokes, and lever mechanism, substantially as shown, for raising the spindle and holding it in its raised position, as and for the purpose described.

3. A machine for setting car-springs, comprising a central beam, adjustable yokes arranged near the ends thereof and sliding on said beams, said yokes adapted to hold the ends of the springs being set, a vertically-movable spindle operating in the beam centrally between the yokes, a concave leaf-spring mounted on the upper end of said spindle, and means, substantially as shown and described, for raising the spindle, as and for the purpose described.

4. The combination, with the beam A and yokes mounted near the outer ends thereof for holding the ends of the springs, of a vertically-movable spindle operating in said beam centrally between the yokes, a concave leaf-spring mounted on the ends of the spindle, and means for raising said spindle, substantially as shown and described.

5. The combination, with the beam and yokes mounted thereon adapted to hold the ends of the springs, of a vertically-movable spindle operating in the beam centrally between the yokes, said spindle provided with a friction-roller in its lower end, a rock-shaft mounted below the beam provided with a crank-arm engaging the roller in the spindle, and a lever connected with said rock-shaft, substantially as and for the purpose described.

6. The combination, with the beam A, provided with longitudinal rack-bars B, of the adjustable yokes D, said yokes embracing the beam A, the upper arms thereof extended above the same, and pawls journaled in said arms adapted to engage the rack-bar, substantially as and for the purpose described.

7. In a machine for setting car-springs, the yokes E, said yokes consisting of a body portion adapted to embrace the beam A, a gravity-pawl journaled between the vertical arms, near the upper end thereof, and a detachable rod or pin mounted in the outer ends of said arms, substantially as shown, and for the purpose described.

8. In a machine for setting car-springs, the combination, with the yokes E, adapted to encircle the beam A, the upper extended arms thereof provided with beveled edges, of the detachable sliding caps 7, substantially as and for the purpose specified.

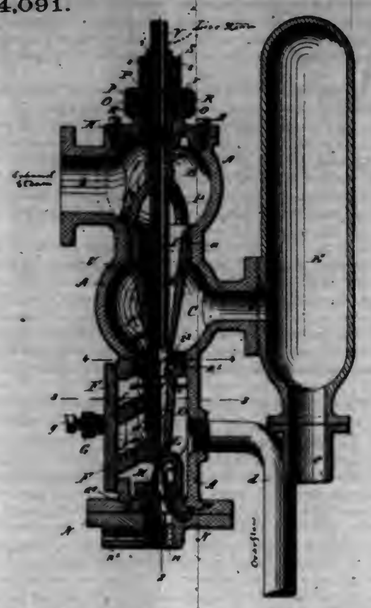
404,090. **HORSE-DETACHER.** JOHN J. JEYES, Campbellsville, Ky. Filed Dec. 27, 1888. Serial No. 294,795. (No model.)

Claim.—1. The improved horse-detacher, substantially as described, comprising the traces and detachable connections between such traces, the harness-draft bearing, the holdback or backing-strap connected at one end with the vehicle-shafts and provided at their opposite ends with rings *b*, and the ring-clips I, secured to the breeching, having hooks I′, opening rearwardly and arranged for engagement by rings *b*, and provided with detents by which to hold the said rings from jarring out of the ring-clips, all substantially as and for the purposes set forth.

2. In a horse-detacher substantially as described, the hames F, constructed with keepers G, the latch-pins D, operating in said keepers, the spring for actuating such latch-pins, guides *h*, constructed on the hames above the latch-pins, and the cords H, connected with the latch-pins and extended up through the guides *h*, all substantially as and for the purposes specified.

3. The improved horse-detacher herein described, consisting of the collar provided with keepers for the trace-eyes and with latch-pins operating therein, and provided above each latch-pins with guides *h* for cords H, the traces having eyes held in said keepers, the cords H, connected with the latch-pins and extended through guides *h*, the holdback or backing-strap secured to the thills and provided with the rings *b*, the breeching, and the ring-clips I, secured to such breeching and constructed with the hooks I′ for engagement by the rings *b*, and with spring-actuated detents *i*, all constructed, arranged, and adapted for use substantially as and for the purposes set forth.

404,091. **LOW-PRESSURE INJECTOR.** JOSEPH H. KELLEY, Hamilton, Ontario, assignor to himself, and Thomas Worswick, Toronto, Canada. Filed Aug. 25, 1883. Serial No. 263,753. (Model.)



Claim.—1. The combination, in an injector, and with a case having three chambers, B C D, the first two having steam and water inlets *b c*, respectively, a steam-cone fitted at the chamber C and opening to the chamber B, a mixing-cone fitted at the chamber D and receiving the discharge of the steam-cone and the water from the chamber C, said steam-cone having a screw-threaded stem fitted in the injector-case cap, of a packing fitted to the steam-cone stem and cap, a nut, P, provided with a flange, *p*, and threaded to the stem beyond the packing, and a gland, R, provided with a flange, *r*, adapted to the nut-flange *p*, and fitted to the cap and holding the nut P, to pack the joint, while allowing rotation of the nut to adjust the steam-cone endwise for regulating the water-supply, substantially as herein set forth.

2. The combination, in an injector, and with its case having three chambers, B C D, and steam and mixing cones, and the stem of the steam-cone fitted loosely in the case or its cap, of a nut held to the case and in which the steam-cone stem is adjustable, and a collar, as S, fixed to the cone-stem and limiting the inward movement of the cone, substantially as herein set forth.

3. In an injector, the steam-cone provided at its discharge end or nozzle with fins or flanges having a bearing at the water-inlet of the mixing-cone, substantially as described, whereby the nozzle of the steam-cone will be centered and steadied by the mixing-cone, as set forth.

4. The combination, in an injector, of a case having three chambers, B C D, the first having steam and water inlets *b c*, respectively, a steam-cone fitted at the chamber C and opening to the steam-chamber B, a mixing-cone fitted to the chamber D and receiving the discharge of the steam-cone and the water from the chamber C, and said steam-cone provided at its nozzle with fins or flanges having a bearing at the water-inlet of the mixing-cone, substantially as herein set forth.

404,091.

5. In a low-pressure injector, the steam-cone provided with a stem fitted adjustably in the injector-case, combined with a live or high-pressure steam pipe, passed through the cone-stem and along the cone-body toward its discharge-nozzle, substantially as herein set forth.

6. In a low-pressure injector, the steam-cone provided with a stem fitted adjustably in the injector-case, combined with a live or high-pressure steam pipe fitted through said stem and into the cone-body, and said cone-stem having a pin entering a longitudinal slot of the live-steam pipe, substantially as herein set forth.

7. In an injector, the steam-cone made with a body portion fitted at the water-inlet chamber of the injector-case and a stem passing through the case and adapted for adjusting the cone, and said cone-body connected to the stem by three or more ribs, *i*, substantially as herein set forth.

8. In an injector, the combination, with its case having a fluid-chamber, D, of a cone, J, and a connected plug, *l*, having a shoulder, *l*′, fitting a recess of the case, a discharge-nozzle, M, having a shoulder, *m*′, and fitted to the plug *l*, and a bottom plate, N, holding the parts J *l* M into the injector-case, substantially as herein set forth.

9. An injector formed with a fluid-chamber having a hot-water outlet, a mixing-cone held in said chamber and provided with a loose or movable side plate, and said chamber having a removable side wall adjacent to said plate, substantially as herein set forth.

10. An injector made with a fluid-chamber having a hot-water outlet and a mixing-cone fitted in said chamber and provided with a loose side plate fitted for direct outward and inward bodily movement on guides held to the cone-body, substantially as herein set forth.

11. An injector made with a fluid-chamber having a hot-water outlet and a mixing-cone fitted in said chamber and provided with a loose side plate fitted for outward bodily movement on downwardly slanting or inclined guides held to the cone-body, substantially as herein set forth.

12. An injector made with a fluid-chamber having a hot-water outlet, a mixing-cone in said chamber and provided with a loose side plate fitted for outward bodily movement on guides held to the cone-body, and said side plate limited in its outward movement by contact with the injector-case or lugs thereon, substantially as herein set forth.

13. In an injector, the mixing cone or chamber L, made with a cone, J, having a loose bodily movable side plate, W, a plug, *l*, connected by ribs *i*′ to the cone J, and a nozzle, M, fitted in the plug *l*, substantially as herein set forth.

14. The injector bottom plate or case formed with two openings one for connection of a water-discharge pipe and the other for connection of a pressure-gage, substantially as herein set forth.

404,092. **ORNAMENTAL RING FOR JEWELRY.** GEORGE H. KNIGHT, Providence, R. I., assignor to William R. Lane & Co., same place. Filed Oct. 27, 1888. Serial No. 289,330. (No model.)

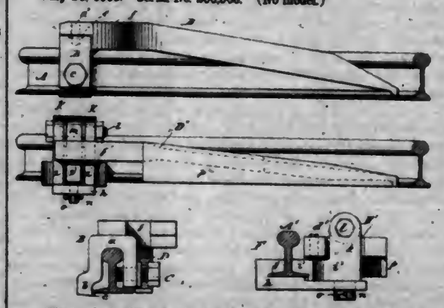
Claim.—A jointless ring having plated inner and outer surfaces, and having the base metal at the edge of the ring concealed by means of a flange which is beveled at its end, and turned so that the plating of the flange will be carried over the edge of the ring and over the base metal at the end of the flange, and be made to abut edge to edge with the plating of the opposite surface, substantially as described.

404,093. **ORNAMENTAL RING FOR JEWELRY.** GEORGE H. KNIGHT, Providence, R. I., assignor to William R. Lane & Co., same place. Filed Oct. 27, 1888. Serial No. 289,331. (No model.)

Claim.—1. A jointless ring having plated inner and outer surfaces, and having thickened edges formed by an outwardly-turned thinned portion or flange, which carries the inner plating outwardly and back against the surface of the outer plating over the edge of the ring and conceals the base metal, substantially as described.

2. A jointless ring having plated inner and outer surfaces and having angular thickened edges formed by an outwardly-turned thinned portion or flange, which carries the inner plating outwardly and back against the surface of the outer plating over the edge of the ring and conceals the base metal, substantially as described.

404,094. **ORNAMENTAL RING FOR JEWELRY.** GEORGE H. KNIGHT, Providence, R. I., assignor to William R. Lane & Co., same place. Filed Oct. 27, 1888. Serial No. 289,332. (No model.)

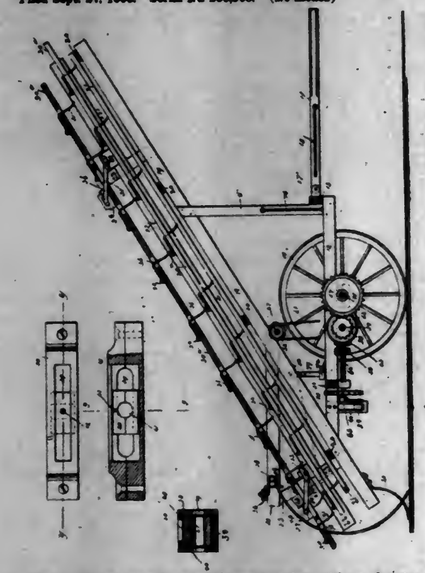


Claim.—1. An ornamental ring formed from a seamless plated tube and having the end portions of the tube turned backward, so that the ends thereof will abut against the surface of the tube and the exterior plated sides of the turned end portions will be in contact with each other, substantially as described.

2. An ornamental ring formed from a plated seamless tube and having the ends of the tube turned backward to meet at their plated side, substantially as described.

3. An ornamental ring formed from a plated seamless tube and having the ends of the tube turned to meet at their plated side and compressed to angular form, substantially as described.

404,095. **REPLACING-FROG.** JOSEPH J. LADD, Callao, Peru. Filed July 21, 1888. Serial No. 280,583. (No model.)



Claim.—1. In a replacing-frog, the clamp B, formed of a ∩ shaped bar, *a*, having one leg provided at its lower end with an offset, *b*, for receiving the base of the rail, said offset portion having an inwardly-projecting lip, *c*, to pass under the rail, and the bolt C, extending through the opposite leg of the clamp, substantially as set forth.

2. In a replacing-frog, the clamp F, consisting in the horizontal piece *h* to pass under the rail and slotted to receive one side of its base, the cross-bar *i*², resting on piece *h* and having the part *i*′ to engage the opposite side of the base of the rail, and the parts *i i*, each having an apertured ear, *k*, the shank *n*, passing downward through

a hole in the part *k*, and having an eye, *m*, in line with the ear-aperture, and the bolt *l*, passing through said ears and eye.

3. In a replacing-frog, the combination of the clamp B, adapted to engage the head of the rail, the clamp F, arranged to engage the foot of the rail, and the forked inclined bars D D', arranged to be supported and held in position of use by the said clamps, substantially as specified.

404,096. HAY-LOADER. ADOLPH LASACK, Oxford Junction, Iowa.
Filed Sept. 27, 1888. Serial No. 286,508. (No model.)

Claim.—1. In a hay-loader, the combination, with an elevator or chute, of two crank-shafts journaled transversely on the same near the top and bottom, a series of longitudinal rake-bars connected to the shafts, the journal-boxes receiving the arms of the lower crank-shaft being fixed on the bars and the journal-boxes receiving the arms of the upper crank-shaft movable on said bars, and angular fingers pivoted upon the said bars and projecting below the same, substantially as shown and described.

2. In a hay-loader, the combination, with a chute or elevator, crank-shafts having their cranks oppositely inclined, journaled transversely above the same near the top and bottom, a series of longitudinal rake-bars provided with stationary journal-boxes journaling the crank-arms of the lower crank-shaft, and reciprocating or sliding journal-boxes journaling the crank-arms of the upper crank-shaft, of angular fingers pivoted to the upper face of the rake-bars projecting downward through slots in the same, and means, substantially as shown and described, for rotating the crank-shafts from the axle, whereby the rake-bars are alternately reciprocated, as and for the purpose specified.

3. In a hay-loader, the combination, with an upwardly-inclined chute or elevator, a rake-head fixed to the elevator at the lower end thereof, provided with curved spring rake-teeth, crank-shafts journaled transversely above the said elevator or chute near the top and bottom, a series of longitudinal rake-bars attached to the crank-arms of the respective crank-shafts, and fingers pivoted upon the upper face of the said rake-bars and projecting through slots in the same, of auxiliary side rakes extending at a forward inclination from the elevator, a shifting device for each side rake provided with an outwardly and upwardly inclined guide-rod, an eye supporting the said rod and connected with the rake-heads of said rakes, a rod connected to each of the shifting devices, and intermediate gearing connected with each of the said rods and operated by the main axle, said gearing arranged to alternately move one of said shifting devices in an upward inclination while the other is moved in a downward inclination, substantially as and for the purpose hereinbefore described.

4. The combination, with an inclined elevator or chute and crank-shafts journaled near the top and bottom of the same and having their crank-arms oppositely disposed, of a series of longitudinal rake-bars, stationary journal-boxes attached to the lower ends of the said rake-bars, journaling the crank-arms of the lower crank-shafts, and sliding journal-boxes attached near the upper ends of the said rake-bars, journaling the crank-arms of the upper crank-shaft, substantially as shown and described, whereby the rake-bars are alternately and freely reciprocated without interference by the vibration or irregular motion of the loader when the loader is passed over rough ground, as specified.

5. The combination, with the elevator or chute of a hay-loader, longitudinal alternately-reciprocating rake-bars suspended over the elevator, and the axle and drive-wheel carrying the elevator, of auxiliary side rakes extending at a forward inclination from the elevator, a shifting device for each side rake provided with an outwardly and upwardly inclined guide-rod, an eye supporting the said rod and connected with the rake-heads of said rakes, and means, substantially as shown and described, for reciprocating the shifting devices from the axle in the same direction, as set forth.

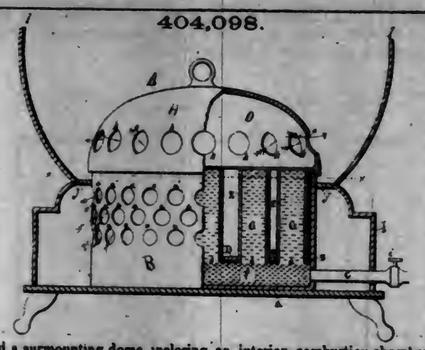
6. In a hay-loader, the combination, with the elevator, crank-shafts journaled transversely above the elevator near the lower and upper ends, and longitudinal rake-bars having fingers attached thereto, of journal-boxes attached to the upper face of said rake-bars, journaling the crank-arms of the crank-shafts, the journal-boxes for the upper crank-shafts, consisting of a casing provided with a central longitudinal slot, and a movable journal-box to reciprocate in the said slot in the casing, all combined to operate substantially as shown and described.

7. The combination, in a hay-loader, of the axle and drive-wheels thereof, a spur-wheel mounted upon the axle, a transverse shaft journaled in the main frame of the loader parallel with the axle, having a pinion engaging the spur-wheel, a bevel-gear secured to the said parallel transverse shaft, and two parallel longitudinal connected shafts provided with similarly-disposed crank-arms, one shaft being provided at its forward end with a pinion meshing with the bevel-gear of the transverse shaft, with auxiliary rakes attached to the sides of the loader, a shifting device suspended from each of the auxiliary rakes in front of the teeth, consisting of a toothed carrying-frame, a guide-rod having an upward and outward inclination secured to the said frame, an eye connecting the rake-head and guide-rod, and connecting-rods uniting the frames of the shifting devices with the contiguous crank-arms of the said longitudinal shafts, as and for the purpose specified, whereby the two shifting devices are reciprocated in the same direction from the axle, the incoming shifting device being carried down an inclined plane and the outgoing shifting device up an inclined plane, as set forth.

8. The combination, with a hay-loader, of auxiliary rakes attached to opposite sides of the same, each consisting of a rake-head, teeth attached to the said head, and a bar projected rearwardly from the outer end of the head, a shifting device in front of the teeth, consisting of an essentially-rectangular toothed carrying-frame provided upon the top at or near the center with a guide-rod having an upward and outward inclination, an eye connecting the rod and the extremity of the rearwardly-projecting bar, a crank-shaft connected with the axle of the loader, and a pitman-connection between the crank-shaft and the frame of the shifting device, as specified.

9. In an auxiliary side rake for hay-loaders, the combination, with a rake-head having teeth attached thereto and a bar extending rearwardly from the outer end, of a shifting device in front of the teeth, consisting of an essentially-rectangular tooth-carrying frame, an upwardly and forwardly projecting guide-rod attached at or near the center of the said frame, and an eye attaching the said rod to the said rearwardly-extending bar on the rake-head, as and for the purpose described.

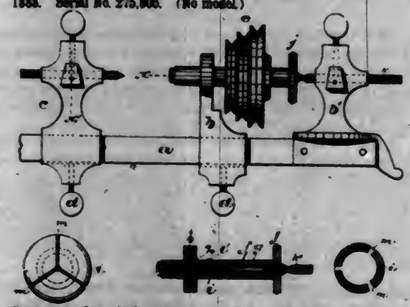
404,097. PRODUCTION OF YELLOW COLORING-MATTER. ADOLF LIEBMANN, Manchester, County of Lancaster, England. Filed Aug. 16, 1888. Serial No. 282,674. (No specimens.)



Claim.—As a new product, the soluble yellow coloring-matter herein described, which is decomposed by caustic alkalies, reproducing the original insoluble coloring-matter; when printed on cloth and afterward steamed, the product is decomposed and red color developed on the cloth; when dissolved in concentrated sulphuric acid, a claret color is produced and sulphurous acid simultaneously evolved, substantially as described.

404,098. OIL-BURNER. FRANK M. MAHAN, Chicago, Ill., assignor of one-half to Charles H. Morse, same place. Filed Mar. 26, 1888. Serial No. 268,591. (No model.)

Claim.—1. In an oil-burner, the combination of the walls of the burner and a surmounting dome inclosing an interior combustion-chamber and an underlying oil-chamber immediately beneath said combustion-chamber and subject to the heat thereof, a series of pipes communicating with said oil-chamber and extending up into the combustion-chamber, said pipes being filled with suitable material to carry the oil up to the tops thereof, and a series of openings in the walls of the burner below the level of the tops of said tubes, as and for the purposes set forth.



2. In an oil-burner, the combination of the walls of the burner

404,098.

and a surmounting dome inclosing an interior combustion-chamber and an oil-chamber contiguous thereto, a series of pipes provided with wicking leading from said oil-chamber into said combustion-chamber, a series of air-inlets into said combustion-chamber below the level of the tops of said pipes, and a surmounting dome, as and for the purposes stated.

404,099. WATCH-MAKER'S LATHE. STEPHAN MIESSNER, Newark, N. J., assignor of one-half to Jean Tack, same place. Filed June 2, 1888. Serial No. 275,903. (No model.)

Claim.—1. In a lathe, the combination, with the front and rear head-stocks thereof, the latter being provided with a center, of a hollow spindle, *f*, a chuck within the same, provided with expansible jaws having a taper connection with the forward end of said spindle, a draw-in spindle screw-threaded to said chuck and socketed at its outer end to said center, and a finger-piece secured to said draw-in spindle and shouldered against the spindle *f*, substantially as described.

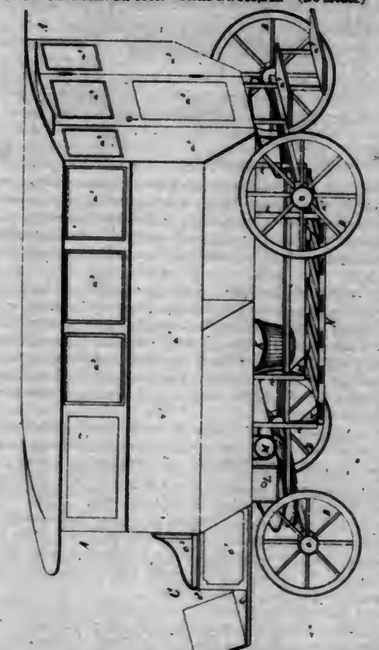
2. In a lathe, the combination, with the front and rear head-stocks thereof, the latter having an adjustable center, *k*, of a hollow spindle, *f*, provided with a flange, as *h*, a chuck, *i*, and a draw-in spindle, *g*, screw-threaded to said chuck at its inner end, and provided at its outer extremity with a socket to receive the center *k*, and with a suitable finger-piece, substantially as and for the purposes set forth.

404,100. BOLTING-CHEST. HUGH W. MCEWEN, Tiverton, Ontario, Canada. Filed Jan. 25, 1889. Serial No. 297,513. (No model.)

Claim.—1. The combination, with a bolting-chest and a cloth covering terminating at the under side in offtake-chutes, of a horizontally-adjustable cut-off attached to the cloth covering and dividing the chutes, substantially as shown and described.

2. The combination, with a bolting-chest and a cloth covering terminating at the under side in offtake-chutes, of upper and lower rods passing longitudinally through the chest within the covering, and a cut-off held to slide upon the said rods, attached to said covering, and dividing the said offtake-chutes, substantially as and for the purpose specified.

3. The combination, with a bolting-chest and a cloth covering terminating at the under side in offtake-chutes, of a reel journaled in the frame of the chute within the covering, and a cut-off consisting



of a plate centrally bored to receive the reel, held to slide upon the said rods, and having attached thereto at opposite sides the cloth constituting the covering of the chest, whereby the offtake-chutes are divided, substantially as and for the purpose specified.

4. The combination, with a bolting-chest and a cloth covering terminating at the under side in offtake-chutes, of a reel journaled in the frame of the chest within the covering, rods passing longitudinally and horizontally through the chest above and below the reel and within the covering, a cut-off consisting of a plate centrally bored to receive the reel, held to slide upon the said rods, and having attached thereto at opposite sides the cloth constituting the covering of the chest, whereby the offtake-chutes are divided, set-screws passing through the cut-off and contacting with the said rods, and a rigid cover attached to the ends of the bolting-chest and covering the top of the same, substantially as shown and described.

404,101. CAMPING-VEHICLE. ALONZO J. MCMASTER, Lockport, N. Y. Filed Mar. 14, 1888. Serial No. 303,248. (No model.)

Claim.—1. In a camping-carriage, the combination of the swinging basin K, privy-seat I, and privy-door *i*, substantially as and for the purpose described.

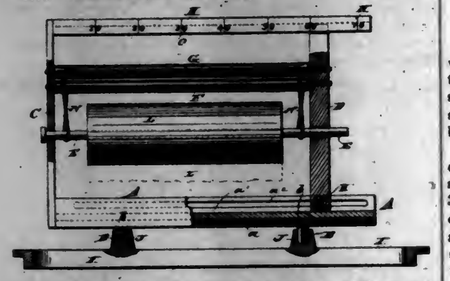
2. In a camping-carriage, the combination of the driver's seat c^2, hinged at c^3, seat-box c', oil-stove c^4, windows c^5, and doors c^6, substantially as and for the purpose described.

3. In a camping-carriage, the combined arrangement of an ice-box, wardrobe, drawer-chest, wash-basin, privy, water-tanks, seats, and convertible sleeping-berths, substantially as described.

4. A camping-carriage having kitchen and toilet accommodations, provided with a portable sleeping-cot ladder, and supports n n' for said ladder, said supports being constructed and arranged to permit the ladder to be adjusted beneath the carriage at a proper alti-

tude for forming a sleeping-cot between the ladder and the carriage-bottom, substantially as described.

5. A camping-carriage provided with a wardrobe having a portable door with folding table-legs attached to it, substantially as and for the purpose described.



404,102. CATCH-PIN. EDWARD H. NASH, Westport, Conn., assignor to Lloyd Nash and Elbert H. Sipperley, same place. Filed Jan. 8, 1889. Serial No. 296,757. (No model.)

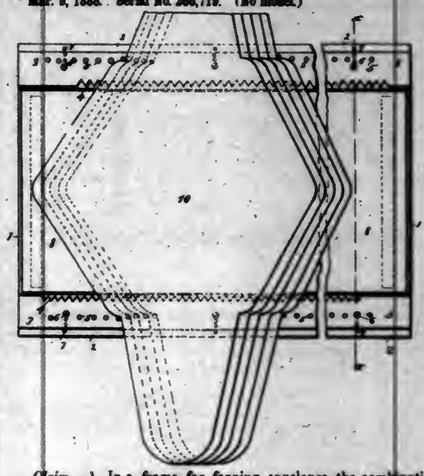
Claim.—1. A catch-pin consisting of an attaching-shank and a supporting-point formed by curving the wire downward, and then outward and upward, said attaching-shank extending below the curve of the supporting-point.

2. A catch-pin consisting of supporting-points curved downward and upward, and one or more sharpened attaching-shanks, the whole being formed from two pieces of wire attached together in any suitable manner, substantially as shown and described.

404,103. PAPER-HOLDING ATTACHMENT FOR TYPE-WRITING MACHINES. WILLIAM B. NORTHROP, Charleston, S. C. Filed May 29, 1888. Serial No. 275,458. (No model.)

Claim.—1. The combination, with the base-piece and the upwardly-projecting posts or arms having bearings, of fasteners depending from the base-piece and having a sliding connection therewith, whereby the fasteners may be adjusted toward and from each other without interfering with the relative position of the posts or arms, substantially as set forth.

2. A paper-holding attachment for type-writers, consisting, essentially, in a base-piece, vertical posts provided with bearings, one post being adjustable along the base-piece, and pins adjustable bodily along the lower side of the base-piece, whereby the space between the posts may be varied for rolls of different lengths without changing the relative positions of the pins, and said pins be adjusted for different type-writers without changing the relative positions of said posts, substantially as set forth.



3. In a paper-holding attachment for type-writing machines, the combination, with a base-plate having a dovetailed slot and provided with bearings for a paper-holding roller, of fastenings holding the attachment to a type-writer carriage and having dovetail heads fitting the base-plate slot, substantially as herein set forth.

4. In a paper-holding attachment for type-writing machines, the combination, with a base-plate having a dovetail slot, *a*, in its under side and provided with posts or bearings for a paper-holding roller, of fastening-pins B, having heads *b*, fitting the slot *a* and adjustable therein, substantially as herein set forth.

5. A paper-holding attachment consisting in the top piece having a longitudinal dovetail slot in its lower side, the base-piece having a longitudinal slot in its upper side, a longitudinal dovetail slot in its lower side, and a transverse longitudinal slot in one wall of the upper slot, the fixed end post, the parallel opposite sliding end post having its ends corresponding with and mounted in the slots in the adjacent faces of the top and base pieces, an adjusting-screw extending through the transverse slot into the lower end of the adjustable end post, and the fastening-pins having dovetail heads entering the dovetail slot in the base-piece, the said posts having roller-bearings, substantially as set forth.

6. In a paper-holding attachment for type-writing machines, the combination, with a base-plate slotted at a' a^2 and a fixed post, C, on the base-plate, of an adjustable post, D, fitted in the slot a', and a screw, K, fitted in the post D, through the slot a^2, and provided with a nut, substantially as herein set forth.

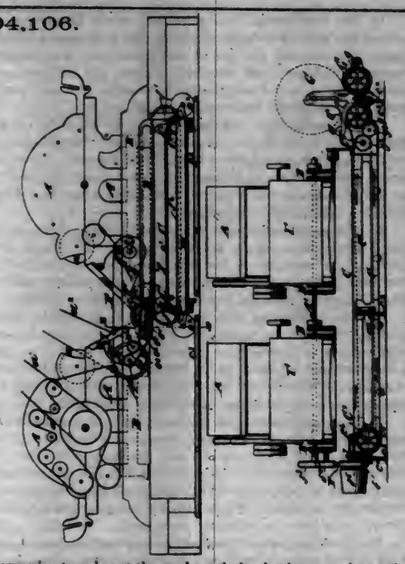
404,104. FRAME FOR FANNING OUT WRITING-PAPER, ENVELOPES, CARDS, &c. JAMES C. OLIVER, Bergen Point, N. J. Filed Mar. 9, 1888. Serial No. 266,719. (No model.)

Claim.—1. In a frame for fanning envelopes, the combination, with the base-board 1, longitudinal side strips, 2, secured thereto, and the notched strips 3, laterally adjustable upon the upper face of the side strips, 2, of the removable board 9, arranged between the side strips, 2, said board forming the support for the body of the envelopes being formed, substantially as and for the purpose specified.

2. The herelsebefore-described improvement in frames for fanning envelopes, consisting of a base, 1, provided with longitudinal side strips, 2, strips 3, laterally adjustable on the side strips, 2, said strips 3 provided with equally-spaced notches on their inner edges and equally-spaced pins on their upper faces, and removable boards adapted to be placed between the side strips, 2, said boards forming supports for the body of the envelopes being operated on, substantially as and for the purpose described.

404,105. SYRINGE. MARTIN OVERLACH, Frankfort-on-the-Main Germany. Filed Mar. 12, 1889. Serial No. 302,953. (No model.)

Claim.—1. The combination, with the piston and open-ended cylinder of a syringe, of a detachable nozzle with a flange at its inner end, a detachable head-plate mounted on the nozzle and bearing against one end of the cylinder, with a detachable disk, and elastic packing-disk located on the nozzle between the head-plate and the flange of the nozzle, the edge of the packing-disk pressing against the wall of the cylinder, a detachable head-plate, a screw-threaded socket-bearing having an inner flanged end, through which the piston-rod passes, the socket-bearing projecting through the head-plate, an elastic packing-disk mounted on the socket-bearing between its flanged end and the head-plate, and a detachable cap screwing onto the socket-bearing, substantially as described.



2. In a syringe, a cylinder with open ends, a detachable nozzle with a flanged inner end, a head-plate mounted on the nozzle and bearing against the end of the cylinder, and a disk, and elastic packing-disk mounted on the nozzle between its flanged end and the head-plate, the periphery of the packing-disk pressing against the interior wall of the cylinder, substantially as shown and described.

3. In a syringe, a cylinder with open ends, a piston and piston-rod, a detachable head-plate bearing against the ends of the cylinder, a screw-threaded socket-bearing with an inner flanged end, through which the piston-rod passes, the socket-bearing projecting through the head-plate, an elastic packing-disk located on the socket-bearing between its flanged end and the head-plate and having its edge pressing against the inner wall of the cylinder, and a cap screwing onto the socket-bearing, substantially as shown and described.

404,106. MACHINERY FOR MAKING LAPS. WILLIAM H. PALMER, Jr., Norwich, assignor to Palmer Brothers, Montville, Conn. Filed Jan. 30, 1888. Serial No. 262,402. (No model.)

Claim.—1. The combination, with two series of cards arranged side by side and the two series facing each other, of an apron having

404,106.

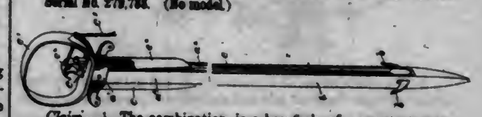
a progressive travel past the cards, and also having a reciprocating traverse in a direction transverse to its progressive travel, and mechanism, substantially such as described, for imparting the progressive and traverse movements to the apron, substantially as herein described.

2. The combination, with a series of cards arranged side by side and an elevated support for the cards, of an apron having a progressive travel past the series of cards, and also having a reciprocating traverse in a direction transverse to its progressive travel and beneath the elevated support, and mechanism, substantially such as described, for imparting the progressive and traverse movements to the apron, substantially as herein described.

3. The combination, with two series of cards, those of each series being arranged side by side and facing those of the other series, of delivery apparatus whereby the fleeces from two opposite cards are combined, an apron having a progressive travel past the cards, and also having a reciprocating traverse in a direction transverse to its progressive movement, and mechanism, substantially such as described, for imparting to the apron both its progressive and traverse movements, substantially as herein described.

4. The combination, with two series of cards, those of each series being arranged side by side and facing those of the other series, of an apron having a progressive movement past the cards, and having also a traverse movement in a direction transverse to its progressive movement, delivery-boards extending downward from opposite cards and one delivering against the other, whereby the fleeces from the two cards are combined before being delivered to the apron, and mechanism, substantially such as described, for imparting both the progressive and traverse motion to the apron, substantially as herein described.

5. The combination, with a series of cards arranged side by side, of an apron-carrying frame and an apron having a progressive movement therein past the series of cards, a mangle-rack and pinion-gearing for reciprocating the said frame in a direction transverse to the progressive movement of the apron, and mechanism, substantially such as described, for imparting the progressive movement to the apron in said frame, substantially as herein described.



6. The combination, with a series of cards arranged side by side, of an apron-carrying frame having rollers and an endless apron passing around said rollers; a mangle-rack upon the frame, having adjustable portions at its end, and the pinion-guide, extensible, and having means for holding the extensible end portions in fixed position after adjustment, a mangle-pinion engaging said rack, and mechanism, substantially as described, for operating it, and mechanism for operating the apron-rollers to give the apron a progressive travel, substantially as herein set forth.

7. The combination, with a series of cards arranged side by side, an apron-carrying frame having rollers, and an apron having a progressive travel around said rollers in a direction past the series of cards, of mechanism, substantially such as described, for imparting a reciprocating traverse motion to the frame in a direction transverse to the progressive travel of the apron and for operating the apron roller or rollers, a pair of supporting-rollers beyond the apron in said frame and serving to support a take-up roller, and mechanism, substantially such as described, for driving the supporting-rollers both in the same direction, so that they will rotate the take-up roller placed upon them, substantially as herein set forth.

8. The combination, with a series of cards arranged side by side and an apron-carrying frame having rollers supporting a traveling apron for movement in a direction past the cards, of supporting-rollers beyond the apron in said frame for supporting upon them a take-up roll, mechanism, substantially such as described, for imparting a progressive travel to the apron and a reciprocating traverse motion to the frame and for rotating the supporting-rollers both in the same direction, the fixed slotted bearings H for the take-up roll, and the pivoted slotted bearings H', forming continuations of the slots in the fixed bearings, and having brackets H^3 for the support of a fresh roller, which will roll into the slots of the fixed bearings when the pivoted slotted brackets are swung on their fulcrums, substantially as herein set forth.

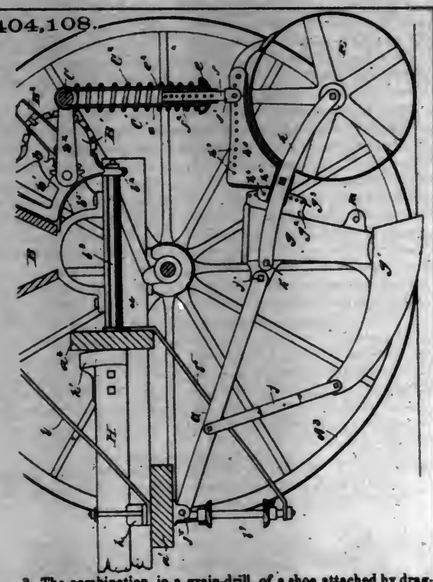
9. The combination, with a series of cards arranged side by side and an apron-carrying frame having rollers and an endless apron passing around said rollers, a mangle-rack upon the frame having adjustable portions at its ends, a pinion-guide made extensible, a pin for holding the extensible end portion in fixed position after adjustment, a mangle-pin engaging said rack, and mechanism, substantially such as described, for operating said pinion and the apron-rollers, substantially as specified.

404,107. HAY-FORK. CHARLES E. PATRIC, Springfield, Ohio, assignor to the Superior Drill Company, same place. Filed July 12, 1888. Serial No. 279,782. (No model.)

Claim.—1. The combination, in a hay-fork, of a penetrator provided with a connecting-piece adapted to hold the same in different positions of adjustment, and an operating-rod provided with openings in which the connecting-piece is adapted to engage, and having a seat at the bottom of the lower opening formed at right angles to the line of descent of the said penetrator, said connecting-piece having a bottom face parallel with said seat and formed rectangular in cross-section, substantially as and for the purpose set forth.

2. The combination, in a hay-fork, of a penetrator provided with a connecting-piece adapted to hold the same in different positions of adjustment, and an operating-rod provided with openings in which the connecting-piece is adapted to engage, and having a seat at the bottom of the lower opening formed at right angles to the line of descent of the said penetrator, a joint, *f*, in said seat, and beveled faces on each side of said joint, substantially as specified.

3. The combination, with the operating-rod provided with upper and lower openings, the upper opening having at the bottom thereof the beveled faces c^1 c^2, of a penetrator adapted to form a sheath for said operating-rod, a connecting-piece extending through said operating-rod and connected at each end of the sides of said penetrator, said connecting-piece being rectangular in cross-section, the said operating-rod being provided with a jointed seat at the bottom of the lower opening at right angles to the line of descent of said penetrator, and beveled faces on each side of said joint, substantially as and for the purpose set forth.



404,108. GRAIN-DRILL. CHARLES E. PATRIC and FRANK R. PACKHAM, Springfield, Ohio, assignors to the Superior Drill Company, same place. Filed Oct. 22, 1888. Serial No. 289,433. (No model.)

Claim.—1. The combination, with a shoe, of a wheel journaled in a hanger which is pivoted to the front of said shoe, a rib or flange on the rear of said shoe, and a guide on said hanger adapted to travel alongside of said flange, substantially as specified.

2. The combination, with a shoe, of a wheel journaled in a hanger pivoted to the front of said shoe, a rib or flange on the rear portion of said shoe, a guide on said hanger adapted to embrace said flange, and means, substantially as described, for connecting said hanger to said flange in different positions of adjustment.

404,108.

3. The combination, in a grain-drill, of a shoe attached by drag-bars to the main frame of said drill and a wheel journaled in a hanger pivoted to said shoe, the centers of the connections between said frame and shoe and said shoe and wheel being such that the bottom of the shoe shall stand below said wheel when said connections are in a straight line, substantially as specified.

4. The combination, in a grain-drill, with a shoe having a drag-bar attached to the frame, of a wheel journaled in a hanger pivoted to said shoe, so that the connecting-points between the shoe and the frame and the shoe and wheel shall be in a straight line when the shoe is slightly below said wheel, and means, substantially as described, for adjusting the frame of the drill to change the position of the point of attachment between the drag-bar and frame, substantially as specified.

5. The combination, with a shoe, of a gaging and pressing attachment pivoted thereto and provided with a rigid bearing-support, a pressure-bar with stirrups and springs, as described, and a connecting-bar from said springs and stirrups to said presser attachment, means for connecting said presser attachment rigidly to said shoe, and means, substantially as described, for adjusting the position of said connecting-bar on said bearing-support, substantially as specified.

6. The combination, with a shoe, of a gaging and pressing attachment pivoted thereto, a flange on said shoe having a series of openings through which said pressing attachment may be attached to said shoe in different positions of adjustment, and a bearing-support on said pressing attachment having a series of openings, whereby the lifting and pressure bar may be connected at different positions to said pressing attachment, substantially as specified.

7. The combination, with the pressure-bar and the lifting-levers adapted to operate the same, of the stirrups and springs thereon, said stirrups being formed in two parts having the hook-shaped ends adapted to be slipped over said pressure-bar, substantially as specified.

8. The combination, with the pressure-bar and a lifting-lever adapted to operate the same, stirrups on the said bar, springs about said stirrups, and shoes under said stirrups, of connecting-bars attached to said stirrups and to said shoes, and means, substantially as described, for adjusting said connecting-bars with reference to said stirrups to move the shoes to or from the said pressure-bar without changing the tension of the said springs, substantially as specified.

9. The combination, with the pressure-bar, the stirrups thereon, and the springs about said stirrups at right angles to said pressure-bar, of sleeves on said pressure-bar, each provided with end flanges thereon adapted to separate the said sleeves and engage in the ends of the said springs and hold the same in position about said stirrups, substantially as specified.

10. The combination, with a series of grain-drill shoes and a pressure-bar connected thereto, of the rocker-arms attached to said pressure-bar, one of said arms being provided with gear-teeth thereon, a lifting-lever having a segment of gear-teeth adapted to engage with the teeth on said rocker-arm, and a ratchet-stand on which said lever is journaled, substantially as and for the purpose set forth.

11. The combination, in a grain-drill, of the lifting-lever and pressure-bar, said lever being provided with a segment adapted to engage with teeth on the arm of said pressure-bar, a ratchet-stand secured to the hopper and adapted to support said lifting-lever and bar, and a sleeve and connecting-bolt extending from said ratchet-stand to the drill-frame, substantially as specified.

12. The combination, with the drill-frame and hopper, of a ratchet-stand secured to said hopper adapted to support the lifting-lever, a brace from said frame connected through said hopper to said ratchet-stand, a sleeve between said frame and ratchet-stand below said hopper, and a bolt or rod connecting said frame and ratchet-stand through said sleeve, substantially as specified.

13. The combination, with the shoes having the drag-bars attached rigidly thereto at one end, so as to project at an angle, as described, of the trunnions on the frame, to which said drag-bars are adapted to be attached, said bars being formed of resilient metal and adapted to spring over said trunnions, substantially as specified.

14. The combination, with the shoes having the angular faces to which the drag-bars are attached, of the drag-bars formed of resilient metal, secured to said angular faces so as to project at an angle, as described, and trunnions on the main frame, with which said bars are adapted to engage, said bars being held in position on said trunnions by the resilience thereof, substantially as set forth.

15. The combination, with the hopper and the ratchet-stand attached thereto, of the pressure-bars having crank-arms at either end thereof, one of the crank-arms of each bar being journaled to said ratchet-stand and provided with gear-teeth, lifting-levers having gear-teeth adapted to engage the teeth in said crank-arms, stirrups on said pressure-bars, springs on said stirrups, and connecting-rods from said stirrups to the shoes, substantially as set forth.

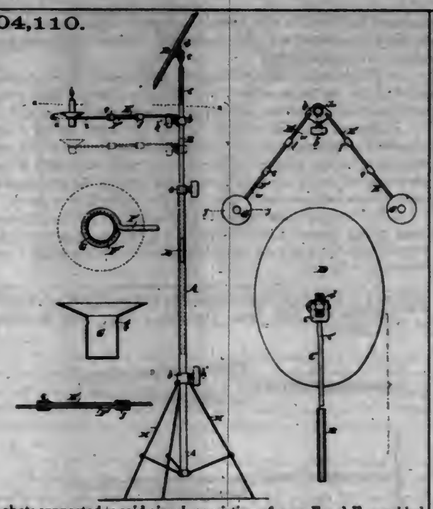
16. The combination, with a pressure-bar and its operating-lever, of the stirrups formed in two parts of resilient metal, springs on said stirrups, sleeves on said pressure-bar between said stirrups, said stirrups having flanges at the ends adapted to engage said springs, and connecting-rods from said stirrups to the drill-shoes, substantially as set forth.

17. The combination, in a grain-drill, of a shoe with a pressing and gaging wheel attached to and adapted to follow said shoe, a hanger in which said wheel is journaled, having a bearing-support connected rigidly to said hanger over said wheel, variable pressure-springs over said hanger, and means for connecting said springs to said bearing-support at different points, substantially as specified.

18. The combination, with a shoe having a gage and pressing attachment pivoted thereto, of a pressure-bar having a stirrup and spring thereon above said pressing attachment, and an independent bar connecting said pressing attachment to said stirrup, whereby said pressing attachment may be adjusted to or from said pressure-bar without changing the tension of said springs, said connecting-bar being provided with a series of openings adapted to receive the connecting pin or bolt which secures the same to the said stirrup, substantially as specified.

19. The combination, with a series of grain-drill hoes and a pressure-bar having the stirrups and springs arranged above said hoes, one stirrup and spring for each hoe, of independent bars connecting said stirrups to the respective hoes, and means, substantially as described, for changing the point of connection between the respective stirrups and bars to adjust the hoes to or from the pressure-bar without changing the tension of the spring, substantially as and for the purpose set forth.

404,109. TOE-WEIGHT. FRED H. PERRY, Montpelier, Vt. Filed Aug. 13, 1888. Serial No. 282,823. (No model.)

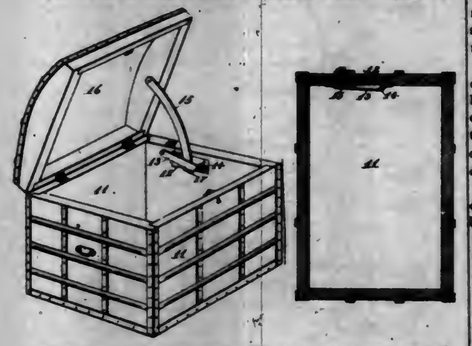


Claim.—The toe-weight A, provided with a fixed spur, F, and the orifice E, extending longitudinally through the weight, in combination with the screw-bolt B, fitting the orifice and provided with a hooked spur projecting oppositely to spur F, and fastening-nut, substantially as and for the purpose described.

404,110. PORTABLE SHAVING-STAND. HENRY PERRY, Rockaway, N. J. Filed May 29, 1888. Serial No. 275,459. (No model.)

Claim.—1. In a portable stand, the upright rod A, having collapsible legs H, in combination with rod B, vertically adjustable therein, looking-glass D, removably connected with said rod B by an adjustable connection, adjustable ring *b* upon said rod B, and adjustable candle-brackets E F, supported in said ring *b*.

2. In a portable stand, the upright rod A, having collapsible legs H, in combination with rod B, vertically adjustable therein, looking-glass D, removably connected with said rod B by an adjustable connection, adjustable ring *b* upon said rod B, and adjustable candle-brackets supported in said ring *b*, consisting of arms E and F, provided with rings *e* and *f*.

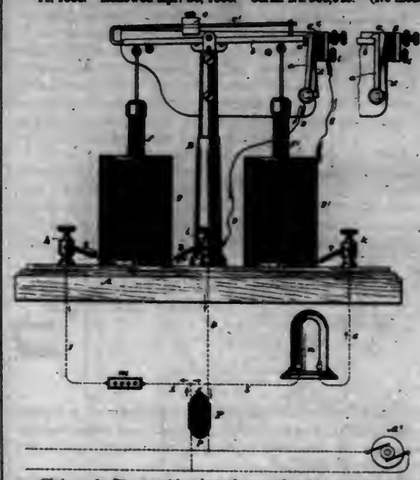


404,110.

3. In a portable stand, the upright rod A, having collapsible legs H, in combination with rod B, vertically adjustable therein, looking-glass D, removably connected with said rod B by an adjustable connection, adjustable ring *b* upon said rod B, and adjustable candle-brackets supported in said ring *b*, consisting of arms E and F, provided with rings *e* and *f*, the arms F, having spring ends, and candle-supports G, having grooves *g*, adapted to receive said spring ends.

4. In a portable stand, the upright rod A, having collapsible legs H, in combination with rod B, vertically adjustable therein, looking-glass D, supported on said rod B, ring *b* upon said rod B, consisting of two parts riveted together and forming spring-arms, and adjustable candle-brackets E F, supported in said spring, the arms of the ring *b* being firmly held by them, but with freedom of lateral adjustment.

404,111. TRUNK-FIXTURE. JAMES B. PORTER, Yarmouth, Nova Scotia, Canada. Filed Mar. 12, 1889. Serial No. 302,964. (No model.)



Claim.—1. In trunk-fixtures, a lid or cover stay consisting of a spring-plate, a keeper secured to one end of said plate, capable of extending outwardly therefrom and contacting with the opposite end, and a segmental bar adapted to be secured to the lid and sliding vertically and laterally between the keeper and the spring-plate and provided with a lip at the lower extremity, substantially as shown and described.

2. In trunk-fixtures, a lid or cover stay consisting of a spring-plate, a keeper diagonally secured to one end of the plate, capable of extending outwardly therefrom and contacting with the opposite end of the plate, and a segmental bar adapted to be secured to the lid and having vertical and lateral movement between the spring-plate and keeper and provided with a diagonal lip at the lower extremity, substantially as shown and described.

3. The combination, with the body of a trunk having a recess produced in the inner end face and a lid hinged to said body, of a spring-plate secured at one end in the body-recess, a keeper secured to the fixed end of the plate extending outwardly therefrom and transversely across the plate to a contact with the free end, and a segmental bar attached at one end to the lid and capable of passing downward between the keeper and spring-plate and provided at the lower extremity with a diagonal lip, substantially as shown and described.

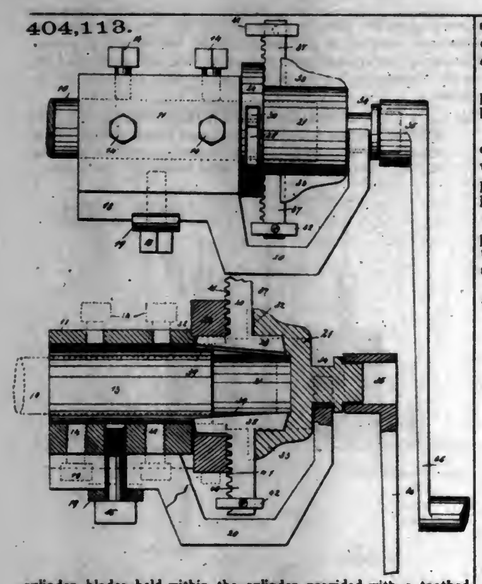
404,112. AUTOMATIC CIRCUIT-INTERRUPTER FOR ELECTRIC CIRCUITS. ALBERT L. REHNARD and PHILIP LANGE, Pittsburg, Pa., assignors to the Westinghouse Electric Company, same place. Filed July 11, 1888. Renewed Apr. 20, 1889. Serial No. 308,049. (No model.)

Claim.—1. The combination of two solenoids, two cores respectively applied thereto and acted upon in opposition by said solenoids, a carbonized filament in circuit with one solenoid, and an automatic circuit-interrupter in series with only the last-named solenoid and the filament, whereby the circuit of that solenoid alone may be broken.

2. The combination of two solenoids, two cores respectively applied thereto and acted upon in opposition by said solenoids, a carbonized filament in circuit with one solenoid, an automatic circuit-interrupter in series with only the last-named solenoid and the filament, whereby the circuit of that solenoid may be interrupted without interrupting the circuit of the other solenoid, and a detent engaging the support of the cores and holding them in a predetermined position upon the interruption of the circuit by the circuit-controller.

3. The combination, with a source of alternating electric currents, of two branch circuits, two solenoids respectively included in said branch circuits, an adjustable resistance in the one branch, and a circuit-interrupter and a carbonized filament in the other branch, and thus in series with only one of said solenoids, whereby the circuit-connections of that branch may be interrupted independently of the other branch, substantially as described.

4. The combination, with a source of alternating electric currents, of two branch circuits, two solenoids respectively included in said branch circuits, an adjustable resistance in one branch, a carbonized filament and a circuit-interrupter in the other branch, whereby its circuit-connections may be severed independently of the first-named branch, two cores respectively applied to said solenoids, a pivoted support upon the respective arms of which said cores are carried, and a detent controlled by the circuit-interrupter holding the support in a given position, upon the interruption of the circuit through the corresponding solenoid, against the action of the other solenoid.



5. The combination of two solenoids, two cores respectively applied thereto, a pivoted lever upon opposite arms of which the solenoids are respectively carried, an arm normally pressed toward one end of said support, a contact-spring carried upon said arm or moved thereby, and a contact-point against which said spring is pressed when the core is withdrawn from its solenoid a predetermined distance.

6. In an automatic circuit-interrupting device or cut-out, the combination of a movable lever, *b*, the cores *f* and *f'*, suspended therefrom, and their corresponding solenoids, the lever or arm *a*, applied to said support, the contact-spring *c* and its point *c*, and a pressure-spring, *d*, all organized substantially as described.

404,113. MACHINE FOR TURNING TENONS. WILSON ROGERS, Barboursville, W. Va. Filed Oct. 24, 1888. Serial No. 288,013. (No model.)

Claim.—1. The combination, with a fixed casing provided with a tubular bore, a ring having one threaded face and attached to said casing, and a releasing device pivoted in the said ring, of a rotary

404,113.

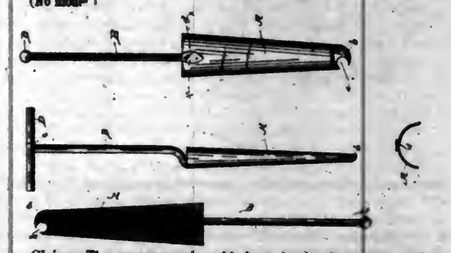
cylinder, blades held within the cylinder provided with a toothed shank engaging the threaded surface of the ring, and means, substantially as shown and described, for rotating the said cylinder, as and for the purpose specified.

2. The combination, with a fixed casing provided with a central bore, and set-screws passing through to the interior of the casing, a ring secured to one end of said casing having one threaded face, and a releasing device pivoted within the ring, of a rotary cylinder, blades held within said cylinder provided with a toothed shank engaging with the threaded surface of the ring, and trip-blocks detachably secured to said shank, substantially as and for the purpose specified.

3. The combination, with a fixed casing provided with a central longitudinal bore, set-screws passing through the casing to the interior thereof, a ring secured to one end of the casing and having one threaded face, a toothed pawl pivoted within the ring engaging with the casing, and a pinion engaging with said pawl and provided with an outwardly-extending lug, of a rotary cylinder, blades loosely held within the cylinder, toothed shanks attached to said blades engaging the threaded surface of the ring, trip-blocks adjustably secured upon said shanks adapted to limit the movement of the blades, and means, substantially as shown and described, for rotating the cylinder, as and for the purpose specified.

4. The combination, with a base provided with an intermediate yoke-section and an upwardly-extending arm at one extremity, a casing provided with a central bore supported by said base, set-screws passing through said casing to the interior thereof, a binding-plate clamping at under side of the base beneath the casing, and a set-screw passing through the clamping-plate and base into the casing, of a ring secured at one end of the casing having one threaded face, a toothed pawl pivoted in the ring engaging the casing, a pinion meshing with the pawl provided with an outwardly-extending lug, a cylinder journaled upon the arm of the base abutting with the fixed casing, blades adjustably held in the cylinder, toothed shanks integral with said blades, a trip-block adjustably secured upon each shank, and means, substantially as shown and described, for rotating the cylinder, as and for the purpose specified.

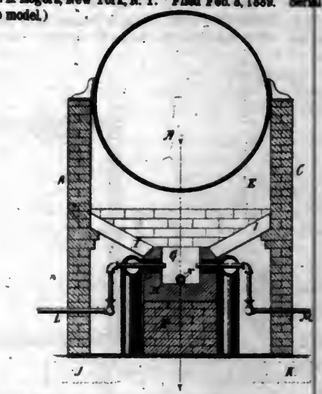
404,114. ELECTRIC-CONVERTER BOX. ALBERT SCHMID, Allegheny, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Dec. 26, 1888. Serial No. 294,569. (No model.)



Claim.—1. A combined electric converter and converter-box consisting of the coils and core of the converter, the latter being formed of plates of soft iron, and a box having lugs between which the plates of the core are clamped.

2. The combination, with the core of an electric converter composed of thin flat plates of soft iron, of a converter-box having lugs between which the plates are compressed, substantially as described.

3. The combination, with an electric converter having a core composed of thin plates of soft iron surrounding the coils of the converter and having tongues which extend through such coils, of end plates applied to the core, and a converter-box having lugs upon its inner surface between which said end plates are held by pressure.

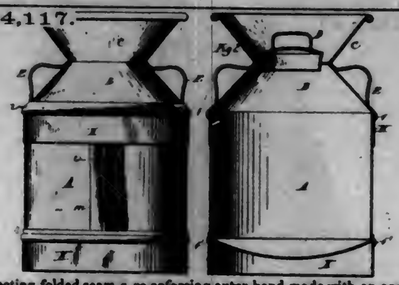


4. In an electric converter, the combination of the core B, composed of thin plates *b*, a box for the same having the shoulders *b'*, between which the plates are held, and the cover having a lug, *c*, substantially as described.

404,115. POST-HOLE DIGGER OR EARTH-AUGER. EDWARD F. SCHOLDER, Fort Scott, Kans. Filed Feb. 1, 1889. Serial No. 298,353. (No model.)

Claim.—The concave pod or blade A, having its upper portion, where connected to the shank, of greatest width and gradually tapering and terminating in a narrow portion, and an inwardly-curvilinear lip, *b*, formed by means of scalloping out a piece of metal as at *a*, said lip being located at one side of the longitudinal plane or axis of the pod, and having its cutting side or edge wider than its non-cutting or opposite side, and having the shank B and handle D, all substantially as described, and for the purposes herein set forth.

404,116. HEATING-FURNACE FOR STEAM-BOILERS. COURTNEY S. SERVOSS, Brooklyn, N. Y., assignor to R. Page Davis, same place, and Ann L. Rogers, New York, N. Y. Filed Feb. 8, 1889. Serial No. 299,107. (No model.)

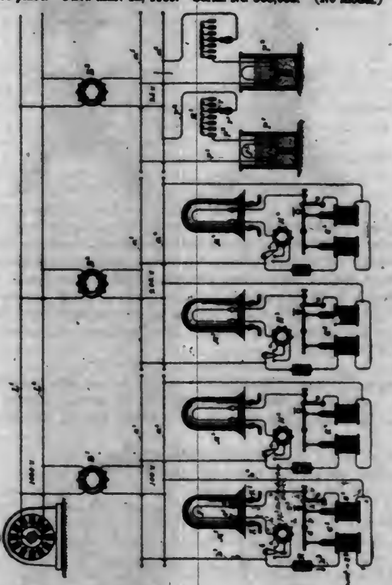


Claim.—1. The combination of a trough or box containing a chamber, air-pipes entering said chamber on opposite sides thereof and in line with one another, oil-pipes entering said chamber through said air-pipes and having their delivery-orifices disposed relatively opposite one another, and a water-delivery pipe arranged in said chamber and below said air and oil pipes, substantially as described.

2. The combination of the boiler and its supporting-walls, as B C D, a trough or box, H, arranged below said boiler, a series of bars, I, set at intervals apart and extending from said trough to said walls, air-pipes entering through the sides of said trough and disposed in line and relatively opposite one another, oil-pipes entering said trough through said air-pipes and having their delivery-orifices opposite one another, and a perforated water-delivery pipe in said trough below said air-pipe and oil-pipe, substantially as described.

404,117. MILK-CAN. FRANK P. SHEPHERD, South Elgin, Ill. Filed Mar. 28, 1889. Serial No. 304,414. (No model.)

Claim.—1. A milk-can having in combination with its outwardly-projecting folded seam a re-enforcing outer band made with an annular outwardly-projecting bead, as set forth, adapted to receive such seam, such band being applied to the can and seam, substantially as set forth.



404,117.

2. In combination with a can having a conical top, and an outwardly-projecting seam connecting such top to the body of the can, a re-enforcing outer band made with an annular outwardly-projecting bead adapted to such seam as set forth, and with a conical portion projecting above such bead, the whole applied to the body of the can and its top, as set forth.

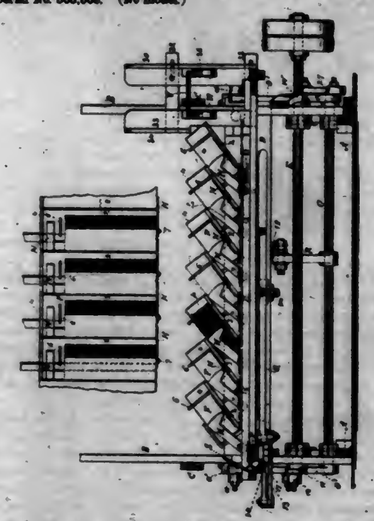
3. In a can having a vertical outwardly-projecting folding seam, a re-enforcing strip, *m*, provided with an outwardly-projecting bead or grooved rib, as described, adapted to cover and protect such seam and applied to the can, as set forth.

404,118. APPARATUS FOR TREATING FILAMENTS. FRANK S. SMITH, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Mar. 12, 1889. Serial No. 303,082. (No model.)

Claim.—1. In an apparatus for treating filaments for incandescent electric lamps, the combination of a source of alternating electric currents, supports or electrodes for the respective ends of the filaments, conductors leading thereto from the source, and a reactive coil included in one of the said conductors.

2. In an apparatus for treating filaments for incandescent electric lamps, the combination of a source of alternating currents, electrodes for receiving the respective ends of a filament, conductors leading thereto, a reactive coil included in one of said conductors, and an automatic circuit-interrupting device, also included in one of said conductors.

3. In an apparatus for treating filaments for incandescent electric lamps, the combination of a source of alternating electric currents, electrodes for receiving the respective ends of the filaments, conductors leading thereto, and a reactive coil included in one of said conductors, whose coefficient of self-induction increases as the resistance of the filament decreases, substantially as described.



4. In an apparatus for treating filaments for incandescent electric lamps, the combination of a chamber for receiving the filaments, a source of alternating electric currents, an electric circuit therefor having its terminals within said chamber, and an adjustable reactive coil included in said circuit.

5. The hereinbefore-described organization of apparatus for treating filaments for incandescent electric lamps, consisting of two or more treating-chambers, circuits for supplying alternating electric currents thereto of different electro-motive forces, and a single source of alternating electric currents supplying said circuits.

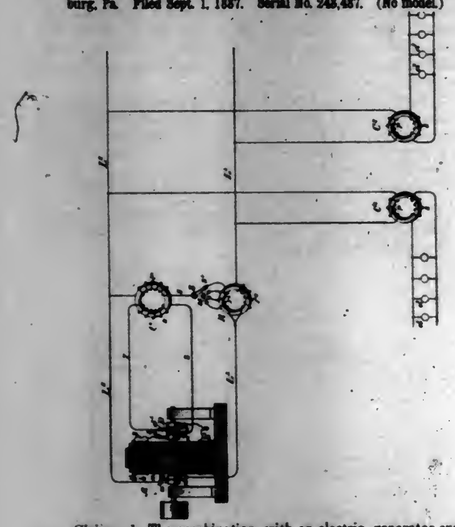
6. An organization of apparatus for treating filaments by alternating electric currents, consisting of a source of alternating electric currents, electric converters deriving currents from said source independently of each other, independent treating-circuits derived from the respective secondary circuits of said converters, independent treating apparatus included in said secondary circuits, and reactive coils included in the respective treating-circuits.

7. The combination, with a treating apparatus for the filaments of incandescent electric lamps, consisting of a source of alternating electric currents, a circuit derived therefrom in which said filaments may be connected, and a reactive coil connected in said circuit, of apparatus for cementing or otherwise treating the filaments, also receiving currents from the said source, substantially as described.

404,119. MACHINE FOR GATHERING SIGNATURES. DAVID M. SMYTH, Hartford, Conn. Filed Aug. 27, 1887. Renewed Apr. 2, 1889. Serial No. 305,808. (No model.)

Claim.—1. The combination, in a machine for gathering signatures, of a range of bins for holding the piles of signatures, reciprocating pushers for discharging the lower signature of each pile of signatures automatically, a collecting-slide upon which the signatures fall, and a traveler for moving the signatures along upon the collecting-slide and gathering the signatures into a bundle, substantially as set forth.

2. The combination, with the range of inclined bins for holding the piles of signatures, of an adjustable separator at the end of each bin and a pusher in the bottom of the bin, and means for reciprocating the same along the bin and below the pile of signatures for removing automatically the lower signature from each pile of signatures and a collecting-slide for receiving said signatures, substantially as set forth.



3. The combination, in a machine for gathering book-signatures, of a range of bins, separators at the ends of the bins, a reciprocating pusher in the bottom of each bin for discharging the lower signatures in the piles of signatures, a stock to which the pushers are connected, guide-bars for the same, connecting-rods, crank-levers, and a rock-shaft for giving motion to the stock, substantially as set forth.

4. The combination, in a machine for gathering book-signatures of a range of bins for holding the piles of folded signatures, automatic mechanism, substantially as specified, for discharging the lowest signature from each pile of signatures, a collecting-slide for receiving the signatures, a traveler, mechanism for actuating the same, and a pivoted push-plate and means for turning the same horizontally when the traveler is returning, and for swinging the push-plate nearly ver-

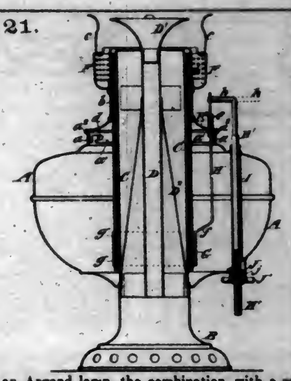
tical before moving the same to gather the sheets, substantially as set forth.

5. The combination, in a machine for gathering signatures, of a collecting-slide, means for delivering the signatures upon such collecting-slide, so as to lap one upon the other, a traveler for gathering the signatures into one pile, an elevating-table for receiving the pile or volume of signatures, and corner-pieces between which the volume of signatures is raised, substantially as set forth.

404,120. REGULATING SELF-EXCITING ALTERNATE-CURRENT ELECTRIC GENERATORS. WILLIAM STANLEY, Jr., Great Barrington, Mass., assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Sept. 1, 1887. Serial No. 248,487. (No model.)

Claim.—1. The combination, with an electric generator supplying alternate currents, of a converter having its primary coil connected across the terminals of the armature of the generator, a rectifying-commutator through which the currents from the secondary coil of the converter are delivered to the field-magnet coils of the generator, and a differential inductive resistance, one coil being included in series with the primary coil of the converter and the other coil in series with the work-circuit, substantially as described.

2. The combination, with an alternate-current electric generator, of an inductive resistance wound with opposing coils, one coil being connected in series with the work-circuit of the generator and the other in multiple arc with the work-circuit, a converter having its primary coil in series with the last-named coil, a rectifying-commutator connected with the terminals of the secondary coil of the converter, and conductors connecting the rectifying-commutator with the field-magnet coils of the generator.



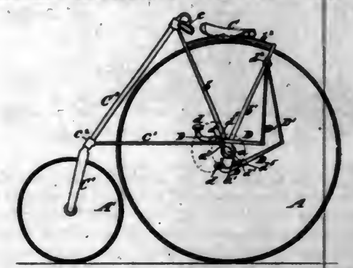
3. The combination, with an alternate-current electric generator, of an inductive resistance wound with opposing coils, one coil being connected in series with the work-circuit of the generator and the other in multiple arc with the work-circuit, a converter having its primary coil in series with the last-named coil, a rectifying-commutator connected with the terminals of the secondary coil of the converter, conductors connecting the rectifying-commutator with the field-magnet coils of the generator, and means for varying the relative lengths of the coils of the inductive resistance.

4. The combination, with an alternate-current electric machine, of a conductor connected across the poles of the same through which currents are supplied to the field-magnet coils, an inductive resistance included in said conductor, and a coil connected in the main circuit for varying the value of the inductive resistance in inverse proportion to the current consumed in the work-circuit.

404,121. WICK-RAISER FOR LAMPS. ALVIN TAPLIN, Forestville, Conn., assignor to the Bristol Brass and Clock Company, same place. Filed Oct. 10, 1888. Serial No. 287,765. (No model.)

Claim.—1. In an Argand lamp, the combination, with a reservoir, of a wick-tube, a wick-carrier, and a wick-raiser connected to the wick-carrier and having a portion extending upwardly above the reservoir, said portion being resilient, and a portion extending downwardly below the same provided with an arm above the reservoir adapted to be swung around to engage said first-named portion and around out of engagement therewith, substantially as specified.

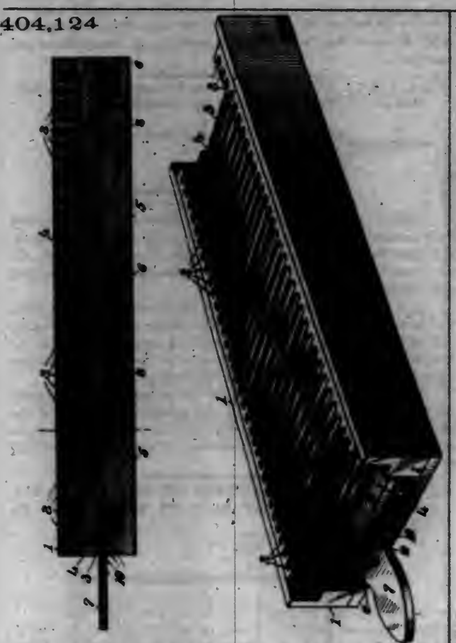
404,121.



2. In an Argand lamp, the combination, with a reservoir, of a wick-tube, a wick, a wick-carrier, and a wick-raiser connected to the wick-carrier and having a portion extending upwardly above the reservoir and provided with one or more apertures, and another portion extending downwardly below the reservoir, the last-named portion being provided above the reservoir with an arm engaging one of said apertures, substantially as specified.

404,122. BOTTLE-STOPPER AND FAUCET. CHARLES A. TATUM, New York, N. Y., assignor to Whitall, Tatum & Co., same place. Filed Mar. 6, 1888. Serial No. 266,230. (No model.)

Claim.—The bottle-stopper and faucet, comprising the nut F, adapted to fit in the neck of the bottle and having the flange *e* at its upper end, the cock D, having the threaded tube A extending through the nut and having its lower end reduced in diameter and extending below the nut and provided with the shoulder *d*, the elastic ring or stopper E, fitting on the reduced end of the tube and bearing on the shoulder *d*, and the washer *b*, loose on said reduced end of the tube and bearing on the upper side of the ring or stopper, substantially as described.



404,123. VELOCIPEDE. GEORGE J. TAYLOR, Salt Lake City, Utah. Filed Feb. 7, 1888. Serial No. 263,222. (No model.) Patented in England June 1, 1885, No. 8,015, and in Canada Sept. 17, 1885, No. 22,482.

Claim.—The combination, with the driving-wheel and its cranks, having foot-pedals on the crank-pins, of treadle-levers D, having foot-pedals at their forward ends and pivotally connected between their ends with the said crank-pins, whereby provision is afforded for using either the crank-pedals or the lever-pedals in propelling the machine, substantially as herein described.

404,124. APPARATUS FOR MAKING GARMENT-STAYS. ALFRED TAYLOR, Bridgeport, Conn.; Thomas P. Taylor administrator of said Alfred Taylor, deceased. Filed Dec. 7, 1888. Serial No. 292,954. (No model.)

404,124

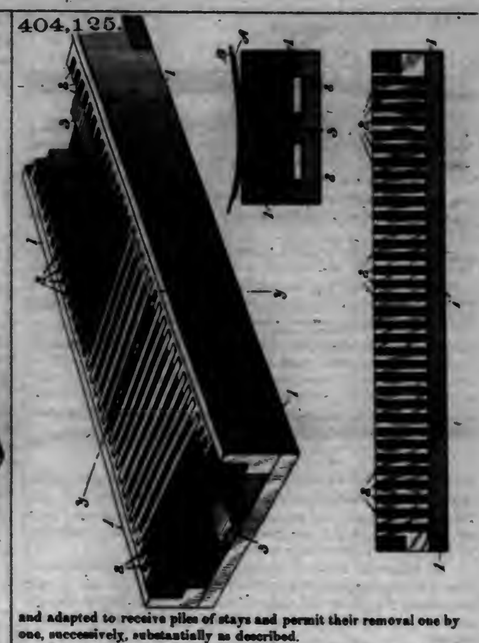
Claim.—1. In a machine for making garment-stays, the trough having substantially parallel sides and pockets arranged in the walls thereof for the reception of the ends of the blades, in combination with a platform arranged within the trough and means for varying the vertical plane of the platform, substantially as set forth.

2. In a machine of the character described, the combination, with the trough whose side walls are substantially parallel, of the pockets located in the inner walls of the trough and arranged in opposed pairs, a platform lying within the trough, and means—as, for instance, wedges—for varying the plane of the platform, and a stop for the retention of the platform at the required height.

3. The combination, with the trough having in the inner side walls thereof the pockets arranged in pairs for the retention of the ends of the blades, of the platform arranged within the trough, a series of bars upon the surface of the platform, said bars extending one between each opposed pair of pockets, and means for the elevation and retention of the platform, substantially as specified.

4. The combination, with the trough and the pockets arranged in the side walls thereof, of the platform having thereon the bars, the slide-bar beneath the platform, the wedges for the elevation of the platform and slide-bar, and a stop for the retention of the platform, substantially as set forth.

5. The combination, with the trough, the same having pockets in the sides thereof and arranged in opposed pairs, of the platform, the slide-bar beneath the latter, the wedges, and a stop for the detention of the slide-bar, substantially as described.

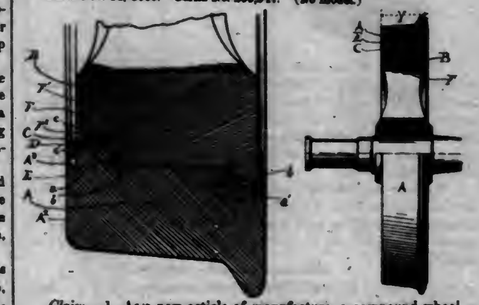


6. In a machine of the character described, the trough provided with pockets in the side walls thereof for the piling of the blades, the movable platform arranged in said trough, the longitudinal slide-bar, the wedges, and the stop-pin, whereby the slide-bar is retained, substantially as specified.

7. The combination, with the trough having pockets, as described, of the platform lying in said trough, the slide-bar carrying on its under surface a pair of wedges and arranged beneath the platform, and a pair of stationary wedges secured in the bottom of the trough and engaging the surfaces of the wedges on the slide-bar, and a stop, whereby the slide is secured.

404,125. APPARATUS FOR MAKING GARMENT-STAYS. ALFRED TAYLOR, Bridgeport, Conn.; Thomas P. Taylor administrator of said Alfred Taylor, deceased. Filed Jan. 18, 1889. Serial No. 296,745. (No model.)

Claim.—1. An apparatus for making garment-stays, the same consisting of a trough having a floor, side walls parallel to each other and extending vertically upward from said floor, and a series of pairs of pockets formed in the side walls and extending toward the floor



404,125.

and adapted to receive piles of stays and permit their removal one by one, successively, substantially as described.

2. As an apparatus for use in making garment and similar stays, the rectangular trough having in the side walls thereof pockets opening inward and upward, and a support for the center line of all the piles of blades arranged upon the floor of the trough and extending longitudinally thereof, substantially as specified.

404,126. CAR-WHEEL. FREDERICK W. TAYLOR, Philadelphia, Pa. Filed Feb. 11, 1889. Serial No. 299,547. (No model.)

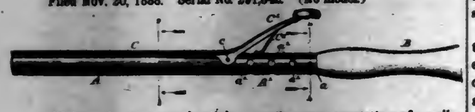
Claim.—1. As a new article of manufacture, a compound wheel consisting of a tire having on its internal periphery or base two or more rabbeted ascending steps, a wheel-center having a male periphery of corresponding descending rabbeted steps engaging and registering with said tire's base, as well as having within its step of smallest diameter a peripheral annular chamber communicating with said wheel-center's adjoining side, and a retaining-ring having an inwardly and centrally extending body secured within said wheel-center's peripheral chamber by the overlying tire, and having an outwardly-protruding flange bent over onto said tire's adjoining cheek, so as to connect the wheel-center therewith and prevent the retreat of said rabbeted steps from interlocking, substantially as shown and described.

2. As a new article of manufacture, a tire-retaining ring having inwardly or centrally extending shoulders and a laterally-extending flange, the outer surface of said ring being provided with an annular recess or gutter, substantially as shown and described.

404,127. CURLING-IRON. GEORGE L. THOMPSON, Chicago, Ill. Filed July 24, 1888. Serial No. 280,898. (No model.)

Claim.—1. As a novel article, a curling-iron consisting of a mandrel, a handle, and a tube for uniting the handle and mandrel, said tube being attached to the handle and fitted over the end of the mandrel and permanently secured thereto, substantially as described.

404,127.



2. As a novel article, a curling-iron consisting of a mandrel, a handle, and an apertured tube for uniting the handle and mandrel, which is attached to the handle and is fitted over the end of the mandrel and permanently secured thereto, substantially as described.

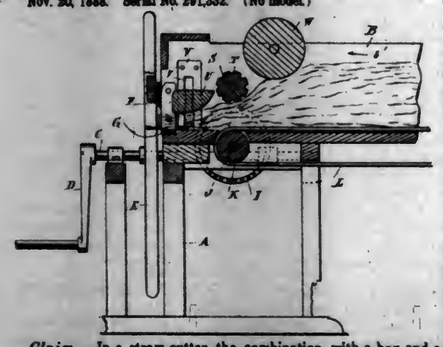
3. A curling-iron comprising a mandrel, a handle, a tube connecting the same, and a spring-clasp pivoted to the said tube, substantially as described.

4. The combination, with a mandrel and a handle, of a tube connecting the handle and mandrel, a spring-clasp pivoted to said tube, a leaf-spring attached to the handle of the clasp and bearing on the tube, and a piece or layer of non-conducting material placed between the handle and spring, substantially as described.

404,128. CURLING-IRON. GEORGE L. THOMPSON, Chicago, Ill. Filed Nov. 20, 1888. Serial No. 291,342. (No model.)

Claim.—1. As a novel article, a curling-iron consisting of a cylindric mandrel, a handle, and a tube connecting the same, said tube forming a continuation of and being made of the same external diameter as and integral with the mandrel, and provided with a plurality of perforations, substantially as described.

2. As a novel article, a curling-iron consisting of a cylindric mandrel, a handle provided with a cylindric prolongation, *b*, and a tube connecting the handle and mandrel, said tube being integral with the mandrel and embracing the said prolongation *b*, substantially as described.



404,129. COMBINED COMB AND CURLING-IRON. GEORGE L. THOMPSON, Chicago, Ill. Filed Dec. 20, 1888. Serial No. 294,187. (No model.)

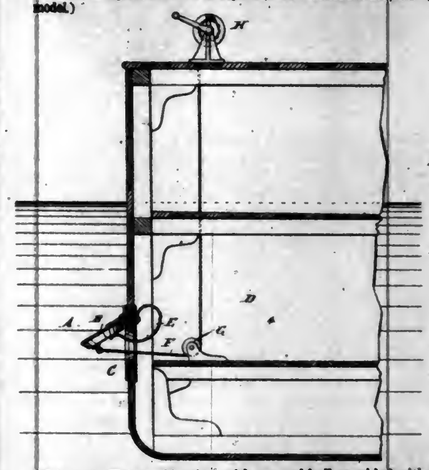
Claim.—1. A combined comb and curler consisting of a solid cylindric metal back provided with a longitudinal slot and a flat metal comb-plate inserted and immovably secured in said slot, with the inner ends of the slots or spaces between its teeth substantially flush with the adjacent parts of the back, thereby forming a cylindric surface about which the hair may be wrapped in curling the same, substantially as described.

2. The combined comb and curler consisting of the metal cylinder A, provided with a through-slot, *a a'*, and the comb-plate C, extending through the back in said slot and secured by a heading or lateral enlargement at the opening *a'* of the back, substantially as described.

404,130. STRAW-CUTTER. JOHN TÜPPER, Brooklyn, N. Y. Filed Nov. 20, 1888. Serial No. 291,332. (No model.)

Claim.—In a straw-cutter, the combination, with a box and a knife-wheel, of an endless belt, L, in the bottom of the box, the vertically-sliding block near the cutting end of the box, the fluted roller T above the endless belt and in rear of the said block, and the plain roller W above the fluted roller, substantially as herein shown and described.

404,131. FRYING-PAN. MILTON S. TRACY, Glastonbury, Conn. Filed Dec. 27, 1888. Serial No. 294,760. (No model.)



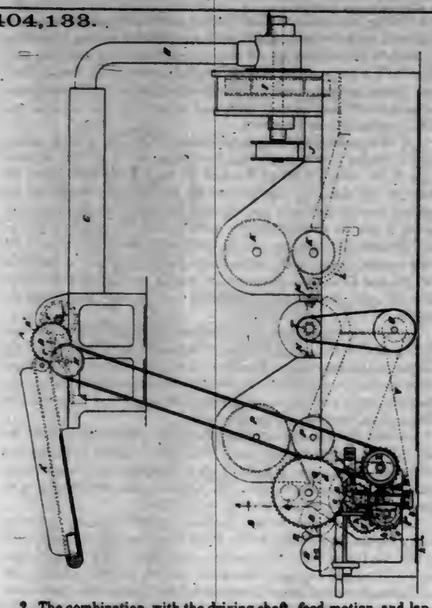
Claim.—1. A frying-pan or culinary vessel having the inclosed fume-passage 10 extending on the exterior of its sides 4 downwardly and thence inwardly through the bottom rim, 6, to a point inside the perimeter of the bottom, substantially as described, and for the purpose specified.

2. A frying-pan or culinary vessel having smooth interior sides, the fume-passage 10, extending on the exterior of the wall forming said smooth sides down to and through the bottom rim, 6, and the handle 8 and brace 11 on the projecting outer wall of said fume-passage, substantially as described, and for the purpose specified.

3. A frying-pan or culinary vessel having smooth sides 4, eccentric top rim and cover-seat, and the fume-passage 10, formed on the exterior of the sides 4 and extending from the wider portion of the cover-seat to the inside of the bottom rim, 6, substantially as described, and for the purpose specified.

404,132. FIRE-EXTINGUISHER FOR SHIPS. WILLIAM D. T. TRAVIS, Burlington, N. J. Filed Sept. 21, 1888. Serial No. 285,864. (No model.)

Claim.—1. The combination, with a vessel-hull provided with an opening therein below the water-line, of a valve hinged to the outside of the vessel adjacent to said opening, a spring secured to the hull and having its free end engaging the said valve, and means for locking the valve closed against the action of the spring, substantially as described.



2. The combination, with the hull of a vessel provided with the valve-seat C, below the water-line, of the valve B, hinged to the seat, the spring E, secured to the inside of the valve-seat and having its free end engaging the valve, the windlass H, and the cable F, secured to the valve and wound on the windlass, substantially as herein shown and described.

404,133. MACHINE FOR OPENING AND SCUTCHING COTTON. SAMUEL TWEEDALE, Accrington, County of Lancaster, England. Filed Jan. 21, 1887. Serial No. 224,968. (No model.) Patented in England July 29, 1884, No. 10,092.

Brief.—The object of the invention is to provide improved driving mechanism whereby the lap-motion shall be continued in gear long enough after the feed has been stopped to withdraw the cotton from the trunk, and whereby on restarting the machine the feed will be started first and the lap-motion be started automatically when the trunk has been filled with cotton.

Claim.—1. The combination, with the driving-shaft and lap-motion, of an intervening driving-gear, an operating-lever for throwing said gear into or out of action, and a lost-motion device intervening between the operating-lever and said gear for delaying the effect on said gear of a manipulation of said lever.

404,133.

2. The combination, with the driving-shaft, feed-motion, and lap-motion, of gearing for driving the feed-motion, gearing for driving the lap-motion, and an operating-lever for starting or stopping said motions, connected directly to the feed-motion driving-gear for throwing it into or out of connection immediately upon the manipulation of said lever, and a lost-motion device intervening between said lever and the lap-motion driving-gear for delaying the stopping or starting thereof on a manipulation of said lever, whereby the feed-motion is started or stopped in advance of the lap-motion.

3. The combination, with the driving-shaft, the lap-motion, and gearing for driving the latter, of a clutch adapted to connect or disconnect said gearing and a cam for operating said clutch.

4. The combination, with the driving-shaft, the lap-motion, and gearing for driving the latter, of a clutch adapted to connect or disconnect said gearing, a rotary cam for driving said clutch, and an adjustable driving-gearing between said cam and the driving-shaft, whereby the speed of said cam relatively to the driving-shaft may be varied.

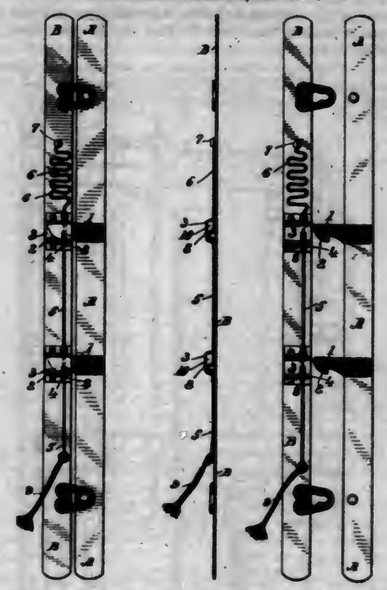
5. The combination, with the driving-shaft, the lap-motion, and gearing for driving the latter, of a clutch adapted to connect or disconnect said gearing, a rotary cam for driving said clutch, and another clutch adapted to engage with and drive said cam, and means for throwing said latter clutch into and out of engagement with said cam, whereby the rotation of said cam can be controlled and its action on the lap-motion driving-gear regulated.

6. The combination, with the driving-shaft, the lap-motion, and gearing for driving the latter, of a clutch adapted to connect or disconnect said gearing, a rotary cam for driving said clutch, and another clutch adapted to engage with and drive said cam, and a throw-off cam adapted to act against said latter clutch and to throw it into or out of engagement with said rotative cam.

7. The combination, with the driving-shaft, the feed-motion, and the lap-motion, of a feed-motion driving-gear for driving the feed-motion, a lap-motion driving-gear for driving the lap-motion, a clutch adapted to connect or disconnect said lap-motion driving-gear, a rotary cam for operating said clutch, another clutch adapted to engage with and drive said rotary cam, and a connection between said latter clutch and the feed-motion driving-gear, adapted to throw said latter clutch into action upon the stopping or starting of the feed-motion driving-gear, whereby the said cam is set in operation upon stopping or starting the feed-motion driving-gear.

404,134. SPINDLE FOR SPINNING AND SUPPORT THEREFOR. JOSEPH E. TYRAN, Paterson, N. J. Filed June 8, 1888. Serial No. 276,501. (No model.)

Brief.—The object of the invention is to enable a spindle to accommodate itself in its rotation to an unbalanced load.



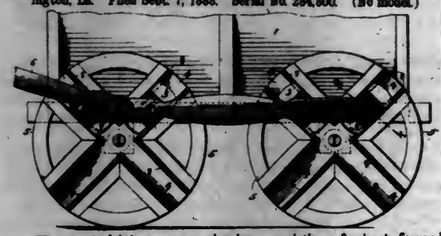
Claim.—1. The combination, with a rigid bolster containing a single bearing, of a spindle composed of an upper member for receiving the bobbin, a chambered lower member which alone is fitted to the said bolster, and an intermediate member which connects the said upper and lower members and which is flexible within the said chambered lower member which is within the bolster, substantially as herein described.

404,134.

2. The combination, with a spindle composed of an upper and a lower member and an intermediate flexible member, the said flexible member being connected with the lower member at or near the bottom thereof, and the lower member being chambered above said connection to permit the flexure of the intermediate member, a single unyielding bolster-bearing, to which only the said lower spindle member is fitted, and a whirl attached to the said upper member and overlapping the said lower member and having its band-groove opposite the connection between the said intermediate and lower members and outside the bolster, substantially as herein described.

404,135. CORSET-CLASP. DE VER H. WARNER, Bridgeport, Conn. Filed Feb. 23, 1889. Serial No. 300,899. (No model.)

Claim.—1. In a corset-steel fastening, the combination, with the hooks upon one of the steels, of the open-ended housings, into which the hooks may slide, the wire extending along the face of the steel beneath the housings, and the doubled latch-sections of said wire, one within each housing, whereby the hooks are retained as against retrograde movement, substantially as and for the purpose set forth.

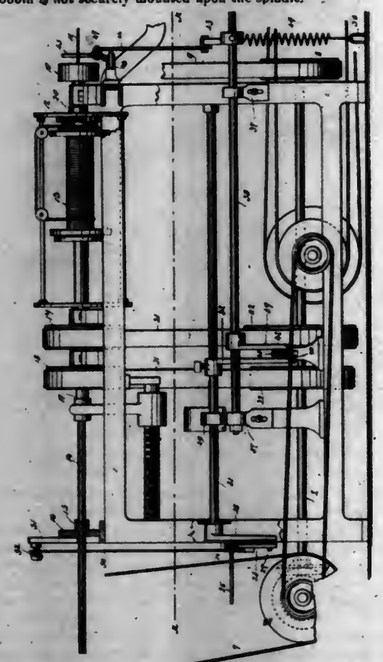


2. In a corset-steel fastening, the combination, with the hooks stationary upon one steel, of the open housings upon the other steel in the path of the hooks, and the wire extended along the steel beneath the housings and doubled within each housing, said doubled portion engaging and held by a guideway in said housing, substantially as and for the purpose set forth.

3. In a corset-steel fastening, the combination, with the hooks upon one steel, of the open-ended housings on the other steel opposite said hooks, a wire spring actuated in the direction of its length passing beneath each of the housings, a series of projecting latches rigid on the wire, one within each housing, and means, as a cord, for imparting lengthwise movement to said wire, as specified.

4. In a corset-steel fastening, with one of the steels thereof and the hooks arranged upon said steel, each hook having an oblique front edge, of the complementary steel, the open housings secured thereon and slotted through their top surfaces, the wire

lying along the steel and having the spring-loops at its upper end, the latches on said wire, one within each housing and engaging with the slot therein, and the operating-cord secured to the other end of the wire and adapted to operate the same in the direction of its length, substantially as described, and for the purpose set forth.



404,136. MECHANICAL POWER. LEMUEL B. WATKINS, Washington, La. Filed Sept. 7, 1888. Serial No. 284,800. (No model.)

Claim.—A driving-gear mechanism consisting of wheels formed with diametrical grooves crossing each other and having their sides provided with V-shaped edges, in combination with a connecting-rod having slides pivoted thereto and located in the diametrical grooves, said slides having V-shaped grooves engaging the V-shaped edges of the diametrical grooves, and a pitman pivoted to the connecting-rod, substantially as shown and described.

404,137. CORDAGE-SPINNING MACHINE. ANTON WEBER and CLEMENT LAMBERT, Elizabeth, N. J. Filed Mar. 30, 1888. Serial No. 268,995. (No model.)

Brief.—The object of the invention is to provide means whereby the machine is stopped if the cord breaks and cannot be started when the bobbin is not securely mounted upon the spindle.

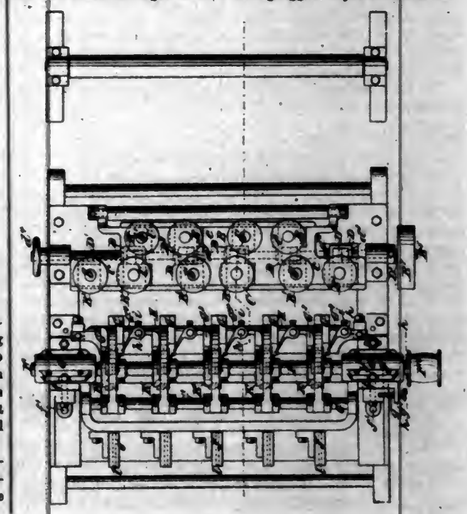
Claim.—1. In a cordage-spinning machine, a belt-shifting mechanism, a counterweighted crank-shaft which moves the belt-shifting mechanism in one direction to shift the driving-belt from the fast to the loose pulley, a spring-actuated latching and tripping mechanism connected with and holding the counterweighted crank-shaft, an arm pivoted adjacent to the capstan-tube, adapted to normally bear against the cord, and a rod connecting said arm with the spring-actuated tripping mechanism, substantially as described.

2. In a cordage-spinning machine, a belt-shifting mechanism having a depending arm, a counterweighted crank-shaft having a depending arm pivotally connected with said depending arm on the belt-shifting mechanism, a shaft having a depending arm with a pin, a pivoted lever beneath which said pin projects, having a notch, a second arm depending from the counterweighted crank-shaft and provided with a pin engaged by said notch, a lever on the second shaft with retracting-spring, and an arm pivoted adjacent to the condenser, connected with said second shaft, and adapted to bear against the cord, substantially as described.

3. In a cordage-spinning machine, the combination, with sliding bar 24, having pins 25 projecting by driving-belt 7, and the depending arm 25', with slot 26, of the shaft 31, having depending arm 28 with pin 27, engaging slot 26, arm 29, with counter-weight 30, depending arm 32, having a pin, 40, shaft 38, with depending arm 39, having a pin, 33, pivoted arm 35, having notch 42 engaging pin 40 and shoulder 34 engaging pin 33, horizontal lever 43 on shaft 38, with retracting-spring 49, and arm 45, pivoted adjacent to pulley 10 and adapted to bear against the cord, rod 44, connecting arm 45 with lever 43, and stop-pin 45', adjacent to arm 45, substantially as described.

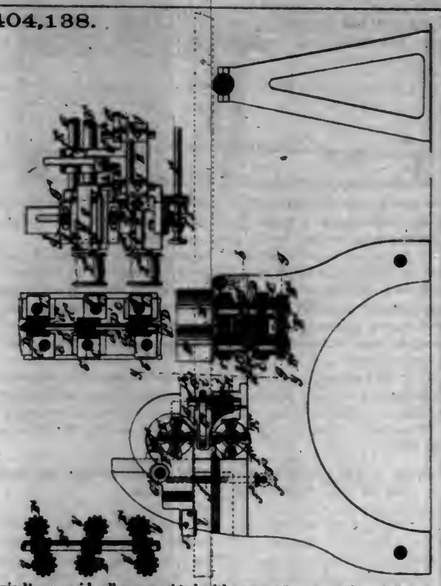
4. In a cordage-spinning machine, the combination, with the belt-shifting mechanism and the sliding detachable spindle of the winding-bobbin, of a sliding plate extending over the end of the spindle, a shouldered pivoted lever adjacent to the belt-shifting mechanism to engage the same, and a vertical rod connecting the shouldered lever with the sliding plate, substantially as described.

5. In a cordage-spinning mechanism, the combination, with the belt-shifting mechanism, of a shouldered lever adapted to engage one of the belt-shifting pins, a sliding plate extending over the end of the removable bobbin-spindle, and a rod connecting the sliding plate with the shouldered lever, substantially as described.



6. In a cordage-spinning machine, the sliding plate 51, having handle 52, the supporting-bracket 16, having sleeve 15, the removable spindle 14, the end of which is supported in said sleeve, rod 56, having a hooked end engaging handle 52, lever 53, pivoted to bracket 23 and having shoulder 54, and a belt-shifter having pins 25, substantially as described.

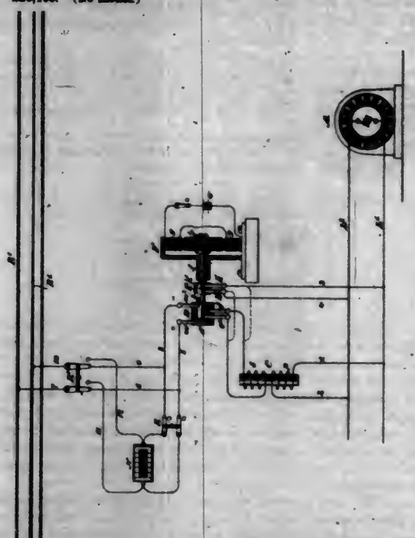
7. In a cordage-spinning machine, the removable bobbin-spindle, a vertically-movable plate extending over the end of spindle, a lever adjacent to the belt-shifting pins, and a rod connecting said lever and plate, in combination with the belt-shifting mechanism provided with said pins, a counterweighted crank-shaft connected with said belt-shifting mechanism, a spring-actuated latching tripping mechanism which holds and sets free the counterweighted crank-shaft, a pivoted arm adapted to bear against the cord, and a rod connecting said arm with the spring-actuated tripping mechanism, substantially as described.



404,138. PLANING-MACHINE. JAMES F. WELCH, Brooklyn, N. Y., assignor to the Glen Cove Machine Company, (Limited,) same place. Filed Nov. 17, 1888. Serial No. 291,154. (No model.)

Claim.—1. The combination of pairs of vertically-extending presser and feed rollers arranged in rows and zigzagged, and horizontally-arranged cutter-heads arranged in pairs and one above another, substantially as specified.

2. The combination, with pairs of vertically-extending presser and feed rollers arranged in rows and zigzagged, of journal-boxes for



404,138.

spindles on said rollers, provided with nuts, and a screw-threaded shaft extending horizontally across the machine and engaging all said nuts, which shaft when rotated will adjust all the rollers in unison, substantially as specified.

3. The combination, with pairs of vertically-extending presser and feed rollers arranged in rows and zigzagged, of journal-boxes for the spindles of said rollers, boxes on said journal-boxes, nuts within said boxes, a screw-shaft engaging all said nuts for adjusting the rollers in unison, and springs operating on said nuts to admit of the yielding of the presser-rollers, substantially as specified.

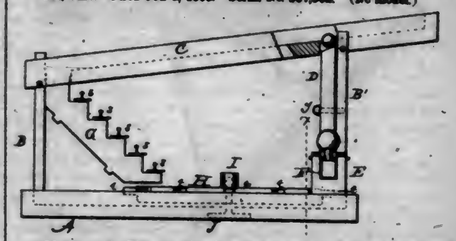
404,139. SYSTEM OF ELECTRICAL DISTRIBUTION. GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Filed Feb. 23, 1887. Serial No. 228,103. (No model.)

Claim.—1. The combination, substantially as described, of an alternate-current electric generator, a converter having primary and secondary circuits, the primary circuit being connected with the generator, an electric motor, an electric railway, and a rectifying-commutator driven by said motor, through which currents from said secondary circuit are supplied to said railway.

2. The combination, substantially as described, of an electric generator delivering alternating electric currents, an alternate-current motor driven thereby, a rectifying-commutator rendering continuous the current delivered from said generator, or a portion of the same, and an electric railway supplied by such continuous current.

3. The combination of an alternate-current electric generator, a converter reducing the potential of the currents delivered thereby, a rectifying-commutator rendering continuous such reduced currents, and an electric railway supplied by such continuous currents.

4. The combination, substantially as hereinbefore set forth, of an alternate-current electric generator, a converter supplied with currents therefrom, a rectifying-commutator straightening the currents from said converter, an electric railway supplied with such rectified currents, and a storage-battery charged by currents from said rectifying-commutator.



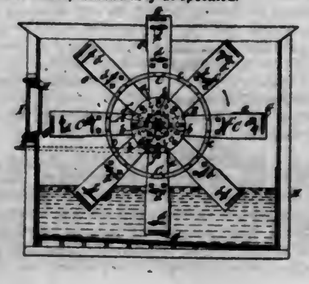
5. The combination of an electric railway, an electric locomotor moving thereon, a source of alternating electric currents, an electric converter having its primary connected with the source, a current-rectifier with which the secondary of the converter is connected, and means for conveying currents from said rectifier to said locomotor.

6. The combination of an electric locomotor, a current-rectifier upon said locomotor, a source of alternating electric currents, and means for connecting said source with said rectifier.

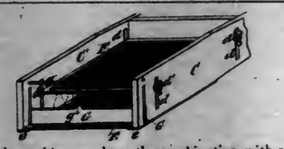
7. The combination, with an electric locomotor, of a current-rectifier and a storage-battery carried thereby, circuit-connections from said rectifier to said storage-battery, whereby the battery may be charged by currents delivered through said rectifier, and electrical connections from the storage-battery with the electrical locomotor.

8. The combination of an electric motor, a vehicle carrying the same, a source of alternating electric currents, and a rectifying-commutator through which currents are delivered from said source to said motor.

404,140. MUSICAL GAME-WHEEL. GOTTLIEB WILKENING, Dayton, Ohio. Filed Oct. 6, 1888. Serial No. 287,362. (No model.)



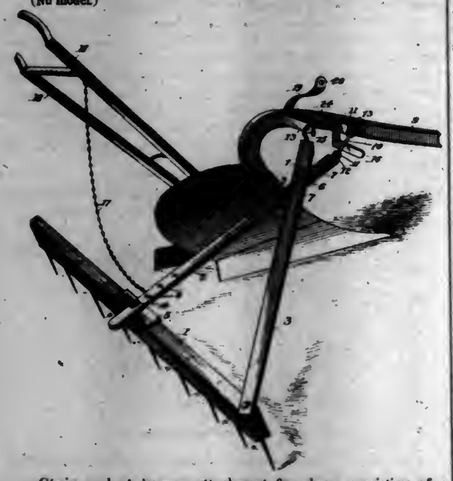
Claim.—1. The combination of frame A, having uprights and inclining trough thereon and rails holding sounding-plates *s*, the pivotal wheel H, having lugs at its periphery and numbered depressions on its face, the operating-bar F, with projection *w* on its upper surface, and pawl *u*, held from its under surface and arranged tangentially with reference to said wheel, and the discharging-bar D, having a beveled top held in a slot of said trough and directly over said operating-bar, as shown and described.



2. The combination of frame A, having uprights and inclining trough C thereon, rails holding a series of sounding-plates, *s*, in successive steps, the operating-bar F, with projection *w* and pawl *u*, and discharging-bar D, substantially as and for the purpose specified.

404,141. BOTTLE-WASHING MACHINE. OLIVER WILLCOX, Brooklyn, assignor of one-half to Robert A. Cheesbrough, New York, N. Y. Filed Nov. 16, 1888. Serial No. 291,046. (No model.)

Claim.—1. In a bottle-washing machine, the combination, with a tank, of a rotary wheel arranged in said tank, spokes comprised in said wheel, trays for containing the bottles arranged upon the spokes, and screens for maintaining the bottles upon the trays during the rotation of the wheel, substantially as specified.



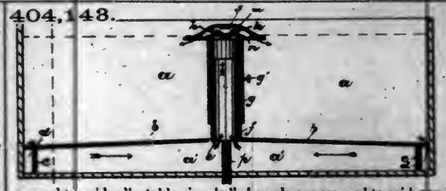
404,141.

2. In a bottle-washing machine, the combination, with a tank, of a rotary wheel arranged in said tank, spokes comprised in said wheel, trays for containing the bottles arranged upon the spokes, and adjustable screens for maintaining the bottles upon the trays during the rotation of the wheel, substantially as specified.

3. In a bottle-washing machine, the combination, with a tank, of a rotary wheel arranged in said tank, spokes comprised in said wheel, trays arranged on said spokes for holding the bottles, screens for maintaining the bottles upon the trays during the rotation of the wheel, and gates for preventing the trays and bottles from being thrown outwardly by centrifugal force, substantially as specified.

404,142. HARROW ATTACHMENT FOR PLOWS. JOHN F. WILLIAMS, Grand Forks, Dak. Filed Aug. 17, 1888. Serial No. 282,978. (No model.)

Claim.—1. A harrow attachment for plows, consisting of a toothed bar, a drag-bar pivoted at about the middle of its length, a brace-bar pivoted to one end of the toothed bar and to the drag-bar, and a U-shaped bar adapted to be secured to the plow-beam, and to the arms of which the drag-bar and brace-bar are flexibly connected, substantially as described.



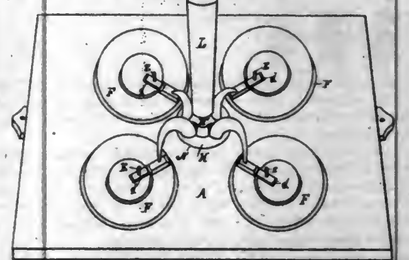
2. A harrow attachment for plows, consisting of the toothed bar 1, the drag-bar 2, pivoted to the middle of the toothed bar, the brace-bar 3, pivoted to the outer end of the toothed bar and to the forward end of the drag-bar, and the U-shaped bar 14, provided with the arms 13, one of which is provided with L-shaped arm 16, and the upwardly-projecting bar 19, the drag-bar and brace-bar being pivotally connected to the said arms 13, substantially as herein shown and described.

3. The combination, with plow-beam 9, of U-shaped bar 14, having perforated arms 13, and vertical arm 19, with hole 20, and L-shaped arm 16, secured to forward arm, 13, harrow 1, drag-bar 2, having one of its ends provided with perforations 8 and connected by pin 4 with harrow 1 and its other end resting on arm 16 and flexibly connected to forward arm, 13, by rod 10, having eyes 11 engaging said arm 13 and ring 12 in bar 2, brace-bar 3, pivoted at one end to the outer end of harrow 1, at its other end being connected by hook 15 to the rear arm, 13, and adjustably pivoted between its ends to drag-bar 2 by pin 6, by a series of adjacent holes, 7, in bars 2 3, and the chain 17, connected at one end to the outer end of rod 2 and at the other to one of the plow-handles 18, substantially as shown and described.

404,143. BEER-STEAMING APPARATUS. WILLIAM J. WIRTZ, Newark, N. J. Filed Dec. 20, 1888. Serial No. 294,935. (No model.)

Claim.—1. An improved steam tank or vessel, as herein described, having an intermediate or double bottom tapering downward from the center and with openings at the ends thereof, a central upwardly-extending pipe secured to said intermediate bottom over a central opening, an adjustable pipe fitting over said secured pipe, standards

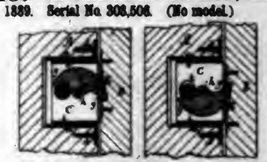
404,148.



secured to said adjustable pipe, bell-shaped caps secured to said standards, as shown, and a steam-pipe arranged under said intermediate bottom, as shown, and for the purposes set forth.

2. An improved steam tank or vessel as herein described, having an intermediate or double bottom tapering downward from the center and with openings at the ends or sides, a central upwardly-extending pipe secured to said intermediate bottom over a central opening therein, bell-shaped caps secured to said pipes, as shown, and a steam-pipe arranged under said intermediate bottom, as shown, and for the purposes set forth.

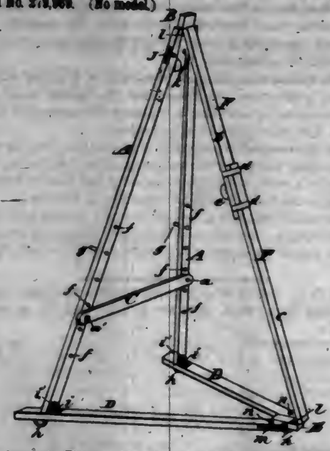
3. In a steam-tank provided with suitable steam-pipes, the combination of a centrally-perforated bottom, *b*, openings *d*, intermediate chamber, *a'*, vertical pipe *f*, bell-shaped cap *m*, secured to said pipe *f*, and spreader *s*, secured to said pipe, as shown, and for the purposes set forth.



404,144. PATTERN-BOARD. JOHN WRIGHT, Cleveland, Ohio. Filed Mar. 18, 1889. Serial No. 303,797. (No model.)

Claim.—1. A pattern or match board provided with a series of two or more face-plates and patterns in pairs, substantially as herein described, in combination with horn-gates radiating from a central gate and communicating with a central sprue, substantially in the manner and for the purposes specified.

2. In combination, a pattern-board provided with face-plates and patterns, a series of horn-gates gating to and with a central connecting-gate, an anchor-plate, and a locking-sprue, the parts being constructed, arranged, and operating substantially in the manner and for the purpose described.

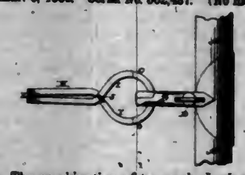


404,145. SASH-FASTENER. JOSEPH ABBOTT, Rumney, N. H. Filed Mar. 16, 1889. Serial No. 303,508. (No model.)

Claim.—1. The window-sash fastener, substantially as described, comprising the case *a*, having the flange *c* and bearing *m*, and adapted to receive and support the case *b*, the latter having bearings for the pin *j* and provided with slots *k*, the half-wheel *f*, provided with eccentric periphery and pivoted within and to the case *b*, the shaft D, arranged in the slots in case *b* and supported in a bearing in case *a*, and also in a nut, *o*, in combination with the sash and its casing, the latter having catches E, constructed, arranged in the casing, and to receive one end, *g*, of the half-wheel to lock the sash, essentially as set forth and represented.

2. The combination of the case *a*, provided with the flange *c*, hole *m*, and lips *e*, and adapted to receive and support the case *b*, the said case *b* provided with bearings for the pivot *j* and formed with slots *k*, the half-wheel *f*, pivoted to the case *b* and having eccentric periphery, and provided with bearings to rest against shaft D when either end of it is engaged with catch E, the eccentric-shaft D, one journal of which is supported in case *a* and the other in a bearing or nut, *o*, which is adapted to retain the shaft D in position in the case *a* and support said shaft while moving the case *b*, and the said nut *o*, all substantially as shown and set forth.

404,146. RAZEL WASHINGTON V. ACKERMAN, New York, N. Y., assignor to F. W. Devoe & Co., same place. Filed July 14, 1888. Serial No. 279,969. (No model.)



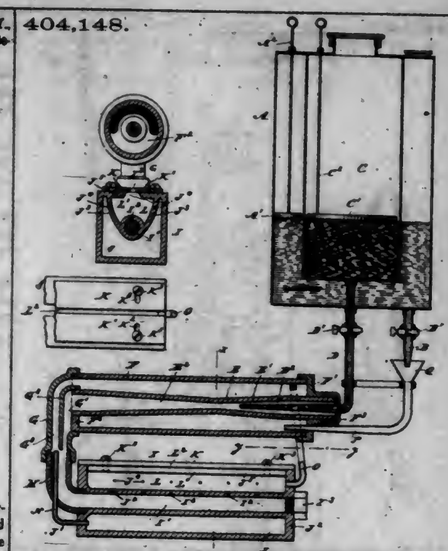
Claim.—1. The combination, in a folding easel, of a front portion having a joint at its upper end to permit of its being spread and contracted laterally at its bottom, a base hinged at its front to the bottom of the said portion and having a joint at its back to permit of its front part being spread and contracted laterally, and an extensible back leg hinged at its upper end to the upper part of said front portion and at its lower end to the back of the base, substantially as herein described.

2. The combination, in a folding easel, of a front portion composed of a spreader piece or head, and two legs pivoted at their upper ends thereto to provide for their lateral angular movement, a base composed of a spreader-piece and two bars pivoted thereto and hinged at their front ends to the bottom of the front legs, and an extensible back leg hinged at its upper end to the head of the front portion and at its lower end to the spreader-piece of the base, substantially as herein described.

3. The combination, in a folding easel, of laterally-folding front legs, a laterally-folding base hinged at its front to the said legs, and an extensible back leg connecting said base and front portion, and casters applied to said base, one under or near each of said front and back legs, substantially as herein described.

4. The combination, in a folding easel, with front legs having a pivotal connection at their upper ends, and the folding base composed of two bars having a pivotal connection at their rear ends, of the hinges *i i*, connecting the said front legs and bars and having their upper leaves connected with the front legs by pivotal connections *i' i'*, to permit the movement of the said legs toward and from each other while connected with the folding base, substantially as described.

404,147. WHIFFLETREE-IRON. ARON A. ACKLEN, Armistead, La. Filed Mar. 8, 1889. Serial No. 302,467. (No model.)



Claim.—1. The combination of two rods, I, pivoted together at J and having their outer ends formed into a hook and their inner ends into a ring, the rods being adapted to be turned upon their pivot for the purpose of opening or closing their ends, substantially as described.

2. A whiffletree-iron composed of the two parts B, the flat spring for connecting them together, and a screw, with the hook formed of two pivoted bars, which are shaped and bent as shown, substantially as set forth.

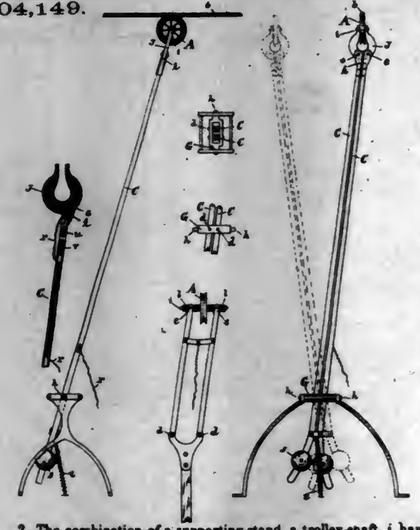
404,148. HYDROCARBON-BURNER. JOHN ADAMS, Nashville, Tenn. Filed May 1, 1888. Serial No. 272,409. (No model.)

Claim.—1. In a hydrocarbon-burner, the combination, with a steam-generator provided in its interior with a pipe into which the oil is sprayed, of a pipe divided by a partition into two compartments connected, respectively, with the said steam-generator and its central

404,148.

pipe, and a burner consisting of an apertured pipe connected with the lower end of the said double pipe, a casing inclosing the said perforated pipe, apertured partitions extending in the said casing to the said central pipe to form a mixing-chamber, plates held adjustably on the slotted top of the said casing, and a steam-pipe leading from the said steam-generator to the interior of the said mixing-chamber, substantially as shown and described.

2. In a hydrocarbon-burner, the combination, with a steam-generator provided in its interior with a pipe into which the oil is sprayed, of a pipe divided by a partition into two compartments connected, respectively, with the said steam-generator and its central pipe, and a burner consisting of an apertured pipe connected with the lower end of the said double pipe, a casing inclosing the said perforated pipe, apertured partitions extending in the said casing to the said central pipe to form a combustion-chamber, plates held adjustably on the slotted top of the said casing, a steam-pipe leading from the said steam-generator into the interior of the said mixing-chamber, and a second steam-pipe leading from the steam-compartment of the double pipe into the said casing, substantially as shown and described.



3. In a hydrocarbon-burner, the combination, with a water-tank and an oil-tank, each containing a float and each provided with a discharge-pipe, of a tube having a double cone shape, and into which discharges said oil-discharge pipe, a steam-generator surrounding the said tube and connected with the said water-outlet pipe, a double pipe held on the end of the said steam-generator and having two compartments opening, respectively, into the said tube and the said steam-generator, a burner consisting of a pipe connected with the said double pipe and having openings in its top, a casing surrounding the said pipe and having perforated partitions extending to the said perforated pipe, so as to form a mixing-chamber, and plates held adjustably on the slotted top of the said casing, substantially as shown and described.

4. In a hydrocarbon-burner, the combination, with a water-tank and an oil-tank, each containing a float and each provided with a discharge-pipe, of a tube having a double cone shape, and into which discharges said oil-discharge pipe, a steam-generator surrounding the said tube and connected with the said water-outlet pipe, a double pipe held on the end of the said steam-generator and having two compartments opening, respectively, into the said tube and the said steam-generator, a burner consisting of a pipe connected with the said double pipe and having openings in its top, a casing surrounding the said pipe and having perforated partitions extending to the said perforated pipe, so as to form a mixing-chamber, plates held adjustably on the slotted top of the said casing, and a steam-pipe leading from the said generator to the said combustion-chamber, substantially as shown and described.

404,149. TROLLEY FOR ELECTRICAL RAILWAYS. DAVID A. ADELIA, Richmond, Va. Filed Jan. 19, 1889. Serial No. 296,834. (No model.)

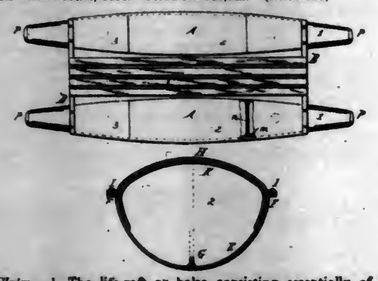
Claim.—1. The combination of a supporting-stand, a trolley-wheel hanger, parallel arms C, pivoted at the stand and at their upper ends to the said hanger, and a contact-wheel.

404,149.

2. The combination of a supporting-stand, a trolley-shaft, *i*, having bearings, parallel arms C, pivoted below at the stand and above at the shaft-bearings and the pivots of both arms an equal distance apart, and a contact-wheel mounted on said shaft.

3. The combination of the parallel arms C, each pivoted at two points which are an equal distance apart, an approximately U-shaped or horseshoe-shaped holder, to the lower rounded part of which the upper pair of said arm-pivots *e* are attached, a shaft, *i*, having bearings on the two arms of said holder, a contact-wheel occupying the space between the said two holder-arms, and a supporting-stand at which the parallel arms are pivoted.

4. The combination of a gimbal-frame, a trolley-wheel holder, two arms, C, each pivoted in the gimbal-frame and also pivoted to the said holder, the two pivots of one arm being the same distance apart as the pivots of the other, and a contact-wheel.



5. The combination of a gimbal-frame, a holder for a contact device, and two arms, C, each pivoted in the gimbal-frame and also pivoted to the said holder, the two pivots of one arm being the same distance apart as the pivots of the other.

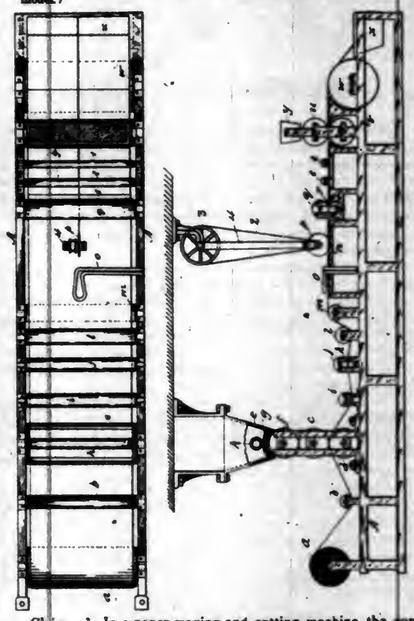
6. The combination of a gimbal-frame, a holder for a contact device, two arms, C, each pivoted in the gimbal-frame and also pivoted to the said holder, the two pivots of one arm being the same distance apart as the pivots of the other, and counterpoise weights or springs attached to the lower ends of said parallel arms below the gimbal-pivots.

7. The combination of the contact-wheel, its holder, a plate, *k*, pivoted to the holder and attached to a coupling-plug of insulating material, and a tubular arm, C, whose end is occupied by said coupling-plug.

8. The combination of the contact-wheel, its holder, a plate, *k*, pivoted to the holder and attached to a coupling-plug of insulating material, a tubular arm, C, whose end is occupied by said coupling-plug, and an insulated wire passing down inside of the tubular arm.

404,150. BALSA OR LIFE-BOAT. DANIEL AMMEN, Ammendale, Md. Filed Oct. 2, 1888. Serial No. 286,942. (No model.)

Claim.—1. The life-raft or balsa consisting, essentially, of two molded floats, each float composed of sections held together and stiffened by longitudinal flanges, the floats being connected by binders which support the deck, all combined substantially as described.



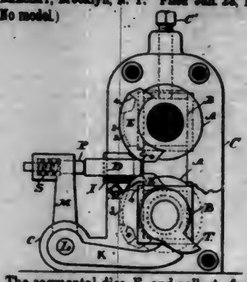
2. A float for a raft or balsa, consisting of molded sections, said sections having longitudinal flanges by which the parts are joined and stiffened, the whole forming a closed chamber impervious to water, substantially as described.

3. The float-section described, consisting of a molded body portion having longitudinal side flanges and the molded cover portion having corresponding side flanges, the flanges being secured together to make a tight joint, substantially as stated.

4. The float-section consisting of a molded body having an integral longitudinal rib for keelson and longitudinal side flanges, in combination with a cover having corresponding side flanges, whereby it is attached to the body portion, substantially as described.

5. The combination, in a float-section, of a molded body portion having side flanges, a molded cover having corresponding flanges, and ribs which extend transversely inside said cover, substantially as set forth.

404,151. PAPER WAXING AND CUTTING MACHINE. JORAH R. ANDERSON, Boston, Mass. Filed Nov. 3, 1888. Serial No. 289,899. (No model.)



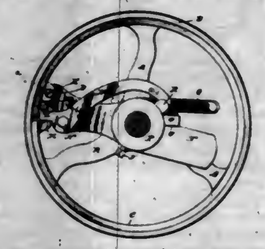
Claim.—1. In a paper waxing and cutting machine, the combination of the vertical series of cylinders *c d f* and a wax-receiving tank arranged above said cylinders and encompassing the upper portion of the upper cylinder, *f*, and provided with a perforated bottom, and a slide provided with perforations designed to register or coincide with the perforations of said bottom to regulate the supply of wax, substantially as set forth.

2. In a paper waxing and cutting machine, the combination, with the waxing-rollers and the table *n*, of means to draw the paper thereover, the cooling-tube O, and the rotating knife arranged adjacent to said cooling-tube, such tube projecting over the table to a point in front of and in line with the rotating knife, considered with respect to the direction of the traverse of the paper, as set forth.

3. In a paper waxing and cutting machine, the combination, with the waxing rollers and the table *n*, of means to draw the paper thereover, the cooling-tube, the rotating knife located in rear of said cooling-tube, and the rollers *q r*, arranged adjacent said knife and provided with cutting-blades, said cooling-tube projecting over the table to a point in front of and in line with the rotating knife, considered with respect to the direction of the traverse of the paper, substantially as set forth.

4. The herein-described improved paper waxing and cutting machine, comprising the series of cylinders *c d f*, a wax-receiving tank located above said cylinders and provided with a perforated bottom, the perforated slide within said tank, the series of guide and tension rollers, the table *n*, the rotating cutting-knife, the cooling-tube projecting over the table to a point in front of and in line with the rotating knife, considered with respect to the traverse of the paper through the machine, the cutting-rollers *q r*, the finishing-rollers, the dust-receiving tank located above said latter rollers, and the paper-receiving box, all constructed and arranged substantially as set forth.

404,152. MACHINE FOR MANUFACTURING TURN-BUCKLES. ROBERT L. BARCLAY, Brooklyn, N. Y. Filed Jan. 28, 1888. Serial No. 297,772. (No model.)

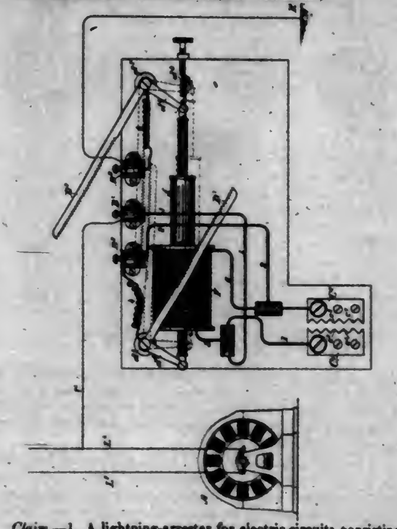


Claim.—1. The segmental dies E, and rolls A, for receiving the same, such segmental dies having end recesses, 4 4, side recesses, 3 3, and central corrugations, 7, for grasping and drawing in the heated blank in the manufacture of turn-buckles, substantially as set forth.

2. The combination, with the rolls A and segmental dies E, having end recesses, 4 4, and side recesses, 3 3, corresponding to the shape of the turn-buckle, of an automatic pusher adapted to act upon the heated blank and force the same endwise in between the segmental dies as such dies are carried around by the rolls, substantially as set forth.

3. The combination, with the rolls and the segmental dies, of the lever K, rock-shaft L, arm M, spring-pusher P, and the cam T, for automatically forcing in the heated blank between the dies and rolls, substantially as set forth.

404,153. FRICTION-CLUTCH. GEORGE A. BARBER, New Haven, Conn. Filed Jan. 14, 1889. Serial No. 296,345. (No model.)



Claim.—1. The combination, with a pulley loosely mounted upon a shaft, of a friction-band normally disengaged from the said pulley, a carrier rigidly connected with the shaft and having one end of the band attached to it, a single operating-lever pivoted to the carrier, connected with the opposite end of the band and curved to extend around on the opposite side of the shaft from its connection with the carrier and band, and a collar movably mounted upon the shaft and carrying a beveled operating-finger adapted to engage with the end of the lever, which is constructed, as described, to secure a long leverage and to occupy the minimum of room.

2. The combination, with a pulley loosely mounted upon a shaft, of a friction-band normally disengaged therefrom, a carrier rigidly connected with the shaft having a carrying-arm to which one end of the band is attached, and two counterbalance-arms extending in opposite directions from the carrying-arm, a lever pivoted to the carrying-arm and connected with the opposite end of the band, and a collar provided with an operating-finger movably mounted on the shaft engaging with the operating-lever and playing between the counterbalance-arms, substantially as set forth.

3. The combination, with a pulley loosely mounted upon a shaft, of a band normally disengaged from the said pulley, a carrier consisting of a collar chambered to fit over the hub of the pulley, a carrying-arm to which one end of the band is attached, and two counterbalance-arms, an operating-lever pivoted to the said carrying-arm and connected with the other end of the pulley, and a collar movably connected with the shaft and carrying an operating-finger playing between the counterbalance-arms which confine it and prevent the collar from rotation with the shaft, and co-operating with the said lever to expand the band, substantially as set forth.

404,154. LIGHTNING-ARRESTER. REGINALD BELFIELD, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Oct. 14, 1887. Serial No. 252,290. (No model.)

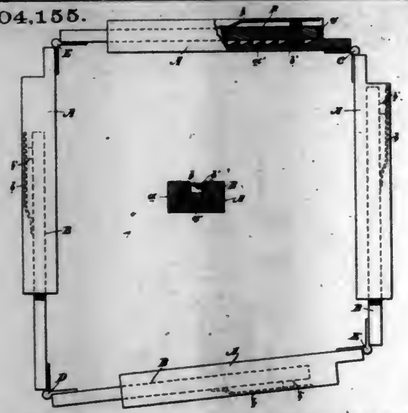
Claim.—1. A lightning-arrester for electric circuits, consisting of two pairs or sets of discharge-points, one of said pairs being separable, and an electro-magnetic device for separating the latter included in a shunt-circuit around the other pair, substantially as described.

2. A lightning-arrester for electric circuits, consisting of two sets of discharge-points, a solenoid in a shunt-circuit around one of said sets, a core or armature applied to said solenoid and acted upon thereby, and connections between said core or armature and one of said sets of discharge-points, whereby the movement of the core or armature toward the solenoid will cause the points to separate.

3. A lightning-arrester consisting of a solenoid, a set of separable discharge-points in circuit therewith, an armature or core applied to the solenoid and connected with said discharge-points, whereby the latter are separated by the movement of the core consequent upon the vitalization of the solenoid and a high-resistance circuit around the solenoid.

4. In a lightning-arrester, the combination of the coil F, the core or armature *f* applied thereto, the movable levers D' and D², respectively pivoted to the respective ends of said core or extensions thereof, said levers having discharge-points normally confronting each other, and electric connections between said discharge-points and said coil whereby electric currents traversing the discharge-points traverse also said coil, substantially as described.

5. In a lightning-arrester, discharge-points movable with reference to each other, an electro-magnetic device for operating the same, consisting of a solenoid and a core movable therein under the influence of currents continuously escaping through the lightning-arrester, and levers connecting the core with the respective discharge-points, the pivotal points of the respective levers being between the core and discharge-points, whereby the core serves as a weight acting in opposition to the effects of such currents and operating to return the points to their normal position when the currents cease.



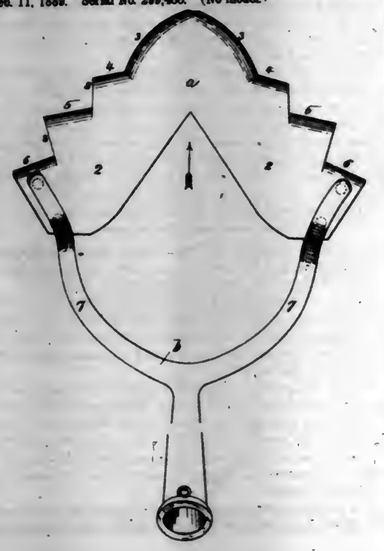
404,155. BUNDLE-BINDER. EUGENE BERRY and HOMER LAMBERT, Crescent City, Cal., assignors of one-third to Jacob Marhoffer, same place. Filed Mar. 16, 1888. Serial No. 303,611. (No model.)

Claim.—1. A bundle-binder consisting of a frame made of side pieces and sliding extension-pieces fitted thereto, said side pieces and extension-pieces having a pawl-and-ratchet connection between their adjacent faces to permit the expansion and contraction of the frame, substantially as described.

2. A bundle-binder consisting of a frame made of side pieces and sliding extension-pieces fitted in grooves therein, said side and extension pieces being so united as to permit the expansion and contraction of the frame, and pawl-and-ratchet locking devices between the adjacent faces of the side pieces and extension-pieces for holding the sliding extension-pieces in the position to which they are adjusted, substantially as described.

3. A bundle-binder consisting of a frame made of side pieces and sliding extension-pieces fitted thereto, said side and extension pieces

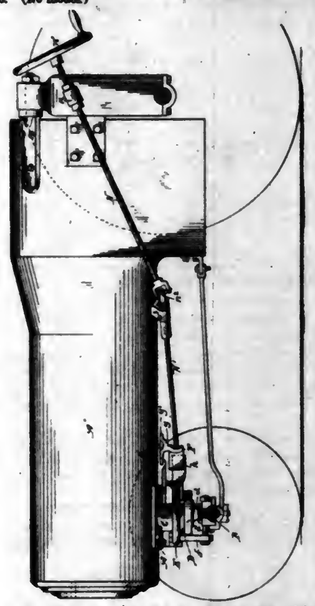
404,155.



being so united as to permit the expansion and contraction of the frame; and means for locking the sliding extension-pieces in the position to which they are adjusted, consisting of pawls carried by the extension-pieces and ratchets on the side pieces, with which the pawls engage, substantially as described.

4. A bundle-binder consisting of a frame made of side pieces having the grooves *a* and sliding extension-pieces fitted thereto, hinges uniting the adjacent ends of the side pieces and extension-pieces, whereby the frame may be expanded and contracted and its sides made to conform or adjust themselves to the sides of the bundle, and a locking-pawl carried by the sliding pieces and engaging the side pieces, substantially as described.

5. A bundle-binder consisting of a frame made of side pieces and sliding extension-pieces fitted thereto, hinges uniting the side and extension pieces, whereby the frame may be expanded and contracted and made to adjust itself to the bundle by conforming its sides thereto, and means for locking the sliding extension-pieces in the position to which they are adjusted, consisting of pawls carried by the extension-pieces and ratchets on the side pieces, with which the pawls engage, substantially as described.



6. The bundle-binder herein described, consisting of the side pieces, A, having the T-shaped grooves, the sliding extension-pieces B, fitted to said grooves, the hinges C, D, and E, uniting the side and extension pieces, the ratchets in the grooves of the side pieces, and the spring-pawls carried by the extension-pieces and engaging the ratchets, substantially as described.

404,156. SCUFFLE-HOE. CHARLES H. BULL, Waltham, Mass. Filed Feb. 11, 1889. Serial No. 299,400. (No model.)

Claim.—A scuffle-hoe composed of the wings 2 2, arranged as shown, and having the blades 3 4 5 6 on their outer edges, said blades having their cutting-edges extended outwardly and inclined backwardly, as set forth.

404,157. TRACTION-ENGINE. EDGAR M. BIRDSALL, Buffalo, N. Y., assignor to Mary Birdsall, same place. Filed Dec. 29, 1888. Serial No. 294,928. (No model.)

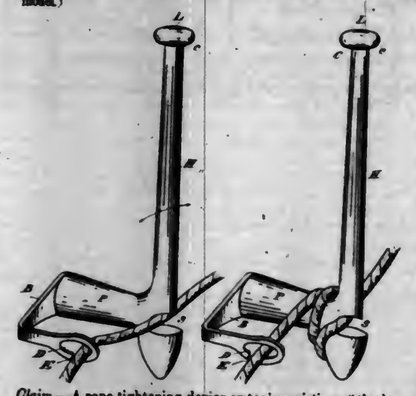
Claim.—1. In a traction-engine, the combination, with the boiler support or saddle and the front axle, of a steering-post pivoted to the front axle and connected with the saddle, a spring or cushion interposed between the saddle and the steering-post, a gear-segment supported from the saddle and connected with the steering-post, and a worm-wheel engaging with the gear-segment, whereby the segment and steering-post are turned upon rotating the worm-wheel, substantially as set forth.

2. In a traction-engine, the combination, with the boiler support or saddle and the front axle, of a steering-post pivoted to the front axle, a spring seated in a socket formed in the steering-post and supporting the saddle, a movable gear-segment supported from the saddle and connected with the steering-post so as to turn therewith and move vertically independent of the steering-post, and a worm-wheel engaging with the gear-segment, whereby the segment and steering-post are turned upon rotating the worm-wheel, substantially as set forth.

3. In a traction-engine, the combination, with the boiler-saddle, the front axle, and the steering-post, of a movable gear-segment supported from the saddle and adjustably connected with the steering-post, a worm-wheel engaging with the gear-segment, and an adjustable hanger upon which the worm-wheel is mounted, whereby said worm can be engaged with or disengaged from the gear-segment, substantially as set forth.

4. In a traction-engine, the combination, with the boiler-saddle, the front axle, and the steering-post, of a gear-segment supported from the saddle and adjustably connected with the steering-post, a worm engaging with said gear-segment, and a sectional shaft attached to said worm and extending to the rear end of the machine, substantially as set forth.

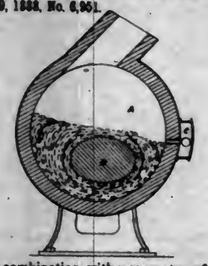
5. In a traction-engine, the combination, with the boiler-saddle A, provided with a segmental rim, C, and a bracket, G, of the steering-post D, provided with a head, E, having a segmental slot, e^1, in which the segmental rim of the saddle engages, and radial arms h, formed on said head, and a movable gear-segment, F, supported from the bracket G and provided with vertical ways or jaws h', which engage with the arms h of the steering-post, substantially as set forth.



6. In a traction-engine, the combination, with the bracket G, provided with grooves g^1, and the gear-segment F, provided with flanges g', engaging in the grooves g^2 of the bracket, of an adjustable arm or hanger, L, pivoted to said bracket, a worm, H, mounted on an arbor arranged on said hanger, and a steering-shaft connected with said worm by a swiveling-connection, substantially as set forth.

7. In a traction-engine, the combination, with the bracket G, and the gear-segment F, supported by said bracket, of the worm H, meshing with said segment, and the adjustable hanger L, secured to the bracket G and carrying said worm, substantially as set forth.

8. In a traction-engine, the combination, with the saddle A, provided with a segmental rim, C, and a bracket, G, of a steering-post, D, a head, E, formed on said steering-post and provided with a segmental slot in which the rim C of the saddle engages, and a gear-segment supported on said bracket and movably connected with the head of the steering-post, substantially as set forth.

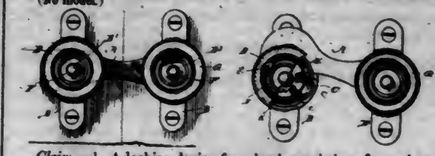


9. In a traction-engine, the combination, with the front axle, and the boiler-saddle A, provided with a segmental rim, C, and a bracket, G, of a steering-post, D, pivoted to the axle by a bolt, d', a head, E, formed on the steering-post and provided with a segmental slot in which the rim C of the saddle engages, a depending arm, f, formed on the head of the steering-post and secured at its lower end to the pivot-bolt d', and a gear-segment, F, supported from the bracket G and adjustably connected with the head of the steering-post, substantially as set forth.

404,158. DEVICE FOR TIGHTENING ROPES. WILLIAM F. BLAKEMORE, Davenport, Iowa. Filed Oct. 17, 1888. Serial No. 288,366. (No model.)

Claim.—A rope-tightening device or tool consisting of the bar or handle H, having the aperture in one side and near its end, the arm P, formed opposite the said aperture, the bracket B, pivoted to the arm and formed with the open loop D, and the locking-lug C near the other end of the bar or handle H, substantially as specified.

404,159. APPARATUS FOR CONVERTING CRUDE IRON INTO MALLEABLE IRON OR STEEL. JOHN W. BOOKWALTER, Springfield, Ohio. Filed June 13, 1888. Serial No. 276,906. (No model.) Patented in England May 9, 1888, No. 6,951.



Claim.—1. The combination, with a converter, of a core arranged transversely therein and situated about the center of motion of the circulating mass of metal and below the level thereof, substantially as described.

2. The combination, with a converter having a tuyere arranged to deliver air transversely to the surface of the metal, of a core arranged transversely within the converter and situated so as to occupy the space which would otherwise be occupied by a comparatively inert mass of metal and below the level of the molten mass, substantially as described.

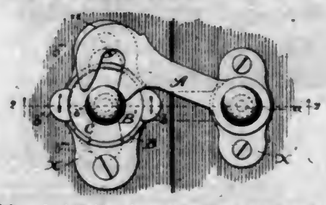
3. A converter provided with a transverse block, and with tuyeres arranged to inject a blast upon the metal from one side across said block, substantially as set forth.

404,160. LOCK-HOOK. CHARLES T. BROWN, Chicago, Ill., assignor to Flora L. Brown, same place. Filed Mar. 18, 1889. Serial No. 303,651. (No model.)

Claim.—1. A locking device for a hook, consisting of a stud, two disks rotatively mounted on the stud, each having an inwardly-directed ear extending into the plane of the hook, and a spring between and engaging both the disks, which spring yieldingly holds the ears substantially opposite each other, substantially as described.

2. A locking device for a hook, consisting of a stud, two disks rotatively mounted on the stud, of which the outer one has an inwardly-projecting marginal flange outside the plane of the hook and an ear, d', extending into the plane of the hook, and the inner one of which has a projection, c', adapted to enter the notch of the hook and extending into the plane of the hook, and a spring between and engaging the two disks, which spring yieldingly holds the ear d' and projection c' substantially opposite each other, substantially as described.

3. A locking device for a hook, composed of a stud, two disks having oppositely-directed marginal flanges set one within the other and forming an inclosed space between them, a projection on each disk extending into the plane of the hook, and a spring arranged between and engaged with the disks, which yieldingly holds the projections substantially opposite each other, substantially as described.



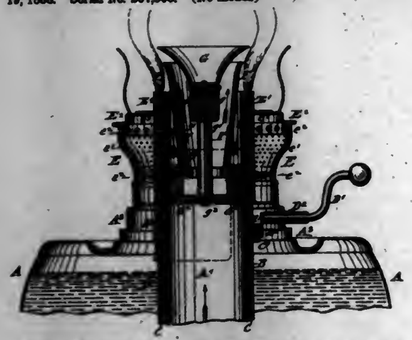
4. In a hook-locking device, the combination of the base B, the stud B^3 thereon provided with shoulders, disk C, resting on the inner shoulder of the stud, the disk D, supported by the inner disk, and the retaining-disk F, secured against the outer of the shoulders of the stud, substantially as described.

5. The combination of base B, provided with stop b^4 and stud B^3, of a disk, C, provided with projection c', proximating the base, the flanged disk D, provided with a marginal projection, d', also proximating the base, and with flange-shoulder d^3, and a coiled spring, E, having its ends attached to the several disks and arranged to cause the projection c' to yieldingly bear against the shoulder d^3, substantially as described.

6. The combination, with the hook-locking device composed of a base, B, provided with stop b^4 and stud B^3, disk C, provided with projection c', a flanged disk, D, provided with a marginal projection, d', and flange-shoulder d^3, and a coiled spring, E, having its ends attached to the several disks and arranged to cause the projection c' to yieldingly bear against the shoulder d^3, of a hook, a base, B', having the stud B^3, upon which the hook is pivoted, and provided with the stops b^9 and b^8, and a flanged cap covering the pivoted end of the hook, substantially as described.

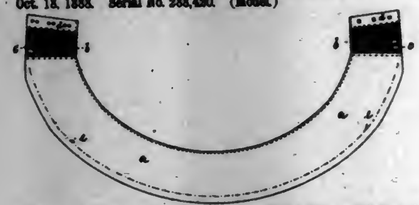
7. In combination with a hook-locking device composed of a base, B, provided with stop b^4 and with the stud B^3, disk C, provided with projection c', disk D, provided with projection d' and flange-shoulder d^3, and coiled spring E, having its ends attached to the several disks and arranged to cause the projection c' to yieldingly bear against the shoulder d^3, of a base, B', having the stud B^3 and provided with the stops b^9, b^8, and b^{10}, the hook pivoted on the stud, flanged cap covering the pivoted end of the hook and having a projection, g', arranged between the stops b^9 and b^8, and a spring underneath the cap and engaging therewith and with the hook, substantially as described.

404,161. LOCK-HOOK. CHARLES T. BROWN, Chicago, Ill., assignor to Flora L. Brown, same place. Filed Feb. 8, 1888. Renewed Mar. 18, 1889. Serial No. 303,823. (Model.)



Claim.—1. A locking device for a hook, consisting of a post, two disks rotatively mounted on the post, an ear on each of the disks extending into the plane of the hook, and a spring engaging the disks and yieldingly holding the ears substantially opposite each other, substantially as described.

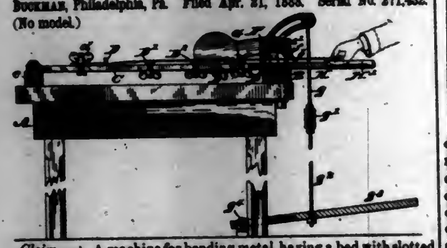
2. A locking device for a hook, consisting of a post, two disks rotatively mounted on the post, an ear on each of the disks extend-



ing into the plane of the hook, and a spring engaging the disks and yieldingly holding the ears substantially opposite each other, in combination with a pivoted hook and a spring arranged to retract the hook from the post when released from the locking device, substantially as described.

404,162. LAMP. ALFRED O. BRUNER, Meriden, Conn. Filed Mar. 19, 1888. Serial No. 267,595. (No model.)

Claim.—The combination of a fixed central-draft tube, A', provided with inwardly-projecting studs *f*, a base-ring, F', supported on said studs and provided with an interior seat, *f'*, with segmental openings *f³*, and with a diametrical U-shaped yoke, G², having a socket, *g⁵*, a spindle, G', supported at its lower end in said socket and provided in its upper end with a shoulder, *g'*, a draft-cone, F, supported on the interior seat of said base-ring, and a deflector, G, provided at its lower end with a perforated socket, *g*, which receives the upper end of said spindle and rests on said shoulder thereof, substantially as described

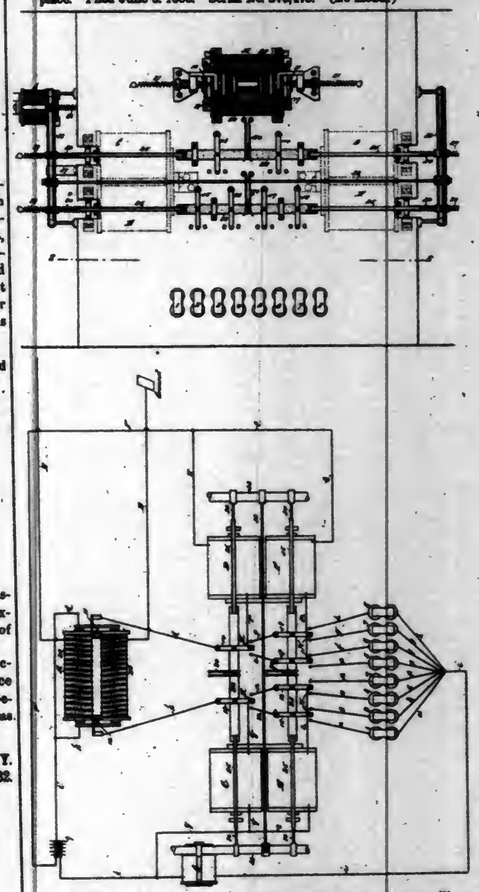


404,163. SKIRT-BELT. MARIE BRUNNER, Brooklyn, N. Y. Filed Oct. 13, 1888. Serial No. 288,420. (Model.)

Claim.—1. The combination of semi-annular belt *a* with the elastic sections *b* within the body of said belt, and with ruffles *c*, that extend across such elastic sections and are in line with the lower edge of the belt, substantially as specified.

2. The combination of semi-annular belt *a* with the elastic sections *b*, inserted therein, and with the ruffles *c*, secured across the face of said sections, the belt *a* being made of a double thickness and being wider in cross-section than the elastic sections, substantially as specified.

404,164. MACHINE FOR BENDING SHEET METAL. SAMUEL Y. BUCKMAN, Philadelphia, Pa. Filed Apr. 21, 1888. Serial No. 271,432. (No model.)



Claim.—1. A machine for bending metal, having a bed with slotted arms, a bender, and a creaser, a guide having its ends adjustably secured in said slots, and adjustable stops secured in said slots between the guide and creaser, said parts being combined, substantially as and for the purpose set forth.

2. In a machine for bending metal, the bed B, with ears therein, having the extension *d'*, the front face of which is vertical and in the same plane as the front face of the bed, a creaser with sharp front edge and journaled so as to be at an acute angle when in contact with the bed, and a bender adapted to bear against the vertical front face of the extension *d'*, said parts being combined substantially as described.

3. In a machine for bending metal, the combination, with the bender, of the adjustable slotted plate, substantially as and for the purpose described.

4. In a machine for bending sheet metal, a bed having slotted arms, a series of adjustable stops arranged in said slotted arms, ears having extensions or stops carried by the bed, a creaser pivoted to the ears and having weighted arms for returning the same to its normal position, and a bender adapted to contact with the extensions on the ears carried by the bed, said parts being combined and operating substantially in the manner and for the purpose described.

404,165. TELEGRAPH. JOHN BURRY, New York, N. Y., assignor of two-thirds to James R. Munson and Aloys Wirsching, both of same place. Filed June 8, 1888. Serial No. 276,475. (No model.)

Claim.—1. The combination, with a main circuit, of an auxiliary circuit having branches which include working-magnets, switches arranged to direct the current over the auxiliary circuit through the different branches, switch-magnets included in auxiliary circuits and connected to operate the switches, and connections between the main circuit and the switch-magnets, whereby different switch-magnets are energized by different conditions of the current over the main circuit, substantially as described.

2. The combination, with a main circuit including an electro-magnet, of an auxiliary circuit having branches which include working-magnets, a circuit-closer operated through the action of the magnet in the main circuit to close the auxiliary circuit, a switch mechanism for directing the current over the auxiliary circuit through different working-magnets, and switch-magnets also included in auxiliary circuits which are closed and broken through the action of the magnet in the main circuit, a catch mechanism for holding the switch mechanism in its shifted position, and a releasing-magnet, G, for operating said catch mechanism to release the switch mechanism, substantially as described.

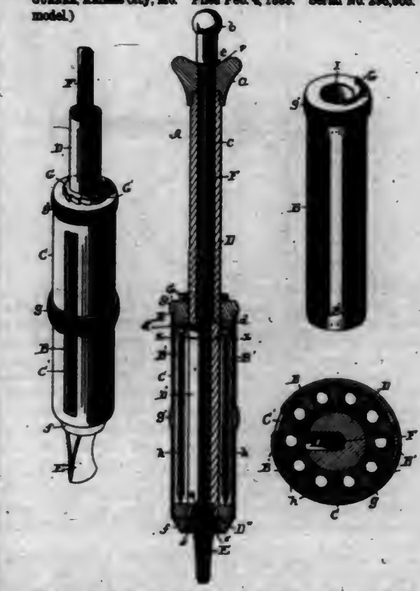
3. The combination, with a main circuit including an electro-magnet, of an auxiliary circuit having branches which include working-magnets, a circuit-closer operated through the action of the magnet in the main circuit to close the auxiliary circuit, a switch connecting the auxiliary circuit to a plurality of branches, each of which has a switch connecting with a plurality of other branches which connect with said working-magnets, switch-magnets for shifting said switches, located in auxiliary circuits which are closed and broken through the action of the magnet in the main circuit, circuit-closers M N, located in the circuits of the respective switch-magnets and operating after each switch-magnet acts to break the circuit through that magnet and close the circuit through another, substantially as described.

4. The combination, with a main circuit including an electro-magnet, of an auxiliary circuit having branches which include working-magnets, a circuit-closer operated through the action of the magnet in the main circuit to close the auxiliary circuit, a switch mechanism for directing the current over the auxiliary circuit through different working-magnets, and switch-magnets also included in auxiliary circuits which are closed and broken through the action of the magnet in the main circuit, a catch mechanism for holding the switch mechanism in its shifted position, and a releasing-magnet, G, for operating said catch mechanism to release the switch mechanism, substantially as described.

5. The combination, with a main circuit including an electro-magnet, of an auxiliary circuit having branches which include working-magnets, a circuit-closer operated through the action of the magnet in the main circuit to close the auxiliary circuit, a switch connecting the auxiliary circuit to a plurality of branches, each of which has a switch connecting with a plurality of other branches which connect with said working-magnets, switch-magnets for shifting said switches, located in auxiliary circuits which are closed and broken through the action of the magnet in the main circuit, circuit-closers M N, located in the circuits of the respective switch-magnets and operating after each switch-magnet acts to break the circuit through that magnet and close the circuit through another, a catch mechanism for holding the switches in their shifted position, and a releasing-magnet, G, for operating said catch mechanism to release the switches, substantially as described.

6. The combination, with a main circuit including a polarized relay, of an auxiliary circuit having branches which include working-magnets, circuit-closers operated through the action of said relay to close the auxiliary circuit through different branches, according to the polarity of the current, a switch mechanism for directing the current over the auxiliary circuit through different working-magnets, and switch-magnets also included in an auxiliary circuit which is closed and broken through the action of the relay, substantially as described.

7. The combination, with a main circuit including a polarized relay, of an auxiliary circuit having branches which include working-magnets, circuit-closers operated through the action of said relay to close the auxiliary circuit through different branches, according to the polarity of the current, a switch mechanism for directing the current over the auxiliary circuit through different working-magnets and switch-magnets also included in an auxiliary circuit which is closed and broken through the action of the relay, a catch mechanism for holding the switch mechanism in its shifted position, and a releasing-magnet, G, for operating the catch mechanism to release the switch mechanism, substantially as described.



8. The combination, with a main circuit including a polarized relay, of an auxiliary circuit having branches which include working-magnets, circuit-closers operated through the action of said relay to close the auxiliary circuit through different branches, according to its polarity, switches 13 14, connecting each of said branches with a plurality of branches, each of which has a switch connecting with a plurality of other branches which connect with said working-magnets, switch-magnets for shifting said switches, located in auxiliary circuits which are closed and broken through the action of said relay, and circuit-closers M N, located in the circuits of the respective switch-magnets and operating after each switch-magnet acts to break the circuit through that magnet and close the circuit through another, substantially as described.

9. The combination, with a main circuit including a polarized relay, of an auxiliary circuit having branches which include working-magnets, circuit-closers operated through the action of said relay to close the auxiliary circuit through different branches, according to its polarity, switches 13 14, connecting each of said branches with a plurality of branches, each of which has a switch connecting with a plurality of other branches which connect with said working-magnets, switch-magnets for shifting said switches, located in auxiliary circuits which are closed and broken through the action of said relay, circuit-closers M N, located in the circuits of the respective switch-magnets and operating after each switch-magnet acts to break the circuit through that magnet and close the circuit through another, a catch mechanism for holding the switches in their shifted position, and a releasing-magnet, G, for operating said catch mechanism to release the switches, substantially as described.

10. The combination, with a main circuit including an electro-magnet, of an auxiliary circuit including an auxiliary magnet, P, and having branches which include working-magnets, a circuit-closer operated through the action of the magnet in the main circuit to close the auxiliary circuit, a circuit-closer, O, included in the auxiliary circuit and operated by the auxiliary magnet to close the auxiliary circuit at intervals, a switch mechanism for directing the current over the auxiliary circuit through different working-magnets, and switch-magnets included in auxiliary circuits which also include the auxiliary magnet and which are closed and broken through the action of the magnet in the main circuit, substantially as described.

11. The combination, with a main circuit including a polarized relay, of an auxiliary circuit including an auxiliary magnet, P, and having branches which include working-magnets, circuit-closers operated through the action of the relay to close the auxiliary circuit through different branches, according to the polarity of the current, a circuit-closer, O, included in the auxiliary circuit and operated by the auxiliary magnet to close the circuit at intervals, a switch mechanism for directing the current over the auxiliary circuit through different working-magnets, and switch-magnets included in auxiliary circuits which also include the magnet P and which are all closed by the action of the relay, and circuit-closers M N, included in said auxiliary circuits with the respective switch-magnets and operated by the auxiliary magnet to close the circuits through the respective switch-magnets successively, substantially as described.

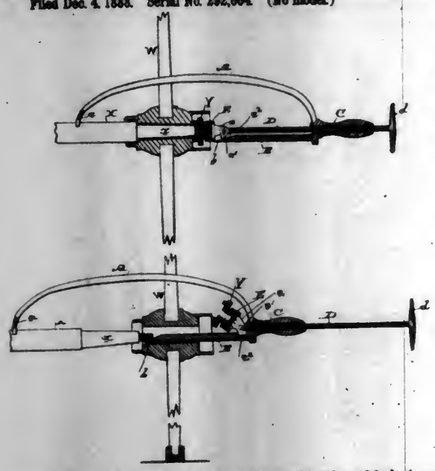
404,166. NAIL-DRIVER. WILLIAM C. BURTON and ELBERT M. GURNEE, Kansas City, Mo. Filed Feb. 4, 1889. Serial No. 298,903. (No model.)

Claim.—1. In a nail driving and setting implement, the combination of a main tube slotted at one side to receive the nails, the driver-bar carried within said tube, and the spring cutting-blades mounted in the lower end of the tube on each side of the driver-bar, substantially as and for the purpose set forth.

2. The combination, with the main tube provided with a slot to receive the nails, of the shouldered nut secured in its lower end and carrying the spring-blades E, the knob *a*, carrying projection *p*, and the driver F, working in the main tube and provided with the lug *d*, adapted to slide in groove *c* and engage with projection *p*, substantially as shown and described.

3. In a nail driving and setting implement, the combination, with a main tube carrying a driver within the same and having in its lower end the spring-blades E, of a magazine secured upon said main tube and adapted to revolve around the same, substantially as shown and described.

4. The combination, with the main tube provided with a slot to receive the nails and carrying the blades E at its lower end, of a driver working in said tube and between the knives, a cylinder secured upon the main tube and slotted, as shown, and the jacket C, surrounding the cylinder B, substantially as shown and described.



5. In a nail driving and setting implement, the combination, with a main tube having different-sized bores and slotted to receive the nails, of a driver working in said tube and shaped to correspond with said tube, the knob *a*, secured to the main tube and carrying projection *p*, the lug *d*, formed on driver F and sliding in groove *c* cut in main tube, the ratchet-wheel G, cast upon main tube and adapted to engage with the spring-pawl G', the cylinder B, and jacket C, all arranged and adapted to operate substantially as shown and described.

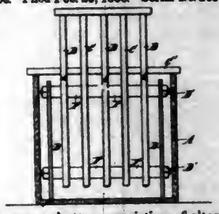
6. In a nail driving and setting implement, the combination, with a main tube slotted to receive the nails, of the driver F, working in said tube, the cylinder B, secured to the main tube and turning on the same, the slotted jacket C, surrounding the cylinder B, the shouldered nut D", slotted to receive the blades E, the nut *f*, working on nut D", the ratchet G, formed upon main tube, and the spring-pawl G', adapted to engage with said ratchet, substantially as shown and described.

7. A nail driving and setting implement having a slitting device comprising a pair of blades at its delivery end, said blades being disposed upon each side of the driver-bar of the implement, whereby a slot in the material for the reception of the nail to be driven and set may be opened, substantially as described.

8. A nail driving and setting implement having the oppositely-located slitting-blades projecting from its delivery end, whereby a slit may be opened in the material for the reception of the nail to be driven and set, substantially as described.

404,167. CARRIAGE-JACK. EDWARD F. BURTIS, Sacramento, Cal. Filed Dec. 4, 1888. Serial No. 292,664. (No model.)

Claim.—1. In a carriage-jack, and in combination with the bowed arm A and the axle rod or bar B thereof, a longitudinally-movable and rotary stem seated in the bowed arm and having a wrench upon its end adapted to fit the nut of the axle-spindle, substantially as herein described.



2. In a carriage-jack, and in combination with the bowed arm A and the axle rod or bar B thereof, the tubular handle C, the rotary and longitudinally-movable stem D, mounted in said handle, and the wrench E at the inner end of the stem, adapted to engage and remove the nut of the axle-spindle, substantially as herein described.

3. In a carriage-jack, the bowed arm A and the axle rod or bar B thereof, in combination with the longitudinally-movable and rotary stem D, seated in the bowed arm parallel with the axle rod or bar, and the wrench pivoted to the inner end of the stem and adapted to engage the nut of the axle-spindle, said wrench having arms adapted to come in contact with cams on the axle rod or bar to turn it upwardly and hold the nut safely when removed, substantially as herein described.

4. In a carriage-jack, the bowed arm A and the axle rod or bar B, having a beveled end, *b*, with inclined planes or cams *b'* on each side, in combination with the longitudinally-movable and rotary stem D, seated in the bowed arm, and the wrench E, having the arms *e* pivoted to the inner end of the stem, and projecting bearing-ends e^4, adapted to come in contact with the inclined planes or cams *b'* of the axle rod or bar, whereby the wrench is turned upwardly when retracted and holds the nut safely, substantially as herein described.

5. A carriage-jack comprising the bowed arm A, having the bearing *a* at its inner end for resting on the axle, the rod or bar B, secured to its outer end and having a beveled end, *b*, adapted to bear under the axle-spindle and provided with inclined planes or cams *b'* on its sides, the tubular handle C, the stem D, mounted in said handle and adapted to be moved longitudinally and rotated and having the handle *d* on its outer end, and the wrench E, having the arms *e* pivoted to the end of the stem D, with projecting bearing-ends e^4, adapted to come in contact with the inclined planes or cams *b* of the rod or bar B, substantially as herein described.

404,168. SECONDARY BATTERY. HENRY P. DE B. CAMERON and THOMAS HARRIS, Detroit, Mich., assignors of one-third to Alfred Woodward, same place. Filed Feb. 29, 1888. Serial No. 265,760. (No model.)

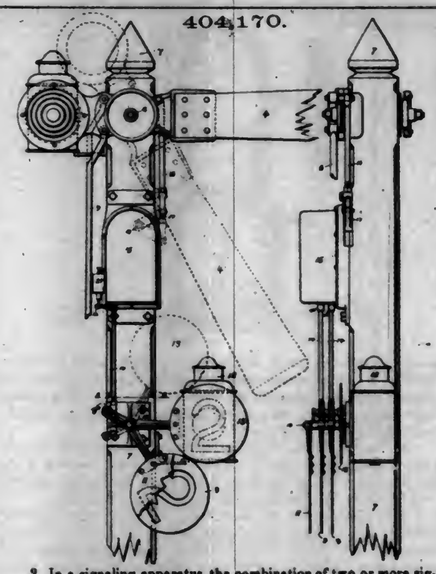
Claim.—1. A storage-battery consisting of alternate positive and negative plates supported free from the bottom of the cell by supports of non-conducting material, washers of non-conducting material interposed between said plates, bolts of non-conducting material passed through the plates and washers, and the plates and washers bound firmly together by nuts D', whereby warping and derangement of the plates and washers are prevented, substantially as described.

2. A storage-battery element consisting of a lead plate perforated with round holes for the reception of the salts of lead, said holes screw-threaded, thereby affording firm engagement for the said salts, substantially as and for the purposes described.

3. The combination, with the elements B and C, of one or more supports, *d'*, of non-conducting material, said support at its upper end projecting between the elements and constituting a washer, and in connection therewith a supporting-bolt of non-conducting material passed through the plates and washer, whereby the whole are bound together and to said washer, substantially as and for the purpose described.

404,169. COMBINED SHEARS, BUTTON-HOLE CUTTER, AND RIPPER. MORGAN S. CLARK, Toronto, Kans. Filed Sept. 22, 1888. Serial No. 286,061. (No model.)

Claim.—1. The combination, with one of the blades of the shears, having at its rear end a cutting-edge to be used in cutting button-holes, and a set-screw for regulating the size of the same, of a dove-tailed recess formed on its outer side, designed for the reception of a ripper, substantially as described.



2. The combination, with one of the blades of a pair of shears, having at its rear end a cutting-edge formed for cutting button-holes, a set-screw engaging an opening in the said handle and designed to regulate the size of the holes to be cut, a dovetailed recess formed on the said blade, and a ripper provided with a cutting-edge and having its sides beveled to engage the said recessed opening, substantially as described.

3. The combination, with the ripper mounted in a dovetailed recess formed in the upper edge of one of the blades, of a spring secured within the said recess and adapted to hold the ripper in any desired position, substantially as described.

404,170. ELECTRICAL SIGNALING APPARATUS. JOHN P. COLEMAN, Swissvale, Pa. Filed Apr. 2, 1888. Renewed May 4, 1889. Serial No. 309,670. (No model.)

Claim.—1. In a signaling system wherein there are a primary signal and two or more secondary signals referring thereto, the combination of the primary signal and two or more secondary signals which are normally disconnected from the primary signal, and each of which is provided with a lock for connecting it with the primary signal, whereby motion of the primary signal will mechanically actuate that one of the secondary signals which is connected therewith, substantially as and for the purposes described.

404,170.

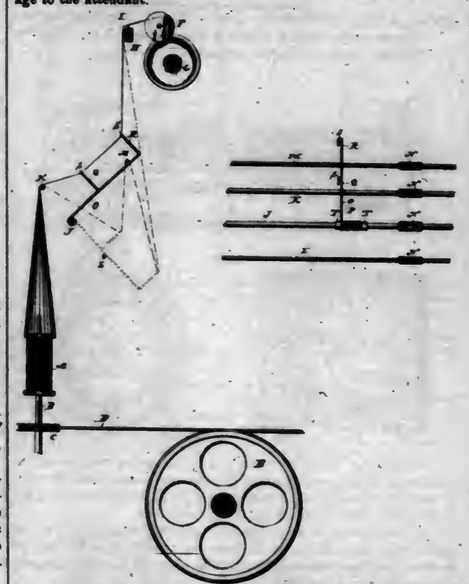
2. In a signaling apparatus, the combination of two or more signals, an actuating-rod provided with locks which adapt it to be connected with each of said signals, electro-magnets controlling said locks, and electric circuits wherein the magnets are included, substantially as and for the purposes described.

3. In a signaling apparatus, the combination, with two or more signals, of a shaft, 18, a system of levers connecting said shaft with each of said signals, and electro-magnets which engage said systems of levers and bring them into operative connection with said shaft 18, substantially as and for the purposes described.

4. In a signaling apparatus, the combination of two or more signals, an actuating-rod common to all said signals and normally disconnected therefrom, electro-magnets having armatures which engage and connect the secondary signals with the said actuating-rod, electric circuits in which the magnets are included, and a primary signal also connected with the actuating-rod, substantially as and for the purposes described.

5. In a signaling system, the combination, with a primary signal and two or more secondary signals, of electrical indicating-circuits and circuit-closers which are actuated by motion of the secondary signals to control said circuits, substantially as and for the purposes described.

6. The combination, with the signal and its actuating-rod, of the electro-magnet and its armature, and interlocking devices—such, for example, as the hooks *f* and *d*, one of which is moved by the electro-magnet into engagement with the other, and the other of which is movable in a reverse direction to engage the first-named hook and to tend to move the same and to free it from the electro-magnet—substantially as and for the purposes described.



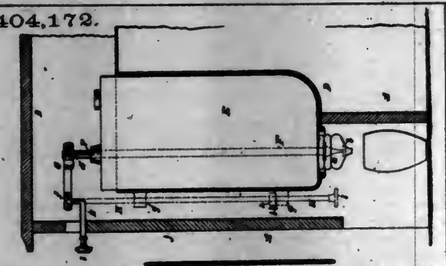
7. In a signaling apparatus, the combination, with a signal and its actuating-rod, which is normally disconnected therefrom, of an electro-magnet having an armature which engages and connects the signal with its actuating-rod, an electrical indicating-circuit, and a circuit-closer operated by movement of the armatures of the magnet to control the indicating-circuit, substantially as and for the purposes described.

8. In a signaling apparatus for railways wherein there are a primary signal and two or more secondary signals, each provided with an electro-magnet which controls it, the combination, with the said electro-magnets and their circuits, of railway-switches, circuit-controlling mechanisms (such as circuit-closers) operated by motion of the railway-switches and controlling the circuits of the magnets of the secondary signals, the circuit of the electro-magnet of the primary signal being connected with each of the circuits of the electro-magnets of the secondary signals, whereby the magnet of the primary signal is operated simultaneously with the operation of the magnets of each of the secondary signals, substantially as and for the purposes described.

9. In a signaling system wherein there are a primary signal and two or more secondary signals which refer to the primary signal, an actuating-rod common to all said secondary signals and normally disconnected therefrom, separate electro-magnets having armatures which engage and connect the secondary signals with the said actuating-rod, and electric circuits in which said magnets are included, said primary signal being also connected with said actuating-rod, whereby motion of the actuating-rod shall actuate the primary signal and one of the secondary signals simultaneously, substantially as and for the purposes described.

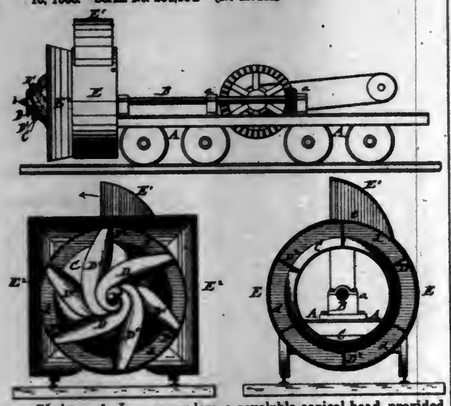
404,171. MACHINE FOR SPINNING AND WINDING SILK. HIRAM R. CONANT, Stonington, Conn. Filed May 31, 1887. Serial No. 239,736. (No model.)

Brief.—The object of the invention is to provide for machines for throwing, twisting, and spinning silk an improved take-up attachment combining the functions of taking up the slack, controlling more perfectly than heretofore the tension on the silk, and signaling a breakage to the attendant.



Claim.—1. In a machine for making silk, the combination, with a silk supporting and guiding wire located between a winding-off and a winding-up device, a suspension-wire located below the said silk supporting and guiding wire, a lift-detent wire located above the suspension-wire, a gravity take-up constructed and hung so as to swing free of all obstruction on the suspension-wire and having two silk-engaging arms separated to give clearance between them to the lift-detent wire, which is located in the arc in which the take-up moves, and a drop-detent wire located below the suspension-wire in the said arc, all of the said wires being parallel and the take-up being free to swing between the limits of the lift and drop detent wires, substantially as set forth.

2. In a machine for making silk, the combination, with a silk supporting and guiding wire located between a winding-off and a winding-up device, a suspension-wire located below the said silk supporting and guiding wire, a lift-detent wire located above the suspension-wire, a gravity take-up made of wire coiled to form a wide eye receiving the suspension-wire and bent to form two silk-engaging arms, which are separated to give clearance between them to the lift-detent wire, which is located in the arc in which the take-up moves, a drop-detent wire located below the suspension-wire in the said arc, and two collars mounted on the suspension-wire on opposite sides of the eye of the take-up, which they hold in place, all of the said wires being parallel and the take-up being free to swing between the limits of the lift and drop detent wires, substantially as set forth.



404,172. SODA-WATER APPARATUS. JOSEPH CONNER, New York, N. Y., assignor to The Firm of John Matthews, same place. Filed Mar. 2, 1888. Serial No. 301,737. (No model.)

Claim.—The syrup-tank E and valve-rod F, having the projecting arm G, said arm having a recess on its under side, in combination with the pusher-rod H, engaging said recess, all arranged to admit the removal of the syrup-tank without disturbing the rod H, substantially as described.

404,172.

404,173. SNOW-PLOW. JOSEPH CORBETT, New York, assignor, by mesne assignments, to Charles H. Otis, Brooklyn, N. Y. Filed Nov. 16, 1888. Serial No. 291,004. (No model.)

Claim.—1. In a snow-plow, a revoluble conical head provided with spiral blades increasing in width from the point toward the base of the head, and with alternating shorter blades that are not extended to the point of the head, substantially as set forth.

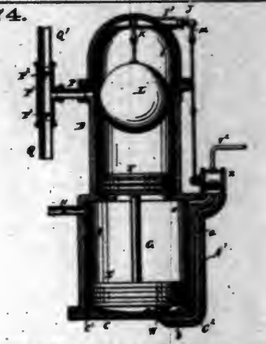
2. In a snow-plow, a revoluble conical head having a number of spiral blades increasing in width from the point toward the base of the head and bent into wings or paddles near the base of the head, substantially as set forth.

3. In a snow-plow, a conical revoluble head provided with a number of spiral blades increasing in width from the point toward the base of the head and bent at the base into wings or paddles radial to and parallel with the axis of the head, substantially as set forth.

4. In a snow-plow, a conical revoluble head provided with a number of spiral blades increasing in width from the point toward the base of the head and bent into the shape of radial wings or paddles near the base of the head, said wings being connected by a circumferential flange at the base of the head, substantially as set forth.

5. The combination of a revoluble conical head having spiral blades diminishing in width toward the point of the head and forming radial wings or paddles at the base of the same, with a cylindrical casing provided with a flaring front portion and with a discharge-aperture and hood at the top, substantially as set forth.

6. The combination of a conical revoluble head having spiral cutter-blades diminishing in width toward the point of the head and bent into radial wings or paddles at the base of the same, a circumferential flange connecting the wings or paddles, and a cylindrical casing surrounding the paddles and provided with a top opening and hood and with a flaring front portion recessed at the lower part, substantially as set forth.



7. In a snow-plow, a conical revoluble head provided with spiral blades of increasing width and wing-shaped ends for lifting and throwing off the snow by centrifugal force, substantially as set forth.

8. In a snow-plow, a conical revoluble head provided with spirally-curved blades which terminate in an auger-shaped point at the apex and in paddles or wings at the base of the head, substantially as set forth.

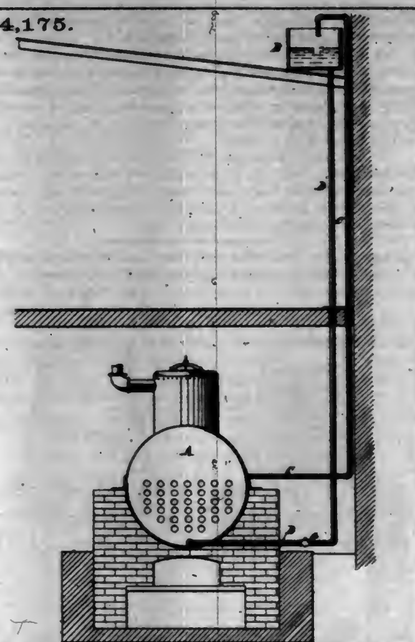
404,174. STEAM-TRAP. HENRY UEHLING, New York, N. Y. Filed July 26, 1888. Serial No. 281,056. (No model.)

Claim.—1. In a steam-trap, the combination, with the united steam and water cylinders, of a piston in each cylinder, a rod uniting said pistons, a transverse shaft in the top of the water-cylinder, a float suspended from the inner end of said shaft, a valve-actuating rod connected with the outer end of said shaft, a cam-lever in the water-cylinder, a shaft on which said cam-lever is secured, and a rod connecting the outer end of said shaft with the valve-actuating rod, substantially as herein shown and described.

404,174.

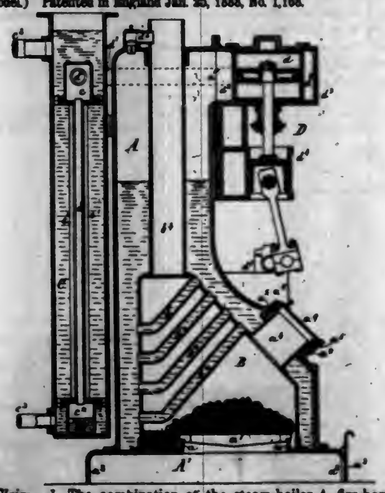
6. In a steam-trap, the combination, with united steam and water cylinders, connected pistons in the cylinders, a float in the top of the water-cylinder, a valve-actuating rod connected with the float and provided with a hook on its lower end, of a rocking steam-valve, a weighted lever on said valve, and a pin on said rod, on which pin the hook on the lower end of the valve-actuating rod can catch, substantially as herein shown and described.

7. The combination, with a valve-casing, of a rocking shaft in the same, a valve on one end of the shaft, and a balancing-disk on the opposite end of the shaft, substantially as herein shown and described.



8. The combination, with a valve-casing, of a rocking shaft in the same, the valve S on one end of the said shaft, the balancing-disk S^2 on the opposite end of the shaft, the neck T on the outer side of the valve, which neck has the two opposite longitudinal grooves T^2, the rocking shaft U in the bonnet R^2 of the casing, the transverse pin U^2 in the inner end of the shaft U, the ends of said pin passing into the grooves T^2, and a lever on the outer end of the shaft U, substantially as herein shown and described.

9. The combination, with a valve-casing, of the bonnet R^2, provided with the neck R^4, the rocking shaft U in said neck, a weighted lever on the outer end of said shaft, the collar U^3 on said shaft U, and resting against the inner surface of the closed end of the neck R^4, the transverse pin U^2 in the inner end of the shaft U, the rocking shaft S^2, the valve S on one end of the same, the neck T on said valve, which neck is provided with the opposite longitudinal grooves T^2, and the balancing-disk S^2 on the opposite end of the rocking shaft, substantially as herein shown and described.

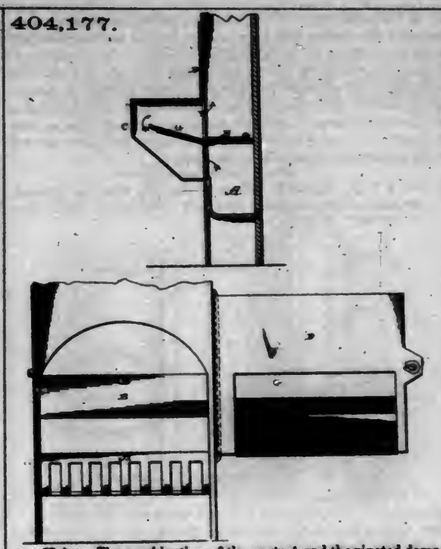


404,175. SAFETY APPARATUS FOR STEAM-BOILERS. WILLIAM F. CHEESEMAN, Brooklyn, N. Y., assignor of one-half to Enoch Rutzler, same place. Filed Jan. 23, 1889. Serial No. 297,319. (No model.)

Claim.—The combination, with a boiler, of a stand-pipe in communication with the boiler at one of its ends at a point approximating the water-level of the boiler, and opening at its other end into an an elevated tank, said open upper end of the pipe being in free communication with the atmosphere, and another pipe separated from the pipe first named communicating with said tank and also with the boiler at a distance below the water-level of the water, substantially as specified.

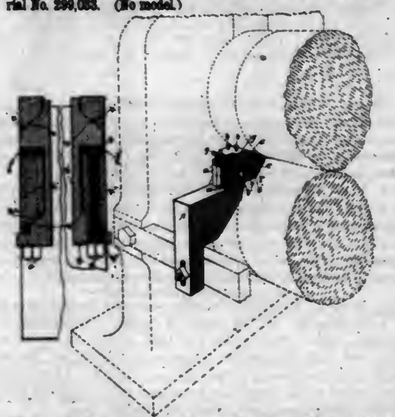
404,175.

404,176. STEAM-BOILER. HENRY DAVEY, Westminster, County of Middlesex, England. Filed Oct. 2, 1888. Serial No. 287,001. (No model.) Patented in England Jan. 25, 1888, No. 1,168.



Claim.—1. The combination of the steam-boiler A, fire-box B, having inclined circulation-flues within it, plate A', and chimney b^4, all constructed and arranged substantially as described.

2. The combination of the steam-boiler A, fire-box B, fuel-chute a^4, packing-ring a^6, and packing a^5, substantially as and for the purpose described.



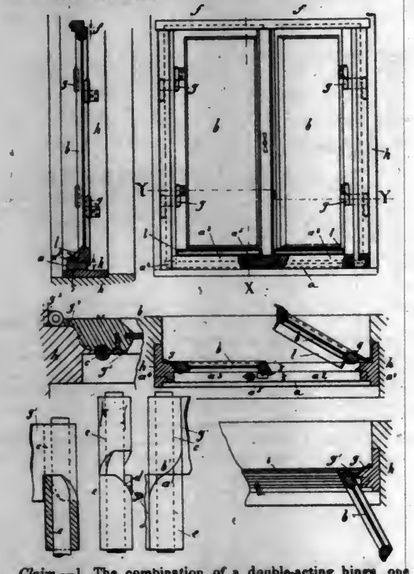
404,177. COMBINED COOKING-STOVE AND GRATE. ISAAC N. DAVIS and GEORGE TWEEDY, West Elizabeth, Pa. Filed Mar. 3, 1888. Serial No. 302,093. (No model.)

404,177.

Claim.—The combination of the grate A and the pivoted damper B above it with the pivoted casing C, provided with the stationary division-plate G and the vertical plate D, which closes the opening above the damper, the edge of the damper when closed being made to meet the edge of the division-plate when the casing is closed over the front of the grate, substantially as shown.

404,178. GUIDE-BOX. PATRICK I. DAY, Cleveland, Ohio, assignor to the American Wire Company, same place. Filed Feb. 7, 1889. Serial No. 299,083. (No model.)

Claim.—1. In a guide-box, the combination, with a guide, of adjusting mechanism engaging with the inner end of said guide and having its outer extremity located near the outer end of the guide-box, substantially as set forth.



2. In a guide-box, the combination, with a guide, of a guide-adjuster having its inner extremity engaging with the inner end of said guide, the outer extremity of said adjuster located near the outer extremity of said guide-box, substantially as set forth.

3. In a guide-box, the combination, with a guide and a pin engaging with it, said pin having an angular head, of an actuating-bolt movably fitted in said guide-box and provided with an angular extremity engaging with the angular head of said pin, the head of said actuating-bolt located near the outer end of said guide-box, substantially as set forth.

4. In a guide-box, the combination, with a guide and a pin provided with an angular head, of a bolt threaded in said box, the head of said bolt located near the outer extremity of said guide-box, the point of said bolt of angular formation and engaging with the head of said pin, substantially as set forth.

5. The combination of a guide-box provided with a guide-opening and a pin-opening, said latter opening located near the inner end of the box, a guide fitting in said first opening, a pin rectangular in cross-section and fitting in said pin-opening, said pin provided with an angular head of greater transverse area than the body of the pin, said guide-box also provided with a barrel, and a bolt threaded in said barrel, the point of said bolt being angular and engaging with the head of the pin, the head of said bolt located near the outer end of the guide-box, substantially as set forth.

404,179. **WINDOW.** GUSTAV J. DOLLINER, Hamburg, Germany, assignor to Josef Steindecker, same place. Filed July 11, 1888. Serial No. 279,663. (No model.)

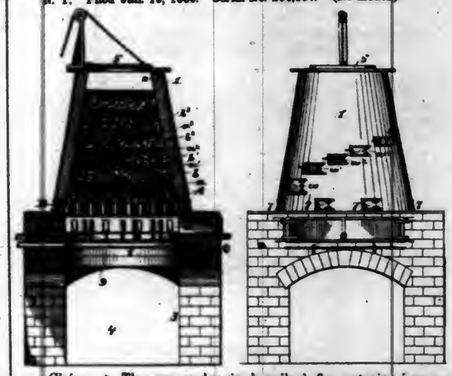
Claim.—1. The combination of a double-acting hinge, one of whose joints or hinge-points is made with spiral or inclined bearings, a casement hinged thereto, and a removable bottom strip arranged in the opening at the bottom of the casement for the latter to close against, substantially as and for the purpose described.

2. The combination of a double-acting hinge having inclined bearings at one of its articulations, a casement hinged thereto, a removable bottom strip for the lower part of the casement to bear against, and a lip, *l*, attached to the lower part of the casement and overhanging the removable bottom strip to catch the condensed water on the casement, substantially as and for the purpose described.

404,180. **PURIFYING WATER.** CHARLES A. DOREMUS, New York, N. Y. Filed Jan. 14, 1889. Serial No. 296,307. (No specimens.)

Claim.—The herein-described process for removing calcium, magnesium, and other like substances from waters, brines, &c., the same consisting in introducing into said waters, brines, &c., a fluorine compound, whereby the calcium or other substance is converted into an insoluble fluorine compound, substantially as described.

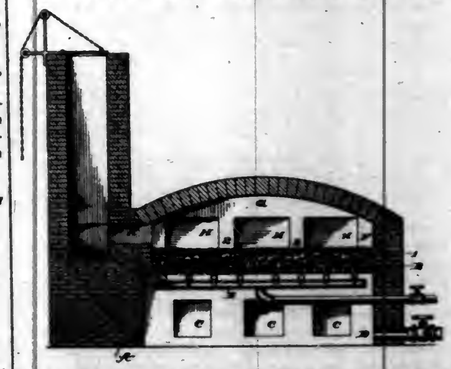
404,181. **REDUCTION OF IRON ORE.** CHARLES J. RAMM, New York, N. Y. Filed Jan. 19, 1889. Serial No. 296,536. (No model.)



Claim.—1. The process herein described for reducing iron ores, which consists in subjecting alternately-arranged strata or layers of carbon and granulated iron ore and carbon in admixture to currents of heated carbonic oxide, which are caused to permeate said strata, substantially as and for the purposes specified.

2. The process herein described for reducing iron ore, which consists in subjecting alternately-arranged strata or layers of carbon and granulated iron ore admixed with carbon to currents of heated carbonic oxide, which are formed in a base-strata of carbon and which permeate the superimposed strata of iron ore, &c., substantially as and for the purposes specified.

3. As a step in the herein-described process of reducing iron ore, the arrangement of a bed-strata of graphitic carbon as a means of generating carbonic oxide, and a series of superimposed alternate layers of carbon alone and an admixture of carbon and iron ore, substantially as and for the purposes specified.



404,182. **REDUCING IRON ORE.** CHARLES J. RAMM, New York, N. Y. Filed Jan. 19, 1889. Serial No. 296,537. (No model.)

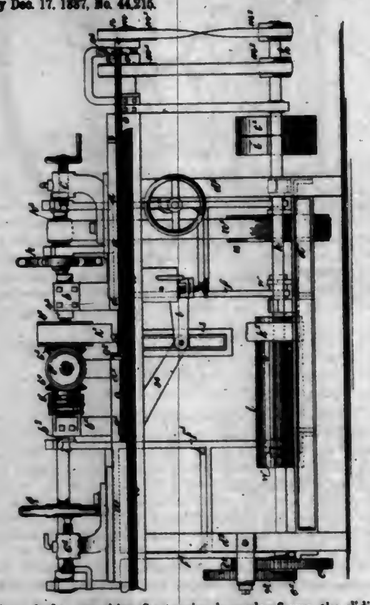
Claim.—1. The process herein described for reducing iron ore, which consists in arranging a series of layers composed alternately of lump carbon alone and granulated graphitic carbon mixed with granulated iron ore to currents of highly-heated carbonic-oxide gas, which permeate the several strata, substantially as and for the purposes specified.

2. The process herein described for reducing iron ore, which consists in arranging a series of layers composed alternately of lump carbon alone and granulated graphitic carbon admixed with granulated iron ore and subjecting the said layers to gaseous products in which a low state of combustion has been induced, said products being caused to permeate the several alternately-arranged layers of carbon alone and granulated iron ore mixed with granulated graphitic carbon, substantially as and for the purposes specified.

404,183. **PROCESS OF REDUCING IRON ORE.** CHARLES J. RAMM, New York, N. Y. Filed Jan. 19, 1889. Serial No. 296,539. (No model.)

Claim.—1. The method herein described for reducing ores, which consists in subjecting a single layer or stratum of granulated iron ore and granulated graphitic carbon intermingled, arranged on a permeable carbonaceous bed-layer and contained in a closed chamber, to the action of highly-heated currents of carbonic oxide, which currents pass up from the carbonaceous bed-layer into and through the stratum of iron ore and reducing agent, substantially as and for the purpose specified.

2. The process of reducing iron ores, which consists in arranging a single stratum of mixed granulated carbon and granulated iron ore upon a permeable bed-layer of graphitic carbon alone, and passing heated currents of carbonic oxide through the interposed permeable bed-layer of carbon and into and through the stratum of mixed carbon and ore, substantially as and for the purpose specified.



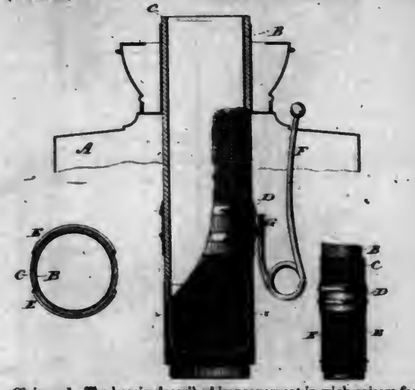
404,184. **REDUCING ORE.** CHARLES J. RAMM, New York, N. Y. Filed Feb. 7, 1888. Serial No. 298,062. (No model.)

Claim.—1. As an improvement in the art of carbonaceous reducing ore, subjecting a moist or plastic mass of admixed pulverized iron ore and a reducing agent to a reducing heat in a reverberatory or other suitable furnace, substantially as and for the purposes specified.

2. As an improvement in the art of reducing ore, subjecting a mixture of pulverized ore and a carbonaceous reducing agent which has been rendered moist or plastic by the addition of two fluids which distill or vaporize at different temperatures to a suitable reducing heat, substantially as and for the purposes specified.

3. As an improvement in the art of reducing ore, subjecting a moist or plastic mixture of pulverized ore and a carbonaceous reducing agent, to which has been added paraffine or crude petroleum residuum and water, to the action of a reducing heat in a suitable furnace, substantially as and for the purposes specified.

404,185. **MACHINERY FOR THE MANUFACTURE OF BOOT AND SHOE LASTS.** CHARLES W. EVANS, Old Compton Street, County of Middlesex, England. Filed Jan. 23, 1888. Serial No. 261,573. (No model.) Patented in England May 17, 1887, No. 7,180; in France Oct. 1, 1887, No. 186,163; in Belgium Oct. 1, 1887, No. 79,062, and in Germany Dec. 17, 1887, No. 44,215.



Claim.—1. In a machine for turning irregular forms, the sliding saddles *a'* and *a*, carrying, respectively, the pattern and the block to be cut, the rock-frame *f'*, wheel *g*, shaft *p*, and arm *p'*, link p^3, the rock-frame *f* and cutter-wheel, the arm *q*, link *q'*, and block q^4, and mechanism, substantially as specified, for adjusting the same, in combination with the link *s*, swinging on a fixed pivot, the arm *t*, connected to saddle *a*, the arm s^4, connected to saddle *a'*, and the sliding blocks s^3 s^3, connected to the arms s^4 and *t*, respectively, together with the means described for adjusting the arm *t*, all as hereinbefore set forth.

2. In a machine for turning irregular forms, the combination, with the sliding saddles *a'* and *a*, carrying, respectively, the pattern and the block to be cut, of the link *s*, swinging upon a fixed pivot, the arm *t*, connected to the saddle *a*, the arm s^4, connected to the saddle *a'*, the blocks s^3 and s^3, connected to the arms s^4 and *t*, respectively, and fitted to slide in the link *s*, and means, substantially as specified, for adjusting the arm *t*, as set forth.

3. In a machine for turning irregular forms, the combination, with the rock-frame *f'* and wheel *g*, carried by the same, the shaft *p*, arm *p'*, and link p^3, of the rock-frame *f* and cutter-wheel, the arm *q*, link *q'*, block q^4, and means, substantially as specified, for adjusting said block.

404,186. **WICK-RAISER FOR CENTRAL-DRAFT LAMPS.** CHARLES A. EVANS, Meriden, Conn., assignor to The Bradley & Hubbard Manufacturing Company, same place. Filed Nov. 26, 1888. Serial No. 291,862. (No model.)

Claim.—1. The herein-described improvement in wick-raisers for central-draft lamps, consisting of the ring D, encircling the wick within the fount and in connection with the wick-raising mechanism, the said ring constructed with springs extending vertically therefrom, adapted to impinge upon the surface of the wick at a distance from the ring, substantially as described.

2. In a central-draft lamp, the ring D, adapted to encircle the wick within the fount and in connection with the wick-raising mechanism, and provided with two or more U-shaped wire springs, the legs of the U attached to the ring and the bend of the U curved corresponding to the exterior surface of the wick and adapted to impinge on the wick at points distant from said ring, substantially as described.

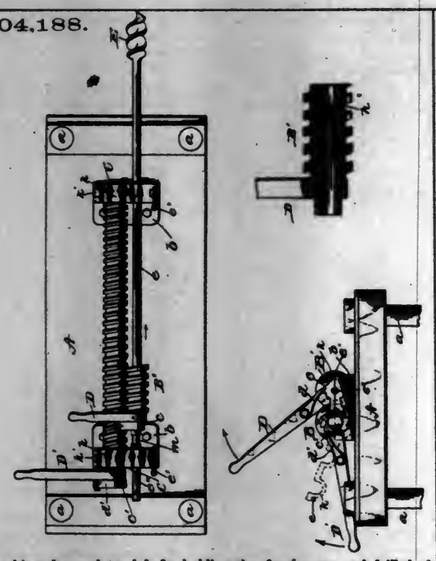
404,187. **CHAPLET FOR SAND CORES.** ALVA J. FISHER, Chicago, Ill. Filed Sept. 28, 1888. Serial No. 286,673. (No model.)

Claim.—1. As a new article of manufacture, a chaplet composed of solid carbon, substantially as described.

2. A chaplet composed of solid carbon and having a shoulder, A^3, and oppositely-inclined swell *A'*, substantially as described.

404,188. **GROUND-AUGER.** JEFFERSON FLEMING, Kansas City, Mo. Filed Jan. 23, 1889. Serial No. 297,203. (No model.)

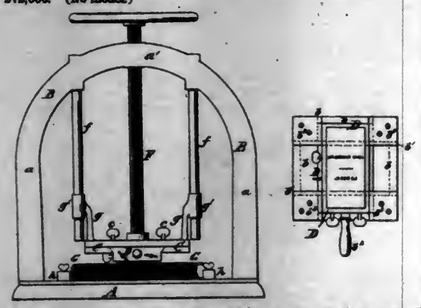
Claim.—1. In a drilling and boring machine, the combination, with a longitudinally stationary but revoluble worm or screw, of a movable screw meshing with the stationary screw and carrying the drill-shaft, substantially as shown and described.



2. In a drilling and boring machine, the combination, with a stationary worm or screw supported in suitable bearings, of a movable worm or screw meshing with and fed along the stationary worm, said movable worm being hollow and adapted to receive the drill-shaft, substantially as shown and described.

3. In a drilling-machine, the combination, with a stationary worm, of a movable worm meshing with and fed along the stationary worm, said movable worm being hollow and adapted to receive the drill-shaft, and the levers attached to the worms for operating the same, substantially as shown and described.

4. The combination, with a fixed worm, of a movable worm carrying the drill-shaft and meshing with the fixed worm, the ratchet-wheels keyed on the ends of the worms, and the levers loosely mounted on the said ends and carrying pawls adapted to engage with the ratchets, substantially as and for the purpose described.



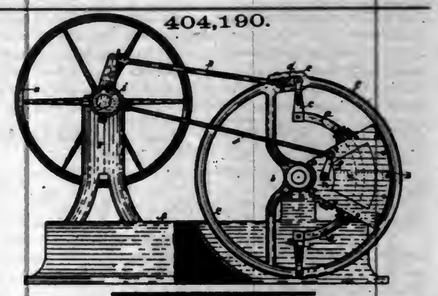
5. The combination, with a bed-plate carrying the bearings C C, of the fixed worm journaled in said bearings, the hollow movable worm meshing with the fixed worm and carrying the drill-shaft, which is also mounted in the bearings C C, the levers D D', carrying pawls *d d'*, adapted to engage, respectively, with the ratchet-wheels *c c'*, and

404,188.

the hinged cap-plates *k k*, for holding the fixed worm and drill-shaft in position, substantially as shown and described.

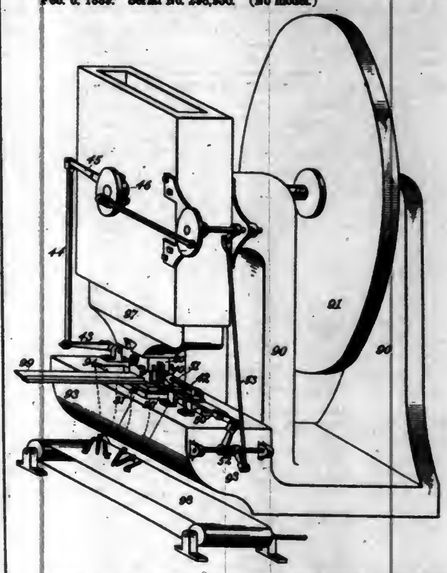
404,189. MACHINE FOR LETTERING THE COVERS OF BOOKS. WILLIAM J. FOSTER, Hoboken, N. J. Filed Apr. 27, 1888. Serial No. 272,006. (No model.)

Claim.—1. In a machine for lettering the sides of books, the combination, with a base, of a frame, a chase-holder, a screw journaled in the frame and having a loose connection with the chase-holder, and vertically-extending guide-rods secured near one of their ends to the frame and terminating at their other ends at a considerable distance above the base, said guide-rods having a loose connection with the chase-holder, substantially as specified.



2. In a machine for lettering the sides of book-covers, the combination, with a chase-holder provided with slideways upon its under side extending at approximately right angles to each other, of a chase adapted to be inserted in either of said slideways, substantially as specified.

404,190. STEAM-ENGINE. WILLIAM GEID, Kalamazoo, Mich. Filed Oct. 10, 1887. Serial No. 251,880. (No model.)



Claim.—In a steam-engine, the combination of the oscillating shaft, the oscillating wheel rigidly mounted on said shaft, the curved stationary cylinder, the piston-rod projecting out of each end of the cylinder and curved on a plane smaller than the rim of said wheel, the two radial arms, one attached rigidly to each end of said piston-rod, the free ends of said arms being pivotally attached to the rim of the oscillating wheel at points diametrically opposite each other, a cranked power-shaft, and a connecting-rod pivotally attached at one end to the rim of said wheel and to the crank of the power-shaft at the other end, substantially as set forth.

404,190.

404,191. SPIKE-MACHINE. HOWARD GREER, Lake View, Ill. Filed Feb. 6, 1889. Serial No. 298,930. (No model.)

Claim.—1. In a spike-machine, the combination of a punch-operating die conformed in its working-face to the irregular shape of one side of the spike to be made, a pair of supporting-dies, one on each side of the path of the punching-die, and each conformed in its working-face to the irregular shape of the opposite side of the spike to be made, and a stop and gripper arranged on the side toward which the feed movement takes place, the stop being arranged at a distance from the punching-die equal to the width of one spike, substantially as set forth.

2. In a spike-machine, the combination of a series or gang of die-punches, two or more in number, each conformed in its working-face to the irregular shape of one side of the spike to be made, and a series or gang of three or more supporting-dies interspaced with the punch-dies, and each conformed in its working-face to the irregular shape of the opposite side of the spike to be made, whereby each punch-die operates both as a punch-die and as a gripper or presser foot as regards the spike cut out on the adjacent die of the opposite gang, substantially as set forth.

3. A pair of dies, substantially such as A' A^1, suitably spaced for the cutting out of a spike from a suitably ribbed or beaded bar, and having each a shoulder, *c*, in combination with a punch-die, substantially such as B', for operating in the cavity so formed, and having a working-face conformed to the irregular shape of one side of the spike to be made, substantially as set forth.

4. A pair of dies, substantially such as B' B^2, suitably spaced for the cutting out of a spike from a suitably ribbed or beaded bar, and having each a shoulder, *c*, in combination with a die, substantially such as A^2, for operating in the cavity so formed, and having a working-face conformed to the irregular shape of one side of the spike to be made, substantially as set forth.

5. A spike-making die substantially such as A^2, and a pair of spike-making dies, substantially such as B' B^2, and relatively arranged substantially as described, in combination with a knocker operative endwise against the spike formed on A^2, so as to effect its discharge, substantially as set forth.

6. A series or gang of two or more punch-dies, and a series or gang of three or more supporting-dies relatively arranged with reference to severing a bar by transverse cuts into spikes without waste, in combination with a series or gang of knockers, 51, operative simultaneously by an endwise motion against the spikes formed on the supporting-dies, so as to effect their discharge, substantially as set forth.

7. The combination of a series or gang of punch-dies, a series or gang of supporting-dies, stripping-shoulders *s* and *c*, a stop, 40, and gripper 41, substantially as set forth.

8. The combination of a series or gang of punch-dies, a series or gang of supporting-dies, stripping-shoulders *s* and *c*, a stop, 40, gripper 41, and knocker 51, adapted to operate endwise against the otherwise undischarged spikes, substantially as set forth.

9. The combination of a series or gang of punch-dies, a series or gang of supporting-dies, stripping-shoulders *s* and *c*, a gripper and knockers, and suitable mechanism, substantially as set forth, for operating all said devices in orderly succession from a single shaft with reference to the production of cut steel spikes without waste from a rolled bar.

404,192. SIRUP-FAUCET. EDWIN HAAS, Philadelphia, Pa. Filed Aug. 18, 1888. Serial No. 283,075. (No model.)

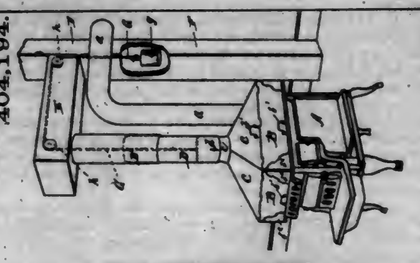
Claim.—1. The combination, in a jar having a neck provided with a plug having a valve-seat, of a valve-plug having a stem, a collar mounted on the neck of the jar, and a weighted lever pivoted in the collar and connected to the valve-stem, substantially as specified.

2. In a faucet, the plug 4, having openings 5 and 6, and the valve-plug 7, fitting into said opening 5, and provided with a stem, 8, passing through said opening 6, in combination with a lever pivoted to said jar and attached to said valve-stem 8, a weight attached to said lever, and a depending bail, also attached to said lever, substantially as described.

3. The combination, in a jar provided with a neck, and a plug inserted therein having a valve-seat and a stuffing-box, of a valve provided with a U-shaped valve-stem, one end being connected to the plug and the opposite end projected through the stuffing-box to the outside of the jar, a collar mounted on the neck of the jar and having a depending arm terminating in a hook, and a weighted lever pivoted in the hook-arm and connected with the valve-stem, and provided with a glass-receiving depending arm, substantially as specified.

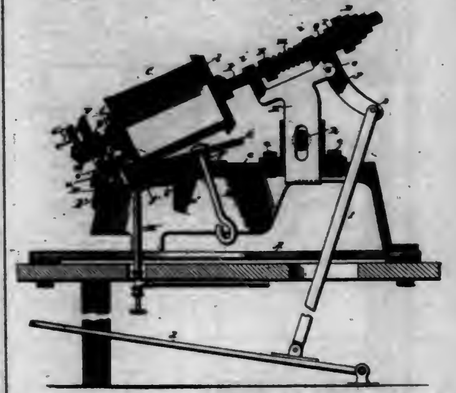
4. The jar 1, having the neck 2, and plug 4, having the seat 5, and stuffing-box 6, in combination with the plug 7, the stem 8, the glands 9, the collar 10, mounted upon the neck having the bolt 11 and the depending hooked-shaped arm 12, the lever 15, having the ring portion 16 mounted in the hook and connected to the valve, as at 17, and having the projecting arm 18, carrying the weight 19 and the depending glass-receiving bail 20, substantially as specified.

404,193. PROCESS OF DISSOLVING ANILINE COLORS. JACOB HAHN, New York, N. Y. Filed Nov. 9, 1888. Serial No. 290,361. (No specimens.)



Claim.—The process of directly uniting aniline with vegetable oil, which consists in dissolving aniline in hot water, adding part of the solution to oil, boiling the mixture, adding the remainder to the boiling oil, and stirring the mixture until the water has evaporated, substantially as specified.

404,194. ODOR-PREVENTING DEVICE FOR COOKING-STOVES. CARL A. HOLM, Chicago, Ill. Filed June 20, 1888. Serial No. 277,656. (No model.)



Claim.—1. The hood for carrying off odors and steam from a cooking-stove, having folding sides or leaves B, said leaves being provided with hinged corners, substantially as specified.

2. The hood for carrying off odors and steam from a cooking-stove, consisting of the hinged leaves or sides B, provided with hinged corners and the sloping-sided top C, substantially as specified.

404,194.

404,195. CAN-SOLDERING MACHINE. JOHN S. HULL, Baltimore, Md. Filed Mar. 26, 1888. Serial No. 304,794. (No model.)

Claim.—1. In a can-soldering machine, the combination of a base provided with a longitudinal slot, a support movable in the slot for the upper end of a can vertically and longitudinally adjustable on the base, a vertically adjustable, revoluble, and oscillating support for the lower end of the can, constructed to oscillate freely, and a solder bath into which the lower end of the can projects, substantially as described.

2. In a can-soldering machine, the combination of a longitudinally-reciprocating support for the upper end of a can, a support for the lower end of the can, constructed and mounted to revolve and oscillate freely, and a solder bath, substantially as described.

3. In a can-soldering machine, the combination of a reciprocating support for the upper end of a can, a revoluble support for the lower end of the can constructed to oscillate freely vertically with relation to the solder bath, a vertically-adjustable bracket in which the lower support is mounted, and a device for limiting the degree of oscillation of said support and for holding it in position for the insertion of a can between the two supports, substantially as described.

4. In a can-soldering machine, a solder bath and a soldering-iron supported on one side of the bath with its working end normally out of the solder, in combination with means for automatically withdrawing the working end of the iron from the solder when a can is removed, and a suitable burner, substantially as described.

5. In a can-soldering machine, a solder bath, an automatically-tilting soldering-iron, and a slot in the base through which said iron is heated, substantially as described.

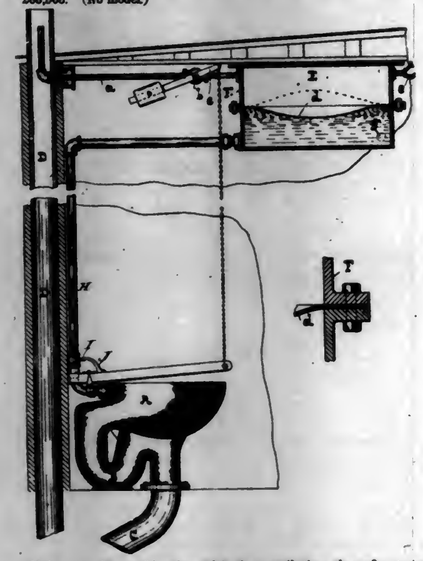
6. In a can-soldering machine, a solder bath, a slot in front of the bath, and a deflector for directing flame against the end of a can, substantially as described.

7. In a can-soldering machine, a solder bath, a slot in front of the bath, and an adjustable deflector secured to the base of the machine, substantially as described.

8. In a can-soldering machine, a solder bath, a transverse slot in front of the bath, and a longitudinal slot in the rear thereof, in combination with a soldering-iron and a burner, substantially as described.

9. In a can-soldering machine, a base having an aperture in it, in combination with a hood secured over said aperture to direct flame against a can, substantially as described.

10. In a can-soldering machine, the combination of a base having a flame-aperture therein, an adjustable hood over said aperture provided with a discharge-nozzle constructed to direct flame against a can, and a burner, substantially as described.



11. In a can-soldering machine, the combination of a base having a solder bath, a soldering-iron, a slot through the base in front of the bath, a slot in the rear of the bath, a hood, an aperture through the base communicating therewith for directing flame on one side of the bath, and a burner for supplying flame to the several flame-directing passages, substantially as described.

12. In a can-soldering machine, the combination of a base, an adjustable bracket, an oscillating can-support in said bracket, and a deflector secured by the bracket, and a slot for supplying flame to the deflector, a reciprocating support for the upper end of the can, and a burner, substantially as described.

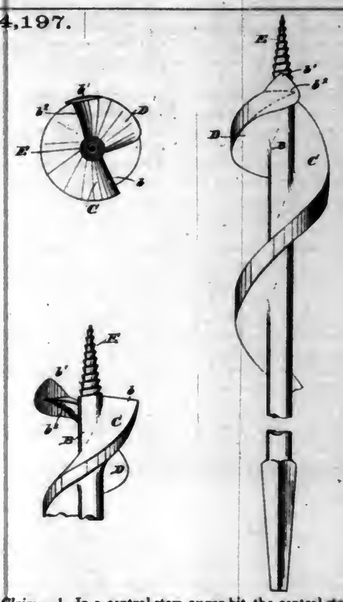
13. In a can-soldering machine, a base provided with a solder bath, a soldering-iron, a slot through which the iron is heated, a flame-confining barrier in the rear of the bath, a slot in front of the bath, and a burner, substantially as described.

404,196. VENTILATING APPARATUS FOR WATER-CLOSETS.

JESSE L. HUTCHINSON, Baltimore, Md. Filed Aug. 23, 1888. Serial No. 283,563. (No model.)

Claim.—1. In combination with the ventilating-pipe of a water-closet, a reservoir of compressed air or water, a pipe leading from the said reservoir to the interior of the ventilating-pipe, a self-closing cock or valve in the said connecting-pipe, and a chain or wire whereby the said cock or valve may be opened and a current of air or water admitted to the interior of the said ventilating-pipe, substantially as and for the purpose specified.

2. In combination with the ventilating-pipe of a water-closet, a reservoir of compressed air or water, a pipe connecting the said reservoir to the ventilating-pipe, a cock or valve in the said connecting-pipe, a movable seat, and a connecting chain or wire, whereby in the movement of the seat the said cock or valve is opened and compressed air or water admitted to the interior of the said ventilating-pipe, substantially as and for the purpose specified.



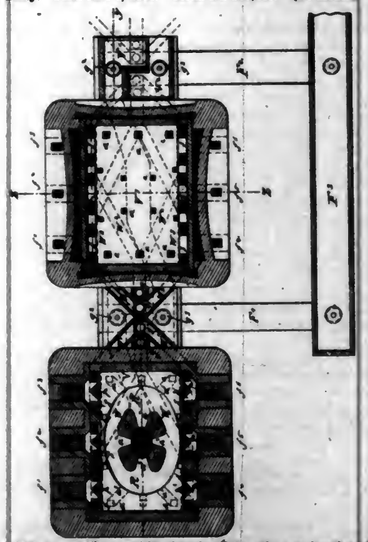
3. In combination with a water-closet and a ventilating-pipe leading therefrom, a tank having a flexible diaphragm therein which divides it into two compartments, one of which is provided with a water-pipe to fill it, and a discharge-pipe for flushing the water-closet bowl, and the other compartment fitted with an inwardly-opening air-check, and a discharge-pipe leading to the ventilating-pipe, having therein a controlling valve or cock, substantially as and for the purpose specified.

4. In combination with the ventilating-pipe of a water-closet, a tank, a flexible diaphragm to divide the tank into two compartments, one for air and the other for water, suitable pipes connected with the water-compartment, whereby the same is filled and discharged, and another pipe leading from the air-compartment to the said ventilating-pipe, whereby in the filling of the water-compartment air is compressed in the other and forced into the ventilating-pipe, substantially as and for the purpose specified.

404,197. AUGER-BIT.

CHARLES H. IRWIN, Wilmington, Ohio. Filed Oct. 20, 1887. Serial No. 252,935. (No model.)

404,197.



Claim.—1. In a central-stem auger-bit, the central stem, B, having a convoluted blade, C, terminating in a floor-lip, *b*, and a short convoluted blade, D, terminating in a floor-lip, b^3, and an outline-lip, *b'*, the latter extending out beyond and below the floor-lip b^3, substantially as set forth.

2. In a central-stem auger-bit, the central stem terminating in a screw-point and provided with a convoluted blade, C, terminating in a floor-lip, *b*, and a short convoluted blade, D, terminating in a floor-lip, b^3, and an outline-cutting lip, *b'*, the latter extending out beyond and below the floor-lip b^3, the cutting-edge of lip *b* being elevated above the lip b^3, substantially as set forth.

404,198. BRICK-KILN.

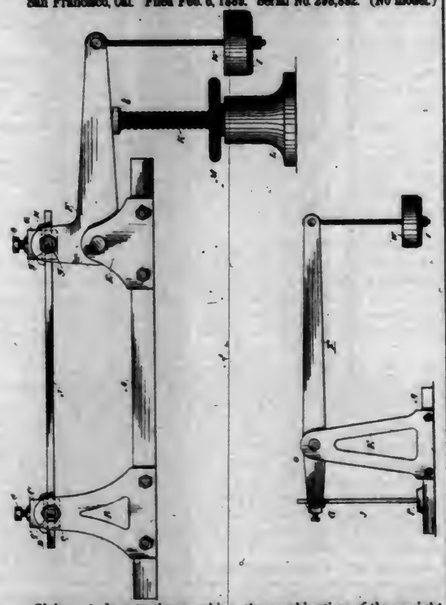
PAUL JOCHUM, Ottweiler, Prussia, Germany. Filed Jan. 4, 1889. Serial No. 295,415. (No model.)

Claim.—1. The combination, in a kiln, of a combustion-chamber, fire-places at both sides of the same, fire-walls located parallel to the side walls at the interior of the combustion-chamber, flues connecting the fire-places with the spaces between the side walls and fire-walls, draft-openings and flues in the bottom of the combustion-chamber, a ring-shaped flue below said bottom, a central smoke-flue, and radial channels connecting the ring-shaped flue with the smoke-flue, substantially as set forth.

2. The combination, in a kiln, with the combustion-chamber, a ring-shaped flue below the bottom of the same, draft-flues connecting the bottom of the combustion-chamber with the ring-shaped flue, a central smoke-flue, radial channels connecting the ring-shaped flue with the smoke-flue, an S-shaped transmitting-flue connecting the combustion-chamber of the first oven with the second oven, branch flues communicating by valves with the S-shaped transmitting-flue, and vertical flues connecting the branch flues intermediately of the direct flues with the bottom of the combustion-chamber, substantially as set forth.

3. The combination, in a kiln, of the combustion-chamber having a number of fire-places located at opposite side pillars of the rear ends of the fire-places, flues at both sides of the pillars communicating with the bottom of the combustion-chamber, intermediate vertical flues, and branch flues connecting said intermediate flues with the combustion-chambers of the adjoining ovens, substantially as set forth.

4. The combination, in a kiln, with the combustion-chamber, draft-flues in the bottoms of the same, a ring-shaped flue below the bottom, radial channels, a central smoke-flue, an S-shaped transmitting-flue, and valved auxiliary flues leading the fire-gases from the S-shaped transmitting-flue of one oven around the adjoining oven to the branch flues of the third oven, substantially as set forth.



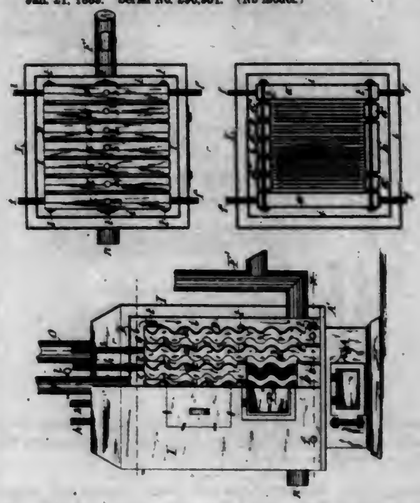
404,199. PROCESS OF MAKING ARTIFICIAL STONE.

PAUL JOCHUM, Ottweiler, Prussia, Germany. Filed Jan. 4, 1889. Serial No. 295,416. (No specimens.)

Claim.—The process herein described of making artificial stone, which consists in mixing pulverized clays containing iron clays with an emulsion composed of a saturated solution of sulphate of iron and finely-ground iron ore; secondly, shaping the mass into blocks and drying the same; thirdly, immersing the same in a second emulsion formed of a saturated solution of sulphate of iron, pulverized iron ore, and manganese, and, lastly, burning the blocks, substantially as set forth

404,200. TENSILE-STRAIN-TESTING MACHINE.

SAMUEL JUMP, San Francisco, Cal. Filed Feb. 6, 1889. Serial No. 298,892. (No model.)



Claim.—1. In a testing-machine, the combination of the upright bracket B, having in its top the pivoted or rocking cross-head, with adjustable clamp for receiving and holding one end of the bar to be tested, the fixed bracket E, and pivoted elbow or bell-crank lever in said bracket and having one end adapted to receive the testing-weights, and the rocking cross-head in the other end of said lever and having an adjustable clamp for receiving and holding the other end of the bar to be tested, substantially as described.

2. In a testing-machine, the fixed brackets B and E, the rocking cross-head with clamp carried by bracket B, the elbow or bell-crank lever pivoted in bracket E and having one end adapted to receive the testing-weights, and the rocking cross-head with clamp in the other end of the lever, in combination with the vertically-movable or adjustable support K under the lever and adapted to receive it instantly when the bar to be tested is fractured, substantially as described.

404,201. BOILER.

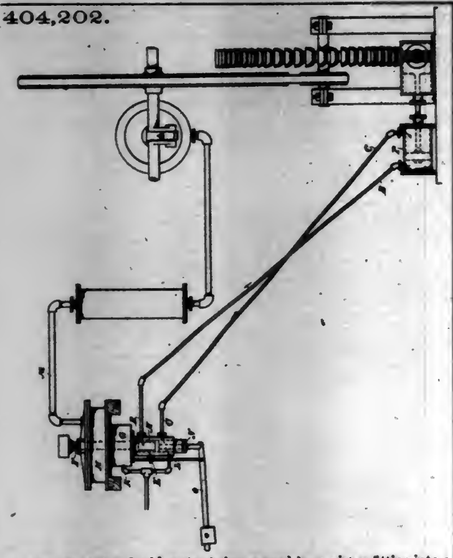
WILLIAM W. KELSEY, Cortland, N. Y. Filed Jan. 21, 1889. Serial No. 296,951. (No model.)

Claim.—1. A steam or hot-water boiler comprising a plurality of hollow walls corrugated externally and internally and disposed side by side, with passages for the products of combustion between them and with the corrugations of each parallel with those of the adjacent wall, and the water-supply pipe communicating with the interiors of said walls, as set forth.

2. A steam or hot-water boiler comprising a plurality of hollow walls corrugated vertically, externally, and internally, and disposed side by side, with the convex portions of each directly opposite the concave portions of the adjacent wall, and with passages for the products of combustion between them, substantially as described and shown.

3. In a steam or hot-water boiler, the combination of a water-jacketed fire-pot, hollow walls rising from said water-jacket at opposite sides of the fire-pot and corrugated vertically, correspondingly-corrugated hollow walls between the aforesaid walls, and each having its convex portions directly opposite the concave portions of the adjacent wall, and forming between them serpentine fire-passages, and having their bases forming the crown of the fire-pot, and water-ducts connecting said hollow walls, as set forth.

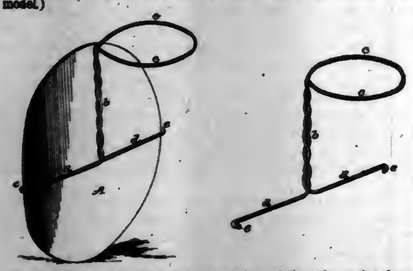
4. A steam or hot-water boiler composed of a series of vertical hollow walls corrugated vertically and arranged parallel side by side, with passages for the products of combustion between them, the outer walls extending beneath the intermediate walls, and the grate surrounded by the bases of the outer walls, water-ducts connecting said walls, a case inclosing the aforesaid walls, with passages for the products of combustion between said case and outer walls, and a smoke-exit pipe connected to the said case, substantially as described and shown.



404,202. AUTOMATIC VALVE ATTACHMENT FOR POWER MECHANISMS.

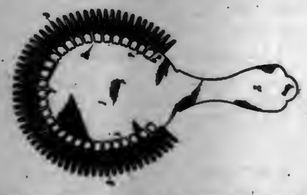
SAMUEL N. KNIGHT, Sutter Creek, Cal. Filed Nov. 3, 1888. Serial No. 289,911. (No model.)

Claim.—1. The valve-chamber having the supply and exhaust passages B, C, and E, and the valve A, in combination with the pistons of different diameters moving in corresponding cylinders, the water and air supply passages opening into the said cylinders upon opposite sides of the two pistons, substantially as and for the purpose herein described.



2. The cylinders G and H, having the pistons I and J fitted therein, a pipe supplying water or other medium under pressure beneath the lower piston, and a pipe supplying air under pressure above the upper piston, a valve connected with the common piston-rod of the two pistons, and supply and exhaust passages controlled by said valve, in combination with an air-compressor connected with the upper cylinder, and a motor from which power is derived to operate said com-

404,202.

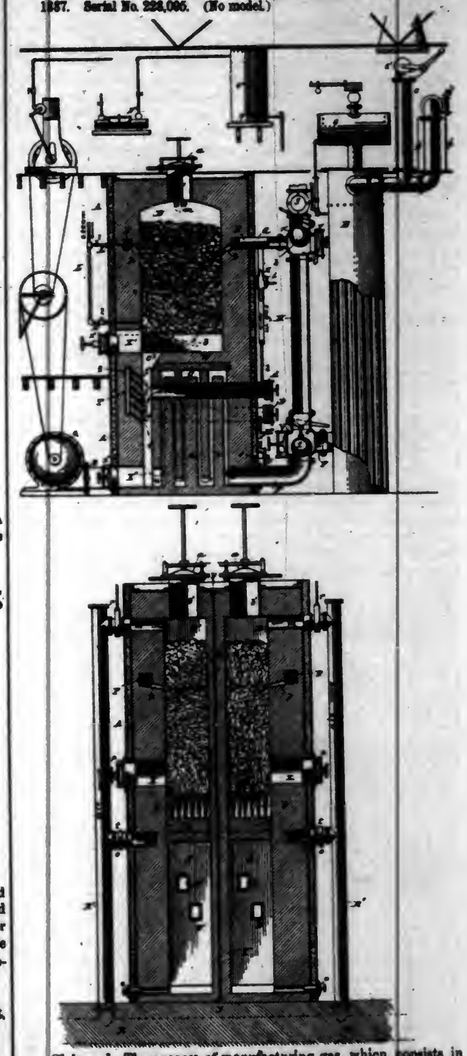


pressor, the gate of said motor being moved by a piston fitting into a cylinder, to the opposite ends of which the supply-passages from the valve A communicate, substantially as herein described.

404,203. SHADE-HOLDER FOR LAMPS. BENJAMIN G. KRAPF, Leavenworth, Kans. Filed Oct. 15, 1888. Serial No. 288,157. (No model.)

Claim.—A lamp-shade holder consisting of the wire twisted and formed at one end into a hanger-loop, the other end of the twisted part formed with the straight arms *d*, terminating in hooks bent over in return-laps *e*, in combination with a shade or screen of flexible spring material sprung into said return-hook laps, as shown and described.

404,204. JULEP-STRAINER. CHARLES P. LINDLEY, Bridgeport, Conn. Filed Dec. 26, 1888. Serial No. 294,615. (No model.)



Claim.—1. A strainer consisting of a plate having a coil of wire secured around its outer edge.

2. A strainer consisting of a plate having openings near its outer edge, and a coil of wire surrounding said edge, the coils thereof being passed through said openings, as and for the purpose set forth.

3. A strainer consisting of a plate having a handle, and a coil of wire partially surrounding the outer edge thereof, said coil being loosely connected to the plate, so as to yield when the latter is pressed into a glass.

404,205. PROCESS OF AND APPARATUS FOR THE MANUFACTURE OF GAS. BURDETT LOOMIS, Hartford, Conn. Filed Feb. 18, 1887. Serial No. 228,095. (No model.)

Claim.—1. The process of manufacturing gas, which consists in superheating steam, then decomposing it in contact with a body of incandescent fuel, and at the same time distilling bituminous coal on top of and in contact with the body of incandescent fuel, and causing the resulting gas and vapors to pass downward through the distilling-coal into contact with the heated fuel below for converting them into fixed gas, and finally conducting off the coal-gas and the water-gas together, some distance below the surface of the distilling-coal and above the bed of the incandescent fuel, whereby fresh charges of bituminous coal are successfully coked and the hydrocarbons distilled therefrom converted into fixed gas without destructive decomposition.

2. The process of manufacturing gas, which consists in heating a body of fuel to incandescence by blasting with air, and by means of the resulting hot products heating a chamber containing refractory material, then shutting off the air and superheating steam in contact with the hot refractory material, decomposing it in contact with the incandescent fuel, and at the same time distilling bituminous coal in the form of lump or slack, in contact with the incandescent fuel, and causing the resulting gas and vapor to pass down through the distilling-coal into contact with the incandescent fuel for converting them into fixed gas, and finally conducting off the coal-gas and water-gas together below the more recent charge or charges of fresh coal and above the bed of incandescent fuel, whereby the coal is better coked, the formation of hard crusts by excessive heat of the water-gas is avoided, and the hydrocarbons are converted into fixed gas.

3. The process of manufacturing gas, which consists in heating two bodies of fuel to incandescence by blasting with air, burning the resulting gaseous products, and thereby heating two superheating and fixing chambers, superheating steam by passing it through one superheating-chamber, decomposing it by passage up through one body of incandescent fuel, and at the same time causing distillation of fresh charges of bituminous coal in contact with the bodies of incandescent fuel, and passing the evolved gas and vapor and water-gas from below the recently-charged coal into the second body of fuel below its surface and down through it for converting carbonic acid into carbonic oxide and hydrocarbons into fixed gas, then carbureting the mixed gas by means of hydrocarbon liquid, and finally combining and fixing the carbureted gas by passage through the heated fixing-chamber.

4. In a cupola gas-generating furnace, the fuel-chamber having a circular flue in its wall, eduction-ports opening therefrom into the chamber, and a connected gas-take-off pipe arranged at a distance below its top and above its central portion, in combination with an air-blast pipe connecting with the top of the furnace, and a steam-supply pipe connecting with the base of the fuel-chamber, for the purpose described.

5. In a cupola gas-generating furnace, the fuel-chamber having an air-blast pipe connecting with its top, and the gas-eduction pipe connecting below its top, as described, in combination with the superheating and fixing chamber placed at the base of the cupola, the connecting-flue O^2 and vaporizing-retorts extending transversely through the superheating and fixing chamber and opening into flue O^3, for the purpose described.

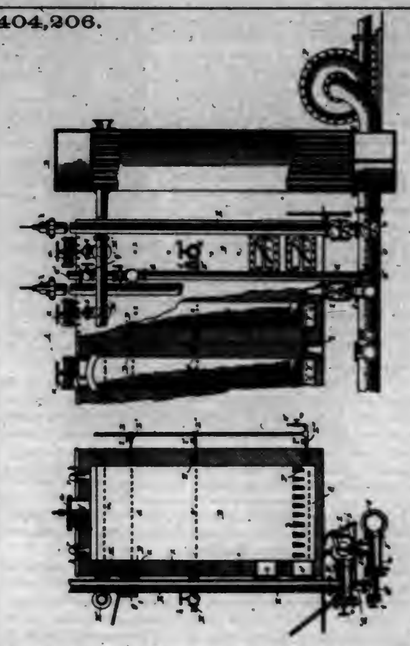
6. In combination with the fuel-chamber of a cupola gas-generator, the deep fire-clay grate-bars resting upon the floor of the chamber, for the purpose described.

7. In a cupola gas-generating furnace, the superheating and fixing chamber having vertical partitions forming connecting-flues, and the vaporizing-retorts extending transversely through the chamber and opening into a flue leading from the fuel-chamber, for the purpose described.

8. The two fuel-chambers connected by a pipe or pipes for the passage of gas from one to the other, in combination with the two superheating and fixing chambers having the vaporizing-retorts, and the outside gas-inlet pipes, K *k*, leading from the connecting gas-pipes of the fuel-chamber into the retorts for conducting water-gas to such retorts to mix with oil-vapor therein generated, all as described.

9. In a cupola gas-generator, the fuel-chamber above and the connected superheating and fixing chamber below, in combination with gas-take-off pipes G and F, connecting-pipe H, connecting valve-boxes U V, having seats at top and bottom, and the ball-valves suitably hung, so as to be adjustable upon either seat, for the purpose described.

10. The combination of the two fuel-chambers and two superheating and fixing chambers connecting therewith, and the double steam-boiler, pipes, and valves connecting the fuel-chambers with each other and with the chambers of the boiler, and pipes and valves connecting the superheating and fixing chambers with the chambers of the boiler, whereby either gas or products of combustion may be passed through each chamber of the boiler, as described.



11. The two fuel-chambers and the two superheating and fixing chambers connecting with such fuel-chambers, in combination with pipes F F', having valve-boxes and valves connecting the superheating and fixing chambers with the double boiler, pipes G, G', and *g*, and valve-boxes provided with double seats, and ball-valves connecting the two fuel-chambers, and the pipes H H' connecting pipes G G' with pipes F F' through the medium of the valve-boxes.

12. The two fuel-chambers connected by a valved pipe or pipes below their tops and below the level at which the fuel is maintained, in combination with two superheating and fixing chambers having steam-supply pipes and valved take-off pipes for gas and products of combustion, as described.

404,206. PROCESS OF AND APPARATUS FOR THE MANUFACTURE OF GAS. BURDETT LOOMIS, Hartford, Conn. Filed May 18, 1887. Serial No. 238,093. (No model.)

Claim.—1. The process of manufacturing heating or fuel gas, which consists in decomposing steam in contact with a body of incandescent fuel, distilling bituminous coal by contact with such body of incandescent fuel, and conducting the resulting oily and tarry vapors downward into contact with such incandescent fuel, thereby converting them into fixed carbureted hydrogen gas, and at the same time generating producer-gas by the admission of air to the ignited fuel in a separate chamber, and mingling the water-gas resulting from decomposed steam, the carbureted hydrogen from the distilled coal, and the producer-gas in the same main.

404,206.

2. The process of manufacturing gas, which consists in decomposing steam in contact with a body of incandescent fuel, thereby producing water-gas in one chamber and simultaneously generating producer-gas in a separate chamber by causing the air blast or draft to pass down through bituminous coal and heated fuel, whereby oily and tarry vapors evolved from the coal are carried into the heated fuel and converted into fixed carbureted hydrogen and the producer-gas freed from condensable matter, and finally mixing the water-gas and the producer-gas containing the carbureted hydrogen.

3. The process of manufacturing gas, which consists in decomposing steam in contact with a body of incandescent fuel and distilling bituminous coal in contact with such fuel, thereby producing water-gas and carbureted hydrogen and causing gas and vapor from the coal to pass in contact with the heated fuel and off below the surface of the charge for converting them into fixed gas, and simultaneously generating producer-gas in a separate chamber by causing the air blast or draft to pass down through bituminous coal and heated fuel, whereby oily and tarry vapors evolved from the coal are carried into the heated fuel and converted into fixed carbureted hydrogen, and finally mixing the water-gas and producer-gas and carbureted hydrogen in a pipe or chamber beyond the generator.

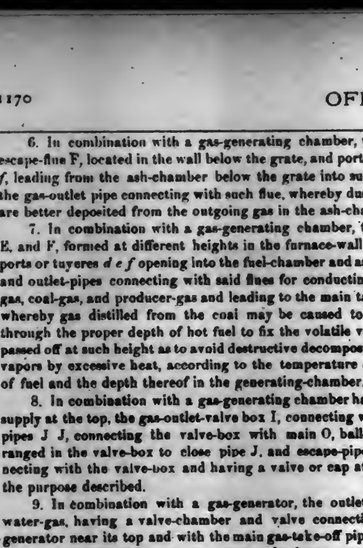
4. In combination with two or more generating-chambers, the air-supply pipes connecting with the tops thereof, outlet-pipes for producer-gas leading from the bottoms thereof, and outlet-pipes for water-gas leading from the upper portions thereof, but below the level at which the charge of fuel is maintained, whereby oily and tarry vapors evolved from the fresh coal supplied to the tops of the bodies of heated fuel are caused to pass down into contact with such heated fuel and thereby converted into fixed gas in both the producer-gas and the water-gas, and whereby both kinds of gas may be simultaneously generated and the manufacture of both kinds be alternated in each chamber.

5. In combination with two or more generating-chambers, the air-supply pipes connecting with the tops thereof, outlet-pipes and valves for producer-gas leading from the bottoms thereof, and outlet-pipes for water-gas leading from the upper portions thereof, but below the fuel level, and a main take-off pipe, both sets of outlet-pipes connecting with the said main take-off pipe, whereby oily and tarry vapors evolved from the fresh coal supplied to the tops of the bodies of heated fuel are caused to pass down into contact with such heated fuel, and thereby converted into fixed gas in both the producer-gas and the water-gas, and whereby both kinds of gas may be simultaneously generated and mixed in the same main for heating purposes.

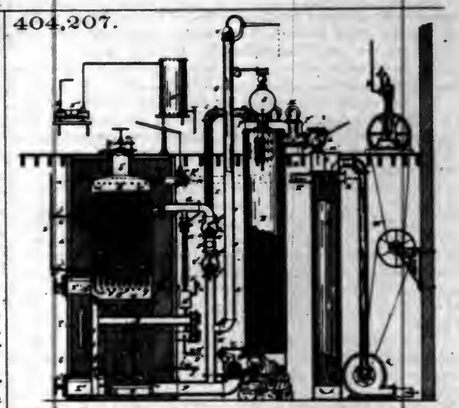
6. In combination with a gas-generating chamber, the annular escape-flue F, located in the wall below the grate, and ports or tuyeres *f*, leading from the ash-chamber below the grate into such flue, and the gas-outlet pipe connecting with such flue, whereby dust and ashes are better deposited from the outgoing gas in the ash-chamber.

7. In combination with a gas-generating chamber, the flues D, E, and F, formed at different heights in the furnace-wall and having ports or tuyeres *d e f* opening into the fuel-chamber and ash-chamber, and outlet-pipes connecting with said flues for conducting off water-gas, coal-gas, and producer-gas and leading to the main take-off pipe, whereby gas distilled from the coal may be caused to pass down through the proper depth of hot fuel to fix the volatile vapor and be passed off at such height as to avoid destructive decomposition of such vapors by excessive heat, according to the temperature of the body of fuel and the depth thereof in the generating-chamber.

8. In combination with a gas-generating chamber having an air-supply at the top, the gas-outlet-valve box I, connecting with its base, pipes J J, connecting the valve-box with main O, ball-valve *i*, arranged in the valve-box to close pipe J, and escape-pipe K K, connecting with the valve-box and having a valve or cap at its top, for the purpose described.



9. In combination with a gas-generator, the outlet-pipe G for water-gas, having a valve-chamber and valve connecting with the generator near its top and with the main gas-take-off pipe for mixed water-gas and producer-gas, a separate valved water-gas pipe leading from said valve-box for conducting off water-gas alone, and a separate pipe for producer-gas leading from the bottom of the generator to said main take-off pipe, substantially as described.



404,207. PROCESS OF, AND APPARATUS FOR THE MANUFACTURE OF GAS. BURDETT LOOMIS, Hartford, Conn. Filed May 24, 1887. Serial No. 239,242. (No model.)

Claim.—1. The process of manufacturing gas, which consists in heating a body of fuel to incandescence by drafts of air drawn downward into the fuel and by drawing off the gaseous products by an exhauster, whereby the fuel may be better fed, inspected, and arranged in the generator during the operation of heating up, then shutting off the air-draft and decomposing steam in contact with the fuel, thereby producing water-gas.

2. The process of manufacturing gas, which consists in heating a body of fuel to incandescence by downward drafts of air, and by means of the resulting gaseous products heating a superheating-chamber and drawing off the products by an exhauster, whereby the furnace may be charged and cleaned during the operation of the exhauster, then shutting off the air-drafts and superheating steam by passage through the superheating-chamber and decomposing it by passage through the incandescent fuel, thereby producing water-gas.

3. The process of producing gas, which consists in first igniting a bed of fuel within a generating-furnace, then admitting fresh air to the top of the fuel and drawing it down into and through the ignited fuel and drawing off the resulting gaseous products at the bottom of the generating-furnace, whereby the generator may be open at the top and supplied with fuel, the walls cleaned of clinker, the fire inspected, and the fuel arranged in the generator while the exhauster is in operation without any danger and delay caused by flame and smoke being blown into the operator's face, and also whereby the coal may be better coked and converted into gas.

4. In combination with a gas-generating cupola or furnace, an air-supply pipe or opening connecting with the top above the fuel, and an outlet for gaseous products leading from the bottom, and an exhauster connecting with such outlet-pipe for drawing off gaseous products from the bottom of the generator, as described.

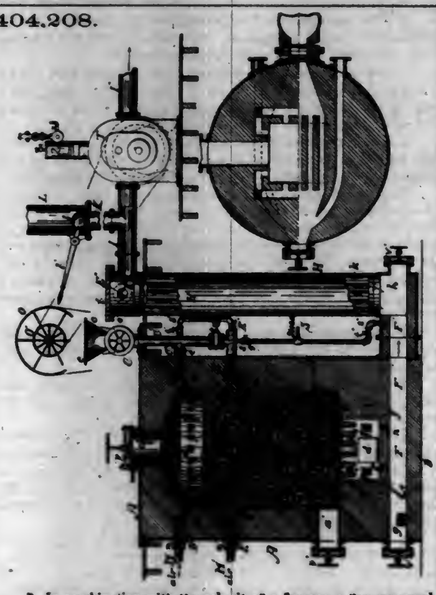
5. In combination with the gas-generating furnace, a tubular air-heater, and gas-cooler having an air-inlet and pipe connecting it with the top of the generator, an exhaust-pipe for gaseous products leading from the bottom of the generator and connecting with the tubes of the heater, and a connected exhauster for drawing off the gaseous products through the tubes and drawing air through the chamber around the tubes and down into the fuel, whereby the gas is cooled by the circulating air and the latter is heated as it flows to the generator.

6. In a cupola gas-generating furnace, the fuel-chamber arranged above and the superheating and fixing chamber below, in combination with the valved take-off pipe F, leading from the superheating-chamber, outlet-pipe G, leading from the fuel-chamber, valved pipe H, connecting pipe G with pipe F, and escape-pipe O, having a closing cap or valve leading from pipe H, for the purpose described.

7. In a cupola gas-generating furnace, the two fuel-chambers and the two superheating and fixing chambers, in combination with valved pipes F F', pipes G G', connecting-pipes H H', having valves *h h'*, cross-pipe *g*, connecting the pipes H H' between the valves, and pipe I, leading from pipe *g* to the seal-box, as and for the purpose described.

404,208. APPARATUS FOR THE MANUFACTURE OF GAS. BURDETT LOOMIS, Hartford, Conn. Filed Apr. 25, 1888. Serial No. 271,792. (No model.)

Claim.—1. A gas-generator having a closed circumferential hearth and a central grate-opening, in combination with an exhauster connecting by suitable flues with the central grate-opening, for the purpose described.

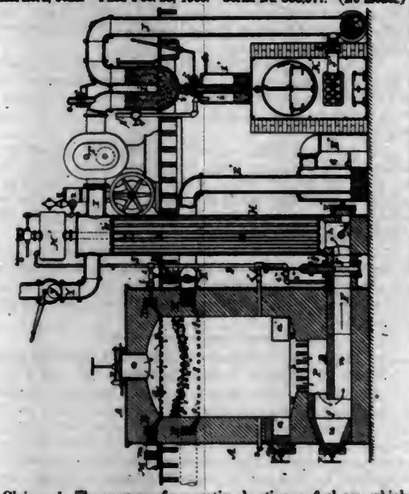


2. A downdraft generator having an air-supply pipe connecting with its top, and a closed circumferential hearth having a central opening and ash-pit, in combination with the exhauster connecting with such central ash-pit, whereby the air-draft and gaseous products are drawn away from the side walls of the furnace and more evenly through the body of fuel, for the purpose described.

3. A gas-generator having an air-supply pipe or opening at its top above the fuel and an outlet-pipe leading from its bottom, in combination with a cooler connecting with such outlet-pipe and an exhauster connecting with the cooler for drawing air down into the fuel and the resulting gases out from the bottom of the generator and through the cooler, as and for the purpose described.

4. A gas-generating furnace having a contracted grate-opening and ash-pit at the base thereof, a wide flue arranged below the ash-pit, and connecting flues and ports constructed in the brick-work, for the purpose described.

5. In combination with the ash-pit of a furnace, the wide central flue placed below it, and division-walls constructed in such flue for supporting the floor of the ash-pit and forming a steam-heating surface.



6. In combination with the ash-pit of a furnace, a central flue formed below it and containing supports for the ash-pit floor, and lateral flues opening by ports into the central flue and connecting with the ash-pit, for the purpose described.

7. In combination with the ash-pit of a furnace, a flue arranged below it, one or more lateral flues leading from the ash-pit and opening at one end into the flue below, and the deflecting-bridge *r*, arranged in the path of the gas in such flue for arresting dust and ashes.

8. A gas-generating furnace having a contracted grate-opening and ash-pit at the base thereof, a wide central flue arranged below the ash-pit, lateral flues G G', having ports *g* formed in the foundation-walls, passages *f'*, having ports *f* leading therefrom into the ash-pit, and outlet-pipe leading from flue F, for the purpose described.

404,209. PROCESS OF MANUFACTURING GAS. BURDETT LOOMIS, Hartford, Conn. Filed Feb. 23, 1889. Serial No. 300,877. (No model.)

Claim.—1. The process of generating heating or fuel gas, which consists in drawing both air and steam down into and through a body of ignited fuel, thereby causing combustion of the fuel with formation of producer-gas and decomposition of the steam with formation of water-gas, causing vapors distilled from the upper layers of coal to pass into the heated fuel below for conversion into fixed gas, and drawing the resulting mixed gases down through the fuel and out at the bottom of the generator, whereby the fuel may be supplied and arranged in the generator while the exhauster is in operation without any danger and delay caused by flame and smoke being blown into the operator's face, and also whereby the coal may be better coked and converted into gas.

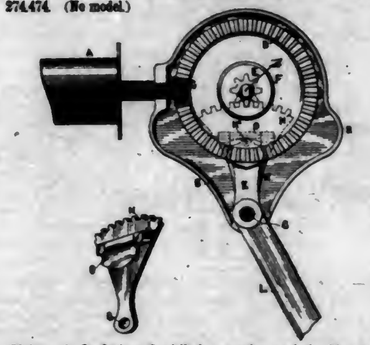
2. The process of generating heating or fuel gas, which consists in admitting air to the top of a bed of ignited fuel for causing combustion thereof, and at the same time admitting steam into the more highly-heated fuel below the top, and drawing both the air and steam down into and through the heated fuel, thereby causing combustion of the fuel with formation of producer-gas and decomposition of the steam with formation of water-gas, causing vapors distilled from the upper layers of coal to pass into the heated fuel below for conversion into fixed gas, and drawing the resulting mixed gases down through the fuel and out at the bottom of the generator, whereby the fuel may be supplied and arranged in the generator while the exhauster is in operation without any danger and delay caused by flame and smoke being blown into the operator's face, and also whereby the coal may be better coked and converted into gas.

404,210. TEMPORARY BINDER. WILLIAM LUMLEY, Chicago, Ill. Filed Oct. 18, 1887. Serial No. 252,693. (No model.)

Claim.—1. The binder-frame, in combination with a holding-pin normally perpendicular to the bottom of said frame, and a pivot-connection between said frame and pin, whereby said pin may be deflected laterally to receive the index-sheets, substantially as and for the purpose described.

2. The binder-frame, in combination with a holding-pin normally perpendicular to the bottom of said frame, a pivot-connection between said frame and pin, and a catch device on the arm of said frame for engaging the free end of said pin and locking the pin in its upright position, substantially as described.

3. The binder-frame, a holding-pin perpendicular to the bottom of said frame, and a pivot-connection between said frame and pin, in combination with a spring actuating the pin resisting a lateral deflection thereof, whereby said pin will be automatically returned to its normal position when released, substantially as described.



4. The binder-frame, a holding-pin normally perpendicular to the bottom of said frame, and a pivot-connection between said frame and pin, in combination with a spring engaging said pin, so as to resist a lateral deflection thereof, and a spring-catch secured to the rim of said frame and arranged to be automatically engaged by said pin, substantially as described.

5. In a temporary binder, the holding-pin provided with longitudinal peripheral grooves, in combination with a disk or head and pins secured to said head for engaging said grooves, substantially as described.

6. In a temporary binder, the index-holder, in combination with the index-frame, a pivot-connection between said frame and holder, and a stop device for preventing a reversal of the operative face of the index-frame with reference to the index-sheets, but permitting a vibration of said frame upon its pivot, substantially as described.

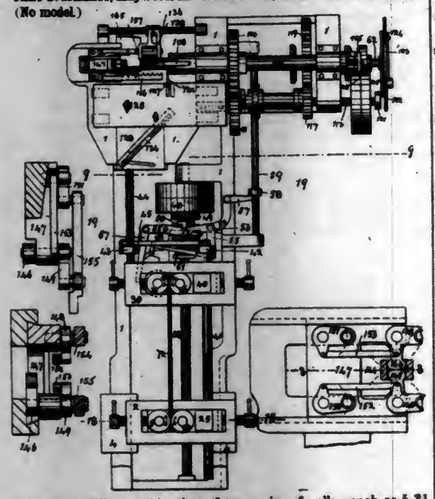
7. In a temporary binder, the index-holder consisting of a flat metallic bail provided with perforations therein, in combination with the index-frame and offset, portions of said frame passing through and working in said perforations and constituting a stop device for said index-frame, substantially as described.

404,211. FITTING FOR BLINDS, CURTAINS, &c. FERDINAND MATTHEY, St. Imier, Switzerland. Filed May 21, 1888. Serial No. 274,474. (No model.)

Claim.—1. In fittings for blinds, curtains, and the like, the com-

bination, with one of the roller-journals, of a pinion mounted thereon, a toothed wheel engaging with said pinion, a coiled spring operating to rotate the toothed wheel, a spring-actuated lever operating upon a dog to hold the same in engagement with said toothed wheel, and a lever adapted to operate upon said spring-actuated lever to allow the dog to release the toothed wheel, as described, for the purpose specified.

2. In fittings for blinds, curtains, and the like, the combination, with the curtain-roller, of a pinion mounted on one of the journals of said roller, a toothed wheel engaging with said pinion, a pinion adapted to rotate with said toothed wheel, a coiled spring acting to rotate the latter, a toothed arm or rack engaging with the latter pinion, a two-armed lever pivoted to said arm, one limb being provided with inclined bearing-surfaces, as described, a spring bearing upon the other limb of said pivoted lever, a dog located between the spring-actuated limb and the toothed wheel aforesaid, and an operating-lever adapted to engage with the inclined bearing-surfaces described, said parts being arranged for co-operation, as described, for the purpose specified.



404,212. BROOM. JOHN A. MIDDLETON, Gordonsville, Ky., assignor of one-half to B. S. Bevier, same place. Filed June 19, 1888. Serial No. 277,509. (No model.)

Claim.—1. In a broom-head, a metallic clamp or holder comprising an outer section or casing the top of which has a transverse groove in its under side, and an inner section consisting of a front plate having inwardly-exteeding flanges that fit between the sides of the outer casing, and a top having on its upper side a transverse ridge entering the groove in the top of the outer casing, the tops of both casings being provided with registering openings for the passage of a tightening-bolt, substantially as set forth.

2. As an improvement in brooms, a clamping device comprising an outer casing the front of which is open and the top of which has a transverse groove in its under side, and an inner casing consisting of a front plate having inward-extending flanges that fit between the sides of the outer casing, and a top having on its upper side a transverse ridge entering the groove in the top of the outer casing, the tops of both casings being provided with openings that register with each other, in combination with a bolt passing upward through the said openings, and a handle having a nut secured in a recess in its lower end, substantially as and for the purpose set forth.

404,213. MACHINE FOR MAKING COILED SPRINGS. HUMPHREY D. MILLETT, Maywood, Ill. Filed Oct. 22, 1888. Serial No. 288,816. (No model.)

Claim.—1. The combination of two pairs of rolls—such as 5 31 and 20 35—for flattening or tapering the ends of rods or bars, a pair of tongs, a carriage carrying the tongs, a track for the carriage, and a mandrel for coiling a spring, substantially as and for the purposes specified.

2. The combination of a coiling-mandrel, a hollow shaft, as 101 a sliding rod, as 103, a clamp, as 108, a lever, as 105, and a spring, 104, substantially as and for the purposes specified.

3. The combination of a coiling-mandrel, a hollow shaft, as 101, a sliding rod, as 103, a clamp, as 108, a lever, as 105, a spring, 104, a cam, as 106, a lever, as 107, and a collar or plate on the end of the rod 103, substantially as and for the purposes specified.

4. The combination of the sliding plates, as 126 and 128, a roller, 135, secured to the plate 126, an adjustable bar, 134, a rack, as 129, and a gear-wheel, as 130, substantially as and for the purposes specified.

5. The combination of a coiling-mandrel on a shaft carrying a gear-wheel, as 110, a driving-shaft, as 113, a sleeve, as 115, having a clutch at each end, gear-wheels 118 and 119, a shaft, as 62, cams, as 61 and 162, lever 163, shaft 164, shaft 59, a clutch-lever thereon, arm 60, gear-wheel 111, having a face-clutch, 114, sleeve 112, worm 132, gear-wheel 133, shaft 131, clutch 161, gear-wheel 130, rack 129, and sliding plates 126 and 128, substantially as and for the purposes specified.

6. The combination of a driving-shaft, 113, a cam-shaft, as 62, disk 122, crank 121, lever 123, pawl 124, and connecting-bar 125, substantially as and for the purposes specified.

7. The combination of a coiling-mandrel, a pressure-roller, 136, shaft 138, levers 137 and 139, and cam 140, substantially as and for the purposes specified.

8. In a machine for flattening the ends of a rod and at the same time coiling another rod or bar to make a spring, the combination of a main driving-shaft, rolls for flattening the end of a rod, tongs to carry forward the flattened rod, a coiling-mandrel, and a shaft, 62, carrying cams for automatically controlling the operations of the machine, substantially as specified.

9. The combination of a pair of rolls, as 5 and 31, a second pair of movable rolls, as 20 and 35, for flattening the ends of a rod, dogs, as 25 and 40, a shaft, 41, a crank, 42, a rod, 45, a crank, 43, a shaft, 44, a lever, 46, and cam 47, substantially as and for the purposes specified.

10. The combination of two rollers, as 31 and 35, with shafts, as 32 and 36, worm-wheel 34, worm 39, shaft 38, a clutch, as 50, a pulley, as 48, having a clutch, 49, a spring, as 51, a clutch-lever, 52, bar 57, crank 58, shaft 59, levers, as 52 and 55, a bar, as 71, levers 70 and 67, a spring, 69, and disk *c*, having a projection, *b*, and a lever, 65, substantially as and for the purposes specified.

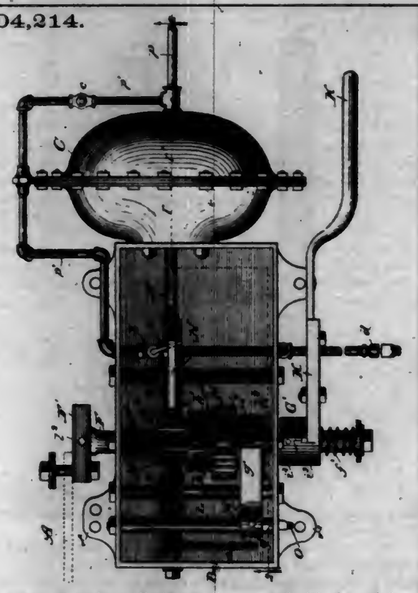
11. A pair of rolls, as 31 and 35, in a fixed frame, in combination with another pair of rolls, as 5 and 20, in a sliding frame, substantially as and for the purposes specified.

12. A pair of rolls, as 31 and 35, in a fixed frame, in combination with another pair of rolls, as 5 and 20, in a sliding frame, a rotating shaft, as 7, a gear-wheel, as 12, and a rack, *a*, substantially as and for the purposes specified.

13. A pair of rolls, as 31 and 35, in a fixed frame, in combination with another pair of rolls, as 5 and 20, in a sliding frame, two shafts, as 7 and 21, two gear-wheels, as 8 and 23, worm-wheel 11, and the worm *k*, sliding on a shaft, as 38, substantially as and for the purposes specified.

14. A coiling-mandrel, in combination with two toothed bars, as 156 and 157, bolted, respectively, to bars, as 154 and 155, bell-crank levers, as 148 and 149 150 151, connecting-bars 152 153, levers 145 and 146, keyed to pins secured to a slide, 147, which carry the levers 148 and 149, a bell-crank lever, as 144, a slide, 158, and cam 159 on a shaft, as 62, substantially as and for the purposes specified.

15. The combination of a sliding plate, as 126, hook 127, a sliding plate, as 128, a roller, 135, secured to the plate 126, an adjustable bar, 134, adjustably connected with the plate 128, a rack, as 129, a gear-wheel, as 130, and a coiling-mandrel, substantially as and for the purposes specified.



404,214. RAILROAD-SWITCH APPLIANCE. MORTIMER R. MILLS, Chicago, Ill. Filed Dec. 20, 1888. Serial No. 294,186. (No model.)

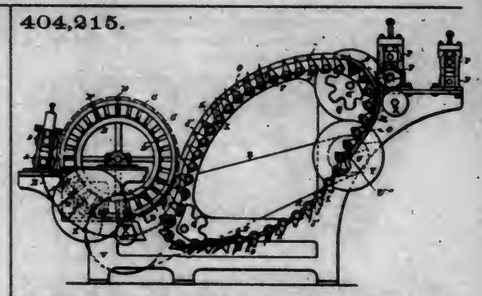
Claim.—1. In a railroad-switch appliance for throwing a switch, the combination of a rotary shaft having connected with it eccentrically the switch connecting-bar, and revolubly in one direction to throw the switch alternately in opposite directions, a reciprocating rack-bar engaging with the shaft, and means, substantially as described, connected with the rack-bar, to produce reciprocation thereof, substantially as set forth.

2. In a railroad-switch appliance for throwing a switch, the combination of a rotary shaft, F, having connected with it eccentrically the switch connecting-bar A and provided with a pinion, E, a reciprocating rack-bar, E, engaged by the pinion, and a clutch, G, on the shaft, substantially as described.

3. In a railroad-switch appliance for throwing a switch, the combination of a rotary shaft, F, having connected with it eccentrically the switch connecting-bar A and provided with a pinion, E, a reciprocating rack-bar, E, engaged by the pinion, a clutch, G, on the shaft, an

404,214.

air-receiver, C, having a diaphragm, D, connected with the rack-bar, and an air-conduit, *p'*, leading to a signal, *d*, and provided with a valve, *b*, opened and closed by the reciprocation of the rack-bar, substantially as described.



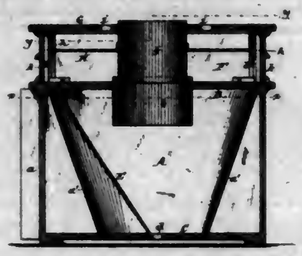
4. In a railroad-switch appliance for throwing a switch, the combination of a rotary shaft, F, provided at one end with a head, F', with which to pivotally connect the switch-bar A, a pinion, E', on the shaft, a reciprocating rack-bar, E, engaged by the pinion, and a clutch, G, on the shaft, substantially as described.

5. In a railroad-switch appliance for throwing a switch, the combination of a box, B, a rotary shaft, F, provided at one end with a head, F', having openings *k* and *k'* at opposite sides of and different distances from its center, and with which to pivotally connect the switch-bar A at one of the said openings, a pinion, E', on the shaft, a reciprocating rack-bar, E, engaged by the pinion, and a clutch, G, on the shaft, substantially as described.

6. In a railroad-switch appliance for throwing a switch, the combination of a box, B, a rotary shaft, F, provided at one end with a head, F', with which to pivotally connect the switch-bar A, and carrying a pinion, E', a clutch, G, a ratchet-wheel, H, and a cam, I, a reciprocating rack-bar, E, engaged by the pinion and carrying a bent arm, N, and an arm, *e*, a dog, *k'*, engaging with the ratchet, a rocking detent, M, having a finger, *g'*, normally engaging with the cam, and an arm, g^2, extending into the path of the arm *e*, an air-receiver, C, having a diaphragm, D, connected with the rack-bar, and an air-conduit, *p'*, leading to a signal, *d*, and provided with a valve, *b*, having a handle, *b'*, extending into the path of the arm N, substantially as described.

7. A railroad-switch appliance for throwing a switch, comprising, in combination, a box, B, a rotary shaft, F, provided at one end with a head, F', with which to pivotally connect the switch-bar A, and carrying a pinion, E, a clutch, G, a ratchet-wheel, H, a cam, I, a clutch, G', and a lever, K, a reciprocating rack-bar, E, engaged by the pinion and carrying a bent arm, N, and an arm, *e*, a dog, *k'*, engaging with the ratchet, a rocking detent, M, having a finger, *g'*, normally engaging with the cam, and an arm, g^2, extending into the path of the arm *e*, an air-receiver, C, having a diaphragm, D, connected with the rack-bar, and an air-conduit, *p'*, leading to a signal, *d*, and provided with a valve, *b*, having a handle, *b'*, extending into the path of the arm N, substantially as described.

404,215.



of the delivery-rolls while being withdrawn thereby from the combing-pins, substantially as described.

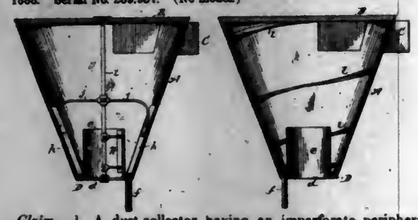
2. In a backling-machine, the combination of detaining-pins, means, substantially as described, for carrying said pins and causing them to advance and retreat, delivery-rolls and a backling-chain following the path of an irregular curve, at one point approaching and approximating the path of the detaining-pins and afterward approaching the delivery-rolls in an arc of reduced radius, and guides for causing the chain to follow said path, substantially as described.

3. In a backling-machine, the combination of advancing and retreating detaining-pins, means, substantially as described, for carrying said pins and causing them to advance and retreat, a chain carrying combing-pins following the path of an irregular curve, at one point approaching the detaining-pins in an arc of reduced radius and afterward approaching the delivery-rolls in an arc of reduced radius, delivery-rolls, and guides for controlling the movements of said combing-pins, whereby said pins are inclined to facilitate their entrance into the fiber held by the detaining-pins and moved into position to hold the fiber properly against the action of the delivery-rolls while being withdrawn thereby from the combing-pins, substantially as described.

4. In a backling-machine, the combination of a revolving cylinder, detaining-pins carried by said cylinder, and a backling-chain traveling in a path approximating the curve of the periphery of said cylinder at the points where the detaining-pins and combing-pins meet, and guides for causing the chain to follow said path, substantially as described.

404,216. DUST-COLLECTOR. ORVILLE M. MOSER, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed Aug. 26, 1886. Serial No. 211,892. (No model.)

Claim.—1. The combination, with the main separating-chamber provided with means whereby the dust-laden air is caused to assume a whirling motion, and which has an outlet for the purified air and a dust-discharge, of a supplementary dust-chamber provided with an air-passage of smaller size than the outlet of the separating-chamber, whereby the outer layer of the outgoing air-current is turned into the supplementary dust-chamber, while the inner portion of the outgoing air-current is permitted to escape, and with an outlet through which the purified air escapes from the supplementary dust-chamber, substantially as set forth.

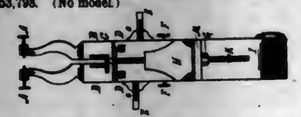


2. The combination, with a separating-chamber, A, having a head, B, and in the same an air-outlet *b*, of a supplementary dust-chamber, F, having a tubular air-passage, *f*, a deflector, H, arranged in a chamber, F, around the passage *f*, and air-escape openings *i*, substantially as set forth.

3. The combination, with a tapering separating-chamber, A, of a head, B, closing the large end of said chamber and provided with a central air-outlet, *b*, and a head, C, closing the small end of said chamber and provided with a peripheral dust-discharge, *c*, and a central air-inlet opening, *d*, substantially as set forth.

404,215. HACKLING-MACHINE. ALPHEUS W. MONTGOMERY, New York, N. Y. Filed Apr. 13, 1888. Serial No. 270,604. (No model.)

Claim.—1. In a hackling-machine, the combination of delivery-rolls, advancing and retreating detaining-pins, means, substantially as described, for carrying said pins and causing them to advance and retreat, a chain carrying combing-pins, and guides for controlling the movements of said combing-pins, whereby the said pins are inclined to facilitate their entrance into the fiber held by the detaining-pins and moved into position to hold the fiber properly against the action



404,217. DUST-COLLECTOR. ORVILLE M. MORSE, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed Nov. 5, 1888. Serial No. 289,957. (No model.)

Claim.—1. A dust-collector having an imperforate peripheral wall, an inlet for the dust-laden air arranged to cause a whirling motion of the air and dust in the separating-chamber, a tight head closing one end of the separating-chamber, and an outlet for the air freed from dust and an outlet for the separated dust, both arranged at the opposite end of the separating-chamber, substantially as set forth.

2. A dust-collector having a tapering imperforate peripheral wall, an inlet for the dust-laden air arranged to cause a whirling motion of the air and dust in the separating-chamber, a tight head closing the large end of the separating-chamber, and an outlet for the air freed from dust and an outlet for the separated dust, both arranged at the small end of the separating-chamber, substantially as set forth.

404,218. DEVICE FOR JOINTING AND DRESSING THE TEETH OF SAWS. MICHAEL J. O'BRIEN, Dunbore, Pa. Filed Oct. 29, 1887. Serial No. 253,798. (No model.)

Claim.—1. In a saw-jointer, the combination, with the base, of the jaw-support mounted at one side thereof, and the jaws provided with files pivoted at opposite sides of the support, substantially as specified.

2. In a saw-jointer, the combination, with the base, of the jaw-support adjustably mounted at one side thereof, and the oppositely-pivoted adjustable jaws mounted on the support and provided with files, substantially as specified.

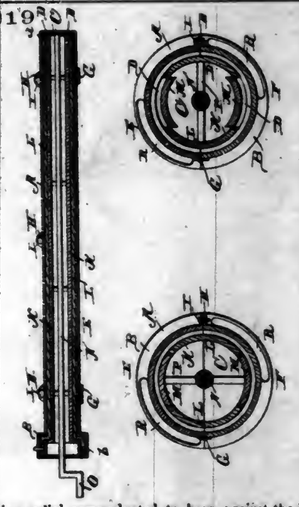
3. In a saw-jointer, the oppositely-located saw-embracing jaws, provided with opposite recesses, as *b*, on their inner faces, and having the side files, C, set in said recesses, substantially as specified.

4. In a saw-jointer, the adjustable jaw-support recessed at its upper end, in combination with the oppositely-located file-carrying jaws provided with set-crews and mounted in said recesses, said screws terminating in bearings formed in the support, substantially as specified.

5. In a saw-jointer, the base provided with opposite grooves upon one of its faces, in combination with the jaw-support having tongues adapted to ride in said grooves, and the opposite saw-clamping file-carrying jaws pivoted to said support, substantially as specified.

6. In a saw-jointer, a base provided with opposite grooves and with an abutment in rear thereof, in combination with the jaw-support having tongues adapted to ride in the grooves, and the screw extending through the abutment and into the support and provided with a set-nut, substantially as specified.

7. In a saw-jointer, the saw-embracing jaw-support having opposite lugs provided with set-screws, in combination with the L-shaped clamping-arms mounted transversely on the support and slotted longitudinally to receive said screws, substantially as specified.



8. In a saw-jointer, the combination, with the jaw-support having a recessed outer end and provided with the opposite transverse openings, of the saw-clamping file-carrying jaws mounted in the recesses, bolts passing through the jaws and openings, the opposite saw-clamping set-screws mounted in the outer ends of the jaws, and similar set-screws mounted at their lower ends and bearing at opposite sides of the support, substantially as specified.

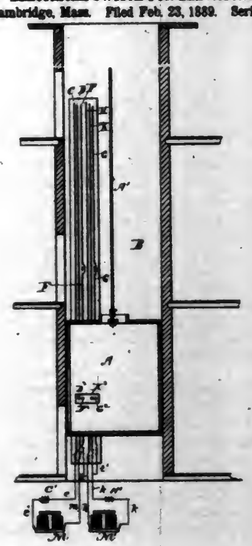
9. In a saw-jointer, the combination of the base I, slotted as at *h*, with the clamping-arm I, hinged thereto, and the set-screw K, projecting from the arm through the slot in the base, substantially as specified.

404,219. MOLD FOR FORMING DRAIN-PIPES. BERTEL E. OLSEN and CHARLES GABRIEL, Victoria, British Columbia, Canada. Filed Jan. 3, 1889. Serial No. 295,296. (No model.)

Claim.—1. In a pipe-mold, the combination of an outer shell composed of sections hinged together and having closed ends with a core composed of separable segmental sections, and a central revoluble

404,219.

shaft having radial arms adapted to bear against the inner sides of the core-sections, substantially as set forth.



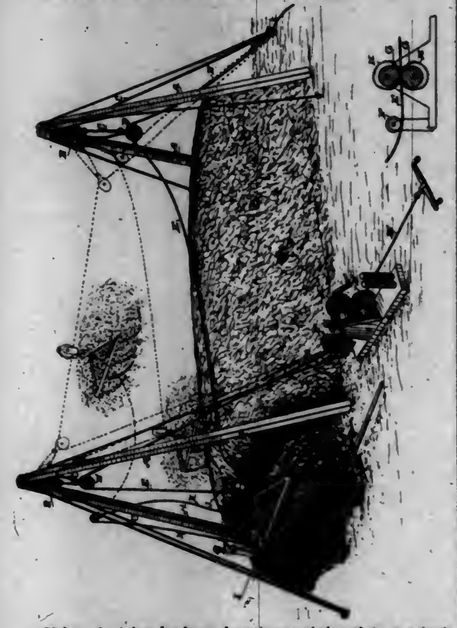
2. In a pipe-mold, the combination, with an outer shell having a closed end provided with an interior annular groove, of a core composed of separable segmental sections having one end fitted in said groove, and a central revoluble shaft having radial arms adapted to bear against the inner sides of the core-sections, substantially as set forth.

3. In a pipe-mold, the core composed of separable segmental sections, in combination with the outer shell, and the central shaft journaled in the ends of the latter and having radiating arms adapted to bear against the inner sides of the core-sections, substantially as set forth.

404,220. METHOD OF RENDERING NICKEL AND NICKEL ALLOYS NON-MAGNETIC. HENRICH OSTERMANN and CHARLES LACROIX, Geneva, Switzerland, assignors to the Usine Genevoise de Degrossissage d'Or, same place. Filed Dec. 20, 1888. Serial No. 294,219. (No specimens.)

Claim.—The method herein specified of rendering nickel and its alloys non-magnetizable and suitable for use in place of iron and steel in watches, consisting in melting chromium with such nickel in the proportion of less than thirty per cent. of chromium, substantially as set forth.

404,221. ELECTRICAL SWITCH FOR ELEVATORS. WILLIAM E. NICKERSON, Cambridge, Mass. Filed Feb. 23, 1889. Serial No. 300,533. (No model.)

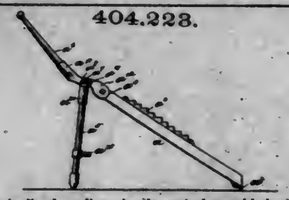


404,221.

Claim.—In an electrical switch device for elevators, the combination of the fixed continuous electrodes C and D and the fixed electrode F F, composed of sections, said sections all electrically connected together and having insulated spaces between them, said spaces corresponding to the various landings, with a switch mechanism within the elevator carriage, consisting, first, of an electric brush in permanent contact with the electrodes C; second, a brush adapted to be manually placed in contact with but normally out of contact with the electrode D, and, third, a brush adapted to be manually placed in contact but normally out of contact with the electrode F F, an electric circuit, and an electric device for actuating the controlling mechanism of the hoisting apparatus, substantially as and for the purpose set forth.

404,222. HAY-STACKER. THEODOR H. PALM, Sacramento, Cal. Filed Oct. 6, 1888. Serial No. 287,394. (No model.)

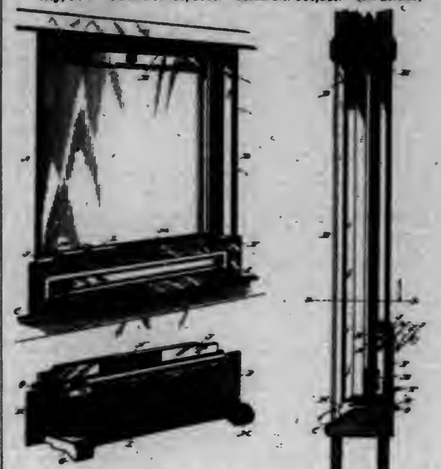
Claim.—1. A hay loader and stacker consisting of the standards and the adjustably-suspended pulleys D D', in combination with the rope E, passing over said pulleys, having one end secured at the opposite end of the stack from the load and the other passing between the holding eccentrics or cams, so that a team may be attached thereto, substantially as herein described.



2. The standards having adjustably-suspended pulleys D D', the rope E, attached and connected as shown, in combination with the fork suspended so as to travel upon the rope E, and the unloading and tripping cord, substantially as herein described.

3. A hay unloader and stacker consisting of the standards or supports with the pulleys D D' suspended at different heights, as described, a rope passing over said pulleys, with one end fixed beyond the lowest pulley, D, and the opposite end passing beneath a guide-pulley between clamping or holding rollers and to a power mechanism or a team, by which the rope may be alternately slackened and tightened between the pulleys D D', together with a fork suspended from said inclined rope between the pulleys, so as to travel upon it by gravitation, and a rope, K, connected with the fork, substantially as and for the purpose herein described.

404,223. WAGON-JACK. WASHINGTON P. PICKERING, Boston, Mass. Filed Jan. 21, 1889. Serial No. 297,075. (No model.)



Claim.—A wagon-jack consisting of the long leg *a*, having at its upper end the metal piece a^{10}, provided with the ears a^{11}, the lever a^4, provided at its upper end with the metal part or socket-piece a^{17}, having the flattened part a^6, the bolt a^7, pivotally joining said lever

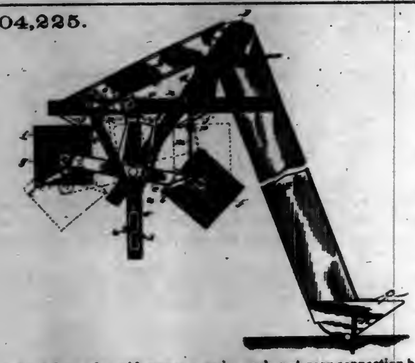
404,223.

and leg, the inclined or diverging legs a^4 a^5, provided with the metal part a^{16}, having the ears a^{11}, and the bolt a^7, joining said ears to said flattened part a^6 and serving as a fulcrum to said lever, substantially as set forth.

404,224. WINDOW-VENTILATOR. CHARLES E. RECTOR, Jersey City, N. J. Filed Feb. 16, 1889. Serial No. 300,140. (No model.)

Claim.—1. A window-ventilator consisting of the vertical side or panel F, extending, when the ventilator is in place, up and in front of the window-pane, so as to leave an air-passage between it and the pane, and the second perforated side at right angles thereto, consisting of the laterally-projecting feet G H, whereby the ventilator is held in place by the closing down of the window-sash, and the grating I, whereby the air is admitted and purified, substantially as hereinbefore set forth.

2. The combination, with a window-ventilator consisting of the vertical side or panel F, extending, when the ventilator is in place, up and in front of the window-pane, so as to leave an air-passage between it and the pane and the second side at right angles thereto, consisting of the laterally-projecting feet G H, adapted to fit over the window-sill and under the sash, of the cover J, having the aperture K, grating N, and valve L, substantially as and for the purpose set forth.



3. The combination, with a window-ventilator consisting of the vertical side or panel F, extending, when the ventilator is in place, up and in front of the window-pane, so as to leave an air-passage between it and the pane, and the second perforated side at right angles thereto, consisting of the laterally-projecting feet G H, adapted to fit over the window-sill and under the sash, and the grating I, of the hinged cover J, having the aperture K, grating N, and valve L, substantially as and for the purpose set forth.

4. The combination, with a window-ventilator consisting of the vertical side or panel F, extending, when the ventilator is in place, up and in front of the window-pane, so as to leave an air-passage between it and the pane, and the second side at right angles thereto, consisting of the laterally-projecting feet G H, adapted to fit over the window-sill and under the sash, of the hinged cover J, having the aperture K, grating N, valve L, groove Q, and projection P, substantially as and for the purpose hereinbefore set forth.

404,225. AUTOMATIC GRAIN-METER. EARL H. REYNOLDS, Propeistown, Ill. Filed May 14, 1888. Serial No. 273,873. (No model.)

Claim.—1. The measure, a pivotal support therefor, and a pivot-connection between said measure and support to one side of and below the center of said measure, in combination with a stop for maintaining the measure in an upright position when elevated, an adjustable

404,225.

counter-balance for said measure, and a rack-and-gear connection between said counter-balance and the support of the measure, substantially as described.

2. The measure, a pivotal support therefor, and a pivot-connection between said measure and support to one side of and below the center of said measure, in combination with an adjustable counter-balance for said measure, a rack-and-gear connection between said counter-balance and support, and a stop for maintaining it in position when elevated, substantially as described.

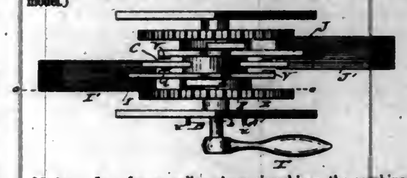
3. The chute, the measure, a pivotal support therefor, and a pivot-connection between said measure and support to one side of and below the center of said measure, in combination with a crank-arm on the pivot of said measure, a rod-and-stop connection between said arm and the chute-frame, a stop for maintaining said measure in an upright position when elevated, and a counter-balance for said measure, substantially as described.

4. The chute, the measure, a pivotal support therefor, and a pivot-connection between said measure and support to one side of and below the center of said measure, in combination with a crank-arm on the pivot of said measure, an eye on the chute-frame, a rod secured at one end to said crank-arm and having its free end working through said eye, stop-nuts on said rod on each side of said eye, a stop for maintaining said measure in an upright position when elevated, and a counter-balance for said measure, substantially as described.

5. The measure, a support therefor, and a pivotal bearing for said support, in combination with a crank-arm, a journal therefor, a rack-and-gear connection between one end of said arm and the support, and a counterbalance spring or weight secured to the other end of said crank-arm, substantially as described.

6. The measure, a support therefor, a pivotal bearing for said support, and a toothed rack secured to said support, in combination with a crank-arm, a journal therefor, a gear on the journaled end thereof engaging said rack, and a spring having one end secured to the other end of said crank-arm and fixed at its opposite end, substantially as described.

7. A chute provided with two discharge-openings, a rocking frame pivotally supported from said chute, two measures supported by said frame, and a rack secured to said frame, in combination with a crank-arm journaled at one end in the chute-frame, a gear thereon meshing with said rack, and a counterbalance spring or weight secured to said crank-arm, substantially as described.



8. A chute provided with two discharge-openings, a rocking frame pivotally supported from said chute, two measures supported by said frame, and a rack secured to said frame, in combination with a crank-arm journaled at one end in the chute-frame, a gear thereon meshing with said rack, and a spring secured at one end to said crank-arm and at its opposite end to the chute-frame, substantially as described.

9. A chute-frame provided with two discharge-openings, a rocking frame journaled thereto, and two measures supported thereby under said openings, in combination with a counter-balance alternately opposed to said measures, a slide-gate arranged to alternately close said discharge-openings, provided with an elongated slot, and a rod or finger projecting from said rocking frame and engaging the slot in said slide-gate, substantially as described.

10. A chute-frame provided with two discharge-openings, a rocking frame journaled thereto, two measures pivotally supported in said rocking frame to opposite sides of and below their centers, and a counter-balance alternately opposed to said measures, in combination with crank-arms on the pivots of said measures, eyes on the chute-frame, rods secured at one end to said crank-arms and having their opposite ends working through said eyes, stop-nuts on said rods to one or both sides of said eyes, and a stop for maintaining said measures in an upright position when elevated, substantially as described.

11. A chute-frame provided with two discharge-openings, a rocking frame journaled thereto, a slide-gate arranged to alternately close said openings, actuated by said rocking frame, two measures pivotally supported in said rocking frame to opposite sides of and below their centers, and a counter-balance alternately opposed to said measures, in combination with crank-arms on the pivots of said measures, eyes on the chute-frame, rods secured at one end to said crank-arms and having their opposite ends working through said eyes, stop-nuts on said rods to one or both sides of said eyes, and a stop for maintaining said measures in an upright position when elevated, substantially as described.

404,226. FIRE AND POLICE SIGNALING APPARATUS. ARTHUR C. ROSSIUS, Brooklyn, N. Y. Filed Dec. 2, 1887. Serial No. 255,737. (No model.)

Claim.—In a fire or police alarm signal-box, the combination, with two signaling devices for sending definite signals and separate trains of gearing therefor, both loosely mounted on the same shaft, of a weighted lever for operating each train, and a disk or segment fixed to the shaft between two levers, the said disk or segment being provided with a pair of catches to engage with the respective levers, whereby, by moving the shaft in the proper direction, either weight may be brought into operative connection with its train, as set forth.

404,227. LATHING. LOUGLEY L. SAGENDORPH, Cincinnati, Ohio. Filed Dec. 10, 1888. Serial No. 293,170. (No model.)

Claim.—1. A sheet of metallic lathing having raised nailing-ribs and suitable retaining-burrs formed from said sheet between said ribs, substantially as set forth.

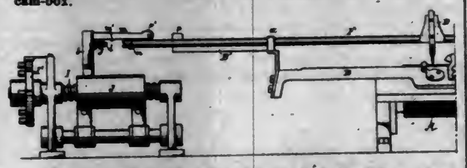
2. A sheet of metallic lathing having raised dovetailed nailing-ribs A and openings *a* therein, and suitable openings between said ribs having retaining-burrs B at the side thereof, substantially as set forth.

404,228. VEHICLE-BRAKE. FRED. SCHELP, Jr., and GEORGE H. SCHELP, St. Louis, Mo. Filed May 4, 1888. Serial No. 273,790. (No model.)

Claim.—1. In combination with the brake-lever B, the herein-described adjustable brake-rod, the same consisting of the parts C C', each having a brake-block on the outer end and flattened at the inner end and slotted at *c'* and perforated at *c²*, the said parts united by bolt and nut, all substantially as set forth.

2. The herein-described adjustable brake-rod, consisting of two parts, each flattened and slotted at the inner end and united by bolt and nut, and having a brake-block at the outer ends and combined with a brake-lever, substantially as set forth.

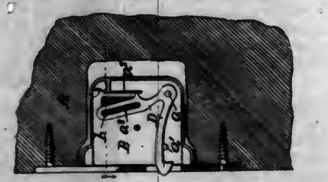
404,229. KNITTED SHIRT. ROBERT W. SCOTT, Philadelphia, Pa. Filed June 11, 1888. Serial No. 276,664. (No model.)



Claim.—1. A knitted shirt having a seamless tubular lower portion and an upper portion, comprising front and back webs connected at the top and having opposite tapered or shaped selvage edges, all substantially as specified.

2. A knitted shirt having a body with tubular seamless lower portion and an upper portion, comprising front and back webs connected at the top and having opposite selvage edges shaped as described, and sleeves consisting of seamless tubes widened at and near the shoulder portion and connected to the selvage edges of the webs forming the upper portion of the body of the shirt, all substantially as specified.

404,230. STRAIGHT-KNITTING MACHINE. ROBERT W. SCOTT and LOUIS H. D. WILLIAMS, Philadelphia, Pa. Filed Aug. 24, 1888. Serial No. 283,650. (No model.)

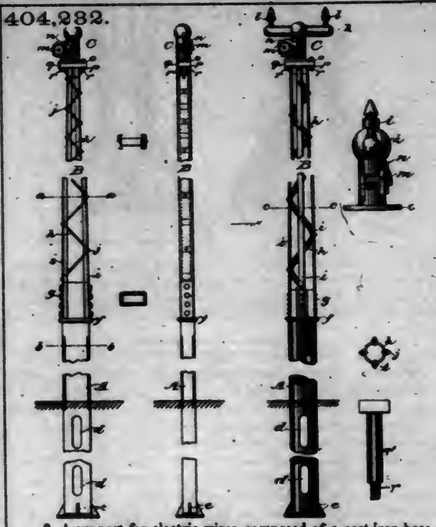


Brief.—The objects of the invention are to insure the proper application of the yarn to the end needles of the acting set and to insure the proper movement of the yarn-guide carrier in respect to the cam-box.

Claim.—1. The combination of the needle-bed and its needles, a cam-slide for actuating the needles, a frictionally-operated rock-bar carrying the thread-guide, a stop for limiting the movement of said bar, and a cam whereby, as it approaches the end of its movement, the guide-bar is rocked in its bearings, so as to slightly shift the guide, all substantially as specified.

2. The combination of the needle-bed and its needles, the cam-slide for actuating the needles, the frictionally-operated guide-bar, a stop for limiting the movement of the same, a catch for retaining the bar, and means for tripping said catch, so as to release the bar, all substantially as specified.

404,231. LATCH. JOHN R. SCOTT, Chicago, Ill. Filed Sept. 18, 1888. Serial No. 285,700. (No model.)



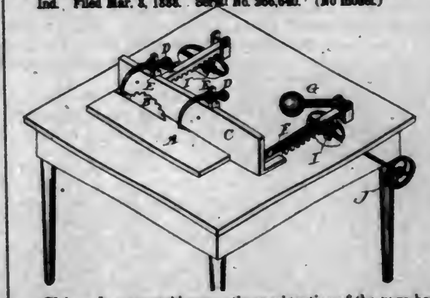
Claim.—1. In a door-latch, the combination, with the recessed escutcheon-plates provided with the stop-pin d^3, of the bottom plate or plates pivoted at one end to said escutcheon-plates, the opposite end being provided with the shoulder d^3, adapted to have contact with said stop-pin, and the finger bar or bars d^3, rigidly secured to the outer side of said bottom plates, whereby the movement of the same is confined to a fixed limit, substantially as and for the purpose set forth.

2. In a door-latch, the combination, with the recessed escutcheon-plates, of the movable bottom plates pivoted thereto, the pin or pins *b*, rigidly secured to the inner side of said bottom plates, the angular latch-bolt provided with the elongated slot a^3, the spring a^3, and the finger bar or bars d^3, secured to the outer side of said bottom plates, substantially as and for the purpose set forth.

404,232. POLE FOR ELECTRIC WIRES. UDOLPHO SHEAD, Louisville, Ky. Filed Jan. 23, 1889. Serial No. 297,302. (No model.)

Claim.—1. A support for electric wires, composed of a cast-iron base, an open wrought-iron upper part, and a completely-insulated top carrying insulators for such wires, and provided with means for tightening cross-wires, substantially as and for the purpose set forth.

404,232.

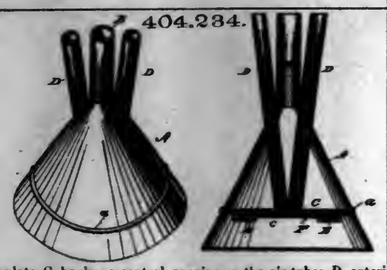


2. A support for electric wires, composed of a cast-iron base, an open wrought-iron upper part, and a completely-insulated top provided with means for tightening cross-wires, substantially as and for the purpose set forth.

3. In a support for electric wires, the combination of a cast-iron base and an upper part of wrought-iron composed of upright bars or rods connected by a bar running angularly or spirally between them, substantially as and for the purpose set forth.

4. In a support for electric wires, the combination of an upper wrought-iron part composed of upright bars or rods, connected by a bar running angularly or spirally between them, and a top part completely insulated, substantially as and for the purpose set forth.

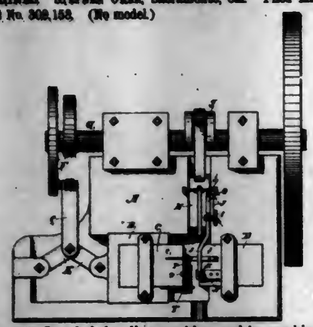
404,233. SAW-TABLE GAGE. FREEMAN M. TREGUARDEN, Colfax, Ind. Filed Mar. 3, 1888. Serial No. 266,640. (No model.)



Claim.—In a saw-table gage, the combination of the gage bar or frame C, the rack-bars F F, attached thereto, the pinions I I, engaging the teeth upon the rack-bars and fast upon a shaft journaled in the main frame and having an operating-wheel, J, on one end thereof, the clamps G, for locking the gage-bar in any adjusted position, the brackets E E on the gage-bar C, and the curved dogs D D, pivoted upon the face of the brackets, so that their lower ends shall rest upon the material as it is fed to the saw, substantially as described.

404,234. CLOTHES-POUNDER. ELIAS W. TUCKER and ASBURY P. ORR, Arcadia, Ind. Filed Jan. 26, 1889. Serial No. 297,743. (No model.)

Claim.—The washing-pounder herein described, consisting of the conical body A, the cylindrical handle-tube B, the horizontally-dis-



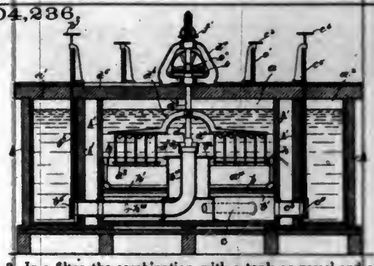
404,234.

posed plate C, having a central opening, c, the air-tubes D, entering said opening and extending to the outside of the cone, the clasps E, formed of strips of spring metal having depressed inner edges, and the flexible valve having its ends secured in the clasps, substantially as described.

404,235. SLOT-MAKING ATTACHMENT FOR BOLT-HEADING MACHINES. STEPHEN UREN, Sacramento, Cal. Filed Mar. 6, 1889. Serial No. 302,153. (No model.)

Claim.—1. In a bolt-heading machine, and in combination with the opposing dies for gripping and holding the bar, and the reciprocating plunger for upsetting its end to form the head of the bolt, a vertically-movable punch, L, adapted to make a slot or keyway in the end of the bolt, a pivoted lever engaging the upper end of the punch for operating it, a bracket secured to the reciprocating plunger, and having a cam-groove and connections between the rear end of the lever and the cam-groove, whereby said lever is operated, substantially as described.

2. In a bolt-heading machine, and in combination with the opposing dies for gripping and holding the bar, and the reciprocating plunger for upsetting its end to form the head of the bolt, a vertically-movable punch, L, adapted to make a slot or keyway in the end of the bolt, a pivoted lever engaging the upper end of the punch for operating it, said lever having at its other end a pin or stud, and a bracket on the reciprocating plunger provided with a cam-groove having a horizontal and an inclined portion, as described, and with which the pin of the lever engages, substantially as described.

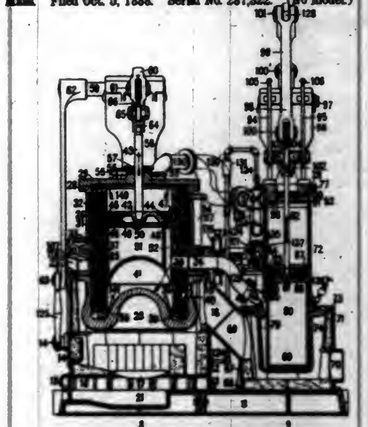


3. In a bolt-heading machine, and in combination with the opposing dies for gripping and holding the bar, and the reciprocating plunger, whereby the end of the bar is upset to form the head of the bolt, in combination with the punch-strip L, for making a slot or keyway in the end of the bolt, the grooved holding-bars K for said punch, and the clamps M, with set-screws for the holding-bars, the pivoted lever J, the forward end of which engages the holder of the punch, said lever having a pin, *j*, at its rear end, and the bracket on the reciprocating plunger, having a cam-groove, *c*, as described, engaging the pin of the lever, whereby said lever is operated, substantially as described.

404,236. FILTER. JOHN R. WARREN, Cumberland Mills, assignor to the Cumberland Manufacturing Company, Portland, Me. Filed Oct. 3, 1888. Serial No. 287,068. (No model.)

Claim.—1. In a filter, a tank or vessel and a filter-bed contained therein, combined with a well extended up through and below the filter-bed and closed at its bottom to receive sediment, and provided with a discharge-outlet through which the sediment in the said well is removed therefrom, and with an inlet-pipe extended into said well, substantially as and for the purpose set forth.

2. In a filter, a tank or vessel and a filter-bed contained therein, combined with a well extended through the filter-bed, and with a peripheral gutter, A, connected to said well, substantially as and for the purpose specified.



404,236.

3. In a filter, the combination, with a tank or vessel and a filter-bed therein, of a vertically-moving shaft, d^3, an agitator secured to said shaft and consisting of an arm having fingers, and a sweep or blade secured to said fingers, and automatic stop mechanism consisting of the threaded shaft f^3, sleeve f^{10}, having an arm, f^9, rod *g*, extended through said arm and provided with collars on opposite sides of said arm, and a clutch connected to said rod and operated through the said arm and collars to produce opposite travel of the shaft d^3, substantially as described.

4. In a filter, the combination, with a tank or vessel and a filter-bed therein, of a well, d^3, an inlet-pipe extended through said well, a vertically-movable shaft, an agitator secured thereto, and mechanism, substantially as described, to automatically stop or limit the movement of the said shaft in opposite directions, substantially as described.

404,237. AIR-ENGINE. JAMES A. WOODBURY, Winchester, and JOSHUA MERRILL, GEORGE PATTEN, and EDWARD F. WOODBURY, Boston, Mass. Filed Oct. 5, 1888. Serial No. 287,322. (No model.)

Claim.—1. An air-engine in which the temperature of the same mass of air is alternately raised and lowered, having a reverser provided with a hot and cold chamber, each of which is directly connected with a working-cylinder, substantially as and for the purpose set forth.

2. In an air-engine in which the temperature of the same mass of air is alternately raised and lowered, the reverser side, as 8, provided with the regenerator-space formed between the regenerator-cylinder, reverser-heater, and displacer-cylinder, within which is placed the regenerator, in combination with the tubular cooler having the cooling-tubes and provided with the cooler-cover, substantially as described.

3. In an air-engine in which the temperature of the same mass of air is alternately raised and lowered, having the reverser side, as 8, the combination, with the tubular cooler having the cooling-tubes and provided with the cooler-cover, of the regenerator composed of wire-cloth and placed within an annularly-constructed space at or near the inner surface of the outer shell of the heater, substantially as and for the purpose set forth.

4. In an air-engine, the combination, with reverser-heater provided with an annular regenerator-space at or near the inner surface of its outer shell, of the cooler provided with the annular tube and water-space, having the cooling-tubes and provided with the cooler-cover, substantially as described.

5. In an air-engine, the combination of the reverser-heater, a wire-cloth regenerator, the tubular cooler, and cooler-cover provided with the connecting-pipe by means of which the cold chamber is directly connected with a working-cylinder, substantially as and for the purpose set forth.

6. In an air-engine, the combination, with the reverser-heater, of the cooler provided with the annular tube and water-space and cooler-cover and having the cooling-tubes, and the cold chamber within which the displacer-piston reciprocates, substantially as described.

7. In an air-engine having a reverser side, as 8, the tubular cooler having the cooling-tubes and provided with the cooler-cover, within which cooler the displacer-piston reciprocates, provided with the displacer-cylinder portion cast on said cooler, said portion being adapted to receive within it the displacer-piston, substantially as described.

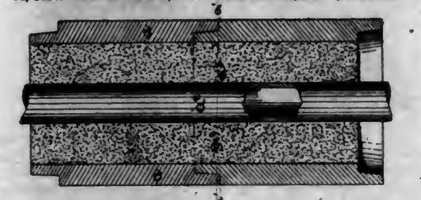
8. In an air-engine having a reverser side, as 8, the tubular cooler having the cooling-tubes and provided with the cooler-cover, within which cooler the displacer-piston reciprocates, provided with the displacer-cylinder portion, in combination with displacer-cylinder (adapted to receive within it the displacer-piston) fastened to said displacer-cylinder portion, substantially as and for the purpose set forth.

9. In an air-engine having a reverser side, as 8, the combination, with the cooler having the cooling-tubes and provided with the displacer-cylinder and cooler-cover, of the regenerator wound on said displacer-cylinder, composed of wire-cloth, substantially as described.

10. In an air-engine having a reverser side, as 8, the cooler provided with displacer-cylinder, which is provided with a series of regenerator-pins, as 37 and 38, in combination with the regenerator composed of wire-cloth and wound on said displacer-cylinder and between said series of regenerator-pins, substantially as described.

11. An air-engine in which the temperature of the same mass of air is alternately raised and lowered, having the reverser, each of which is provided with a hot and cold chamber when each of said chambers is directly connected with the working-cylinders, substantially as described.

12. In an air-engine in which the temperature of the same mass of air is alternately raised and lowered, the combination of two reversers and two double-acting working-cylinders with a regenerator composed of wire-cloth, said cylinders being directly connected by means of connecting-pipes, as shown, substantially as described.



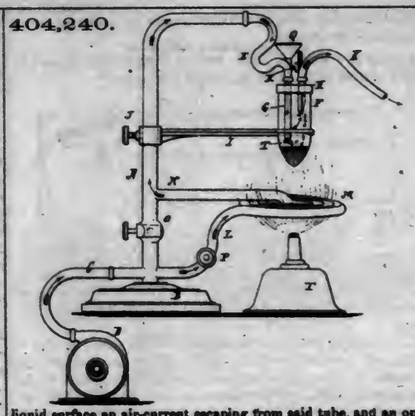
13. In an air-engine in which the temperature of the same mass of air is alternately raised and lowered, having a reverser provided with a hot and cold chamber, each of which is directly connected with a double-acting working-cylinder, in combination with a regenerator, substantially as described.

14. In an air-engine in which the temperature of the same mass of air is alternately raised and lowered, having a reverser provided with a heater, regenerator-cylinder, a wire-cloth regenerator, and a tubular cooler having the cooling-tubes and provided with the cooler-cover, so constructed and arranged as to provide for an annular port having straight or nearly straight sides and extending from the cooler to the bottom of the heater, so that the air may have a direct and a free passage to and from the hot and cold chambers, substantially as described.

404,238. MOLDING MATERIAL. CHARLES H. WILDER, Natick, Mass. Filed Mar. 1, 1889. Serial No. 301,997. (No specimens.)

Claim.—As an improved molding material, a composition of matter comprising coke, graphite, and a coked binder in a loose granular form, as set forth.

404,239. CORE FOR CASTING ORDNANCE. CHARLES H. WILDER, Natick, Mass., assignor to Frederick R. Atteaux, trustee. Filed Mar. 31, 1888. Renewed Mar. 5, 1889. Serial No. 302,016. (No model.)

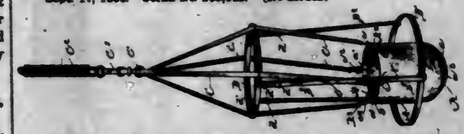


Claim.—The above-described core for use in casting ordnance and analogous articles, it consisting in an outer shell of coke, a central metallic tube, and a filling of sand between the shell and the tube, all substantially as described.

404,240. VAPORIZER. HERBERT F. WILLIAMS, Brooklyn, N. Y. Filed Jan. 16, 1889. Serial No. 296,537. (No model.)

Claim.—1. The combination of a closed vessel adapted to contain a liquid, a tube entering said vessel and terminating above and in proximity to the surface of said liquid, a means, such as a rotary wheel at the lower end of said tube, of scattering or diffusing over the said liquid surface an air-current escaping from said tube, and an opening in said vessel above said liquid surface, substantially as described.

404,240.



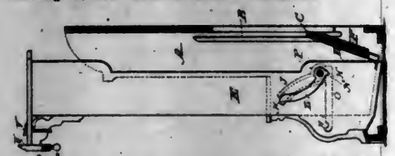
2. The combination of a closed vessel adapted to contain a liquid, two tubes entering said vessel and terminating above the liquid therein, a branch tube communicating at both ends with one of said tubes, a means, such as a lamp in proximity to said branch tube, arranged to heat said tube, and a valve in said branch tube, substantially as described.

3. The combination of a closed vessel adapted to contain a liquid, two tubes entering said vessel and terminating above the liquid therein, a branch tube communicating at both ends with one of said tubes, a means, such as a lamp in proximity to said branch tube, arranged to heat said tube, and a valve in said main tube between the points of connection of the branch tube thereto, substantially as described.

4. The combination of the closed vessel F, adapted to contain a liquid, the tube A, entering said vessel and terminating about and in proximity to the liquid surface, loop-tube L, communicating at both ends with the tube A, a source of heat, such as a lamp, T, and tube K, also entering said vessel F and terminating above the liquid, the vessel F being disposed above the lamp T, and the loop-tube L being interposed between said lamp and said vessel, substantially as described.

404,241. BABY-JUMPER. ADELE WILSON, Chicago, Ill. Filed Sept. 17, 1888. Serial No. 285,512. (No model.)

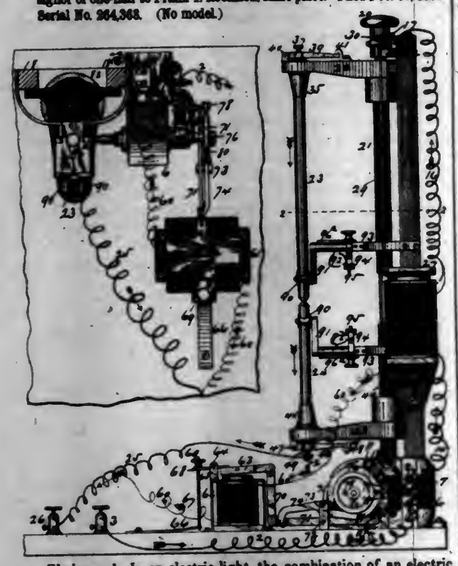
Claim.—In a baby-jumper, the combination, with a saddle-piece provided with a body-piece, a suspension-spring, C^3, suspension-straps $\bar{C}$, connecting the saddle-piece and spring, and a spreading-hoop, of a hoop, D', and adjusting-straps D^3, connecting said hoops, whereby said hoop D' may be adjusted relatively to the body-piece and serve as a rest for the hands or legs of the occupant, as and for the purpose specified.



404,242. SAW. JOHN WIDGER, Harrison, Ark. Filed Aug. 22, 1888. Serial No. 283,434. (No model.)

Claim.—As a new article of manufacture, a saw-blade provided on its edge with the cutter-teeth arranged in pairs, the members of each pair having rounded points *b'* and convex edges *b* near said points and being beveled on opposite sides, and the drag-teeth arranged in pairs between and adjacent to the cutter-teeth, the members of each pair of drag-teeth curving from each other and having transverse chisel-edges, and beveled on the same side as the adjacent cutter-tooth, the

said bevel extending across the space between the cutter-tooth and the drag-tooth, as specified.



404,243. FOLDING BED. FRANCIS R. WOLFINGER, Chicago, Ill. Filed Aug. 22, 1888. Serial No. 283,496. (No model.)

Claim.—1. The combination of the stationary portion of the bed, grooved guides secured thereto, and the recessed tracks, with the folding part of the bed and the rockers secured thereto, and provided with friction-rollers at one end to catch in the grooved guides, substantially as shown.

2. In a folding bed, the combination of the stationary portion of the frame, and stationary tracks rigidly secured thereto and provided with recesses at each of their ends, with the movable portion of the bed, the rockers rigidly secured thereto and provided with pivots or bearing-points at their ends, the pivots or bearing-points being so arranged that the folding portion of the bed moves a given distance upon one pair of the pivots or bearing-points, then rocks to the other pair of pivots at the other ends of the rockers, and swings thereon the remainder of the distance, substantially as set forth.

404,244. ARC LAMP. LA MOTTE C. ATWOOD, St. Louis, Mo., assignor of one-half to Frank T. Robinson, same place. Filed Feb. 17, 1888. Serial No. 264,368. (No model.)

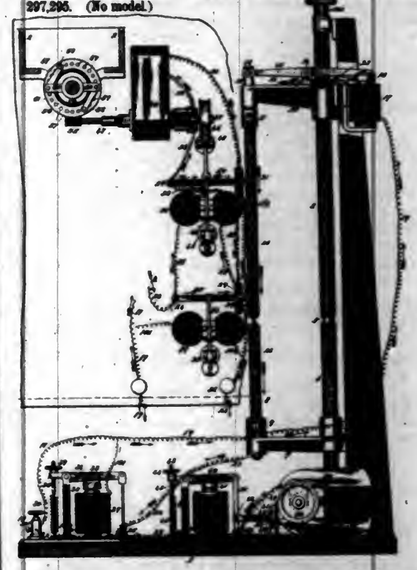
Claim.—1. In an electric light, the combination of an electric motor provided with a brake mechanism, carbons, screws supporting the carbons, shunt-coil and wire, armature operated by the shunt-coil, and connection consisting of bars and levers between the armature and the brake of the motor, substantially as and for the purpose set forth.

2. In an electric light, the combination of the carbons, upper and lower screws carrying the carbons, a motor for turning the screws, and a connection between the screws, consisting of a neck on one of the screws entering a hole in the other, and a key uniting the parts, substantially as and for the purpose set forth.

3. In an electric light, the combination of the carbons, upper and lower screws carrying the carbons, connection between the screws, consisting of a neck on one of the parts entering a hole in the other, a key passing through the parts, one of the parts being slotted to allow the upper screw to be lifted independently of the lower screw, and mechanism for lifting the upper screw, substantially as and for the purpose set forth.

4. In an electric light, the combination of the carbons, adjusting-screws, connection between the carbons and screws, consisting of arms having conical tubes receiving conical heads on the carbons, pins bearing on the ends of the carbons, and levers holding the pins on the carbons, substantially as and for the purpose set forth.

5. In an electric light, the combination of the carbons, adjusting-screws, arms connecting the carbons to the screws, connection between the arms and the carbons, consisting of conical tubes, pins having heads fitting on the ends of the carbons, pivoted levers, catches under which the free ends of the levers engage, and springs between the levers and heads on the pins, substantially as and for the purpose set forth.



6. In an electric light, the combination of the carbons, guides consisting of rollers, arms on which the rollers are secured, journals on which the arms are secured, projections secured to the journals, springs bearing against the projections, adjusting-screws for regulating the tension of the springs, and heads through which the screws pass, substantially as and for the purpose set forth.

7. In an electric light, the combination of the carbons, adjusting-screws carrying the carbons, motor for turning the screws, and a brake mechanism consisting of straps 76 and 81, levers 71 and 74, connecting-bars 70, armature 63, shunt-coil 61, spring 66, and connection between the spring and the armature, substantially as and for the purpose set forth.

8. In an electric light, the combination of the carbons, arms 22 and 43, screws 21 and 44, motor having a wheel or drum connected to the screw 44 by worm and wheel, main wire 16, shunt-wire 60, shunt-coil 61, armature 63, and connection between the armature and the said brake wheel or drum, substantially as and for the purpose set forth.

9. In an electric light, the combination of the carbons, screws supporting the carbons, motor for turning the screws, brake for controlling the motor, and connection between the brake and the brush of the motor, substantially as and for the purpose set forth.

404,245. ELECTRIC-ARC LAMP. LA MOTTE C. ATWOOD, St. Louis, Mo., assignor of three-fourths to Frederick Strainka, Louis Strainka, and Edward R. Roth, all of same place. Filed Jan. 23, 1889. Serial No. 297,295. (No model.)

Claim.—1. In an electric-arc lamp, the combination of the feed-screws, arms connected to the screws and provided with clamps to hold the carbons, a stem on the clamp of the upper carbon passing through a perforation in the upper arm, a pivoted lever connected to the stem, an armature secured to the lever, and a magnet supported by the upper arm, substantially as and for the purpose set forth.

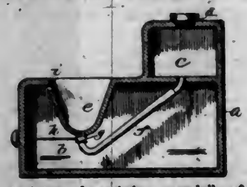
2. In an electric-arc lamp, the combination of the base, a vertical frame, cross heads movably secured to the frame, and upper and lower arms formed upon the cross-heads and provided with clamps for holding the carbons, a stem on the clamp of the upper carbon passing through a perforation in the upper arm, a lever having slot-and-pin connection with the stem, an armature on the lever, and a magnet carried by the upper arm, substantially as and for the purpose set forth.

3. In an electric-arc lamp, the combination of the carbon screws, a motor for automatically feeding the carbons, a magnet, an armature secured over the magnet by means of a pivoted lever, a connection between the lever and a brake of the motor, and plates operated by said armature, and wires adapted to automatically place the motor into and out of operation, substantially as and for the purpose set forth.

4. In an electric-arc lamp, the combination, with the carbons, of magnets 26 and 39, armatures 34 and 41, and contact-plates operated by said armature and wires, all arranged and operating to automatically regulate the distance between said carbons, substantially as and for the purpose set forth.

5. In an electric-arc lamp, the combination of the carbon-feed screws, a motor provided with a brake-wheel, a strap passing around the wheel and connected by one end to a bell-crank lever, a magnet, a pivoted lever having an armature located over the magnet, and a connection between the said levers, substantially as and for the purpose set forth.

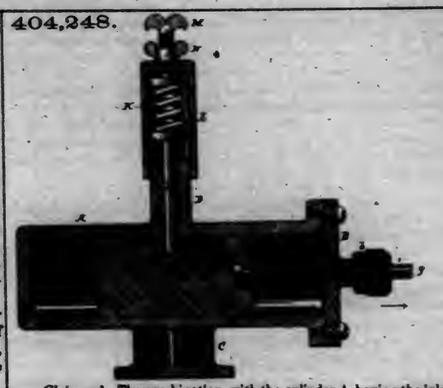
6. In an electric-arc lamp, the combination of the screws for automatically feeding the carbons, a motor, a worm on the shaft of the motor, a wheel on one of the screws and engaging the worm, links secured to the screw, and pins on the links fitting in holes in the wheel, substantially as and for the purpose set forth.



7. In an electric-arc lamp, the combination of the screws for feeding the carbon, a motor, a worm on the shaft of a motor, a wheel, 56, secured to the lower screw and engaging the worm, arm 60, secured to the screw, links 50, secured to the arms, and pins 58 on the links and fitting in holes 57 made in the wheel, said wheel having a groove, 61, substantially as and for the purpose set forth.

404,246. INK-WELL. STEPHEN G. BALDWIN, Marion, Ind. Filed Oct. 18, 1888. Serial No. 288,434. (No model.)

Claim.—An inkstand consisting, essentially, of a closed reservoir having a central threaded opening through its top wall, a pocket in the bottom of the reservoir beneath said opening, a hollow plug or mouth-piece located in said opening in vertical adjustment, having its upper end open and surrounded by a milled rim and its lower end shaped to fit in said pocket and provided with an ink-inlet, the portion of the plug between the rim and said end being of uniform diameter and externally threaded throughout to screw vertically in said opening, substantially as described.



404,247. INK-WELL. STEPHEN G. BALDWIN, Marion, Ind. Filed Oct. 18, 1888. Serial No. 288,435. (No model.)

Claim.—1. An inkstand consisting, essentially, of a hollow body, a normally-closed supply-reservoir upon the rear portion of its top wall, an ink-well depending into the body from the front portion of its top wall, a tube extending from the bottom of the supply-reservoir to the bottom of the well, and a valve to close or open the tube and provided with a stem extending to the exterior of the body, substantially as described.

2. An inkstand consisting, essentially, of a hollow body, an ink-supply reservoir upon the same, an ink-well depending into the interior of the same below the plane of the reservoir and provided with an ink-overflow aperture near its top opening into the body, a tube located in the body and extending from the bottom of the reservoir into the bottom of the well, a cut-off valve in the tube, and a valve-stem to turn the same, extending to the front exterior of the body and provided with a head, substantially as described.

404,248. DIRECT-ACTING ENGINE. JOHN G. BARTLETT, Akron, Ohio, assignor of one-half to Stephen H. Pitkin, same place. Filed Nov. 14, 1888. Serial No. 290,764. (No model.)

Claim.—1. The combination, with the cylinder A, having the inlet E and outlet F and tube D, of the piston G, provided with the ports *c d f f'*, channel H, ledges I I', and inclined planes *i i'*, together with the rod D and spring K, all constructed and arranged substantially as shown, and for the purpose specified.

2. The combination, with a piston having inlet and outlet ports arranged by a partial rotation of said piston to alternately register with inlet and outlet cylinder openings and having a channel provided on opposite sides with ledges inclined in opposite directions, and inclined planes uniting alternate ends of said ledges, of a rod actuated by a spring, which successively travels along said ledges and planes for the purpose of partially rotating said piston, substantially as shown, and for the purpose specified.

404,249. PEN. HENRY BRIGHLING, Wilkeson, Wash. Filed Nov. 6, 1888. Serial No. 290,134. (No model.)

Claim.—1. A writing-pen having one of its nibs provided with a fountain-plate, the front of the pen being slightly concave in its upper face, whereby it is rendered reversible, substantially as and for the purpose specified.

2. A writing-pen having one of its nibs provided with a fountain-plate, said nibs being curved up opposite to the curve of the stem, thereby making the pen slightly concave on its upper face, whereby the said pen is rendered reversible and the flow of the ink regulated, substantially as and for the purpose described.

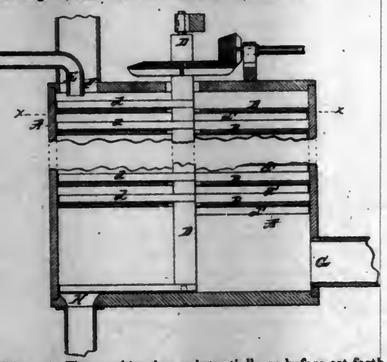
404,250. DESK AND CHAIR FOR SCHOOLS. GABRIEL A. ROBBINS, Boston, Mass. Filed Sept. 15, 1888. Serial No. 285,533. (No model.)

Claim.—1. The combination of the tubular standard having an enlarged upper slotted portion, the threaded shank having a longitudinal groove, binding-screws inserted through the side of the tubular standard and projecting into the groove in the threaded shank, the miter-wheel having upper and lower flat bearing-surfaces engaging, respectively, the upper and lower parts of the cut-away portion of the standard, and means, substantially as described, for operating said miter-wheel.

2. The combination of the tubular standard, constructed substantially as described, the longitudinally-grooved shank supporting a desk or chair body, one or more binding-screws inserted laterally through the standard and projecting into the groove in the threaded shank, the miter-wheel working upon said shank and projecting through an aperture in the tubular standard, and the removable gear-wheel detachably connected to the standard and adapted, when in its operative position, to engage and operate the miter-wheel, all constructed and combined to operate substantially in the manner and for the purpose shown and set forth.

404,251. PROCESS OF DISSOLVING GUM-COPAL, &c. GABRIEL A. BORRICK, Boston, Mass. Filed Sept. 15, 1888. Serial No. 285,524. (No specimens.)

Claim.—The herein-described method of dissolving resinous substances—such as amber, shellac, gum-copal, or their equivalents—in the products of naphtha—such as benzine or kerosene—which method consists in dissolving a suitable quantity of rosin in naphtha at a temperature between 150° and 250° Fahrenheit, and, while the mixture is boiling, adding thereto the amber, shellac, or gum-copal in suitable quantities, substantially as specified.



404,252. COVERED CORSET-STEEL. GUSTAVE BOCHARD, Paris, France. Filed Jan. 23, 1889. Serial No. 297,279. (No model.) Patented in France Apr. 14, 1887, No. 182,864; in Belgium Mar. 15, 1888, No. 80,813, and in England Mar. 24, 1888, No. 4,536.

Claim.—1. A stay, rib, or bone composed of a number of steel wires provided each with a close wrapping of thread, arranged side by side and flexibly connected as a flat web, substantially as described.

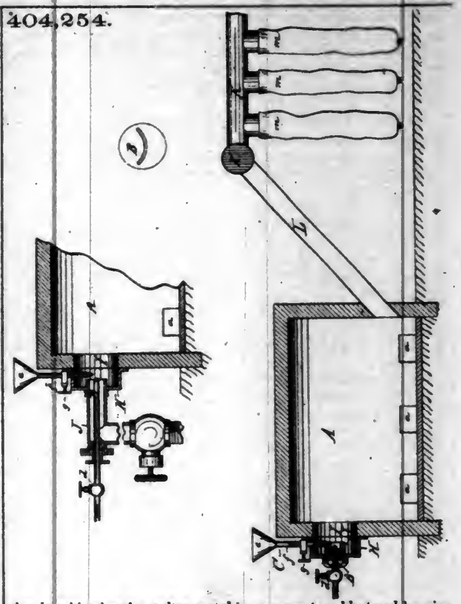
2. A stay, rib, or bone composed of paper-covered steel wires, each provided with a close wrapping of thread, arranged side by side and flexibly connected as a flat web, substantially as described.

404,253. APPARATUS FOR THE MANUFACTURE OF WHITE LEAD. ARTHUR C. BRADLEY and STEPHEN R. BRADLEY, Brooklyn, N. Y. Filed Aug. 19, 1887. Serial No. 247,353. (No model.)

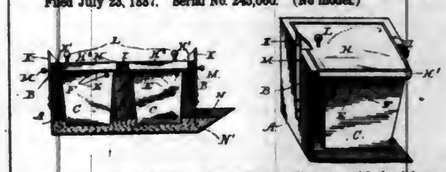
Claim.—1. The combination, substantially as before set forth, of the tight converting-chamber, its solid shelves, each of said shelves having an opening in a different vertical plane from the opening in the next adjacent shelf, and the scraping-arms arranged to sweep one side of said shelves.

2. The combination, substantially as before set forth, of the tight converting-chamber, its solid shelves, each of said shelves provided with an opening in a different vertical plane from the opening or openings of its next adjacent shelf or shelves, the shaft, and the scraping-arms arranged to sweep over the under sides of said shelves.

3. The combination, substantially as before set forth, of the tight converting-chamber, its solid shelves, each of said shelves provided with an opening in a different vertical plane from the opening or openings of its next adjacent shelf or shelves, the shaft, the scraping-arms, the entry-opening for liquid at the top of said chamber, and the exit-opening for liquid at the lower end of said chamber.



404,254. PROCESS OF MANUFACTURING OXIDES. STEPHEN R. BRADLEY and ARTHUR C. BRADLEY, Brooklyn, N. Y. Filed Feb. 18, 1888. Serial No. 264,516. (No specimens.)



Claim.—1. The process, substantially as before set forth, of manufacturing metallic oxides by subjecting molten metal in a stream to a blast under confinement in the presence of burning inflammable gas.

2. The process, substantially as before set forth, of simultaneously comminuting molten metal, distributing it, and oxidizing it, which consists in subjecting the molten metal in a stream to a blast and burning inflammable gas in a confined space, whereby waste is prevented.

3. The process, substantially as before set forth, of simultaneously comminuting molten metal, distributing it, heating it to a burning-point, and saving the oxide, which consists in subjecting the molten metal in a stream and under confinement to a blast and burning inflammable gas and collecting the oxide produced.

404,255. STEAM-COOKER. ISAAC S. BRANDENBURG, Peoria, Ill. Filed July 23, 1887. Serial No. 245,060. (No model.)

Claim.—1. The combination of the shell A, provided with a top frame, B, having openings for the receptacles, and horizontal flanges D around the openings, leaving spaces above the flanges, the receptacles C, having horizontal flanges E at the top thereof resting on the frame-flanges, and the covers H, fitting within the spaces, having vertical flanges H^2 outside and surrounding the tops of the receptacles and fitting against the frame, substantially as described.

2. The combination of the shell A, provided with a top frame, B, having openings for the receptacles, horizontal flanges D around the openings, leaving spaces above the flanges, and curved sockets at the sides of the spaces, the receptacles C, having horizontal flanges E at the top thereof resting on the frame-flanges, and the covers H, fitting within the spaces, having vertical flanges H^2 surrounding the tops of the receptacles, and provided with upwardly-curved pins I, working in the sockets, substantially as described.

3. The combination of the shell A, provided with a top frame, B, having openings for the receptacles, and horizontal flanges D around the openings, leaving spaces above the flanges, the vertical spring-catches K, secured to the shell, having beveled heads, the receptacles C, having horizontal flanges E at the top thereof resting on the frame-flanges, and the covers H, hinged to the frame and fitting within the spaces, having vertical flanges H^2 surrounding the tops of the receptacles and resting on the flanges, the edges of the cover-flanges being adapted to rest on the beveled heads or to drop thereunder, substantially as described.

4. A steam-cooker consisting of the shell A, provided with a top frame, B, having openings for the receptacles, horizontal flanges D around the openings, leaving spaces above the flanges and curved sockets at the sides of the spaces, the vertical spring-catches K, secured to the shell, having beveled heads, the receptacles C, having horizontal flanges E at the top thereof resting on the frame-flanges, and the covers H, fitting within the spaces, having vertical flanges H^2 surrounding the tops of the receptacles and fitting against the frame, substantially as described, and the pins I, working in the sockets, substantially as described.

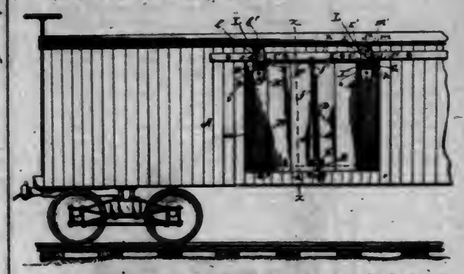
404,256. STALK-CUTTER. WILLIAM M. BERRIMAN, Bennettsville, S. C. Filed Sept. 28, 1888. Serial No. 286,673. (No model.)

Claim.—In a stalk-chopper, the combination, with the rectangular frame provided with the transverse shaft journaled therein and having the armed wheels C C on its ends, of the inclined blades connecting corresponding arms of said wheels, the conveyer-wheels journaled on adjustable arms F, and the diverging arms secured to the front of the rectangular frame and provided with outwardly and downwardly curved arms I, and the cutter provided with the rectangular blade K, substantially as specified.

404,257. AUTOMATIC GRAIN-WEIGHING MACHINE. LAUCHLIN M. BUCHANAN, Elmira, Ill. Filed Nov. 9, 1888. Serial No. 290,382. (No model.)

Claim.—1. The combination, with the frame A, suitably supported, and the stop M, standing upward from said frame, of the beam B, having the bifurcated arms D, pivoted at E upon the side arms of the frame, the shaft F, pivoted in the ends of the arms D and provided with the upstanding arm L, having the roller N at its end, the hopper suspended on the shaft F between the arms D, the valve K, secured to the shaft F within the hopper, and the pea C, sliding on the beam B, substantially as specified.

2. The combination, with the frame A, having the stop-slot A' and the stop M on said frame, of the beam B, having the arms D, the pea C, the shaft F, having the arm L, the hopper suspended on the shaft, and the valve K, mounted on the shaft within the hollow, substantially as specified.



404,258. BROOM. FRANK J. CASE, Arrington, Kans., assignor of two-thirds to F. L. & H. J. Case, same place. Filed July 10, 1888. Serial No. 279,511. (No model.)

Claim.—1. In a broom, the handle, the two similar metal plates, C, connected to the handle by the projecting stripe c, and having the side flanges, E, and the curved bars G on the inner side of the plates, and the bolts passed through the plates and also through the bars, as set forth.

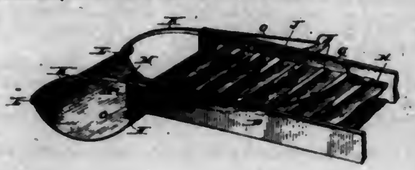
2. In a broom, the combination of the handle, the bundle of broom-straw unconnected to the handle, the metal plates C, provided with the projecting stripe c, the flanges E, and the transverse grooves F, and the curved bars G, lying in said grooves and connected through the straw to the metal plates and to each other, substantially as specified.

404,259. CAR-DOOR. JAMES CHARLTON, Houston, Tex. Filed Aug. 10, 1888. Serial No. 282,478. (No model.)

Claim.—1. The combination, with the car having the door-opening with its upper and lower edges parallel and inclined upward and inward, and the bolt-keeper secured to the sill of the car, of the door having correspondingly-inclined upper and lower edges, the guide-staple *b'* and fulcrum-bracket C, secured to the door at proper points, the operating-lever pivoted to said bracket, the link-rods *d* and bolt E, the link-rod *f*, pivoted at its lower end to the operating-lever and to the link-rods *d* at the same point, the shaft F, having the arm *f'*, pivoted to the rod *f*, and the hanging hinge-joint G, of which the shaft F forms the pintles, substantially as specified.

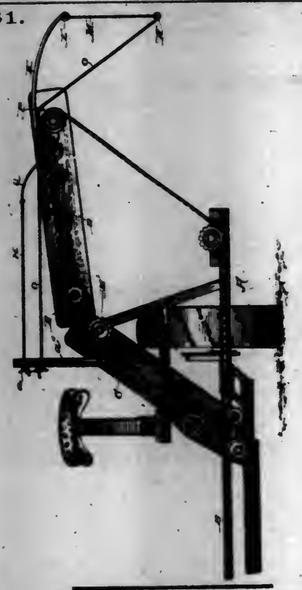
2. The combination, with the car-door B and the way-beam K, having the flat upper edge, *k*, of the operating-lever D, pivoted to the fulcrum-bracket C, secured to the door, the link-rod *f*, the shaft F, having the arm *f'*, the hanging hinge-joints G, composed of the plates H, having their upper edges sleeved at *h*, the plates I, having their lower edges sleeved and connected to the plates H by pintle-pins, and the plates J, sleeved at their lower ends and making joints with the plates I, of which joints the shaft F forms the pintle, and the anti-friction rollers M, the journals of which have bearings proper in the smaller circular upper portions, *l'*, of the openings L in the bent-over upper parts of the plates J, which openings have the larger circular lower parts, *l*, of greater diameters than those of said rollers, substantially as specified.

404,260. POCKET MEMORANDUM-BOOK. ALBERT F. COMART, Boston, Mass. Filed Feb. 25, 1889. Serial No. 301,012. (No model.)



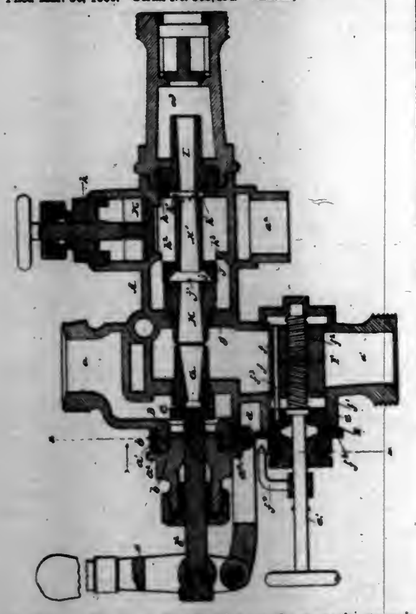
Claim.—1. As an improvement in memorandum-books, the covers and leaves formed with the recesses across the edges thereof and the intermediate slot, *c*, extending through the book, substantially as specified.

2. In combination with the book formed with the edge recesses and intermediate slot formed therein, as specified, the elastic binder *f*, arranged in said slot and recesses, as specified.



404,261. HARVESTER. GEORGE COX, La Delle, Dak. Filed Sept. 27, 1888. Serial No. 286,617. (No model.)

Claim.—1. The combination, with the elevator D, standing nearly horizontally, the ball G, and the rope H, that holds the said elevator in said position on the lower elevator, C, of the arms K, pivoted on the outer portion of the elevator D, the staples P, to support said arms in proper position on the elevator, the flap M, of canvas or other flexible material, the transverse rods L and N, and means, substantially as described, for drawing the free end of said flap under the adjacent end of the elevator D, substantially as specified.



2. In combination with the discharge-elevator D, the arms K K, pivoted thereon at their inner ends, the rod L, connecting said arms at their outer ends, the rod N, the flap M, extending between rods L and N, and the ropes O, attached, respectively, to the ends of rod N and brought within convenient reach of the driver of the machine, substantially as shown, and for the purpose described.

404,261.

404,262. STEAM-INJECTOR. JOHN DESMOND, Brooklyn, N. Y., assignor to the Hayden & Derby Manufacturing Company, same place. Filed Mar. 30, 1889. Serial No. 305,404. (Model.)

Claim.—1. The herein-described improved automatic steam-injector having a continuous communication between the mouth of the combining-tube and the overflow-chamber, said communication being less during the working of the injector than in the starting thereof substantially as set forth.

2. A steam-injector having an overflow-chamber, and the lifting and combining tubes opening thereinto, and having a continuous passage-way or communication therewith, said communication being less during the working of the injector than in the starting thereof, as set forth.

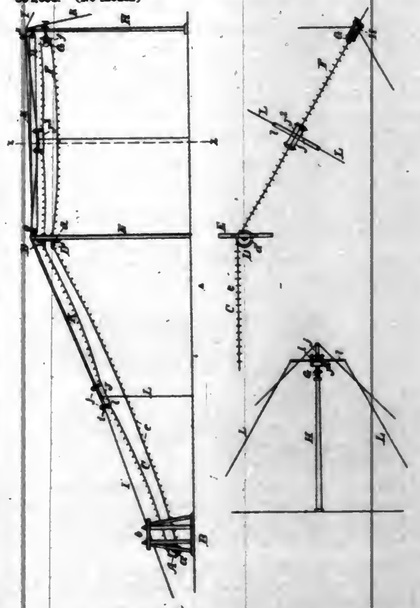
3. As an improvement in steam-injectors having the lifting and combining tubes, the grooved valve sliding on said combining-tube, whereby a continuous passage-way or communication is had between the mouth of said combining-tube and the overflow-chamber, as stated.

4. As an improvement in steam-injectors having an overflow-chamber and the lifting and combining tubes opening thereinto, the sliding valve located at said opening of the tubes, and having holes or ports forming a continuous passage-way, substantially as set forth.

5. As an improvement in steam-injectors having the overflow-chamber, the combining-tube having holes or ports at or near its rear end, the sliding valve located on said combining-tube for closing said holes or ports in the starting of the injector, and having grooves or recesses for forming a continuous passage-way between the mouth of said combining-tube and the overflow-chamber, substantially as set forth.

6. The herein-described improvement in steam-injectors, comprising the lifting and combining tubes, and the valve sliding on said combining-tube and having its normal position against said lifting-tube, as set forth.

7. As an improvement in steam-injectors having a water-inlet arm, the water-inlet valve located in said arm and having two heads or disks fitted on dissimilar screws, and the spindle carrying a finger or pointer, substantially as set forth, said heads or disks being movable in opposite directions, as stated.



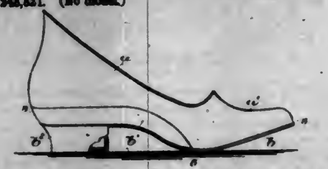
8. As an improvement in steam-injectors, the water-inlet valve having the two heads or disks, and the spindle provided with right and left hand screw-threads upon which said heads or disks are disposed, substantially as set forth.

9. As an improvement in steam-injectors, the water-inlet valve having the two heads or disks, the spindle provided with opposite screw-threads, the plug through which said spindle is passed, and the guide-rod projecting from said plug through said heads or disks, substantially as set forth.

10. In a steam-injector, the combination, with the water-inlet arm, of the valve having oppositely-movable heads or disks, the plug, the graduated scale, and the spindle having a finger or pointer, substantially as set forth.

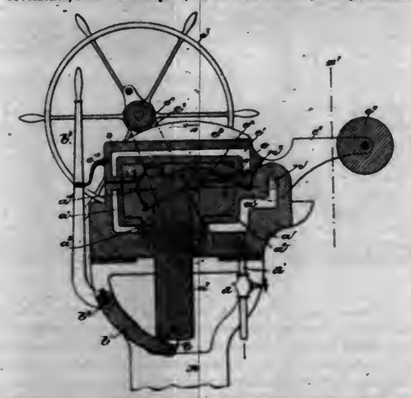
11. In a steam-injector, the combination, with the water-inlet arm having the opposite circular extensions, of the plug having a flange provided with a scale, the heads or disks, the spindle having right and left hand screw-threads, the guide-rod projecting from said plug, and the finger or pointer, substantially as set forth.

404,263. CONVEYER FOR PILING COAL. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, Naugatuck, Conn. Filed Dec. 17, 1887. Renewed Mar. 30, 1889. Serial No. 304,952. (No model.)



Claim.—1. In a coal-piling chain conveyer composed wholly of an endless chain provided with flights which project laterally in one direction, the combination, with said chain and its said flights, of a device which operates, as specified, to prevent the flighted chain from twisting at its upper run, and means for properly supporting said device independently of the chain, the whole arranged and operating together in substantially the manner hereinbefore set forth.

2. In a coal-piling chain conveyer composed wholly of an endless chain provided with flights which project laterally in one direction, the combination, with said chain and flights, of a device operating, as specified, to prevent any undue twisting of the upper run of the chain, and provided with means for partially supporting the gravity of said upper run, all substantially as hereinbefore set forth.



3. A device for both supporting and preventing the twisting of the chain and its flights, composed of a tube or tubular frame-work and provided with a traveling endless carrier, M, substantially as and for the purpose set forth.

404,264. RUBBER SHOE. HENRY J. DOGGETT, Malden, Mass., assignor to Joseph Banigan, Providence, R. I. Filed Sept. 5, 1887. Serial No. 248,821. (No model.)

Claim.—As an improved article of manufacture, a rubber shoe or foot-covering comprising, essentially, two sections or portions—viz., an upper portion, as *a*, and a portion molded or shaped to constitute not only the sole and heel portion, but also to leave a flange-like portion extended upwardly from the sole from the ball of the shoe backwardly along the shank and heel—the two portions or parts being permanently united together in the widest part of the shoe between the toe and heel thereof, substantially as shown and described.

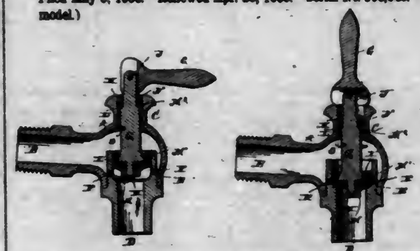
404,265. MECHANISM FOR THE MANUFACTURE OF RUBBER SHOES. HENRY J. DOGGETT, Malden, Mass., assignor to Joseph Banigan, Providence, R. I. Filed Sept. 5, 1887. Serial No. 248,822. (No model.)

Claim.—1. In an apparatus for forming boots and shoes from rubber or equivalent plastic material, the mold a^4 and surrounding steam-chest and the mold c^3 and its surrounding steam-chest, combined with the last and its spindle extended through and adapted to reciprocate in one of the molds, one of the said molds being made movable with relation to the other, to operate substantially as described.

2. The mold a^4, its surrounding steam-chest, the mold c^3, shaped to aid in the formation of the sole and heel and also a part of the upper of the shoe about the heel, and the steam-chest surrounding the said mold c^3 and the metallic last, combined with steam-connecting devices, substantially as described, between the said steam-chest a^4 and c^3, whereby steam may be admitted into both when the said molds are opened and closed, to operate substantially as described.

3. In a machine for the manufacture of shoes from india-rubber compound, a metallic last, its co-operating two-part molds a^4 c^3, divided longitudinally at a point between the line of the bottom of the last and the top of the last for a portion of the length of the said molds where the last is of greatest thickness in longitudinal cross-section, and the steam-chests surrounding the said molds, to operate substantially as and for the purposes set forth.

4. The mold a^4, provided with a shoulder, combined with the last or inside former provided with a lip to co-operate with the said shoulder to form the mouth of the shoe, substantially as described.

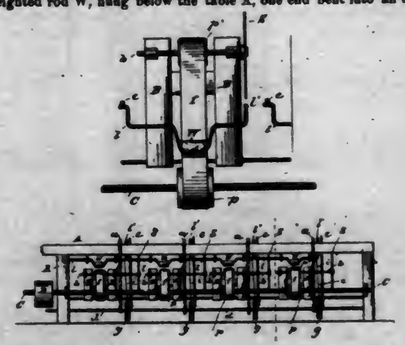


5. The mold a^4, having a shoulder and groove at or near the said shoulder, combined with the last or inside former having a lip, whereby the mouth of the shoe is provided with a bead and is trimmed smoothly, substantially as described.

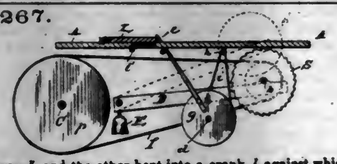
6. In an apparatus for the manufacture of boots and shoes from rubber or other plastic material, a mold, a^4, to receive the material to form the chief part of the top of the shoe, and a metallic last having a shank, as described, to enter and slide vertically within the said mold, combined with a mold, c^3, to force the rubber or equivalent material upon the sole-forming portion of the last held within the mold a^4, the junction of the two molds being substantially in line of the widest part of the shoe throughout from toe to heel, substantially as described.

7. In an apparatus for forming boots and shoes from rubber or equivalent plastic material, a mold, a^4, its surrounding steam-chest, and a mold, c^3, and a steam-chest having cam-surfaces and surrounding the said mold, combined with a pressing-frame to travel over the said cam-surfaces and force the two molds in contact, substantially as described.

8. The mold a^4, its surrounding steam-chest, the pivoted mold c^3, and its surrounding steam-chest, combined with a counterbalancing-weight for the said mold c^3 and steam-chest *c*, substantially as described.



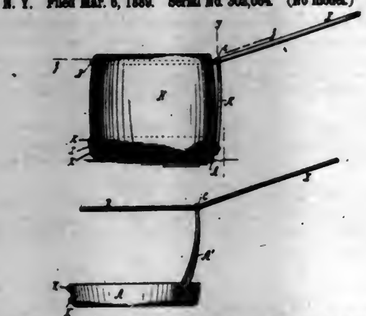
404,266. WATER-BIB. JOHN DOWLING, Wilkes-Barré, Pa., assignor of one-half to the Wilkes-Barré Self Closing Hydrant Company, (Limited.) Filed May 5, 1888. Renewed Apr. 26, 1889. Serial No. 308,040. (No model.)



Claim.—The combination, in a water-bib, of a faucet having an inlet-pipe, a top branch, and a removable nozzle screwed into the globe of the faucet, the inclosed portion of the nozzle extending to about midway of the globe, whereby the water within the globe has free access to the top of the lower valve at all times, and is provided with a series of small apertures, through which the water passes to the exit of the nozzle, a reciprocating stem, two cup-shaped valves upon the stem, one of which is smaller than the other and is located within the top branch, and the larger valve is located within the inclosed portion of the nozzle, whereby the apertures in the end of the nozzle may be closed or opened by the movement of the stem, and a handle for moving the stem, substantially as set forth.

404,267. LUMBER-TRIMMER. WILLIAM DUNBAR, Larrabee, Pa., assignor of one-half to Judson J. Newman, Buffalo, N. Y. Filed Jan. 19, 1889. Serial No. 296,813. (No model.)

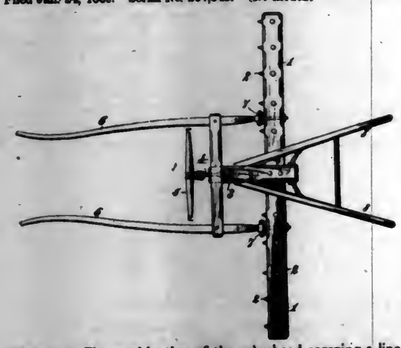
Claim.—In a lumber-trimmer, in combination with a table, A, swinging saw-frame B, and saws S, operated by shafts C *b*, pulleys *p p'*, belts *f*, levers *e*, pulleys *g*, shaft *d*, and cord *i*, the bent and weighted rod W, hung below the table A, one end bent into an up-



404,267.

right lever, *l'*, and the other bent into a crank, *l*, against which latter rests the arbor-lever *c*, which prevents the action of its saw by dropping it backward below the table when the opposite end, *l'*, is pushed forward, all as fully hereinbefore explained.

404,268. HOLDER FOR VESSELS. JOHN P. BOWEN, New York, N. Y. Filed Mar. 6, 1889. Serial No. 302,064. (No model.)

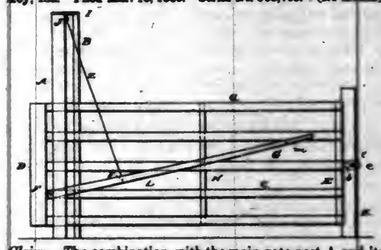


Claim.—1. A vessel-holder consisting of the base A, for supporting the bottom of the vessel, and having the arm or bracket A', the expansible and contractible spring-clamp B, and the handle E, rigid with the clamp, said clamp and handle connected with the arm or bracket by the hinge or joint *c*, which permits the clamp and handle to be moved to and fro, substantially as described.

2. A vessel-holder consisting of the base A, for supporting the bottom of the vessel, the handle E, connected with the base, and the expansible spring-clamp fixed to the handle for encircling the top part of the vessel, substantially as described.

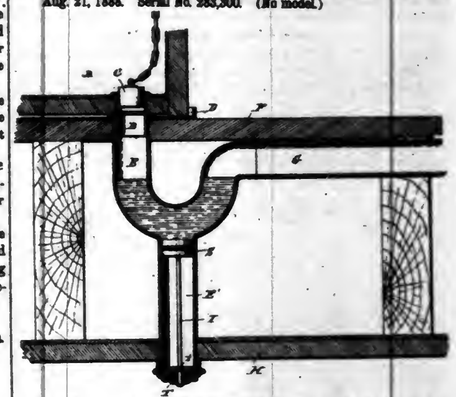
3. A vessel-holder consisting of the base A, for supporting the bottom of the vessel, the handle E, connected with the base, the ring-clamp B, connected with the handle, and the lug I on the vessel, for securing the latter to the base, substantially as described.

4. A vessel-holder consisting of the base A, having a hole the edge of which is provided with a bead, K, the handle E, connected with the base, the ring-clamp B, connected to the handle, and the lug I on the vessel engaging the hole in the base, substantially as described.



404,269. HORSE-RAKE. CHRISTOPHER E. G. FELL, Savannah, Ga. Filed Jan. 24, 1888. Serial No. 297,345. (No model.)

Claim.—1. The combination of the rake-head carrying a line of spring-teeth, the thills secured to the rake-head for guiding and directing the latter, a rigid draft-beam attached to and projecting in advance of the rake-head beneath the horizontal part of the thills for transmitting the draft-strain to the rake-head independent of the thills, and controlling-handles, substantially as described.

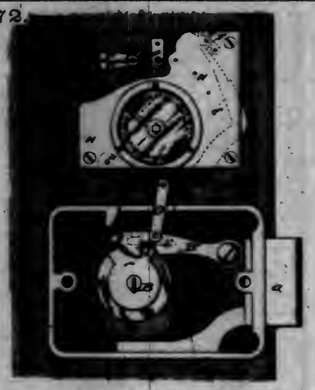


2. The combination of the rake-head carrying a line of spring rake-teeth, the thills hinged to the rake-head for guiding and directing the latter, a rigid draft-beam attached to and projecting in advance of the rake-head centrally between the hinges of the thills and below the horizontal parts of the latter and having a whiffletree at its front end for transmitting the draft-strain to the rake-head independent of the thills, and controlling-handles secured to the draft-beam between its forward end and the rake-head, substantially as described.

404,270. BALANCED SWINGING GATE. JAMES W. PIERR, Red Key, Ind. Filed Mar. 15, 1889. Serial No. 303,705. (No model.)

Claim.—The combination, with the main gate-post A and its subsidiary post B, diagonally arranged near the corner of said main post, the bridge connected to the tops of said posts, and the hook or loop projecting near the upper end of said main post, the gate playing in the interval between posts A and B, of the gate-post K, having the catch-studs *e* arranged one above another, the slotted extension *e* of the middle rail, the pivoted adjustable brace-lever L, having the headed stud *s* adapted to engage any one of said rails, and the suspending-wire Z, connecting the brace-lever to the hook or loop of the main post, substantially as specified.

404,271. TRAP. LAMBERT T. FOLLANSBEE, Washington, D. C. Filed Aug. 21, 1888. Serial No. 283,300. (No model.)



Claim.—1. A bath-tub trap consisting of a U or other suitably-bent pipe and a straight pipe communicating with the bent pipe at the under side of its bend, one end of the bent pipe passing up through the floor on which the tub sits and communicating with the interior of the tub, while its other end is connected to the discharge-pipe, the straight pipe passing downward through the ceiling of the room below and provided at its lower end with a screw-tap, substantially as described.

2. A bath-tub trap consisting of a U or other suitably-bent pipe and a straight pipe communicating with the bent pipe at the under side of its bend, one end of the bent pipe passing up through the floor on which the tub sits and communicating with the interior of the tub, while its other end is connected to the discharge-pipe, the straight pipe passing downward through the ceiling of the room below and provided with a stopper for closing its upper end, a screw-tap for closing its lower end, and a rod connecting the stopper and tap, whereby on unscrewing the latter the former may be withdrawn, substantially as described, and for the purposes set forth.

404,272. TIME-LOCK. BERNARD PEREE, Chicago, Ill. Filed July 11, 1888. Serial No. 278,677. (Model.)

Claim.—1. In a time-lock, a pivotal lever having a hook or lug forming a stop at the free end thereof, in combination with the actuating-lever of a permutation-lock and a disk eccentrically placed on the spindle of said lock, said pivotal lever and said actuating-lever being connected together, and the free end of said actuating-lever connected with the periphery of said eccentrically-pivoted disk, whereby

404,272.

rotation of said disk produces movement in said actuating-lever and in said pivotal lever, all substantially as described.

2. In a time-lock, a lever having a hook or lug forming a stop at the free end thereof and a second stop thereon, a spindle, a dog placed on said spindle adapted to come in contact with the hook or lug on said lever, a stop on said dog adapted to come in contact with said second stop on said lever, and a second dog pivoted on said first-named dog and adapted to engage with the teeth of one of the wheels of the train of a chronometer, in combination with a second spindle, a dog thereon, and a pin on said dog adapted to engage with said first-named dog, and an arm on said second spindle adapted to engage with the teeth of the scape-wheel of said chronometer, whereby when the pin on the dog pivoted on said second spindle is in the slot in said disk the arm on said spindle is in engagement with the teeth of the scape-wheel of the chronometer, the free end of the dog on said first-named spindle is raised from contact with the hook on said lever, and the dog pivoted on said last-named dog is in contact with the teeth of one of the wheels of the train of said chronometer, all substantially as described, and for the purpose set forth.

3. In a time-lock, a chronometer having an hour-wheel with a hub thereon projecting through the front plate of the chronometer and a shoulder thereon, a spring placed on said hub and against said shoulder, and a slotted disk having gear-teeth thereon placed on said hub and spring and secured thereto, in combination with a second gear-wheel having a hub projecting through a hole in the glass in front of the dial-plate of said chronometer, and a spring resting against said glass and against a handle placed on said projecting hub, whereby said last-named gear-wheel is adapted to engage with said first-named gear-wheel on said slotted disk and adjust the same independently of said hour-wheel, and the said hour-wheel actuating said slotted disk in the running down of said chronometer, all substantially as described.

4. In a time-lock, a lever having a hook or lug at the free end thereof forming a stop, and a second stop thereon, a spindle, a dog placed on said spindle adapted to come in contact with the hook or lug on said lever, a stop on said dog adapted to come in contact with said second stop on said lever, and a second dog pivoted on said first-named dog and adapted to engage with the teeth of one of the wheels of the train of a chronometer, in combination with a pin or lever on the hour-indicator spindle of said chronometer adapted to come in contact with a stationary stop in the running down of said chronometer, thereby stopping the same, all substantially as described.

5. In a time-lock, a pivotal lever having a hook and a lug at or near the free end thereof forming stops, the actuating-lever of a permutation-lock, and a disk eccentrically placed on the spindle of said lock, said pivotal lever and said actuating-lever being connected together and the free end of said actuating-lever connected with the periphery of said eccentrically-pivoted disk, whereby rotation of said disk produces movement in said actuating-lever and in said pivotal lever, in combination with a spindle, a dog placed thereon adapted to engage with the hook on said pivotal lever, a plate also placed on said spindle, and a dog on said plate adapted to engage with the teeth of one of the wheels of the train of a chronometer, and a stop on said plate adapted to engage with a lug on said pivotal lever, all substantially as described.

6. In a time-lock, lever E, having stops *c'* and *c''* thereon, spindle K, dog F, having stops P' and *f* thereon placed on said spindle K, dog M', pivoted on dog F and adapted to engage with the teeth of one of the wheels of the train of a chronometer, spindle *k*, dog L' and arm L'' on said spindle *k*, and stops S and *f''* on dog L', in combination with the actuating-lever of a permutation-lock connected to said lever E, all substantially as described.

7. In a time-lock, lever E, having stops *c'* and *c''* thereon, spindle K, dog F, having stops P' and *f* thereon placed on said spindle K, dog M', pivoted on dog F and adapted to engage with the teeth of one of the wheels of the train of a chronometer, spindle *k*, dog L' and arm L'' on said spindle *k*, and stops S and *f''* on dog L', in combination with the actuating-lever of a permutation-lock connected to said lever E, all substantially as described.

8. In a time-lock, lever E, having stops *c'* and *c''* thereon, spindle K, dog F, having stops P' and *f* thereon placed on said spindle K, dog M', pivoted on dog F and adapted to engage with the teeth of one of the wheels of the train of a chronometer, spindle *k*, dog L' and arm L'' on said spindle *k*, and stops S and *f''* on dog L', in combination with the actuating-lever of a permutation-lock connected to said lever E, and eccentrically-pivoted disk D' on the spindle of said permutation-lock, all substantially as described.

9. In a time-lock, lever E, having stops *c'* and *c''* thereon, spindle K, dog F, having stops P' and *f* thereon placed on said spindle K, dog M', pivoted on dog F and adapted to engage with the teeth on one of the wheels of the train of a chronometer, spindle *k*, dog L' and arm L'' on said spindle *k*, and stops S and *f''* on dog L', in combination with the actuating-lever of a permutation-lock connected to said lever E, and permutation-wheel D', having a V-shaped slot therein, whereby the rotating of the spindle of the permutation-lock and said wheel D' will produce movement in said lever E, all substantially as described.

10. In a time-lock, a chronometer having an hour-wheel with a hub thereon projecting through the front plate of the chronometer and a shoulder thereon, a spring placed on said hub and against said shoulder, and a slotted disk having a squared hub thereon, in combination with a key adapted to engage with said squared hub, whereby said slotted disk may be adjusted by said key independently of said hour-wheel, and the said hour-wheel actuating said slotted disk in the running down of said chronometer, all substantially as described.

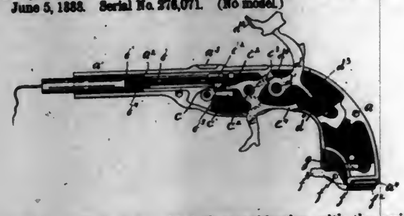
404,273. HEATING-STOVE. ROBERT A. GARDNER and DAVID GARDNER, Baltimore, Md. Filed June 22, 1888. Serial No. 277,912. (No model.)

Claim.—The combination, with a latrobe-stove, of the smoke-flues connected with the stove-body, the air-heating chambers interposed between the smoke-flues and the stove-body and having hot-air-exit orifices in their upper portions, a thimble or flue for conducting the products of combustion to a chimney, the stove-base having a continuous flue communicating with the smoke-flues and air-inlet flues communicating with the air-heating chambers, and a casing or hood partially surrounding the stove and having an air-supply flue, substantially as described.

404,274. WICK-RAISING ATTACHMENT. PATRICK J. GLYNN, Highland, N. Y. Filed June 19, 1888. Serial No. 277,610. (No model.)

Claim.—1. The combination, with a lamp-fount provided with a vertical shaft carrying a bevel-gear and a burner provided with the usual threaded portion, and a wick-shaft provided with a bevel-gear, of an internally-threaded collar revolubly held to the fount, substantially as shown and described.

2. The combination, with the fount O, having the flanged ring L, with flange L^2, permanently secured in the neck-opening of the fount, of the rotary collar E, having an internal shoulder engaging the flange L^2, substantially as shown and described.



3. The combination, with the fount O, the threaded collar E, revolubly held to the fount, the shaft G, and pinion B', of the burner D, the shaft A, and pinion B, substantially as shown and described.

4. The combination, with a lamp having its neck formed with an internally-screw-threaded revoluble collar, a burner having a screw-threaded portion adapted to engage the screw-threaded collar, and a horizontal wick-shaft provided with a bevel gear-wheel, of a vertical operating-shaft mounted on the lamp and having a bevel gear-wheel adapted to mesh with the bevel gear-wheel on the horizontal wick-shaft, substantially as shown and described.

5. The combination, with a lamp having its neck formed with an internally-screw-threaded revoluble collar, a burner having a screw-threaded portion engaging the screw-threaded collar and seated on the neck of the lamp, and a horizontal wick-shaft provided with a bevel gear-wheel, of a vertical operating-shaft mounted on the lamp and having a bevel gear-wheel meshing with the gear-wheel on the wick-shaft, and an arm mounted on the lamp and having a notched end in which the wick-shaft rests, substantially as shown and described.

6. A lamp consisting of the fount O, with the revoluble ring B, revolubly attached thereto at the opening of the fount and having the internally-screw-threaded portion K, the burner D, having the screw D', engaging the screw-threaded portion K of the ring E, the horizontal wick-shaft A, provided with the bevel gear-wheel B, the tube G, mounted on the fount O and having an arm, S, with notch S' in its end, in which rests the wick-shaft A, the vertical shaft G', journaled in the tube G, and the bevel gear-wheel B' on the upper end of the shaft G, meshing with the gear-wheel B on the shaft A, substantially as shown and described.

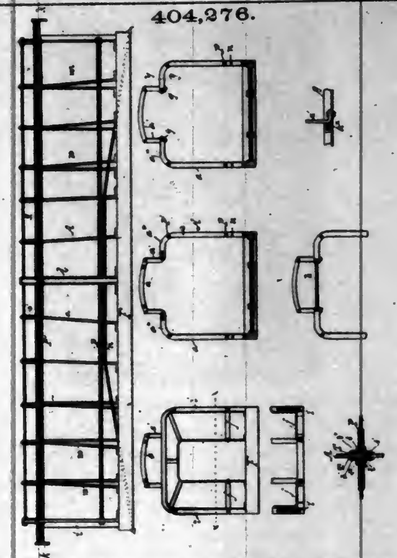
404,275. TOY PISTOL. FRANCIS I. GORDON, Buffalo, N. Y. Filed June 5, 1888. Serial No. 276,071. (No model.)

Claim.—1. In a toy pistol, the combination, with the spring-pressed plunger *b*, having a catch, b^2, of the pivoted lever *c*, having a catch to engage the same, and a rearwardly-extending spring-pressed arm, and the trigger *e*, having the extension e^2, which engages said arm and holds the catch in engagement with the plunger, substantially as shown and described.

2. In a toy pistol, the combination, with the spring-pressed plunger *b*, having catch b^2, the pivoted catch *c*, with spring-pressed extension *c'*, and the hammer *d*, having the catch d^2 and spring-pressed extension d^3, of the trigger *e*, having the catch e^2, the forward extension, e^3, and the rear spring-pressed extension or arm, e^4, all operating substantially as shown and described.

404,276. RAILWAY-CAR FRAME. WILLIAM W. GREEN and JAMES MURDOCH, Chicago, Ill., assignors to the American Fire Proof Steel Car Company, of Illinois. Filed Aug. 29, 1883. Serial No. 284,073. (No model.)

Claim.—1. In a car-frame, the combination of the metal side pieces, *a*, bent at their upper end to form the ribs a^2, with separable pieces *a'* for the arch or raised deck, substantially as described.

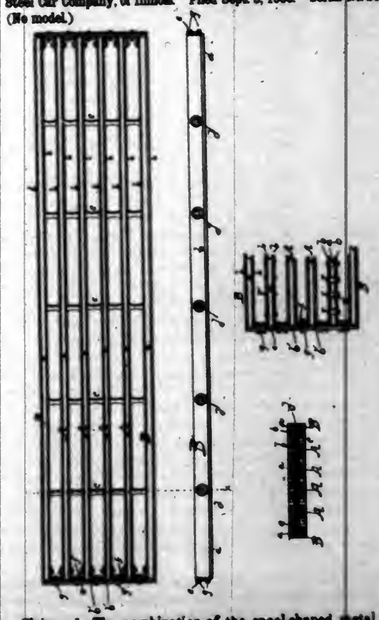


2. In a metal car-frame, the combination of the metal side pieces *a*, bent at their upper end to form the ribs a^2, with the separable pieces *a'* for the arch or raised deck and the angle-iron longitudinal member *g*, connecting the parts *a'* a^2, substantially as described.

3. In a metal car-frame, the combination of the angle-iron corner-posts *i* with the transverse frame-pieces A and their longitudinal connections, substantially as described.

4. In a metal car-frame, the combination of the transverse frame-pieces A, their longitudinal connections, and the bed-frame F with the braces *m*, extending from the bed-frame to the top plate, substantially as described.

5. In a metal car-frame, the combination of the transverse frame-pieces A and the longitudinal members P P' with the socket-pieces T

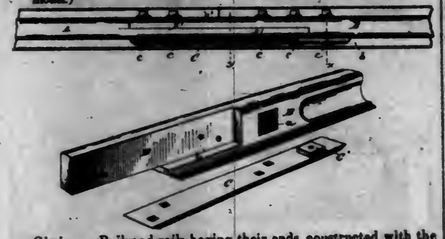


404,276.

provided with the exterior socket for the tubes and the perforation for the rods and clamped to opposite sides of the frame-pieces by the bolts *t'*, substantially as described.

6. In a metal car-frame, the combination of the transverse frame-pieces A and the longitudinal members P P' with the socket-pieces T, provided with the exterior socket for the tubes, the perforation for the rods, the interior concavity, t^3, and the filling-hole t^4, and clamped to opposite sides of the frame-pieces by the bolts *t'*, substantially as described.

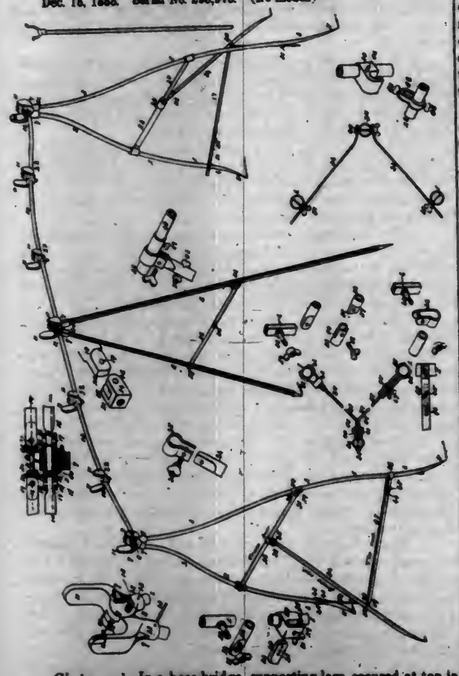
404,277. BED-FRAME FOR RAILWAY-CARS. WILLIAM W. GREEN and JAMES MURDOCH, Chicago, Ill., assignors to the American Fire Proof Steel Car Company, of Illinois. Filed Sept. 5, 1883. Serial No. 284,067. (No model.)



Claim.—1. The combination of the spool-shaped metal struts *c* and the tie-rods *d* with a series of longitudinal members, A B, arranged parallel to each other and each composed of two metal plates, *b*, connected together by bolts or rivets *r*, extending through an interposed spacing material, and by the tie-rods *d*, extending through the struts *c* from side to side of the frame, substantially as described.

2. The combination of a series of longitudinal members, A B, and terminal spacing members *f*, with the outside metal plates, *b*, bent around the corners of the frame, so as to extend longitudinally of its sides and transversely of its ends, and bolted to the spacing members *f*, substantially as described.

3. The combination of the longitudinal members A B, the terminal spacing members *f*, and the outside metal plates, *b*, bent around the corners of the frame, with the transverse end plates, *c*, bolted to the bent plates *b* and spacing members *f*, substantially as described.



4. The combination of the composite longitudinal members A B, the struts C, the tie-rods *d*, the terminal spacing members *f*, the outside plates, *b*, bent around the corners of the frame, and the transverse end plates, *c*, bolted to the bent plates *b* and spacing members *f*, substantially as described.

404,278. MANNER OF JOINTING RAILROAD-RAILS. CHARLES R. HASTINGS, Buffalo, N. Y. Filed Jan. 4, 1889. Serial No. 295,372. (No model.)

Claim.—Railroad-rails having their ends constructed with the half-rail projections A' B', adapted to break joints by overlapping each other and fitting closely side by side, each projection resting on the base *b'* of the opposite rail, and the two rails held together by the plate C, having a square leg, C', on the inside and fitting in a slot, *a*, in the side of the rail B, and the usual bolts, *c c*, all substantially as and for the purpose specified.

404,279. HOSE-BRIDGE. CHARLES J. P. HEIM, St. Louis, Mo. Filed Dec. 14, 1888. Serial No. 293,970. (No model.)

Claim.—1. In a hose-bridge, supporting-legs secured at top in cast-metal jaws hinged together and having a double seat for two lines of hose, substantially as set forth.

2. The combination of supporting-legs, jaws 7, attached to the tops of the legs and connected by a pintle, 8, and bridge 18, hinged to the pintle and having the shoulder 20, adapted to abut against the latter, substantially as and for the purpose set forth.

3. The jaws 7, having hinge-lugs 9, connected by pintle-supporting legs attached to the jaws, the upward projection 10, and horns 11, substantially as and for the purpose set forth.

4. The combination, in a hose-bridge, of jaws secured to the top of supporting-legs and adapted to support and grasp the hose, and cross-bar 23, forming extensible connection between the legs, substantially as set forth.

5. The hose-bridge having a bridge-bar, 18, supported on three pairs of legs with hinged heads composed of jaws 7, the middle head being at at higher level than the heads at the ends of the bridge.

6. The combination, in a hose-bridge support, of the legs 1, secured to hinged jaws 7 and having adjustable connection by cross-bar 23, the brace-rod 34, connected to the cross-bar, and tie-rods 37, connecting the brace-rod with the legs, substantially as set forth.

7. The combination, in a hose-bridge, of a middle pair of supporting-legs, 6, and end pair of supporting-legs, 1, made, respectively, of round and square material to distinguish them from each other, substantially as and for the purpose set forth.

8. The combination, in a hose-bridge, of supporting-legs having a cross-bar with adjustable connection with the legs, a brace-rod having adjustable connection with the cross-bar, and tie-rods connecting the brace-rods with the legs and having means of extension, substantially as and for the purpose set forth.

9. The combination in a hose-bridge, of the pairs of supporting-legs 1 at the ends of said bridge, having extensible cross-bars 23 and brace-rods 34 hinged to the cross-bars and adapted to rest on the ground.

10. The combination, in a hose-bridge, of jaws secured to the top of supporting-legs and adapted to support the hose, the cross-bars 23, extending between said legs, collars on said legs, hooks on said collars for receiving the ends of said cross-bars, and screws in said hooks adapted to impinge said bars, as and for the purpose set forth.

11. The combination, in a hose-bridge, of a pair of supporting-legs, 1, secured to the jaws 7 at top, cross-bar 23, connecting the legs, brace-rod 34, extending from the cross-bar to the ground, and tie-rods 37, one of which has adjustable connection with its leg, for the purpose set forth.

12. The combination, in a hose-bridge, of the supporting pairs of legs 1 at each end, having cross-bars 23 between the legs, brace-rods extending from the cross-bars to the ground and adjustable, the cross-bars and tie-rods extending from the brace-rods to the legs, said tie-rods at one end having notches 52, and thumb-screws 51 on the legs, adapted to engage in said notches, substantially as and for the purpose set forth.

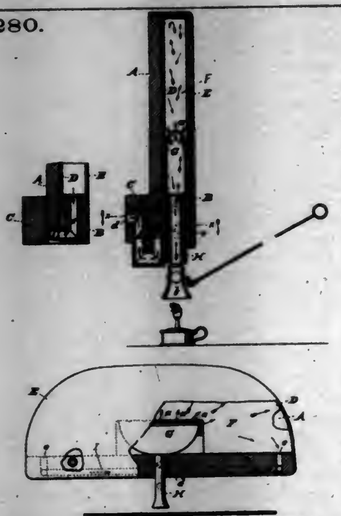
13. The supporting-legs of a hose-bridge bowed between the ends and having their lower ends inclined outward, substantially as and for the purpose set forth.

14. The combination, with the legs 1 of a hose-bridge, of cross-bar 23, brace-rod 34, tie-rods 37, connected to the brace-rod by pintle-bolt 50, and thumb-screws 53 in the brace-rod to engage the tie-rods, as set forth.

15. The combination, with the legs 6 of a hose-bridge, of the cross-bar 23, hinged to the legs and having a rule-joint, 57 58 59, and thumb-screw 56, for tightening said joint, substantially as set forth.

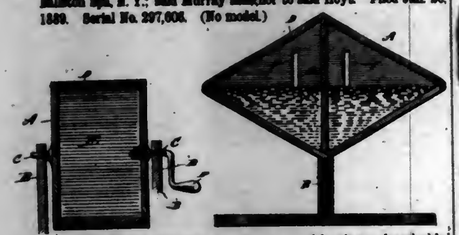
16. In a hose-bridge, the coupling between the bridge 18 and head 7, consisting of a pintle, 8, a nut, 14, screwing on the pintle and having lugs 16, and a pintle, 17, passing through the lugs and the ends of the bridge.

17. The coupling-nut 14, adapted to screw upon the pintle 8 and having lugs 16, substantially as and for the purpose set forth.



18. The combination of the two lengths of bridge 18, the head between the same, the coupling-pintle 8, the nut 14 on one end of the pintle, and the collar 61 on the other end of the pintle, serving, respectively, to couple to the pintle the two lengths of the bridge 18, substantially as and for the purpose set forth.

19. The hinge-connection between the bridge-section 18 and head of the supporting-legs, consisting of a nut, 14, with lugs 16, and pintle 17, the flat end of the bridge adapted to fit between the lugs and having a shoulder, 20, substantially as and for the purpose set forth.

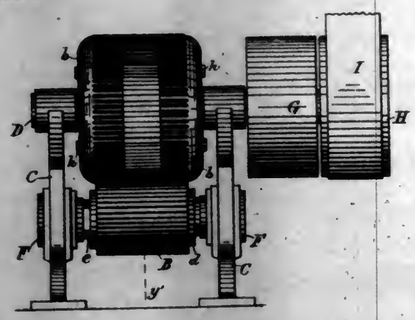


404,280. BED-FURNACE. ELWOOD R. HIATT, Noblesville, Ind. Filed Aug. 25, 1888. Serial No. 283,752. (No model.)

Claim.—The combination of the vertical wall having the metal lining and longitudinal slot, the deflector-plate having the holes in its top, the plinths B C, the metal front wall secured at its edges to the vertical wall and front plinth, the inlet-pipe, and the escape-tube communicating with the chamber F and having the outlet through the plinth, substantially as specified.

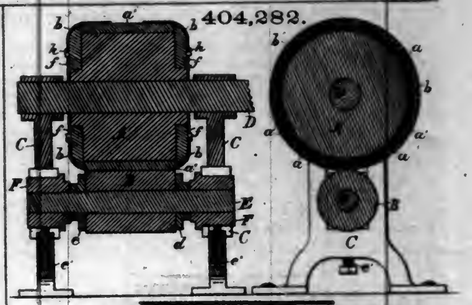
404,280.

404,281. CHURN. MATTHEW L. HOYT and HUGH F. MURRAY, Ballston Spa, N. Y.; said Murray assignor to said Hoyt. Filed Jan. 26, 1889. Serial No. 297,606. (No model.)



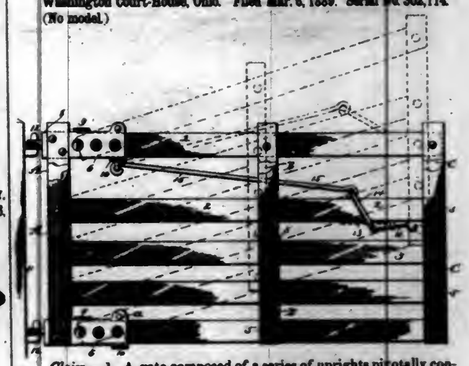
Claim.—The combination, in a churn-vessel having a rhomboidal or diamond shaped body, of an imperforate removable partition dividing the interior into two equilateral-triangular chambers, whereby the body of milk or cream in one chamber will accurately balance that in the other at all points in its revolution, substantially as specified.

404,282. TOOTH-PICK MACHINE. WILLIAM F. HUTCHINSON, Lynn, Mass., assignor to Mary E. Hutchinson, same place. Filed Sept. 3, 1887. Serial No. 248,767. (No model.)



Claim.—1. A tooth-pick machine having the drum A, with the spacers *a* and knives *a'* arranged around its periphery, and suitable springs between said knives, in combination with the drum B, substantially as shown and described.

2. The flanges *f f*, beveled as shown and provided with the slot *c*, in combination with the knives *a'* and drum A, substantially as shown, and for the purpose described.



3. A tooth-pick machine having the drum A, with the knives *a'* arranged around its periphery, and suitable springs between said knives, in combination with the drum B, substantially as shown and described.

404,282.

404,283. GATE. SAMUEL G. JAMESON and EDWARD A. BAIRD, Washington Court-House, Ohio. Filed Mar. 6, 1889. Serial No. 302,114. (No model.)

Claim.—1. A gate composed of a series of uprights pivotally connected by horizontal slats, a bracket connected with one of said uprights, and a horizontal slat having one end resting loosely in said bracket and pivotally connected to the other uprights, substantially as set forth.

2. In a gate, the combination, with horizontal and upright slats, the latter being located in pairs and the former being pivotally secured between them, of brackets secured between one pair of uprights and adapted to receive ends of the horizontal slats and limit their downward movement, substantially as set forth.

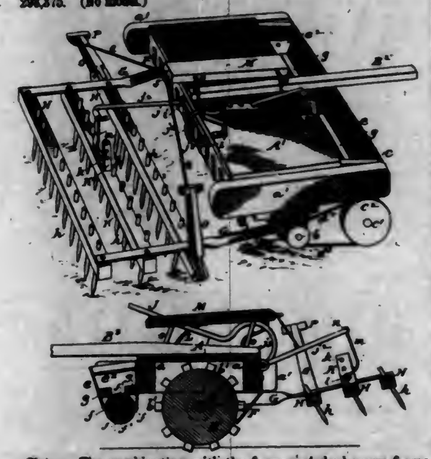
3. The combination, with a series of uprights and a series of horizontal slats pivotally connected to said uprights, of a bracket secured to one upright, a horizontal slat pivotally secured to the other uprights, with its inner end resting in the bracket, and a truss-rod for holding the gate at different angles.

4. The combination, with horizontal and upright slats and brackets secured to the latter, said brackets consisting of a pair of plates with webs on their opposite edges at diametrically-opposite points, of a truss-rod adapted to engage the gate at different points, and a latch for disengaging the truss-rod, substantially as set forth.

5. The combination, with horizontal and upright slats pivotally connected with each other, the latter being in pairs, and a pair of brackets secured between one pair of the upright slats, said brackets each consisting of a restricted neck adapted to be located between the upright slats, and a pair of plates having webs on their edges at diametrically-opposite points, of a fastening device, a truss-rod, and a latch for operating the truss-rod, substantially as set forth.

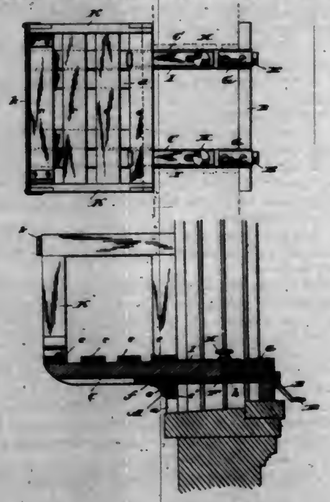
6. The combination, with a series of uprights and a series of horizontal slats pivoted thereto, of a bracket secured to one upright, a horizontal slat pivotally secured to the other uprights, with its inner end resting in the bracket, and a removable pin in the bracket above the slat therein for locking the slats in a horizontal position, substantially as set forth.

7. The combination, with horizontal and upright slats pivotally connected with each other, and brackets secured to a pair of the uprights and provided with openings to receive ends of the horizontal slats, and eyelets to receive a locking-pin over the horizontal slats, of a link loosely mounted on one of the horizontal slats, a truss-rod connecting this link with one of the brackets, and a latch-rod for operating the link, substantially as set forth.



404,284. SPRING-WASHER. FRANK G. JOHNSON, New York, N. Y. Filed Oct. 17, 1888. Serial No. 288,338. (No model.)

404,284.



Claim.—A spring-washer, A A, for bolts having its zone in the form of a zigzag strip of metal, and having its said zigzag zone from the inner to the outer turns thereof concave on one of its sides and convex on the other side, whereby no part of the metal is compressed or stretched when the washer is flattened out, substantially in the manner and for the purpose set forth.

404,285. COMBINED PULVERIZER, SEEDER, AND HARROW. FRANKIE B. KENDALL, Monmouth, Ill., assignor of two-thirds to Casper M. Dull and Mark M. Lucy, same place. Filed Feb. 1, 1888. Serial No. 298,375. (No model.)

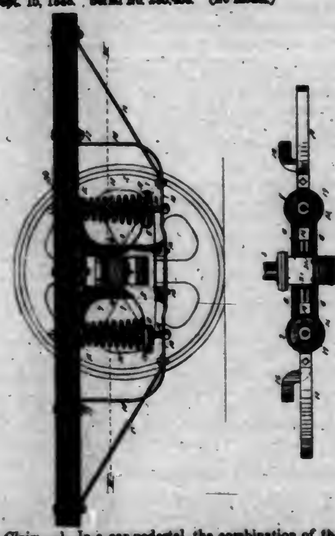
Claim.—The combination, with the frame and the harrow-frame, of the operating-lever journaled on the frame and formed with rearwardly-extending arm and right-angled portion j^3, the U-shaped piece on the harrow-frame, provided with a plurality of holes, K, and the links pivotally connected at one end with said piece and adjustable vertically, and at the other end formed with an eye, *n*, to receive the end of the portion j^3, substantially as and for the purpose specified.

404,286. PORTABLE BALCONY. MEPA I. KING and JAMES R. KING, Atlanta, Ga. Filed Jan. 31, 1889. Serial No. 298,181. (No model.)

Claim.—1. The window-balcony herein described, consisting of the sill-pieces C C, grooved longitudinally on their under edges, said sill-pieces being provided with downwardly-extending straps having outwardly-bent ends, through which straps passes a screw-threaded rod, which engages with a movable casting, *c*, said sill-pieces being provided on their upper edges with slotted straps having upwardly and inwardly bent ends, and a set-screw passing through the slots in said straps to engage with the sill-pieces, the parts being organized substantially as shown, whereby the sill-pieces can be attached to a window-frame and support a balcony rigidly thereon.

2. In combination with a balcony having a rigid removable floor made up of transverse slats, sill-pieces C, carrying on their upper edges adjustable straps I, which are adapted to clamp the floor of the balcony, the outer and inner beams, A and B, and screw-rods to clamp said beams in a window, substantially as shown, and for the purpose set forth.

404,287. HOLDER FOR BLANKS. ALBERT J. KLEINER, St. Louis, Mo. Filed June 17, 1887. Serial No. 241,656. (No model.)

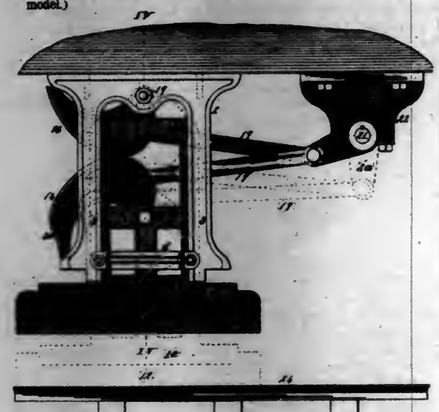


Claim.—1. The combination of the unjointed or integral bottom board, 1, the board 4 and strip 3, hinged together, and the U-shaped spring-clips having legs of different lengths and each having its longer leg pivoted to said board 1 nearer to the end than to the sides of said board and adapted to revolve in a plane therewith and embrace strip 3 with its short leg, as set forth.

2. In a holder for blanks, the combination, with the boards 1 4, between which the blanks rest, and the strip 3, hinged to the board 4 for resting upon the ends of the blanks, of the U-shaped spring-clips 6, having one leg pivoted to the bottom and near the corners of the board 1, and adapted to rotate around said corners in a plane with the board 1, whereby said clip is adapted to embrace strip 3 and board 1 between its legs, as set forth.

3. In a holder for blanks, the combination, with the boards 1 4, between which the blanks rest, and the strip 3, hinged to the board 4, of the U-shaped spring-clips 6, each having one leg longer than the other, and said longer legs being pivoted to the under side of the board 1 at a distance from the end of said board less than the length of the short leg of said clip, whereby the latter is adapted to rotate in a plane with said board 1 and to clasp or unclasp the board 1 and strip between its legs, as set forth.

404,288. CAR-PEDESTAL. PETER M. KLINE, St. Louis, Mo. Filed Sept. 15, 1888. Serial No. 285,438. (No model.)

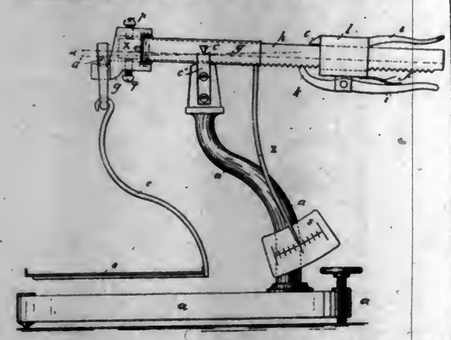


Claim.—1. In a car-pedestal, the combination of the main casting having arms with disks secured to their outer ends, a frame secured to the car-body and having arms embracing the body of the

casting and extending below strap secured to the lower end of the frame and connected to the car-body, and springs fitting at top in disks formed upon the frame by means of bolts and at bottom in disks formed upon the casting and connecting-bolts, substantially as and for the purpose set forth.

2. In a car-pedestal, the combination of the casting 5, frame 9, and rubber blocks 30, placed between the frame and the body of the car, substantially as and for the purpose set forth.

404,289. TRACK-BRAKE FOR STREET-RAILWAY CARS. PETER M. KLINE, St. Louis, Mo. Filed Feb. 12, 1889. Serial No. 299,663. (No model.)

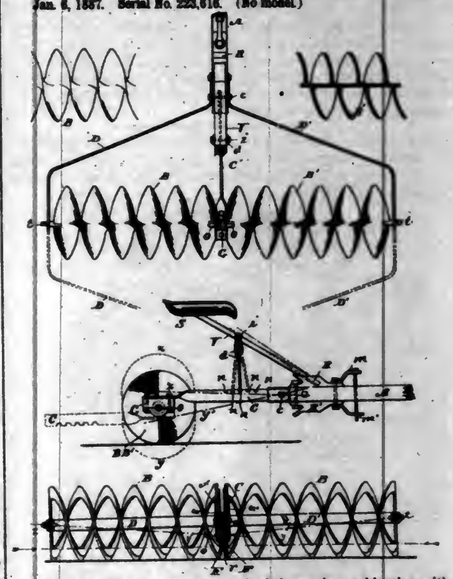


Claim.—1. In a track-brake, the combination of a fixed frame, a movable frame carrying a brake-shoe, pivoted cams, and mechanism for operating the cams to apply the brake, substantially as and for the purpose set forth.

2. In a track-brake, the combination of an outer frame, an inner frame, a shoe secured to the inner frame, a cam pivoted to the outer frame, a cam pivoted to the inner frame, links connected to the cams, a crank, a shaft to which the crank is secured, and an operating-lever, substantially as and for the purpose set forth.

3. In a track-brake, the combination of an outer frame consisting of end pieces, 3, top piece, 4, connecting-bars 6, an inner frame having a brake-shoe, 12, and lugs 13, cams 14 and 16, pivoted to the respective frames, and operating mechanism, substantially as and for the purpose set forth.

4. In a track-brake, the combination of the frames 2 and 8, cams 14 and 16, pin 30, and means for moving the cams, the frame 8 carrying a brake-shoe, substantially as and for the purpose set forth.



404,290. WEIGHING-SCALES. FERDINAND KOCH, Hanover, Prussia, Germany. Filed July 6, 1887. Serial No. 243,489. (No model.) Patented in Germany Feb. 4, 1887, No. 40,194, and July 10, 1887, No. 42,373; in Belgium May 31, 1887, No. 77,514; in France June 22, 1887, No. 184,379, and in England June 23, 1887, No. 8,958.

Claim.—1. In scales or balances, the set-screws *p q*, the lever *h*, and socket *g*, the said lever being pivoted in the socket *g*, and the said socket *g* bearing the knife-edges *d* and *c* and being so arranged that the lever *h*, bearing or forming the sliding weight, is adjusted by means of said set-screws, so that the line passing through the center of gravity in the direction of its length can be adjusted with reference to the two knife-edges *d* and *c*, for the purpose as described.

2. In scales or balances, the lever *h* and socket *g*, the socket *g* being provided with the knife-edges *d* and *c*, and means for adjusting the position of said knife-edges in relation to the lever or beam *h*, which bears or forms the sliding weight, for the purpose as described.

404,291. PULVERIZER. CHARLES LA DOW, Albany, N. Y. Filed Jan. 8, 1887. Serial No. 223,616. (No model.)

Claim.—1. In a pulverizer, a draft-frame, in combination with two independently-revolving opposing spiral cutters set in substantially a straight line with each other and adapted to turn furrows from each other as the implement is drawn forward.

2. In a pulverizer, a draft-frame, in combination with two independently-revolving and opposing spiral cutters adapted to cut and turn furrows in the soil when said cutters are set in line with each other.

3. In a pulverizer, a draft-frame, in combination with two spiral cutters, B B', adapted to revolve independently of each other, said cutter-blades being adapted to enter the earth in substantially the position shown in Figs. 8 and 10 of the drawings.

4. In a pulverizer, a draft-frame, in combination with two independently-revolving and opposing spiral cutters, the blades of each cutter being supported by their ends only and shaped to have both horizontal angle and vertical pitch within themselves.

5. In a pulverizer, two spiral cutters adapted to oppose each other, in combination with a reversible draft-frame.

6. In a pulverizer, two cutters adapted to oppose each other, in combination with the frame D D' and bar C, said frame being adapted to be reversed on its journal-bearings.

7. In a pulverizer, a draft-frame, in combination with two opposing spiral cutters adapted to vibrate vertically at their inner ends.

8. In a pulverizer, a draft-frame, in combination with two independently-revolving spiral cutters adapted to turn furrows when set in line with each other, and adapted to abut directly against each other at their inner ends.

9. In a pulverizer, a draft-frame, in combination with two independently-revolving spiral cutters recessed at their inner ends, substantially as shown.

10. In a pulverizer, a draft-frame, in combination with two independently-revolving spiral cutters adapted to turn furrows when drawn forward in one direction, and to roll over the ground without cutting it up when drawn backward, or in the opposite direction.

11. In a pulverizer, a draft-frame, in combination with two shaftless or hollow spiral cutters arranged on opposite sides of a central draft-line, the blades of one cutter opposing the blades of the other, so as to cut and divide the soil and turn it outward from between the cutters when the machine is drawn in one direction, and adapted to roll over the soil without cutting it up when the machine is drawn backward in the opposite direction.

12. In a pulverizer, a draft-frame, in combination with two revolving shaftless or hollow spiral cutters, the blades of one cutter being adapted to present an opposing angular and vertical pitch relatively to the other cutter, so as to create suction when revolved forward against the soil, and adapted to present a convex surface to the soil when revolved backward in the opposite direction.

13. In a pulverizer, a draft-frame and two gangs of cutters connected therewith, with the inner cutting-edges of the gangs in close proximity to each other, the inner ends of said gangs being formed with recesses extending into the gangs beyond their cutting-edges, in combination with mechanism located within said recesses and adapted to couple the inner ends of the gangs together.

14. In a pulverizer, the bar D D', or equivalent thereof, two cutters, and the bar C, or equivalent center connection, in combination with an angular or downward projection attached to the center connection and adapted to limit the vertical movement of the inner ends of the cutters.

15. In a pulverizer, the bars D D', or equivalent thereof, two cutters, and the bar C, or equivalent center connection, in combination with an angle or downward projection attached to the center connection, with the wheel r mounted on said projection.

16. In a pulverizer, a draft-frame, in combination with shaftless or hollow spiral cutters mounted upon each other in such manner as to have horizontal angles and vertical pitch within themselves.

17. In a pulverizer, a draft-frame and two spiral cutters, in combination with the buffer-rings *h h*, or equivalent mechanism, adapted to counteract the side-thrusts of both cutters between their inner ends and at a point below the center of their revolution.

18. In a pulverizer, a draft-frame and two vibrating cutters adapted to oppose each other, in combination with mechanism located and acting between the inner ends of the cutters in the same vertical plane as the cutters for limiting the vertical vibration of said cutters.

19. In a pulverizer, a draft-frame and two independently-revolving cutters, in combination with a wheel located between the inner ends of said cutters and adapted to have contact therewith on opposite sides of said wheel.

20. In a pulverizer, two cutters and a draft-frame attached to the outer ends of said cutters, in combination with a center coupling adapted to have contact at two points with the inner end of each cutter.

21. In a pulverizer, a draft-frame and two cutters, in combination with the buffer-rings *h h*, each ring being fastened to its cutter at two points.

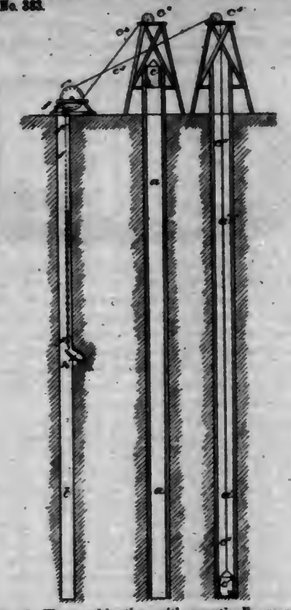
22. In a pulverizer, spiral cutters having continuous cutting-edges revolving independently of each other, and a draft-frame attached to the outer end of each cutter, in combination with a center coupling for the cutters, which permits the cutting-blades of one cutter to revolve in close proximity to the blades of its fellow cutter.

23. In a pulverizer, a spiral cutter, in combination with the buffer-ring *h* and web *w*.

24. As a new article of manufacture, a spiral cutter twisted from sheet metal, so as to form solid blades that are concave or dishing in cross-section, substantially as shown in Fig. 10.

25. In a pulverizer, a draft-frame, in combination with two independently-revolving opposing spiral cutters, whose action can be reversed by applying the draft of the animals in opposite directions relatively to said cutters.

26. In a pulverizer, a draft-frame, two vertically-vibrating cutters flexibly connected at their inner ends, and a seat adjustably hinged to the draft-frame, in combination with mechanism for applying more or less of the weight of the driver directly to the inner ends of the cutters for limiting their vertical vibrations.



27. In a pulverizer, a draft-frame, two vertically-vibrating independently-rotating cutters arranged on opposite sides of the central draft line, and a seat hinged to the draft-frame, in combination with adjustable mechanism attached to the seat by means of which the pressure of the driver's weight upon the inner ends of the cutters can be varied.

28. In a pulverizer, a draft-frame adapted to be reversed by turning it upside down, two cutters, and a seat for the driver mounted on the draft-frame, in combination with suitable seat-supporting devices which are adapted to maintain the seat upon opposite sides of the draft frame.

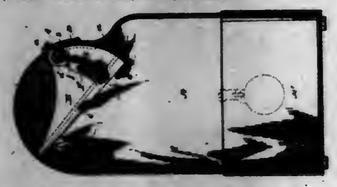
29. In a pulverizer, a draft-frame with two gangs of cutters connected therewith with their inner cutting-edges in close proximity to each other, the inner ends of the gangs having recesses extending into them beyond the inner cutting-edges of the gangs, in combination with mechanism located within said recesses adapted to counteract or receive the side-thrusts of the gangs.

30. In a pulverizer, two gangs of cutters and a draft-frame attached to the outer ends thereof, in combination with independently-revolving wheel mechanism located between the inner ends of the gangs and adapted to counteract the side-thrust of the same, the thrust of the gangs being imparted to or received by said wheel mechanism at a point thereon outside of its center of revolution.

404,292. APPARATUS FOR EQUALIZING THE STRAIN ON WINDING-GEAR. GEORGE LAMBELL, Sandhurst, Victoria. Filed June 23, 1888. Serial No. 277,359. (No model.) Patented in Victoria Nov. 25, 1887, No. 5,465; in New South Wales Nov. 26, 1887, No. 358; in Queensland Jan. 14, 1888; in New Zealand Jan. 27, 1888, No. 2,788; in England Feb. 20, 1888, No. 2,519; in South Australia May 12, 1888, No. 1,022; in Tasmania May 12, 1888, No. 572/10; in Belgium June 21, 1888; in France Aug. 30, 1888; in Italy Sept. 1, 1888, and in India Sept. 20, 1888, No. 383.

Claim.—1. The combination, with a vertically-movable body and the haulage-rope from which said body is suspended, of a like movable flexible body composed of sections of increasing weight, the aggregate weight of the sections being equal to that of the haulage-rope and the body suspended therefrom, said bodies being arranged to move simultaneously, but in opposite directions, substantially as and for the purposes specified.

2. The combination, with a vertically-movable body and the haulage-rope from which said body is suspended, of a like movable flexible body composed of sections of increasing weight, the aggregate weight of the sections being equal to that of the haulage-rope and the body suspended therefrom, said bodies being arranged to move simultaneously, but in opposite directions, and an abutment or stop in the path of the flexible body to limit its downward motion and cause it to accumulate thereon, substantially as and for the purposes specified.



3. The combination, with two bodies of substantially the same weight, movable simultaneously in reverse directions, the haulage-ropes from which said bodies are suspended, and a winding-drum for each of said ropes, of a flexible vertically-movable counterpoise whose weight is equal to that of the haulage-rope of one of the movable bodies, a stop in the path of the counterpoise to limit its downward motion, a winding-drum for said counterpoise, a driving-shaft common to all the winding-drums, and a reversing mechanism operating to reverse the movement of the counterpoise when the two bodies have reached the same altitude, substantially as and for the purposes specified.

4. The combination, with two bodies of substantially the same weight, movable simultaneously in reverse directions, the haulage-ropes from which said bodies are suspended, and a winding-drum for each of the haulage-ropes, of a flexible vertically-movable counterpoise made up of sections of increasing weight, the aggregate weight of said sections being equal to that of one of the haulage-ropes, or such haulage-rope and body suspended therefrom, a stop in the path of said counterpoise to limit its downward motion, a winding-drum therefor, a driving-shaft common to all the winding-drums, and a reversing mechanism operating to reverse the movement of the counterpoise when the two bodies have reached the same altitude, substantially as and for the purposes specified.

5. The combination, with two bodies of substantially the same weight, movable simultaneously in reverse directions, the haulage-

ropes from which said bodies are suspended, and a winding-drum for each of the haulage-ropes, of a flexible vertically-movable counterpoise made up of sections of increasing weight, the aggregate weight of said sections being equal to that of one of the haulage-ropes, or such haulage-rope and body suspended therefrom, a stop in the path of said counterpoise to limit its downward motion, a winding-drum therefor, a driving-shaft common to all the winding-drums, and a reversing mechanism operating on the counterpoise to reverse its movement without reversing the rotation of the winding-drum, substantially as and for the purposes specified.

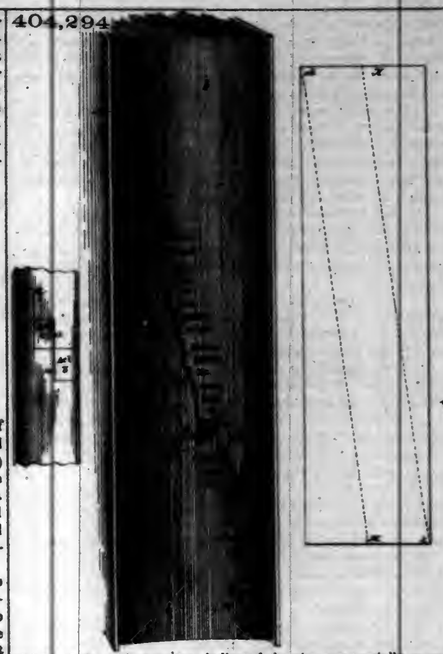
404,293. LETTER-BOX. JOHN T. LENMAN, Washington, D. C. Filed Feb. 8, 1889. Serial No. 299,099. (No model.)

Claim.—1. The combination, with a box the upper portion of which is rounded and has a letter-opening, of a tray pivoted in said rounded portion, and mechanism for operating it, (the said tray,) which comprises a bottom piece, side pieces whose front ends describe an arc of a circle coincident with the curvature of the box, and a front plate secured to the side pieces and partly closing the front end of the tray, being of such length and width that when in a horizontal position it will fill the space between the four walls of the box, substantially as described, and for the purposes stated.

2. The combination, with a box having an inward curve from its front side and a rounded upper portion, in which is formed the letter-opening, of a tray pivoted in said rounded portion and arranged to tilt downward at its front end, and mechanism for operating it, (the said tray,) which comprises a bottom piece, side pieces whose front ends describe an arc of a circle coincident with the curvature of the box, and a front plate secured to the side pieces and partly closing the front end of the tray, being of such length and width that when in a horizontal position it will fill the space between the four walls of the box, substantially as described, and for the purposes set forth.

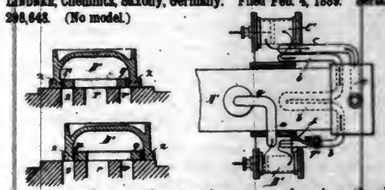
3. The combination, with a box having an inward curve from its front side and a rounded upper portion, in which is formed the letter-opening, and a hinged lid covering said opening, of a tray pivoted in said rounded portion of the box and arranged to tilt downward at its front end, and mechanism for simultaneously raising the tray and lid, the said tray, which comprises a bottom piece, side pieces whose front ends describe an arc of a circle coincident with the curvature of the box, and a front plate secured to the side pieces and partly closing the front end of the tray, being of such length and width that when in a horizontal position it will fill the space between the four walls of the box, substantially as described, and for the purposes set forth.

4. The combination, with the box and the tray pivoted therein constructed as described, of the hinged lid which covers the letter-opening, having a lug that extends into the box, a lever pivoted to the tray and engaging at its upper end with said lug, and a stud secured to the tray and passing through the slotted lower end of said lever and a slot in the box, whereby the lid is caused to be raised by the upward movement of the receiving end of the tray, substantially as described.



404,294. METHOD OF INDEXING BOOKS. WILLIAM M. LESTER, Springfield, Mass. Filed Jan. 26, 1889. Serial No. 297,673. (No model.)

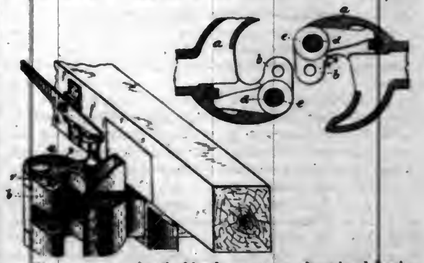
Claim.—1. The improved method of indexing books herein described, the same consisting in indicating by delineating or otherwise marking on the combined edges of the leaves configurations having widths corresponding to the combined widths of the leaves comprising the subject-matters of the book, substantially as described



2. The improved method of indexing books herein described, the same consisting in indicating by delineating or otherwise marking on the combined edges of the leaves configurations having widths corresponding to the combined widths of the leaves comprising the subject-matters of the books, and in marking symbols on the edges of the book on or near said configurations to identify the subject-matters, substantialy as described.

3. The improved method of indexing books herein described, the same consisting in indicating by delineating or otherwise marking on the combined edges of the leaves configurations having widths corresponding to the combined widths of the leaves comprising the subject-matters of the book, and in indicating subdivisions of the widths of any or all of said configurations to determine the subdivisions of the subject-matters indicated thereby, substantially as and for the purpose described.

404,294



404,295. STARTING-GEAR FOR COMPOUND ENGINES. ROBERT LINDNER, Chemnitz, Saxony, Germany. Filed Feb. 4, 1889. Serial No. 298,643. (No model.)

Claim.—1. In a starting-gear for compound engines, the slide-valve D', with the ports *p q* on the exhaust side of the same fitted to the high-pressure cylinder, in combination with a high-pressure cylinder, B', and low-pressure cylinder C', and a steam-pipe, *a*, fitted with a suitable valve leading into the receiver-pipe *b*, substantially and for the purpose as described.

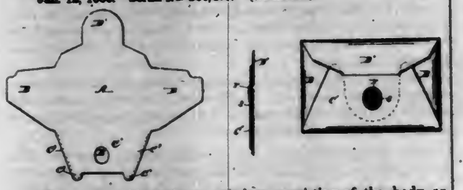
2. In a starting-gear for compound engines, the combination of the valve D', cylinders B' and C', valve V', with plug *d*, having the ports *m* and *n* at right angles to each other, lever *g*, and rod *k*, connecting the said lever *g* to the reversing-lever *h* and pipe *b*, substantially and for the purpose as described.

404,296. CAR-COUPLING. OTHO E. MICHAELIS, U. S. Army, assignor, by mesne assignments, to the Consolidated Coupling Company, New York, N. Y. Filed Apr. 20, 1888. Serial No. 271,233. (No model.)

Claim.—1. In a vertical-hook coupler, a draw-head having a vertical axis or hook fulcrum, and a hook-supporting surface, as a shelf or ledge, *s*, independent of said axis, combined with a hook or knuckle having an enlarged socket or bearing fitting said axis loosely, whereby the hook is adapted to play laterally on its axis, and provided with a bearing-surface, as *s'*, arranged to co-operate with the surface *s* of the draw-head, whereby the hook is adapted to come to a bearing on the draw-head without subjecting said axis to injurious stress or strain, as set forth.

2. In a vertical-hook coupler, a draw-head having a vertical axial pin, *c*, and a hook-supporting surface, as *s'*, independent of said pin, combined with a hook or knuckle formed to bear against said supporting-surface, and having an enlarged orifice, *d*, receiving said pin, and a bearing-surface, as *e*, the arrangement being such that all stress or strain exerted on the hook by an opposing coupler is supported by the said surfaces of the draw-head and hook, and the pin is relieved from such stress or strain, as set forth.

3. In a car-coupling, the combination, with the draw-head, the hook, and the loose pivotal connection between the draw-head and hook, of shoulders or abutments on the hook and corresponding shoulders or abutments on the draw-head, against which those on the hook take their bearings to prevent further rotation of and take up thrust on the hook and protect the pivot, substantially as described.



4. In a car-coupler, and in combination with a draw-head of the Dowling type, provided with a buffing-shoulder on the top and bottom plates of said draw-head, the buffing-surface of which is at substantially right angles to the axis of the coupler, a movable knuckle movable in said head and provided with a buffing-surface, also substantially at right angles to the axis of the coupler, and corresponding, when the knuckle is closed, with the buffing-surface of the draw-head, whereby the blow received by the knuckle in coupling is transmitted in a plane substantially parallel to the axis of the coupler.

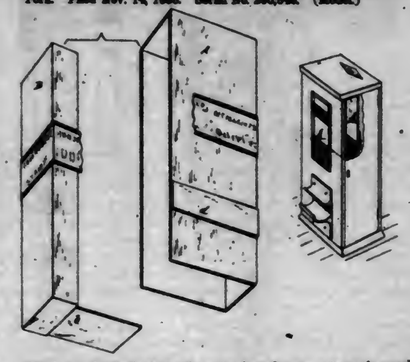
404,297. OIL-BURNER. MARTIN D. MILLER, Leavenworth, Kans. Filed Sept. 3, 1888. Serial No. 284,490. (No model.)

Claim.—In an oil-burner for stoves, grates, &c., the combination, with a perforated supply-pipe, A, of the plate B, bent around such pipe and back upon itself, forming a space between said plates to be filled with a suitable absorbent, the lower plate extended to form the hearth for the oil, said plate to be provided with air-inlet slots, and the plate C and casing D, secured to and extending above said plate, and having air-inlet slots, forming a combustion-flue, all substantially as described.

404,298. ENVELOPE. ELISHA MORGAN, Springfield, Mass. Filed Jan. 12, 1888. Serial No. 260,479. (No model.)

Claim.—1. A blank for an envelope consisting of the body or main portion, the side flaps, the bottom flap cut away at its outer portion so as to form extensions, as described, and having the perforation in it, and the loose or top flap.

2. An envelope consisting of a body or main portion, side flaps folded inward, the bottom flap cut away at its outer portion so as to form extensions, as described, and folded down upon the side flaps and secured at its lateral edges thereto, and the loose flap having a tongue adapted to be inserted beneath the bottom flap and between the extensions thereof, as described.

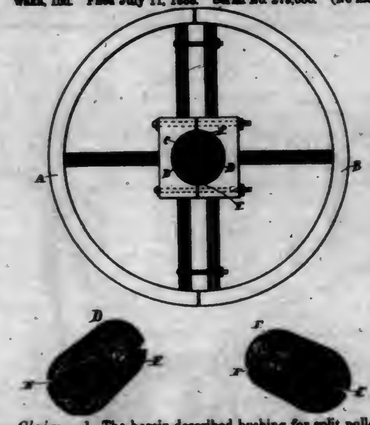


3. An envelope having a loose flap provided with the tongue-extension and a pocket or receptacle in one of its sides formed to receive the tongue of the loose flap and having a perforation in one of the walls of said pocket, through which the finger may be inserted for the purpose of sliding the loose flap and opening the envelope, and having the other wall of the pocket opposite the perforations left intact, substantially as described.

4. The herein-described envelope, consisting of the main portion, the overlapped side flaps, the bottom flap cut away at its extremity so as to form the extensions and having the perforation in it, and the loose flap having the tongue, substantially as described.

5. An envelope consisting of the main portion, the side flaps, the bottom flap having the perforation, and the loose flap having a ridge or projection formed on its tongue for engagement with the edge of the perforation in the lower flap to prevent said loose flap from working out, substantially as described.

6. The herein-described envelope having a loose flap provided with a roughened portion on its tongue, as described, and a pocket or receptacle for receiving the said tongue, having an opening or perforation through which said roughened portion of the tongue is exposed when the envelope is closed, substantially as described.

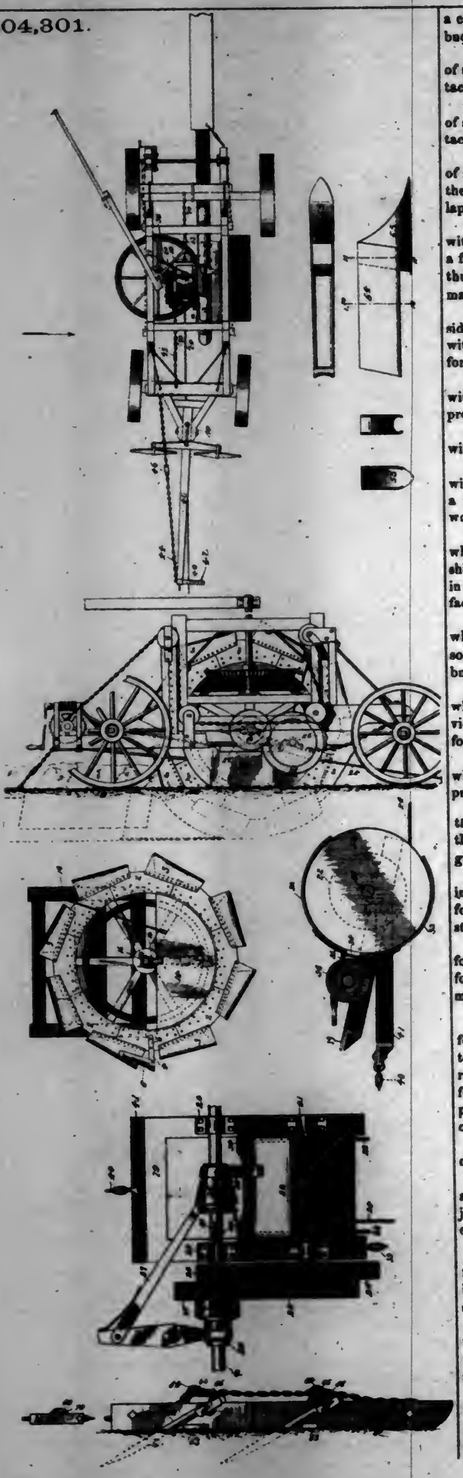


404,299. CIGARETTE-BOX FOR AUTOMATIC VENDING APPARATUS. JAMES M. O'KELLY, New York, N. Y., assignor, by direct and mesne assignments, to the Automatic Vending Box Company, of New York. Filed Nov. 14, 1888. Serial No. 290,548. (Model.)

Claim.—1. A cigar or cigarette box for an automatic vending apparatus, composed of a body open at the top and at one end, and a detachable lid provided with an extension-flap for closing the open end of the box, substantially as set forth.

2. A cigar or cigarette box for an automatic vending apparatus, consisting of a body having an open end, a transverse shoulder extending at one side of the body, and a lid having an extension-flap closing the open end of the box, substantially as set forth.

404,300. BUSHING FOR PULLEYS. FRANK G. PERKINS, Michawaka, Ind. Filed July 11, 1888. Serial No. 279,680. (No model.)



Claim.—1. The herein-described bushing for split pulleys, consisting of a cylindrical tube or sleeve composed of a flexible fibrous material split longitudinally at one side, so that it can be opened and sprung over a shaft, and longitudinally grooved on its exterior surface, substantially as and for the purpose specified.

2. The combination of the shaft and the sectional pulley having a diametrically-divided hub with the bushing D, composed of a flexible fibrous material having a longitudinal split, E, and an external groove, F, diametrically opposite said split, said bushing being interposed between the pulley-hub and shaft in such position that the joints of the hub will come, respectively, over split E and groove F, substantially as set forth.

404,301. DITCHING-MACHINE. DAVID J. POWERS, Chicago, Ill. Filed Oct. 20, 1886. Serial No. 217,822. (No model.)

Claim.—1. An excavating-wheel for a ditching-machine having

404,301.

a circle of segmental metal plates attached to its frame-work and buckets attached to said plates.

2. An excavating-wheel for a ditching-machine having a circle of segmental metal plates attached to its frame-work and buckets attached to said plates and overlapping and connecting adjoining plates.

3. An excavating-wheel for a ditching-machine having a circle of segmental abutting plates about its circumference and buckets attached to said plates and overlapping and connecting adjoining plates.

4. An excavating-wheel for a ditching-machine having a circle of segmental abutting plates attached to its frame-work and lying in the plane of the wheel and buckets attached to said plates and overlapping and connecting adjoining plates.

5. In a ditching-machine, the combination of a bucket provided with a hinged side and a rear door attached to said hinged side, with a fixed stop for preventing the hinged side from opening too far, and thus causing the rear door to come in contact with a fixed part of the machine, substantially as set forth.

6. The combination of the excavating-bucket having a hinged side and a rear door attached thereto, with fixed scraper 7, provided with one or more inclined fingers, 8 9, and stop 13, substantially as and for the purpose set forth.

7. In a ditching-machine, the combination of the excavating-wheel with a protecting-shield, the edge of the shield fitting into a groove provided for its reception in the circumferential part of the wheel.

8. In a ditching-machine, the combination of the excavating-wheel with a protecting-shield hung from the axle thereof.

9. In a ditching-machine, the combination of the excavating-wheel with a protecting-shield hung from the axle thereof and provided with a stay connecting the shield with the stationary part of the frame-work of the machine.

10. In a ditching-machine, the combination, with the excavating-wheel having on one side of its felly a metal facing, of a protecting-shield suspended from the machine, the edge thereof being received in a recess provided between the felly of the wheel and the said metal facing.

11. In a ditching-machine, the combination, with an excavating-wheel provided with fixed buckets, of detachable cutting-fronts for some or all of the buckets and braces connecting the same with the bucket.

12. In a ditching-machine, the combination, with an excavating-wheel provided with fixed buckets, of a detachable cutting-front provided with a shank for attachment to the wheel and one or more braces for connecting the cutting-front with the bucket.

13. In a ditching-machine, the combination, with the excavating-wheel provided with fixed buckets, of the detachable cutting-front 4, provided with shank 5 and braces 6, substantially as set forth.

14. The combination of a ditching-machine, means for propelling the same, and a chain connecting the forward part of the tongue with the frame-work on one side, whereby a permanent inclination may be given to the front axle with reference to the frame-work.

15. The combination, in a ditching-machine, of means for driving the same, a chain connecting the frame-work on one side with the forward part of the tongue, and means for adjusting said chain, substantially as set forth.

16. The combination of a ditching-machine, a cable and drum for propelling the same, and an adjustable connection between the forward part of the tongue and the cable, whereby a fixed inclination may be given to the forward axle.

17. In a ditching-machine, the combination of a drum and cable for propelling the same, means for connecting the forward part of the tongue with the cable, whereby movement of the tongue in one direction is prevented, and a chain connecting the tongue with the frame of the machine, whereby movement in the other direction is prevented and a permanent inclination of the front axle to the frame of the machine is secured.

18. In a ditching-machine, the combination, with the tongue 45, of the arm 47 and adjustable pulley 49.

19. In a ditching-machine, the combination of a swinging frame, a cable, a drum journaled on said swinging frame, and means for adjusting said frame so as to vary the position of the drum with reference to the surface of the ground.

20. The combination, in a ditching-machine, of the swinging frame 19, the drum 22, journaled therein, and the chain 40, connecting the rear end of said frame with the frame-work for holding up said frame-work when the cable is slackened, substantially as set forth.

21. The combination of the swinging frame 19, the chain 40, connecting the rear end of the same with the main frame-work, and means for adjusting said chain, substantially as and for the purpose set forth.

22. In a ditching-machine, the combination of a cable and drum for the same, a swinging frame in which said drum is journaled, and a connection between said swinging frame and the main frame-work of the machine for determining the position of the drum when the cable is under tension and taking a part of the strain of said cable, substantially as and for the purpose set forth.

23. In a ditching-machine, the combination of a cable, a drum for the same, a swinging frame in which said drum is journaled, and a connection between that part of the frame-work in which said drum is journaled and the main frame-work of the machine, for taking the strain of the cable and determining the position of the drum, substantially as set forth.

24. In a ditching-machine, the combination of a cable, a drum for the same, a swinging frame in which said drum is journaled, a connection between said frame and the main frame-work of the machine for determining the position of said frame-work, and means for adjusting said connection.

25. In a ditching-machine, the combination of cable 24, drum 22, swinging frame 19, in which said drum is journaled, bracket 41, and chain 40, substantially as and for the purpose set forth.

26. In a ditching-machine, the combination of a metal cable, a drum, a casing for retaining the cable when slackened upon the drum, and means for adjusting the pressure of said casing upon the cable.

27. In a ditching-machine, the combination of a metal cable, a drum for the same, a casing made in two parts for retaining the cable when slackened upon the drum, said parts having rearward extensions, and means for forcing said rearward extensions apart, so as to cause the two parts of the casing to clasp the cable more tightly when desired.

28. The combination of a metal cable, a drum, a piece of casing mounted so as to swing and having rearward extensions, and means for operating on said rearward extensions to cause the casing to bear more or less heavily upon the cable.

29. The combination, with the drum, of casing 32 and 33, having rearward extensions 35 with conical plug 36, substantially as and for the purpose set forth.

30. In a ditching-machine, the combination of a cable, a drum for the same, a secondary shaft upon which said drum is mounted, a casing for retaining the cable in position upon the drum, means for adjusting the pressure of said casing upon the cable, gearing between said secondary shaft and the main shaft of the machine, means for throwing said gearing in and out of gear with the main shaft, and a connection between the means for regulating the pressure of the casing upon the cable and the means for controlling the gearing of the main shaft with the secondary shaft, whereby, when the main shaft is engeared, the pressure of the casing on the cable will be increased.

31. The combination of cable 24, drum 22, secondary shaft 21, upon which said drum is mounted, casing 32 33, having rearward extensions 35, plug 36, arm 37, gearing 25 27, clutch mechanism 29, and lever 38, substantially as and for the purpose set forth.

32. A follower for a ditching-machine narrower at the rear than at the front, whereby clogging by a caving of the walls of the ditch against its sides is prevented.

33. The combination of a ditching-machine, a follower therefor, a bridge at the rear of the follower, and an adjustable connection between the follower and the bridge.

34. The combination of a ditching-machine, a follower having an inclined rear end, and a bridge bearing against said incline, whereby the follower is prevented from tipping.

35. The combination of a ditching-machine, a follower having an inclined rear end, a bridge bearing against the same, and an adjustable connection between the bridge and the ditching-machine, whereby the bridge may be adjusted to the follower for the varying depths of ditch.

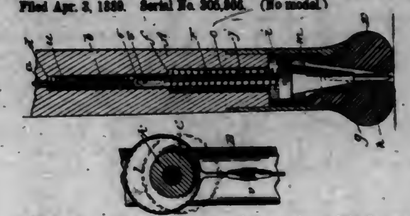
36. The combination of a ditching-machine, a cable for propelling the same, a pivoted frame for holding the cable against the surface of the ground, and a removable stop for preventing the swinging of the frame backward when the machine is in operation.

37. The combination of cable 24, pivoted frame 50, roller 52, and stop 73, substantially as and for the purpose set forth.

38. In an anchor for a ditching-machine, the combination of a frame-work, pins pivoted to said frame-work, stops for preventing said pins from turning completely around, and connections between said pins and the cable, whereby the strain on the cable causes the points of the pins to be thrown downward into the earth.

39. In a ditching-machine anchor, the combination of the frame-work, a pin attached to a shaft journaled in said frame-work, and a projection from said shaft, to which the cable is attached, whereby the tension of the cable causes the points of the pins to be automatically thrown downward into the earth.

40. In a ditching-machine anchor, the combination of pins 62, shaft 60, and projection 64, with which the cable is connected, substantially as and for the purpose set forth.

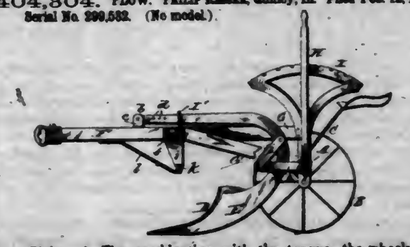


41. In a ditching-machine anchor, the combination of frame-work 56 57, pins 62, shaft 60, upwardly-projecting arm 64, and stop 63.

42. In a ditching-machine anchor, the combination, with a suitable frame-work, of pivoted pins, chain 66, and roller 71, substantially as and for the purpose set forth.

404,302. COMPOUND FOR PRESERVING TIMBER. JOSEPH W. PUTNAM, New Orleans, La. Filed Feb. 21, 1888. Serial No. 300,747. (No specimens.)

Claim.—A wood-preserving compound containing rosin, petroleum, and creosote-oil, substantially as described.



404,303. CRUTCH. LOUIS H. REMILLARD, Northampton, Mass. Filed Apr. 3, 1888. Serial No. 305,986. (No model.)

Claim.—1. A crutch having an axial bore through its lower staff portion, and having its intermediate handle-support provided with a cam mounted for rotation, a spur-spindle in said bore and a spring for forcing same outwardly, and a connection, *q*, by one end secured to said spindle and by its other provided with a ring-head engaging said cam, substantially as described.

2. A crutch having its lower staff portion axially bored and provided therein with the seats *d* and *f*, and having its intermediate handle-support provided with a cam, *l*, mounted for rotation, a shouldered spur-spindle in said axial bore having the bifurcated end and pin *s*, the connection *q*, provided at one end with the ring-head embracing said cam and at its other end with the slot by which it engages said pin, the springs *u* and *j*, and the apertured yielding knob, substantially as and for the purposes described.

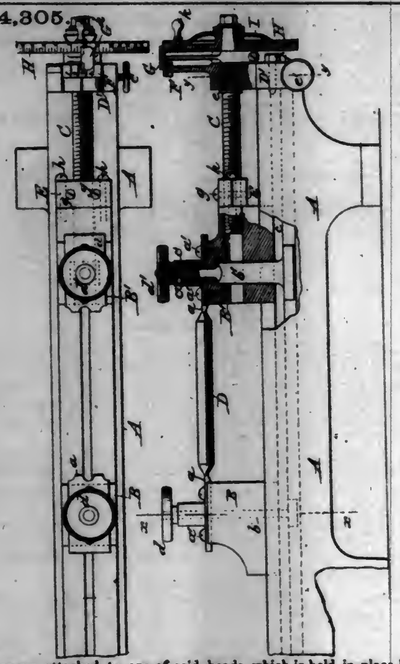
404,304. PLOW. PHILIP REBER, Quincy, Ill. Filed Feb. 12, 1888. Serial No. 299,552. (No model.)

Claim.—1. The combination, with the tongue, the wheels, the axle, and the operating-lever, of the plow-beam, curved, as shown, and pivotally connected at its forward end to the tongue, the arms A, extending forward from the axle and loosely embracing the plow-beam, and the links pivotally connected at one end to the ends of said arms, and at the other end pivotally connected to the plow-beam above said arms, substantially as shown and described.

2. The combination, with the tongue, the wheels, the axle, and the plow-beam pivotally connected at its forward end to the tongue, of the arms A, the operating-lever rigidly connected therewith, the links *i*, pivotally connecting said plow-beam and arms, the adjustable brace G, and angular brace G', secured to the axle and to the rear of the tongue, substantially as shown and described.

404,305. MICROMETER-GAGE. JOHN RICHARDS, San Francisco, Cal. Filed Dec. 29, 1880. Serial No. 23,067. (No model.)

Claim.—1. As an improvement in measuring-machines, the combination, with a dividing-wheel, of an auxiliary scale and a double pointer for the purpose of indicating the errors of the screw, substantially as shown and described.

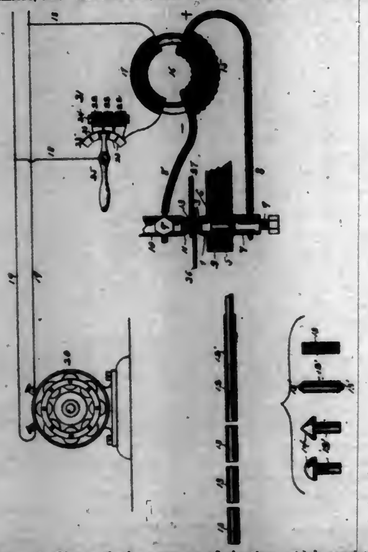


2. A movable double pointer placed between the scales of a measuring-machine, and in combination therewith, for the purpose of indicating the relation between an error-scale and a dividing-scale, substantially as set forth.

3. The combination, in a measuring-machine having inclined ways, of the measuring-screw, the movable or sliding heads provided with contact-points, and an adjustable divided nut clamped to one of the heads transversely to the axis of the screw and above the ways, said screws being placed between the contact-points and ways for the purpose of equalizing strain, substantially as specified.

4. The combination, in a measuring-machine, of a movable double pointer, a division-wheel, a slip-bar or friction-driver, an error-scale, and a measuring-screw, all constructed and arranged substantially as set forth.

5. The combination, in a measuring-machine, of ways with inclined surfaces, movable heads provided with contact-points, a measur-



404,305.

ing-screw attached to one of said heads, which is held in place by devices giving an elastic or yielding pressure, a division-wheel having a slip-bar or friction-driver, an error-scale, and a double pointer, all constructed and arranged substantially as and for the purpose shown and described.

6. In a measuring-machine, the combination, with the division-wheel, of the measuring-screw and the auxiliary scale adapted to compensate for any error of pitch in said screw, substantially as described.

404,306. PROCESS OF ELECTRIC RIVETING. ELIAS R. RICE, Baltimore, Md. Filed Mar. 5, 1889. Serial No. 301,913. (No model.)

Claim.—1. The method or process of riveting, which consists in first interposing insulating material between the rivet and the articles to be riveted, then inserting the rivet into the rivet hole or holes, then heating the rivet by the passage through the same of an electric current of comparatively great quantity and low tension, and then heading the rivet, substantially as described.

2. The method or process of riveting, which consists in interposing insulating material between the rivet and articles to be riveted, then heating the rivet to the required degree of incandescence by the passage through the same of an electric current of suitable quantity and tension, then heading the rivet and maintaining the same in the desired state of incandescence by suitably regulating the current during the heading operation, substantially as described.

3. The method or process of riveting, which consists in first interposing insulating material between the rivet and articles to be riveted, then inserting the rivet into the rivet hole or holes, then passing an electric current of comparatively great quantity and low tension through the rivet until the latter is heated to the desired degree of incandescence, then heading the rivet and at the same time maintaining the incandescence of the same by the continued flow of current, and finally gradually reducing and cutting off the current while the heading is completed, substantially as described.

4. The method or process of riveting metal structures together, which consists in first inserting a metal rivet having an insulated shank and bare conducting ends into the rivet-hole, then connecting the bare ends of the rivet with the terminals of an electric circuit, then charging said circuit with an electric current or currents of proper heating effect until the rivet is heated to the desired degree of incandescence, and then heading the rivet, substantially as described.

5. The method or process of riveting metal structures together, which consists in first inserting a metal rivet having an insulated shank and bare conducting ends into the rivet-hole, then connecting the bare ends of the rivet with the terminals of an electric circuit, then charging said circuit with an electric current or electric currents until the rivet is heated to the desired degree of incandescence, then heading the rivet while the heating-current is maintained, but gradually diminished, and finally breaking the circuit, substantially as described.

6. The method or process of riveting metal structures together, which consists in first interposing insulating material between the rivet and the articles to be riveted, then making electrical contact between the ends of the rivet and an anvil and a heading-die, respectively, which constitute the terminals of an electric circuit, then charging said circuit with an electric current or currents until the rivet is heated to the desired degree of incandescence, and then forcing the heading-die upon the rivet until the heading operation is completed, substantially as described.

7. The method or process of riveting, which consists in interposing between the rivet and the articles to be riveted a coating of insulating material, then passing an electric current of the requisite volume through said rivet to raise it to the required temperature, and then heading or upsetting the rivet, substantially as described.

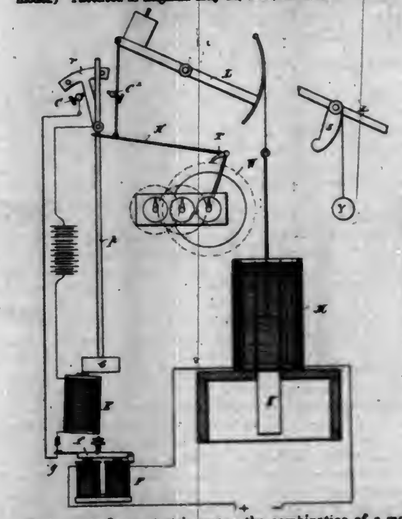
404,307. TRUSS. JOHN C. ROBEN, Wauseon, Ohio. Filed Feb. 13, 1888. Serial No. 263,775. (No model.)

Claim.—A hollow permanently-inflated rubber air-pad cast integral, and consisting of an inner convex face formed by an elastic pliable wall, a rigid flat rear wall formed by a double thickness of rubber, and a flat metal plate centrally located within and of about the same diameter as the wall, the rubber being cast around and completely surrounding said plate, thereby permanently and rigidly securing the same within the rear wall, and one or more screws or lugs extending through the outer rubber portion of the rear wall and secured to or formed with the plate, as set forth.

404,308. RAIL-JOINT. ABEL J. SCHAFF, Marion, Pa., assignor of one-half to William R. Early, same place. Filed Jan. 26, 1888. Serial No. 297,068. (No model.)

Claim.—1. In a rail-joint, the combination, with the chair having a base provided with an inclined upper surface, and having upwardly-extended flanges, and a web between said flanges, of the rail

404,308.



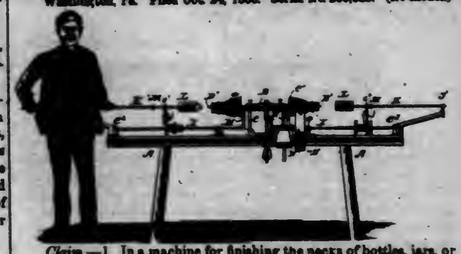
having longitudinal notches engaging said web, and the wedge inserted through the space between the rails and the inclined upper surface of the base of the chair, as set forth.

2. The combination of the chair having a base provided with an inclined upper surface, the flanges rising from the edges of said base, and the web between said flanges of the rails having longitudinal notches engaging said web, and the wedge inserted between the lower side of the rails and the upper surface of the base of the chair and having a tine adapted to be bent to one side, as set forth.

404,309. BLUE AZO DYE. JAKOB SCHMID, Basle, Switzerland, assignor to the Society of Chemical Industry, same place. Filed Sept. 24, 1888. Serial No. 286,242. (No specimens.)

Claim.—The blue dye-stuff or coloring-matter obtained by subjecting the dialkilized asonaphthalise-metaamidophenol to the action of a reducing agent and subsequent treatment with an oxidizing agent, said coloring-matter having the following characteristics: It presents a dark-blue powder of a metallic luster, which is but difficultly soluble in hot water; it dyes blue all animal fibers, as well as cotton prepared with tannin; its blue solution becomes dissolved upon the addition of a reducing agent, but when an oxidizing agent is added the blue color is immediately recovered.

404,310. ELECTRIC METER. ROBERT P. SELLON, Lambeth, County of Surrey, England. Filed Mar. 6, 1888. Serial No. 302,044. (No model.) Patented in England May 14, 1886, No. 6,508.



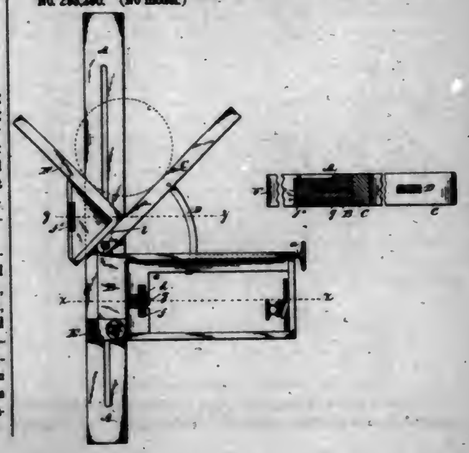
Claim.—1. In an electric meter, the combination of a moving body, such as a pendulum, a counting mechanism, a pawl for actuating the same, a link for transmitting the motion of said pendulum or body to said pawl, adjusting mechanism, as specified, for varying the point of connection between said link and said pendulum or body, and thereby varying the stroke of said pawl, and a solenoid in the circuit whose current is to be measured, the core of said solenoid being connected with and actuating said adjusting devices, substantially as described.

2. In electric meters, a moving body, such as a pendulum, a counting mechanism, a pawl or equivalent device acted upon by the said pendulum or moving body, so as to actuate the counting mechanism, a magnet or solenoid in the circuit of the current to be measured, and a lever, snail-cam, or equivalent device operated by the last-named magnet or solenoid to vary the stroke of the pawl or the like in accordance with the variation in the current to be measured, in combination with a magnet in the circuit of the said current and an armature which completes the circuit for operating the pendulum when a current to be measured is passing, all substantially as hereinbefore described.

3. In an electric meter, the combination of a counting mechanism, a pendulum, a pawl and ratchet-wheel actuated thereby, an oscillating link or connection-rod connected at one end with said pawl and at the other mounted on the pendulum-rod so as to move freely thereon, and an electro-magnetic device for moving said link vertically on said pendulum-rod as the current varies, substantially as described.

4. The combination of a moving body, such as a pendulum, a counting mechanism, a pawl, a variable connection for transmitting motion from said body to said pawl, a solenoid whose core controls said variable connection, a snail-cam or eccentric or a suitable axis interposed between said core and said connection, and a weight whose lift is varied by said eccentric or cam, substantially as described.

404,311. MACHINE FOR FINISHING THE NECKS OF BOTTLES, JARS, &c. HARRY SIMPLE, Steubenville, Ohio, and CHARLES H. BRADY, Washington, Pa. Filed Oct. 24, 1888. Serial No. 289,083. (No model.)



Claim.—1. In a machine for finishing the necks of bottles, jars, or other like articles, the combination of means to hold the outside of the neck and finish the inside of the same, adapted to have a rotative movement back and forth, a rod provided with a socket for holding, presenting, and withdrawing the bottle, jar, or other article from the plug and jaws, and another rod adapted to regulate the distance of travel between the bottle, jar, or other article and the plug and jaws, substantially as described.

2. In a machine for finishing the necks of bottles, jars, and other like articles, the combination of an upper rod provided with a stop to carry the socket for the bottle, jar, or other like article, adjustable supports to hold said rod at the desired elevation, and a lower rod carrying a vertically-adjustable screw-threaded standard and a clutch, substantially as and for the purpose described.

3. In a machine for finishing the necks of bottles, jars, or other like articles, the combination of an upper rod to carry the socket for the bottle, jar, or other like articles, a socket for the same, an adjustable lower rod carrying a standard and a clutch, a sleeve upon a shaft, a shaft having an adjustable plug, and a train of gears to give a rotative movement to the shaft, substantially as described.

4. In a machine for finishing the necks of bottles, jars, or other like articles, the combination of a rod to carry the bottle, jar, or other article, another rod to carry a clutch, a sleeve, and an arm-support upon a shaft, and arms and fingers to hold and finish the necks of such bottles, jars, or other articles, substantially as described.

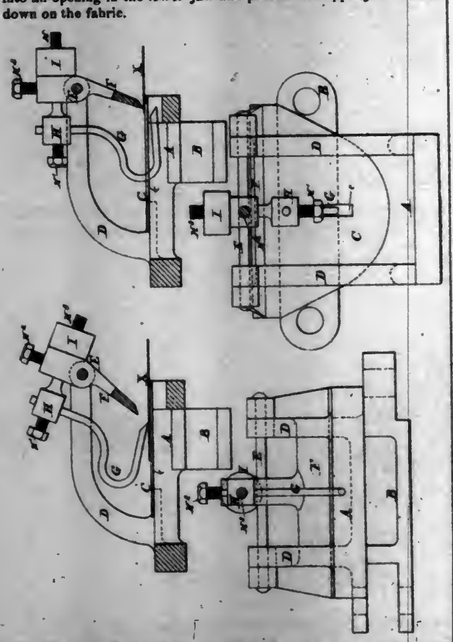
404,312. COMBINED SQUARE, CENTER-SQUARE, AND BEVEL. EDWARD R. SHEPARDSON, Greenfield, Mass. Filed Dec. 11, 1888. Serial No. 293,260. (No model.)

Claim.—1. The combination, with the head B, provided with a slot at its base edgewise to fit over the blade of a square, and having a conical opening, and a T-opening to receive a conical-headed screw and the nut of the same, of the slotted conical clamping screw and head and the blade A, as and for the purpose set forth.

2. The combination, with the rectangular head B, the clamping screw and nut *g h*, fitted therein, as described, the screw *a*, and the slotted blade A, of the arm C, pivoted to an exterior angle of the said head, and the arc D, pinned to said arm and arranged to enter a slot in the edge of said head, as specified.

3. The combination, with the head B, hinged arm C, provided with an arc, D, substantially as described, of the blade A and auxiliary piece F, provided with a conical opening, and a slot to receive, respectively, the conical slotted screw and the head of the same, and the conical slotted screw-bolt, as and for the purpose set forth.

404,313. **HINGE.** LEVI K. SHERMS, New York, N. Y. Filed Jan. 24, 1889. Serial No. 297,411. (Model.)

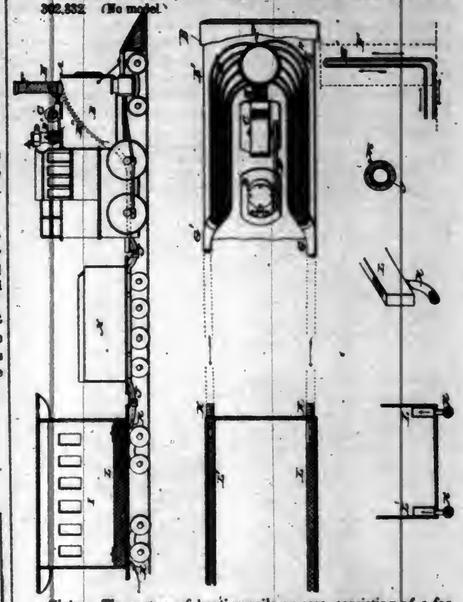


Claim.—1. The hinge-plates A A, and the pintle B, by which said plates are connected, and the axis of which is at right angles with the plane of said plates, in combination with the brace-plates D D, the pintle K, by which said brace-plates are hinged together, said pintle having its axis in the same plane, or one parallel, with the plates A A, and the pintles G G, hinging the plates D to the plates A, substantially as described.

2. The hinge-plates A A, in combination with the brace-plates D D, having ears or lugs E and F, the pintles G G, connecting the plates D to the plates A along the edges, and the springs H, coiled upon said pintles G, substantially as described.

404,314. **CLIP OR HOLDER FOR CLOTH-STRETCHING MACHINES.** DAVID P. SMITH, Salford Iron Works, near Manchester, County of Lancaster, England, assignor to Mather & Platt, same place. Filed Aug. 23, 1888. Serial No. 283,548. (No model.) Patented in England Feb. 25, 1887, No. 2,942, and in France Feb. 23, 1888, No. 183,930.

Brief.—The construction is set forth in the claims, and the object is to keep the upper jaw of the clip raised till the edge of the fabric is in the required position between the two jaws, when the guard drops into an opening in the lower jaw and permits the upper jaw to close down on the fabric.



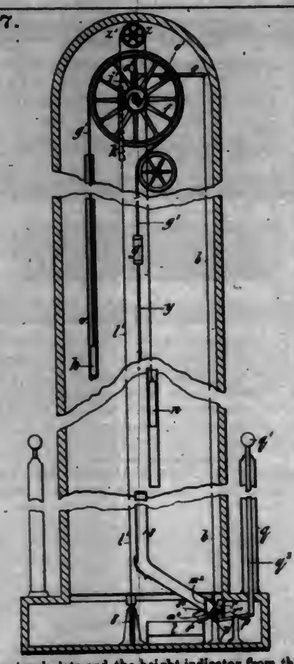
Claim.—1. The combination, with a link, of a clip or holder composed of a lower jaw fixed on the link, a pivoted upper jaw that drops by gravity toward the lower jaw to grip the fabric between them, and a guard carried by the pivoted jaw to rest on the fabric and keep the upper jaw raised until the fabric is drawn under the guard, substantially as described.

2. The combination, with a link carrying a fixed lower jaw, of a pivoted upper jaw that drops by gravity toward the lower jaw to grip the fabric between them, a guard movably connected with the pivoted jaw to rest on the fabric and keep the upper jaw raised until the fabric is drawn from under the guard, and means for adjusting the lower end of the guard to and from the gripping-edge of the pivoted jaw, substantially as described.

404,315. **RULING DEVICE.** MURRAY H. SPEAR, London, England. Filed Apr. 26, 1888. Serial No. 271,842. (No model.) Patented in England Mar. 15, 1888, No. 4,096.

Claim.—A disk for ruling purposes adapted to carry the marking compound, made of vulcanized fiber or equivalent material which is sufficiently fibrous to take the marking compound, and firm enough to form the perfect edge to give the impression to form the line, substantially as described.

404,316. **HEATER FOR RAILROAD-CARS.** DAVID SPRINGER and CHARLES A. SPRING, Royer's Ford, Pa. Filed Mar. 11, 1889. Serial No. 302,832. (No model.)



Claim.—The system of heating railway-cars, consisting of a fan or air pump driven by an engine separate from that of the locomotive and located upon the latter, a cluster of several pipes passing from the fan or air pump into the lower part of stack F and upward close to the inner surface of the latter, thence down again to a point near the bottom thereof, thence in two divided series close to the cylindrical surface of the boiler and between the latter and the outer jacket thereof on each side, then joining each series in one single pipe on each side of the locomotive, and conducting the heated air thence through a system of flexible non-conducting tubes from car to car, and through each car by hot-air conductors located above the floors thereof, substantially as described.

404,317. **MACHINE FOR MEASURING THE HEIGHT OF HUMAN BODIES AUTOMATICALLY.** WILLIAM F. STANLEY, South Norwood, County of Surrey, England. Filed Dec. 6, 1887. Serial No. 257,139. (No model.) Patented in England Apr. 5, 1886, No. 4,726.

Claim.—1. In a machine for measuring the height of a person, the combination of a rotary height-indicator, a descending and ascending head-plate to be brought in contact with the head of the person, and mechanism, substantially as specified, for connecting the head-plate and height-indicator, whereby said indicator is automatically operated by the movements of the head-plate, substantially as described.

2. The combination, in a machine for measuring the height of a person, of a movable platform on which the person stands, a movable height-indicator, a descending and ascending head-plate to be brought in contact with the head of the person, and mechanism for operating the head-plate and the height-indicator from the platform, substantially as described.

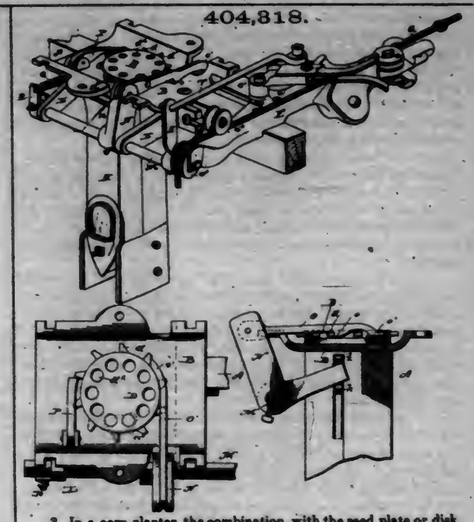
404,317.

3. The combination, in a machine for measuring the height of a person, of a movable platform on which the person stands, a descending and ascending head-plate to be brought in contact with the head of the person, a height-indicator, and mechanism for actuating the head-plate and the height-indicator from the platform, and a tube for the conduct of a coin to act on said mechanism to put it into action, substantially as described.

4. The combination, in a machine for indicating the height of a person, of a vertically-movable carriage, a descending and ascending head-plate connected with the carriage, a suspended weight which tends to counterbalance the carriage and head-plate, a movable height-indicator, and mechanism which actuates the height-indicator by the movement of the head-plate, substantially as described.

5. The combination, in a machine for indicating the height of a person, of a casing, a movable platform, a vertically-movable carriage, a head-plate connected to and movable with the carriage, mechanism for bringing the head-plate into action, a tube for the conduct of a coin to render said mechanism operative, a suspended weight which tends to counterbalance the carriage and head-plate, a movable height-indicator, and mechanism which moves the height-indicator by the movement of the head-plate, substantially as described.

6. The combination, in a machine for indicating the height of a person, of a height-indicator, a movable platform, connections between the platform and height-indicator, a descending and ascending head-plate which actuates the height-indicator, mechanism for bringing the head-plate into action, and a tube for the conduct of a coin to render said mechanism operative, substantially as described.



7. The combination, in a machine for indicating the height of a person, of a descending and ascending head-plate, a height-indicator a movable platform, and mechanism operated by the platform to move the head-plate and height-indicator to indicate the height of a person, substantially as described.

404,318. **CORN-PLANTER.** NILS O. STAHER, Madison, Wis. Filed Sept. 22, 1888. Serial No. 286,074. (No model.)

Claim.—1. In a corn-planter, the combination, with the seed plate or disk, of a reciprocating latch provided with a rigid tooth for rotating and a rigid stop for locking the said plate against further rotation, substantially as described.

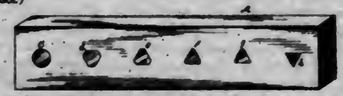
2. In a corn-planter, the combination, with the seed plate or disk provided with peripheral teeth having one side flat and the other side beveled, of a reciprocating latch provided with a downward-extending tooth for engaging the said flat side of the teeth to rotate the seed-plate, and a curved end for engaging the beveled side to lock the seed-plate, substantially as described.

404,318.

3. In a corn-planter, the combination, with the seed plate or disk provided with peripheral teeth having one side flat and the other side beveled, of a reciprocating latch provided with a downward-extending tooth for engaging the said flat sides of the teeth to rotate the seed-plate, and a curved beveled end for engaging the said beveled sides to lock the seed-plate, substantially as described.

4. In a corn-planter, the combination, with the seed plate or disk provided with peripheral teeth having one side flat and the other beveled, of a reciprocating latch provided with a downward-extending tooth for engaging the said flat sides of the teeth to rotate the seed-plate, a curved beveled end for engaging the said beveled sides to lock the seed-plate, and a dog or pawl for preventing backlash, substantially as described.

5. In a corn-planter, the combination of the rock-shaft, a bell-crank fixed thereto, a combined reciprocating and locking latch pivoted to one end of the said bell-crank, a seed plate or disk provided with peripheral teeth, and a dog or pawl, substantially as and for the purpose specified.



6. In a corn-planter, the combination of the rock-shaft, a bell-crank fixed thereto, a reciprocating and locking latch pivoted to one end of the said bell-crank, a seed plate or disk provided with peripheral teeth, a dog or pawl, and a retracting-spring secured to the frame of the machine and to the said rock-shaft, substantially as described.

7. In a corn-planter, the combination, with the rock-shaft, a bell-crank fixed thereto, and a vertically-reciprocating rack-bar connected with the lower limb of said bell-crank, of a rotary seed-valve provided with a cogged hub, substantially as and for the purpose set forth.

8. In a corn-planter, the combination, with the rock-shaft, a bell-crank fixed thereto, a combined reciprocating and locking latch pivoted to the upper end of the said bell-crank, a seed-plate provided with peripheral teeth, and a pivoted pawl or dog, of the rack-bar connected with the lower end of the said bell-crank, and a rotatable seed-valve provided with a cogged hub engaging the said rack-bar, whereby the seed-plate and the seed-valve are operated simultaneously, substantially as and for the purpose set forth.

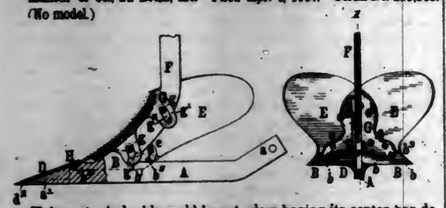
9. In a corn-planter, the combination, with the rock-shaft, a bell-crank fixed thereto, a combined reciprocating and locking latch pivoted to the upper limb of the said bell-crank, a rotatable seed-plate provided with peripheral teeth adapted to engage with the said latch, and a pivoted pawl or dog, of a rack-bar connected to the lower limb of the said bell crank, a rotatable seed-valve provided with a cogged hub, and a retracting-spring for the said rock-shaft, substantially as and for the purpose set forth.

404,319. **METHOD OF DRAWING WIRE OF ONE SECTIONAL FORM INTO WIRE OF ANOTHER SECTIONAL FORM.** WILLIAM TAYLOR, Allegheny, Pa. Filed May 26, 1888. Serial No. 275,302. (No model.)

Claim.—1. The herein-described method of converting wire, or its equivalent, of one sectional form into a wire, or its equivalent, of

another sectional form, it consisting in subjecting it to a series of two or more drawing actions, at each of which a portion of the surface is forced away from its previous form, the material assuming the desired sectional form at the last action of the series, and being subjected during one or more drawing actions preceding the said last one to a drawing action by which a portion only of the surface is forced away from its previous form, the residue of the surface being thereby unaffected, substantially as set forth.

2. The herein-described method of converting wire of one sectional form into wire of another sectional form, it consisting in subjecting it to a series of drawing actions, at each of which a portion of the surface of the wire is forced away from its previous form, the residue of the surface remaining unaffected, and the extent of the surface acted on increasing with each successive action, substantially as described.



3. The herein-described method of converting wire of one sectional form into wire of another sectional form, it consisting in subjecting it to a series of drawing actions, at each of which only a portion of the surface is affected by the walls of the draw-plate, the residue of the surface remaining substantially unaffected, and at the last of which actions the extent of surface affected by the walls of the draw-plate is greater than that affected at any previous action, substantially as described.

4. The herein-described method of manufacturing wire triangular in section, it consisting in subjecting wire initially circular in section to a series of several drawing actions, at each of which three separate portions of the surface of the wire are pressed relatively inward, three intermediate portions of said surface being allowed to remain with the curvature they had prior to said action, substantially as set forth.

5. The herein-described method of manufacturing wire triangular in section, it consisting in subjecting wire initially circular in section to a series of several drawing actions, at each of which three separated portions of the surface are pressed relatively inward, and at each of which actions after the first the extent of the inward-pressed surface gradually increases relatively to the preceding, substantially as set forth.

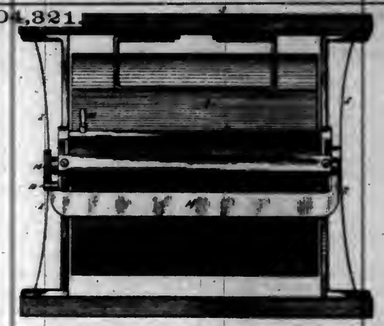
6. The herein-described method of manufacturing wire of one gage and triangular in section, it consisting in subjecting wire initially circular in section and of a larger gage to a series of drawing actions, during the first one or more of which the wire remains round in section, but is reduced to the gage of the desired triangular wire, and during one or more of the remainder of which actions separated portions only of the surface are pressed relatively inward, the wire being thereby gradually brought to a triangular sectional form, substantially as set forth.

404,320. PLOW. LEWIS S. TEBBETTS and CHARLES H. POPE, St. Louis, Mo., and JOHN A. STEWART, Houston, Tex., assignors to Deere, Mansur & Co., St. Louis, Mo. Filed Apr. 4, 1887. Serial No. 233,583. (No model.)

Claim.—1. A double-mold-board plow having its center bar depressed and extended in front of the share and provided with the removable point, said point having a lip which laps upon the nose of the mold-board, as described.

2. The combination of the channeled center bar and the point D, having the flanges *d d* and shoulder d^3, as described.

3. The combination of the channeled center bar and the point D, having the flanges *d d* extended at *d'*, and the shoulder d^3, as described.

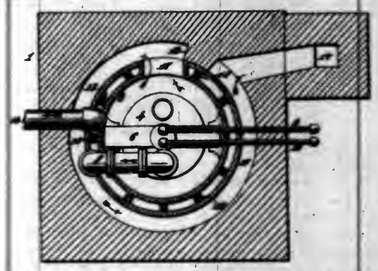


4. The combination of the mold-board, the shares, the standard, and the socket, said mold-board and shares as one piece being adjustable upon the standard, as described.

404,321. PAPER-CUTTER. WILLIAM H. TIVY and LEO EHRLICH, St. Louis, Mo., assignors to the American Roll Paper Company, same place. Filed June 12, 1888. Serial No. 276,792. (No model.)

Claim.—1. In a paper-cutter, the combination of a suitable support, knife, roll of paper, roller located close up against the knife, and a device for turning the roller to cause the paper to be moved by frictional contact between the roller and the knife, substantially as and for the purpose set forth.

2. In a paper cutter, the combination of a suitable support, knife, a roll of paper, roller located close up against the knife, and a means



404,321.

for turning the roller, consisting of a pivoted plate having ratchet-connection with the roller, substantially as and for the purpose set forth.

3. In a paper-cutter, the combination of a suitable support, a knife, a roll of paper, a roller located close up against the knife, means for turning the roller to move the paper forward, and a pivoted ram-bar over the roller to prevent the retrograde movement of the paper, substantially as and for the purpose set forth.

404,322. APPARATUS FOR PRODUCING GAS. LORENZ R. TURNER, Columbus, Ohio. Filed Aug. 10, 1888. Serial No. 282,413. (No model.)

Claim.—1. In a gas-generating apparatus, the combination of a central retort having a box-conduit crossing its top, extending down along its sides, and communicating with the retort near its lower end, a surrounding shell containing alternating baffle-plates, a pipe connecting the top of the retort with the shell, and oil and steam pipes communicating with the box-conduit, substantially as described.

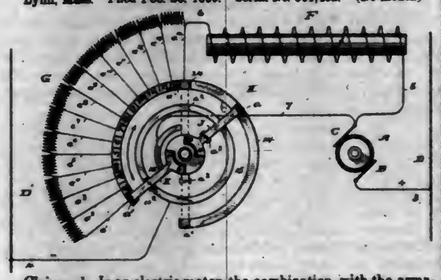
2. In a gas-generating apparatus, the combination of a central retort, a surrounding shell having a flue in its side, a pipe connecting the top of the retort with the interior of the shell, an inclosing furnace structure so arranged as to leave a draft-passage around the outside of the shell and provided with a chimney-flue near to the flue in the shell, but separated immediately therefrom by a buttress or projection in the wall, and a fire-box below the retort communicating with the flue in the shell, substantially as described.

3. In a gas-generating apparatus, the combination of a central retort having a box-conduit crossing its top, extending down its sides, and communicating with the lower part of the retort, a surrounding shell containing alternating baffle-plates and provided with flues in its sides, an inclosing furnace structure so arranged as to leave a draft-passage around the outside of the shell and provided with a chimney-flue near to the flue in the shell, but separated immediately therefrom by a buttress or projection in the wall, oil and steam pipes communicating with the box-conduit, a fire-box below the retort communicating with the flue in the shell, and a pipe connecting the top of the retort with the shell, substantially as described.

4. In a gas-generating apparatus, the combination of a central retort having a box-conduit crossing its top, extending down its sides, and communicating with the lower part of the retort, a surrounding shell provided with a flue in its side, an inclosing furnace structure so arranged as to leave a draft-passage around the outside of the shell and provided with a chimney-flue near to the flue in the shell, but separated immediately therefrom by a buttress or projection in the wall, a fire-box below the vertical retort communicating with the flue in the shell, oil and steam pipes communicating with the box-conduit, and a pipe connecting the retort with the shell, substantially as described.

5. In a gas-generating apparatus, the combination of a vertical retort having a central contraction and provided with a box-conduit crossing its top and extending down its sides and communicating

with the lower part of the retort, a surrounding shell containing a partition and alternating baffle-plates and provided with a flue in its side, an inclosing furnace structure so arranged as to leave a draft-passage around the outside of the shell and provided with a chimney-flue near to the flue in the shell, but separated immediately therefrom by a buttress or projection in the wall, oil and steam pipes communicating with the box-conduit, a fire-box below the vertical retort communicating with the flue in the shell, a pipe connecting the top of the vertical retort with the shell near the partition within the same, and an exit-pipe from the other side of said partition, substantially as described.



404,328. BUCKLE. GORDON M. TYRRELL, New Haven, Conn. Filed Sept. 8, 1888. Serial No. 284,860. (No model.)

Claim.—1. The combination of a frame, A, having an inwardly-turned upper edge and provided with spring-arms *a a*, formed integral with its side, with a movable slide, C, to operate said spring-arms, substantially as set forth.

2. The combination of a frame, A, having an inwardly-turned upper edge, and beveled sides having spring-arms *a a*, formed integral therewith, with a movable slide, C, to operate said spring-arms, substantially as set forth.

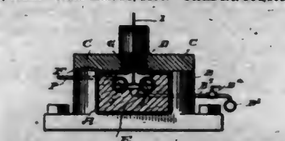
404,324. ELECTRO-DYNAMIC MOTOR. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Feb. 28, 1889. Serial No. 301,492. (No model.)

Claim.—1. In an electric motor, the combination, with the armature thereof, of a long field-magnet coil in series therewith, an adjustable resistance, and means for placing any desired portion of the resistance either in series or in shunt relation to the coils of the field-magnet, substantially as described.

2. In an electric motor, the combination, with the armature thereof, of a long series field-magnet coil, an adjustable resistance adapted to be connected in series therewith at starting, and means for placing said resistance or any desired portion thereof in derivation from the field-magnet coils, substantially as described.

3. In an electric motor, the combination, with the armature thereof, of a long series field-magnet coil, an adjustable resistance adapted to be connected in series therewith at starting, means for placing said resistance or any desired portion thereof in derivation from the field-magnet coils, an opposing or differential coil or coils upon the field-magnet, and series connections between the differential coil or coils and the resistance when in shunt relation with the field-magnet, substantially as described.

4. In an electric motor, the combination, with the armature, of a long field-magnet coil in series therewith, an adjustable resistance, a switch, connections between the coils of the field-magnets and the resistance and the switch, and means for placing the resistance in series or in shunt relation to the field-magnet coils or cutting it out entirely to regulate the power and speed of the motor, substantially as described.



5. In an electric motor, the combination, with the armature, of a long series field-coil and an adjustable artificial resistance, a switch, and connections between the switch and the several portions of the resistance, said switch being so arranged that the resistance can be placed either in series or in derivation from the main field-magnet coils of the motor, substantially as described.

6. In an electric motor, the combination, with the armature, of field-magnet coils, an adjustable resistance, a switch, connections between the field-magnet coils and the coils of the resistance and the said switch, and a switch-lever adapted to be moved into successive engagement with the several parts of the switch, and to thereby connect the field-magnet coils and resistance in series, then gradually cut out the resistance, then connect the said resistance in derivations over the field-magnet circuit, and then gradually cut out the shunted resistance, or vice versa, substantially as described.

7. In an electric motor, the combination, with the armature, of a field-magnet coil in series therewith, an adjustable resistance, a switch, connections between the coils of the field-magnet and of the resistance and the switch, and a switch-lever adapted to be moved into engagement with the several parts of the switch and in one rotation to connect the resistance in series with the field-magnet coils, then to gradually cut it out, then to connect the entire resistance in derivation from the said field-magnet coils and cut it out altogether, substantially as described.

8. The combination, with a series field-magnet and a divided artificial resistance, of a switch having an extended terminal connected to one end of the field-magnet coil, a number of contact-points connected to terminals arranged along the resistance, an extended return-connection, a short segmental contact, a conductor extending from the beginning of the field-magnet to said contact, and a movable contact-arm provided with contacts adapted to engage the several parts of the switch and to connect the resistance in series or in derivation with the field-magnet coils, substantially as described.

404,325. CLOSED SLOTTED CONDUIT. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Mar. 21, 1889. Serial No. 304,195. (No model.)

Claim.—1. A conduit for electric conductors, comprising a slotted exterior casing, a conductor or conductors and supports therefor within the casing, flexible or yielding strips between the conductor-supports and the casing, and an elastic cushion or cushions between the flexible strips and the casing for holding the strips normally in close contact to close the slot.

2. A conduit for electric conductors, comprising a slotted exterior casing, a conductor or conductors, and an insulating support or supports therefor within the casing, strips of flexible insulating material between the conductor-supports and the casing, and elastic cushions between the casing and the strips acting to hold said strips normally in close contact.

3. A conduit for electric conductors, comprising a slotted exterior casing, a conductor or conductors and supports therefor within the casing, flexible strips between the conductor-supports and the casing, an elastic cushion or cushions between the flexible strips and the casing for holding the strips normally in close contact to close the slot, and means for supplying compressed air to the interior of the conduit to prevent the entrance of water.

4. A conduit for electric conductors, comprising a slotted exterior casing, a conductor or conductors, and an insulating support or supports therefor within the casing, strips of flexible insulating material between the conductor-supports and the casing, and elastic cushions between the edges of the slot of the casing and the strips for holding said strips normally in close contact and closing the slot.

5. A conduit for electric conductors, comprising a slotted exterior casing, a conductor or conductors and supports therefor within the casing, flexible or yielding strips of lubricated material between the conductor-supports and the casing, and an elastic cushion or cushions for holding the edges of the lubricated strips normally in close contact.

6. A conduit for electric conductors, comprising a slotted exterior casing, a conductor or conductors, and insulating-supports therefor within the casing, continuous strips of flexible material arranged along the upper part of the interior of the casing and having their upper inner surfaces in close contact and supplied with lubricating-material, continuous supports for the lubricated strips, and elastic cushions acting against the backs of said strips for holding them normally in close contact to close the slot of the casing.

7. A conduit for electric conductors, comprising a slotted exterior casing, a grooved insulating-filling for said casing, a conductor or conductors in the groove or grooves, flexible or yielding insulating-strips interposed between the filling and extending up into the slot of the casing, and elastic cushions against the backs of the strips in the slot and acting to hold them normally in close contact.

8. A conduit for electric conductors, comprising a slotted exterior casing, a conductor or conductors and supports therefor within the casing, flexible or yielding insulating-strips between the conductor-

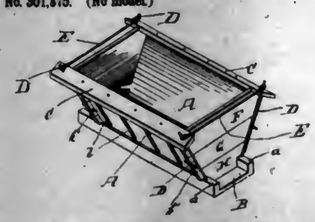
support and the casing, a hollow elastic cushion or cushions between the upper edges of the strips and the casing, and means for distending the cushion or cushions for holding said strips normally in close contact to close the slot.

9. A conduit for electric conductors, comprising a slotted exterior casing, a conductor or conductors and supports therefor within the casing, flexible or yielding insulating-strips between the conductor-support and the casing, hollow elastic cushions interposed between the upper edges of the strips and the casing for normally holding the said strips in close contact to close the slot, and means for supplying compressed air to the interior of the hollow cushions for increasing their pressure upon the slot-closing strips, as desired.

10. A conduit for electric conductors, comprising a slotted exterior casing, flexible slot-closing strips normally in contact to close the conduit, contact devices engaging a conductor or conductors within the conduit, a thin blade or plate carrying contact devices at its lower edge and extending upwardly through the flexible slot-closing material and formed with upwardly-sloping extremities, whereby the slot is opened in an upward direction, but remains tightly closed about the sides of the plate.

11. The combination, with a closed slotted conduit, of an air compressor or compressors, electric motors for actuating the same, a circuit for supplying current to the motors independent of the conduit, and mains or pipes connecting the compressors and the conduit for supplying compressed air thereto.

12. The combination, with a closed slotted conduit, of means for supplying compressed air thereto, comprising one or more air-compressors, and an inlet pipe or pipes connecting the conduit and compressors, and valved outlets for facilitating the egress of water, when desired, and preventing the escape of air.



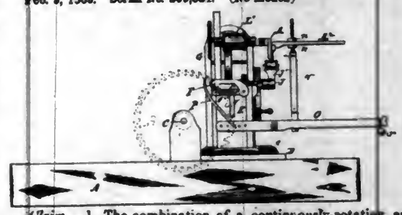
404,326. NUT-LOCK. CHARLES O. VINYARD, Navajo Springs, Ariz. Filed Jan. 10, 1889. Serial No. 296,006. (No model.)

Claim.—1. A nut-lock for a series of adjacent bolts, consisting of a plate or bar provided with a series of apertures to receive the nuts of said bolts and prevent the same from turning, the outer faces of the nuts lying beneath the outer face of said bar, a locking-nut upon an end of one of said bolts, screwed tightly upon the outer face of the bar, and a thin elongated spring-arm formed integral with said nut and extending radially from the same and adapted to engage the projecting end of an adjacent bolt, and thereby prevent the locking bar and nut from turning, said arm being sprung outwardly when the locking-nut is being rotated, substantially as described.

2. A locking-nut provided with an elongated thin spring-arm extending radially from the inner edge of the nut, said nut and arm being formed integral of spring-steel and the arm being adapted to be bent outwardly when the nut is being rotated, and when released to spring to its normal position and engage an adjacent bolt to hold the nut against loosening, substantially as described.

404,327. WOOD-RACK. HOMER N. WADSWORTH, Wellington, Ohio, assignor of one-half to J. H. Dickson, same place. Filed Mar. 5, 1889. Serial No. 301,875. (No model.)

Claim.—1. In a wood-rack, the bottom portion provided with upwardly-projecting perforated flanges, the hooked brace-rods, the end pieces having V-shaped notches formed in the upper corners thereof, and the end pieces having right-angle notches formed in the lower corners thereof, substantially as described, and for the purpose specified.



2. In a wood-rack, the combination of the bottom portion provided with upwardly-projecting perforated flanges, the hooked brace-rods, the notched end pieces, and the perforated cap-pieces, with the side-boards A, provided with side bars, *b*, substantially as and for the purpose set forth.

3. The combination, with a wood-rack, of the bottom B, provided with perforated flanges *a*, the rods D, and the perforated end piece, K, substantially as described and shown.

404,328. PROCESS OF SEPARATING PRECIOUS METALS FROM ORES. JULES WEHRICH, Béziers, Hérault, France. Filed May 10, 1888. Serial No. 273,492. (No specimens.) Patented in France Mar. 20, 1888, No. 176,471.

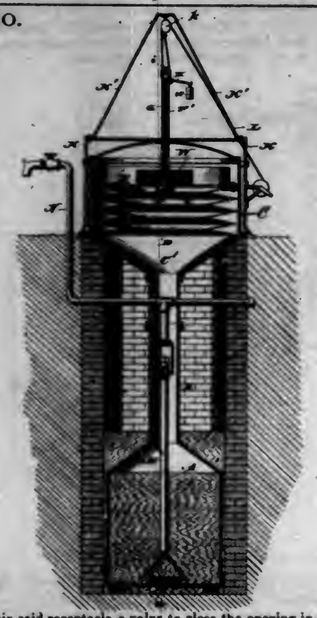
Claim.—The herein-described process of separating precious metals from auriferous or auro-argentiferous minerals, which consists, first, in freeing the mineral from sulphur, arsenic, antimony, &c., and oxidizing the base metals with which the precious metals are combined by heat; secondly, mixing with the mineral so prepared, in or about in the proportions set forth, a salt of the alkalies and silica, (when the mineral is deficient in silica;) third, converting the oxides of the base metals into silicates by fusion, and, lastly, separating the precious metals from the silicates by amalgamation, said silicates being previously pulverized.

404,329. SAW SHARPENER AND GUMMER. MICHAEL J. WELCH, Adel, Ga., assignor of one-half to John L. Studstill, same place. Filed Feb. 9, 1889. Serial No. 299,321. (No model.)

Claim.—1. The combination of a continuously-rotating emery-wheel, an oscillating frame or arm in which it is carried, a fixed plate attached to the frame or arm, an arm or plate pivoted at one end to the fixed plate and extending below the lower edge thereof, and a rocker-shaft and crank operating against the lower edge of the plates, substantially as set forth.

2. The combination of an oscillating arm, an emery-wheel carried thereby, the rocker-shaft and arm for causing the oscillation of the oscillating arm, a plate secured to the oscillating arm and operated upon by the arm of the rocker-shaft, a pivoted arm attached to and extending below the bottom of the plate, also operated upon by the rocker-shaft, a feed-lever connected to the pivoted arm, and a feed-finger connected to the lever for moving the saw in the manner hereinbefore set forth while the emery-wheel is being revolved, as set forth.

3. The combination of an oscillating arm, a side plate fixed to the free end thereof, a plate pivoted to the fixed plate at one end and held in a guide at the other and projecting beneath the lower edge of the said fixed plate, an arbor carried by the free end of the oscillating arm, an emery-wheel mounted in said arbor, a rocker-shaft mounted beneath the oscillating arm, having a roller-crank for operating on the lower edge of the plates, a pivoted feed-lever having a hook for feeding the saw, and connections from the pivoted plate to the feed-lever, as and for the purpose set forth.



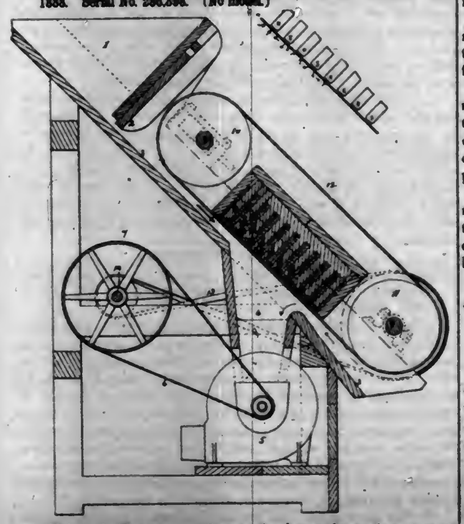
4. The combination of the double-arched standard bearing the main shaft-gears, the crank and pulley, arranged as described, the oscillating arm carrying the emery-wheel, arbor, and pulley, the steadying-post on which it is guided, the rocker-shaft having a slotted arm connected to the crank by a pitman which is detachable from the arm, and a roller-arm, a plate on the oscillating arm, under which the roller operates, a pivoted arm carrying the slotted extension, also resting upon the roller, the jointed rod, and the feed-lever, all substantially as and for the purpose set forth.

404,330. COMPRESSED-AIR WATER-ELEVATOR. MICHAEL WETZEL, Sidney, Nebr. Filed Feb. 28, 1889. Serial No. 301,524. (No model.)

Claim.—1. The combination, substantially as described, of the submerged reservoir provided at bottom with an inwardly-opening valve, a weighted bellows communicating through a pipe, b, with the upper end of said reservoir, a valved water-discharge pipe leading from near the bottom of the reservoir, an air-tube entering the bellows, a valve and its stem, and a weighted lever for controlling the position of the valve.

2. The combination, in a compressed-air water-elevator for wells, cisterns, or other bodies of water, of a frame or superstructure having a windlass attached thereto, a pulley, the cylindrical bellows provided with a weight and a valve-opening, said bellows being connected by a pipe to a submerged reservoir having a valve, *a*, a discharge-pipe

404,330.

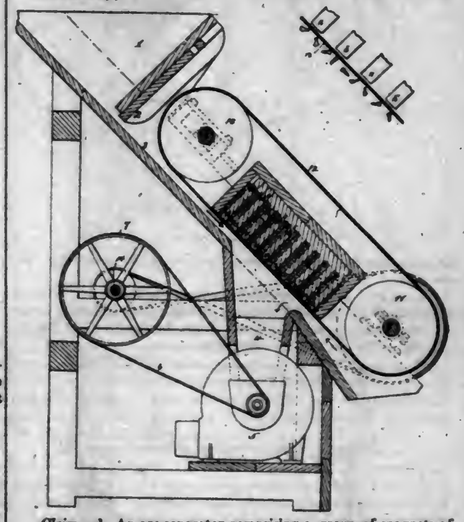


located within said receptacle, a valve to close the opening in the bellows, and a weighted lever to control the position of this valve, the parts being organized substantially as shown, and for the purpose set forth.

404,331. COMPOUND ORCIN DYE. RUPERT GRENVILLE-WILLIAMS, Albany, N. Y. Filed Nov. 1, 1888. Serial No. 289,761. (No specimens.)

Claim.—The process of producing new coloring-matters, which consists in combining one molecule of tetrazo-diphenyl or tetrazo-ditolyl or their sulpho-acids with first one molecule of naphthylamine or one of the present known sulpho-acids of naphthylamine, and then combining this intermediate product with one molecule of orcin or sulpho-acids of the same, substantially as set forth.

404,332. PROCESS OF SEPARATING ORES BY MAGNETISM. CLINTON M. BALL, Troy, and SHELDON NORTON, West Troy, assignors of one-third to Alexander T. Porter, West Troy, N. Y. Filed Sept. 26, 1888. Serial No. 286,398. (No model.)



Claim.—1. The process of separating iron or its ore from impurities, consisting in forcing it in a state of division past a succession of two or more magnetic poles of alternating polarity, whereby the particles are forcibly caused to tumble or rotate end for end.

2. The process of separating iron or its ore from impurities, consisting in forcing it in a state of division past a succession of two or more magnetic poles of alternating polarity, while interposing a non-magnetic screen between the ore and the poles.

3. The process of separating iron or its ore from impurities, consisting in forcing it in a divided state past a succession of magnetic poles of alternating polarity, while subjecting the material to the action of a current of air.

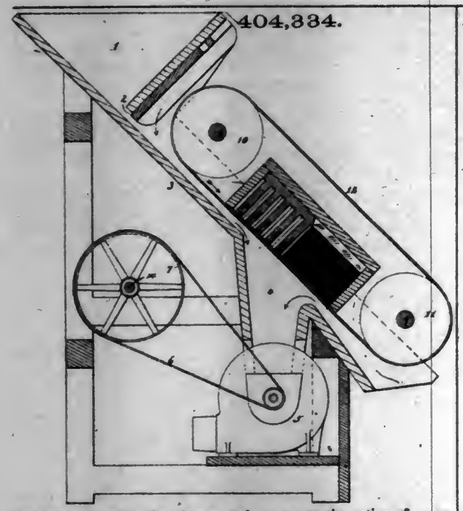
404,333. MAGNETIC ORE-SEPARATOR. CLINTON M. BALL, Troy, and SHELDON NORTON, West Troy, assignors of one-third to Alexander T. Porter, West Troy, N. Y. Filed Oct. 5, 1888. Serial No. 287,329. (No model.)

Claim.—1. An ore-separator comprising a group of magnets of alternating polarity, in combination with means for forcibly conveying the ore past the said magnets successively without contact therewith.

2. An ore-separator comprising, in combination, a group of magnets of alternating polarity, a traveling screen adapted to move across the poles of said magnets, and means for delivering the ore in proximity to the screen.

3. An ore-separator comprising, in combination, a group of magnets of alternating polarity, a traveling screen of diamagnetic material adapted to move across the poles of said magnets, and means for delivering the ore in proximity to the screen.

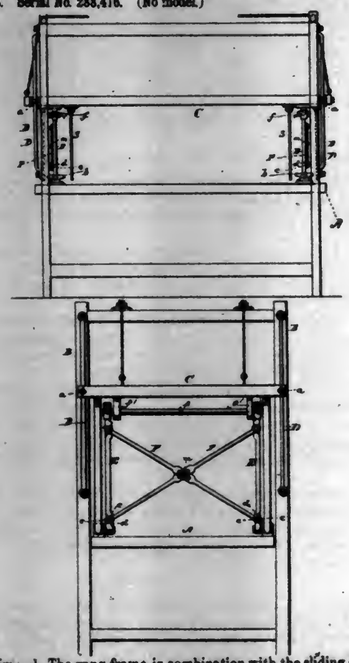
4. An ore-separator comprising, in combination, a group of magnets of alternating polarity, a traveling diamagnetic screen adapted to move across the poles of said magnets, means for delivering the ore to the outer side of said screen, and means for forcing a current of air through the space traversed by the ore as it passes the magnet-poles.



5. An ore-separator comprising, in combination, a group of magnets of alternating polarity, a traveling diamagnetic screen adapted to move across the poles of said magnets, and an apron adapted to confine the ore within inductive range of said magnets and deliver it in close proximity to said screen.

404,334. PROCESS OF SEPARATING ORES. CLINTON M. BALL and SHELDON NORTON, West Troy, N. Y., assignors of one-third to Alexander T. Porter, same place. Filed Jan. 14, 1889. Serial No. 296,372. (No model.)

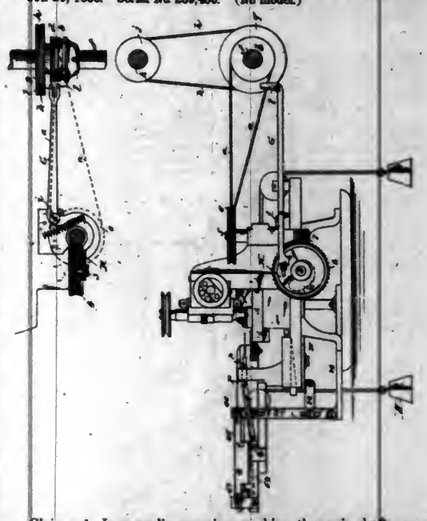
Claim.—1. The process of separating magnetic ore from its accompanying impurities, consisting in causing the movement of the particles of ore through a magnetic field in a given direction by interposing a moving non-magnetic screen between the ore and the magnet producing such field, and at the same time subjecting the body of ore and gangue to the action of a current or currents of air in an opposite direction to that of the ore.



2. The process of separating magnetic ore from its accompanying impurities, consisting in causing the movement of the particles of ore through a magnetic field while interposing a moving non-magnetic screen between the ore and the magnet producing such field, and at

404,334.

the same time subjecting the ore and gangue to the action of a current of air.



404,335. STONE-SAWING MACHINE. RUFUS L. BARNEY, Swanton, assignor of one-half to John N. Baxter, Rutland, Vt. Filed Oct. 16, 1888. Serial No. 288,416. (No model.)

Claim.—1. The gang-frame, in combination with the sliding cross-bars having a sliding combination with the upright supporting-frame, said gang-frame being connected to said cross-bars by hangers pivoted to said frame and to rods bearing boxes applied to the nader side of said cross-bars, substantially as set forth.

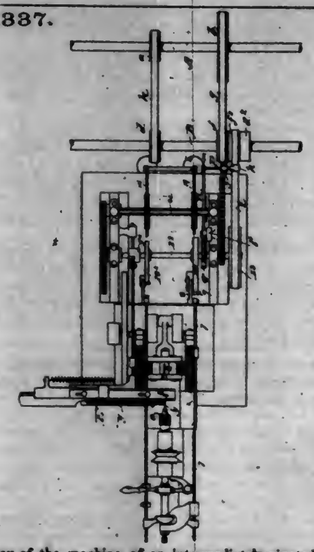
2. The gang-frame, in combinatiom with the cross-bars having a sliding connection with the upright supportidg-frame, said gang-frame being connected to said cross-bars by hangers pivoted to said frame and to rods bearing in boxes applied to the under side of said cross-bars, which cross-bars are connected together by braces having an adjustable or screw-bolt-and-slot connection at their crossing points, substantially as specified.

404,336. NEEDLE-GROOVING MACHINE. JOHN BERRY, Springfield, Mass., assignor to the National Needle Company, same place. Filed Oct. 29, 1888. Serial No. 289,430. (No model.)

Claim.—1. In a needle-grooving machine, the main-shaft worm-wheel having the cam, and the worm-screw shaft having a pulley, the fast and slow pulleys *d b*, and the belt *a*, combined with the pivoted belt-shifter by one end in engagemant with said cam and by its other with said belt, whereby on the swing of the shifter by the cam the belt will be moved from one of said pulleys to the other, substantially as and for the purpose described.

2. In a needle-grooving machine, the main-shaft worm-wheel having the cam M, and the worm-screw shaft having a pulley, the fast and slow rotating counter-shafts *k f*, the pulley *b*, fixed on the latter, and the pulley *d*, loosely rotatable thereon and receiving its rotary motion from said shaft *k*, substantially as described, and the belt *a*, combined with the pivoted belt-shifter by one end in engagement with said cam and by its other with said belt, all substantially as and for the purpose described.

3. The combination, with the slotted needle receiver and guide and the reciprocatory sliding clamp-finger 64, having the way *p* and a shoulder, *n*, substantially as described, of an obstruction-block normally covering the end of the needle-receiver slot, movable in said finger-way and located in the line of travel of said finger-shoulder, whereby at a period of the backward movement of said needle-finger said block will be rearwardly moved thereon, and means substantially as described, for automatically returning said block on the forward movement of said finger, substantially as described.



4. The combination, with the slotted needle receiver and guide and the reciprocatory sliding clamp-finger 64, having the longitudinal way *p* therein and the shoulder *n*, and carrying the shouldered abutment-bar Q, of the obstruction-block P, normally covering the end of the needle-receiver slot movable in said longitudinal way *p* and located in the line of travel of said finger-shoulder, and the compound link *q r*, secured to said block and to a stationary part of the machine, all arranged for operation substantially as and for the purpose described.

404,337. NEEDLE-MACHINE. JOHN BERRY, Springfield, Mass., assignor to the National Needle Company, same place. Filed Feb. 8, 1889. Serial No. 299,307. (No model.)

Claim.—1. The combination, with a needle-machine comprising a main shaft and driving-pulley, devices for feeding and presenting needle-blanks to be clamped, a carrier-chuck for clamping said needle-blanks, and devices, as swaging-dies or grooving-cutters, for acting on said needle-blanks conveyed thereto by said carrier, of the pair of pulleys having variable speeds, the belt between and around one of said pulleys and the driving-pulley of the said needle-machine, the belt-shifter engaging said belt, and the cam for actuating said belt-shifter, whereby the belt may be automatically moved from one to the other of said variably-speeded pulleys, substantially as and for the purpose described.

2. The combination, with the driving-shaft of a needle-machine having the cam *q* and a driving-pulley for said shaft, and with fast and slow speed pulleys and a belt between one thereof and said driving-pulley of the machine, of an intermediately-pivoted belt-shifter engaging said belt, a pivoted lever, *s*, actuated by said cam, and a connecting-rod between said lever and shifter, substantially as and for the purpose described.

404,337.

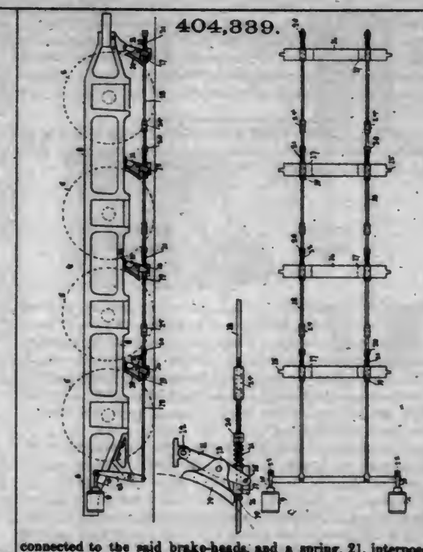
3. The combination, with the driving-shaft of a needle-machine having the cam *q* and a driving-pulley, 13, of a primary driving-shaft, A, having large and small pulleys *b* and *a* fixed thereon, a counter-shaft having fixed pulleys *d* d^2 and the loose pulleys *f* f^2 thereon, and the belts *c* and *g*, a belt, *i*, between and around one of said pulleys f^2 d^2 and said driving-pulley 13, an intermediately-pivoted belt-shifter, D, engaging said belt *i*, a lever, *s*, intermediately pivoted by one end bearing on said cam, and a connecting-rod, *m*, between the other end of said lever and said belt-shifter, substantially as described.

4. In combination, the main shaft having a cam thereon and the driving-pulley, the stationary rod *u*, the belt-shifter D, the pivoted lever *s*, provided with the latching-arm *z*, and the connecting-rod, substantially as and for the purpose described.

404,338. COMPENSATING DEVICE FOR ENGINES. GEORGE F. BLAKE, Belmont, assignor to the George F. Blake Manufacturing Company, Boston, Mass. Filed Aug. 31, 1888. Serial No. 284,267. (No model.)

Claim.—In a direct-acting engine, a high-pressure cylinder and a low-pressure cylinder, pistons located in said cylinders and provided with independent piston-rods having rack-bars 2 3, combined with a gear, 3^2, in mesh with said rack-bars and connecting said piston-rods, and with a compensating cylinder and its piston connected to said gear, to operate substantially as described.

404,339. LOCOMOTIVE-DRIVER BRAKE. GEORGE A. BOYDEN, Baltimore, Md., assignor to The Boyden Power Brake Company, of Baltimore City, Maryland. Filed Jan. 7, 1889. Serial No. 295,625. (No model.)



Claim.—1. In a car or locomotive brake, the combination, with the brake-rods 18, of the pulling headed beams located behind each set of wheels, the adjustable springs, and the links 11, pivoted to the beam, shoe, and frame, substantially as specified.

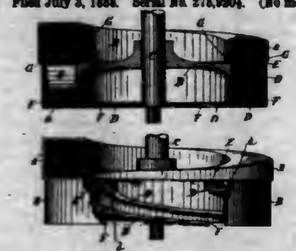
2. In a car or locomotive brake, the combination of the suspending-links 11, two or more brake-heads, 13, the rod 18, the springs 21, and a cylinder and piston to actuate the said rod 18, for the purpose set forth.

3. In a car or locomotive brake, the combination of the suspending-links 11, two or more brake-heads, 13, the rod 18, the springs 21, and the pulling-heads 17, in which may freely move the said rod 18, for the purpose set forth.

4. In a car or locomotive brake, the combination of two or more sets of brake-heads arranged to bear against the wheels, the rod 18,

404,339.

connected to the said brake-heads, and a spring, 21, interposed between the said rod and the brake-heads, whereby an equal brake-tension will be placed on each brake-shoe, for the purpose set forth.



5. In a car or locomotive brake, the combination of two or more brake-heads arranged to bear against the wheels, the cross-beams 16, connected to the brake-heads, the rod 18, moving freely on the said beams, the spring 21, interposed between the said rod and the said beam, and a cylinder and piston for imparting movement to the said rod 18, for the purpose set forth.

6. In a car or locomotive brake, the combination of two or more brake-heads, 13, placed relatively on the same side of each wheel and connected one with the other, and springs 21, located on the said connection, whereby an equal brake-pressure will be applied to each brake-shoe when forced against the wheels, for the purpose set forth.

7. In a car or locomotive brake, the combination of two or more brake-heads, 13, placed relatively on the same side of each wheel and connected one with the other, springs 21, located on the said connection, whereby an equal brake-pressure will be applied to each brake-shoe when forced against the wheels, and a cylinder and piston for imparting power to the said brake-shoes, for the purpose set forth.

8. In a car or locomotive brake, the combination, with the brake-rods 18, of the brake-beams secured to said rods directly behind each set of wheels, the springs 21, mounted on the rods 18 and having bearings against the said beams and the nuts 20, the links pivoted at their ends to the frame of a car or locomotive and to the brake-beams, respectively, and the shoes pivoted to the links between their ends, substantially as specified.

404,340. TURBINE WHEEL. ZIMRI W. BURNHAM, Grand Rapids, Mich. Filed July 3, 1888. Serial No. 278,930. (No model.)

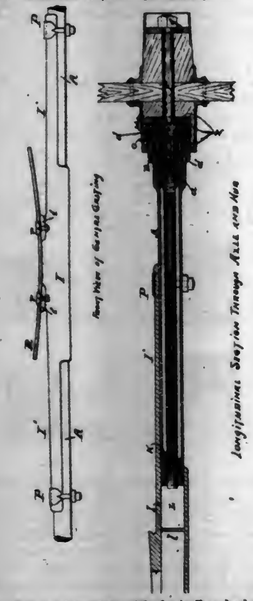
Claim.—1. In a turbine, the combination of a wheel having a pair of concentric vertical annular flanges at its periphery, with a series of underlapping buckets having concaved upper ends and extended downwardly and rearwardly from said concaved portion, and also having short forwardly and downwardly inclined flanges extending from their upper ends, all substantially as described.

2. The combination of the water-chamber A, constructed substantially as described, with the wheel B, having a pair of annular peripheral flanges, G G, the upper edges of which fit into an annular open-

ing in the bottom of chamber A, and which are connected by an imperforate web with the hub, and the series of similar underlapping buckets, D, having downwardly, outwardly, and rearwardly inclined extensions, concaved upper ends, and forwardly, downwardly, and outwardly inclined short flanges, all substantially as and for the purpose specified.

404,341. CRANK-WRIST AND BOXING. OLIVER H. CASTLE, Indianapolis, Ind., assignor of one-half to John R. Allen, same place. Filed Apr. 20, 1888. Serial No. 271,297. (Model.)

Claim.—1. A crank-driving shaft having an annularly-grooved crank-wrist whose central line is set at an angle to the line of bearings, bisected crank-boxings in which said crank-wrist is journaled, provided with circular flanges having annular projections for engaging with corresponding grooves in the halves of the connecting-rod, and a connecting-rod formed in two parts, its lower part adapted to lock over the trunnions of the crank-boxings, all combined substantially as shown and described.



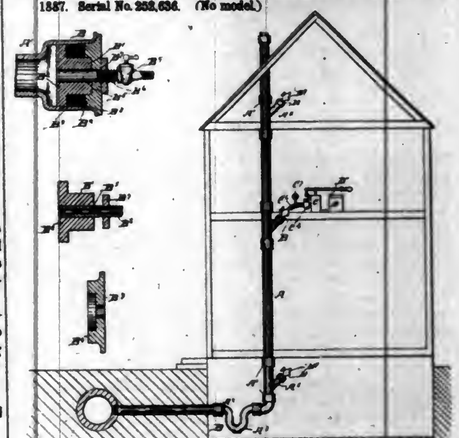
2. A crank-driving shaft for steam-engines, provided with an annularly-grooved crank-wrist journaled in bisected crank-boxings provided with similar grooves, such crank-wrist set at an angle to the line of bearings and adapted to conform to the amount of oscillation necessary to be given the piston, substantially as shown and described.

3. A crank-driving shaft having a grooved crank-wrist working in bisected boxings provided with similar grooves, the central line of such crank-wrist set at an angle to the line of bearings, substantially as shown and described.

4. A crank-driving shaft for steam-engines, having an annularly-grooved crank-wrist whose central line is set at an angle to the line of bearings and journaled in a bisected grooved crank-boxing provided with circular flanges having annular projections fitting into the grooves in the halves of the connecting-rod, in combination with such connecting-rod, substantially as shown and described.

5. A crank-driving shaft for steam-engines, having an annularly-grooved crank-wrist whose central line is set at an angle to the line of bearings, in combination with a crank-boxing having corresponding grooves and provided with trunnions formed integral with one section thereof, substantially as shown and described.

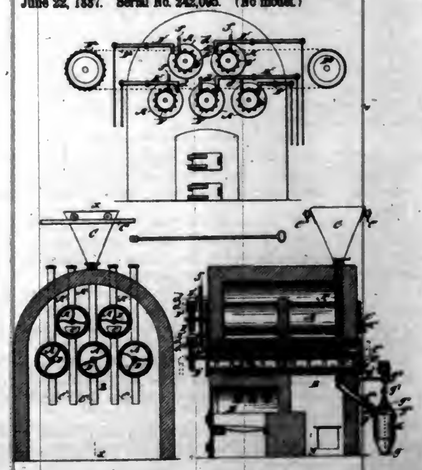
404,342. AXLE. FRANK L. G. CHAPMAN, Stevens Point, Wis. Filed Mar. 27, 1889. Serial No. 304,934. (No model.)



Claim.—1. The combination, with the hollow bed-piece I, having the arms I' and oil-chamber L, of the tubular axle A, screwed into the ends of the oil-chambers, and the clips P, fastening the tubular axle to the arms I', substantially as described.

2. The combination, with the tubular axle A, of the spindle B, having the collar C, and the sleeve D, screwed upon the outer end of the axle and having a flange, *d*, fitting outside of the collar C, substantially as described.

3. The combination, with the tubular axle A, having the enlargement *a*, of the bushing H, received within the enlargement, the spindle B, having a journal mounted in the bushing H, and a collar, C, adjacent to the end of the bushing and within the enlargement *a*, and the sleeve D, screwed upon the outside of the enlargement *a* and having a flange, *d*, fitting the journal outside of the collar C, substantially as described.



4. The combination, with the tubular axle A, of the spindle B, having a collar, C, and a shank, F, a hub mounted on the shank and recessed to receive the end of the axle A, and provided with a hole, O, and a sleeve, D, screwed upon the end of the axle within the recess of the hub and provided with a socket registering with the hole O, substantially as described.

404,343. METHOD OF TESTING AND DISINFECTING DRAIN AND SOIL PIPES. WILLIAM B. CLARK, Philadelphia, Pa. Filed Oct. 17, 1887. Serial No. 252,636. (No model.)

Claim.—The method of fumigating and testing soil-pipes, consisting of first generating air charged with disinfecting fumes or vapors in a separate vessel, next drawing air so charged through said vessel by a pump and forcing it through the pipes to be tested, then closing the outlets of said pipes, and by further pumping establishing a static pressure of the air charged with vapors, substantially as set forth.

404,344. APPARATUS FOR DEOXIDIZING IRON ORES. MICHAEL R. CONLEY, Brooklyn, assignor to William Bell, New York, N. Y. Filed June 22, 1887. Serial No. 242,095. (No model.)

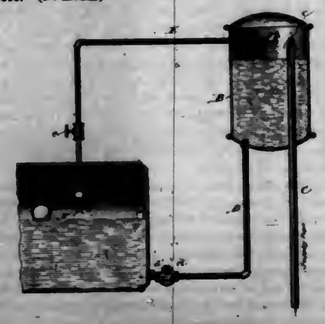
Claim.—1. The combination, with a combustion-chamber, of disconnected retorts arranged therein, chutes communicating with said retorts, through which material may be supplied, stirrers arranged in said retorts, gearing for causing the rotation of said stirrers, discharge-chutes for the retorts, and a furnace, said retorts being wholly closed to the products of combustion from the furnace and to atmospheric air, substantially as specified.

2. The combination, with a combustion-chamber, of a number of fixed retorts arranged therein, chutes communicating with said retorts, through which material may be supplied, stirrers arranged in said retorts, which, when the retorts are all in use, rotate in unison, gearing for causing the rotation of said stirrers, and disengaging devices for causing the non-rotation of any of said stirrers without affecting the others, discharge-chutes for said retorts, and a furnace, substantially as specified.

3. The combination, with a fixed retort, of a rotary stirrer provided with fingers extending radially therefrom, two sets of said fingers being in line with each other, and another set of said fingers being arranged intermediate of the other two sets and extending at approximate right angles therefrom, substantially as specified.

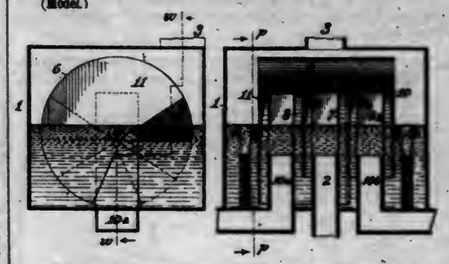
4. The combination, with a fixed retort, of a scraper therefor arranged within the retort and provided with a shank extending to the exterior of the retort, a brace for engaging said shank, and an adjustable handle for engaging said shank and operating the scraper to remove material from the retort after the shank of the scraper has been disengaged from the brace, substantially as specified.

5. The combination, with a combustion-chamber, of a fixed retort arranged therein, a discharge-chute for said retort, and a car adapted to be moved beneath the outer end of said discharge-chute and suspended from a hanger, and a rail along which said hanger may be moved to convey the car away, substantially as specified.



404,345. ROTARY BOLT. JOHN R. CORNWALL, Moline, Ill., assignor to the Barnard & Leas Manufacturing Company, same place. Filed July 9, 1888. Serial No. 279,385. (No model.)

Claim.—1. A bolting-reel frame provided at one end with a spider having a circumferential hoop, in combination with a bolting cloth or covering for said reel-frame, having two strips of flexible material attached to the ends thereof, whereby the cloth is attached to the spider by placing its rim between said strips and fastening the strips together beyond the edge of the rim, substantially as set forth.



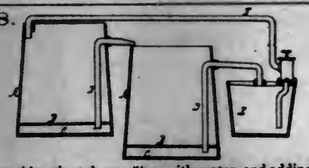
2. The combination, in a bolting-reel, of the central shaft, a head fixed thereon, and a spider at the opposite end of the reel adjustably mounted on the shaft, and the bolting-cloth attached to said head and having strips of flexible material at its other end adapted to be lapped over the rim of said spider and fastened to each other, thereby inclosing said rim and securing the cloth thereto, substantially as described.

404,346. BOILER-FEEDER. JULES CROLLARD, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed Dec. 17, 1888. Serial No. 293,895. (No model.)

Claim.—The combination, substantially as hereinbefore set forth, with a boiler, of the closed supply-tank B, the steam-pipe E, connecting the boiler with the supply-tank and provided with a float-valve arranged within the boiler, the valved water-supply pipe C, which extends downwardly from the supply-tank and which also extends upwardly through the bottom of the said tank to an extent to bring its upper valved end at the upper portion of the chamber within the supply-tank, and the valved feed-water pipe D, leading from the lower portion of the tank to the lower portion of the boiler, as and for the purpose described.

404,347. FLUID-SEAL VALVE FOR METERS. CHAUNCEY N. DUTTON, Pittsburg, Pa., assignor to the Fuel Gas and Electric Engineering Company, (Limited,) same place. Filed Aug. 20, 1888. Serial No. 283,294. (Model.)

Claim.—1. The combination of an inclosing-casing provided with an outlet-pipe and adapted to contain a sealing-fluid, an oscillating valve having two or more compartments formed in a shell by heads, and a partition or partitions the edges of which are inclined relatively to a diametric plane of the valve and to each other, an inlet-pipe extending into one of the valve-compartments, and a pipe or channel extending into each of the other compartments, substantially as set forth.

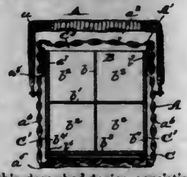


2. The combination of an inclosing-casing provided with an outlet-pipe and adapted to contain a sealing-fluid, an oscillating valve having three compartments formed in a shell by heads, and two intermediate partitions, the edges of said heads and partitions being inclined in alternate pairs in opposite directions relatively to a diametric plane of the valve, an inlet-pipe extending into one of the valve-compartments, and a pipe or channel extending into each of the other compartments, substantially as set forth.

3. The combination, in a fluid-seal valve, of a substantially semi-cylindrical shell, two end plates or heads, and two intermediate partition-plates secured thereto and forming three compartments therein, the edges of said heads and partition-plates being inclined in alternate pairs in opposite directions relatively to a diametric plane of the valve, an inner supplemental shell forming an annular space within the valve around its middle compartment, and a longitudinal partition dividing said annular space into two sections which communicate on opposite sides, respectively, of the axial line of the valve with the end compartments thereof, substantially as set forth.

404,348. PROCESS OF MAKING FERTILIZERS. HERMANN RUDOLPH, Brooklyn, assignor to Leopold Wallach, New York, N. Y. Filed Sept. 22, 1888. Serial No. 286,109. (No specimens.)

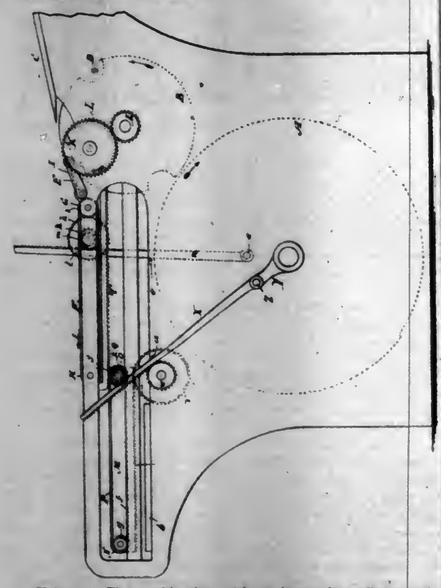
Claim.—1. The process for producing a fertiliser from tobacco, which consists in subjecting the tobacco to the action of a solution of



404,348.

mineral acid, washing the tobacco fiber with water, and adding to the extract produced basic material, substantially as described.

2. The process for producing a fertilizer from tobacco, which consists in moistening the tobacco, crushing the same, subjecting it to the action of mineral acid, washing the tobacco fiber with water, and adding to the extract produced basic material, substantially as described.

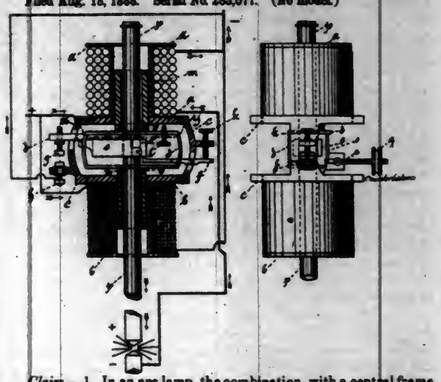


404,349. EGG-BASKET. JOHN T. FRAGER, St. Louis, Mo. Filed Mar. 31, 1888. Serial No. 269,060. (Model.)

Claim.—1. The within-described device, consisting of the wicker-work basket A, having an upper portion, a^7, and a shoulder, a^8, combined with the egg-case B, having plain walls, as and for the purpose stated.

2. The wicker-work basket A, having the upper binding portion, a^7, combined with the egg-case B, having plain walls projecting below its bottom, whereby the case comes in contact with the basket at its bottom edges, b^8, and at its upper portion, b^7, and a ventilating-space is provided between the sides and bottoms of the case and basket, substantially as set forth.

404,350. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. GEORGE P. FRENIER, New London, Conn. Filed Sept. 20, 1888. Serial No. 285,380. (No model.)



Claim.—1. The combination, with an impression-cylinder and a receiving-table, of an intermittently-moving delivery traveler or tapes, and a reciprocating carriage on which the printed sheet is deposited by the delivery-tapes, substantially as described.

2. The combination, with an impression-cylinder, a receiving-table, and delivery traveler or tapes, of a reciprocating carriage on which the printed sheet is deposited by the delivery-tapes, and a rack and clutch connection for imparting an intermittent motion to the delivery-traveler, substantially as described.

3. The combination, with an impression-cylinder, a receiving-table, and a reciprocating carriage, of a delivery traveler or tapes for delivering the printed sheet to the carriage, said delivery-traveler being actuated while a sheet is being delivered to the carriage, but being motionless when a sheet has been delivered to the carriage, substantially as described.

404,351. ELECTRIC-ARC LAMP. JOHN R. FOX, Fort Wayne, Ind. Filed Aug. 18, 1888. Serial No. 283,077. (No model.)

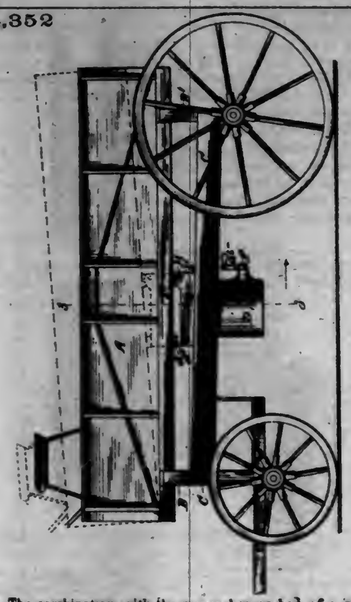
Claim.—1. In an arc lamp, the combination, with a central frame, of regulating-solenoids detachably secured thereto, hollow cores controlled by the solenoids, a positive carbon rod extending through the cores, and a clutch controlled by the cores, said clutch engaging the carbon rod.

2. In an arc lamp, the combination of an upper and lower regulating-coil, hollow cores rigidly connected corresponding to the coils, a clutch connecting the positive carbon rod mechanically with the cores, and an adjusting-screw to limit the upward thrust of the cores and the consequent length of the arc.

3. In an arc lamp, the combination, with the regulating-coils, of a vertically-movable frame controlled thereby, a clutch, a positive carbon engaged thereby, one end of the clutch being seated loosely in the frame to permit slight vertical and lateral movement, and a tripping device for engaging the other end of the clutch when it reaches a predetermined limit of depression.

4. In an arc lamp, the combination, with the regulating-coils, of a movable frame controlled thereby, and a clutch supported by the frame, one end of the clutch being provided with a tongue entering a recess in the frame and the other end engaging the positive carbon rod.

5. In an arc lamp, the combination, with the movable carbon rod, of a counter-balance therefor, comprising a weighted horizontal arm pivotally secured to the frame and a vertical rod pivoted to one end of the arm and bearing against the upper magnet-core.



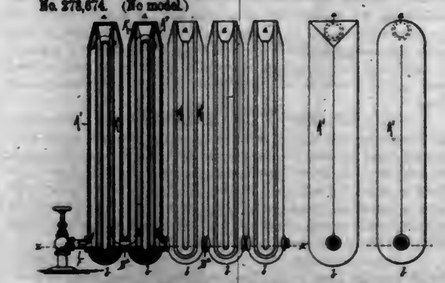
6. In an arc lamp, the combination, with the main and shunt solenoids secured to a central frame, a movable yoke within the frame, solenoid-cores secured to the yoke, a trip-lever, *f*, supported on the frame and co-operating with the clutch, and an adjusting-screw, *l*, for varying the length of the arc, substantially as and for the purpose set forth.

404,352. DUMPING-WAGON. WILLIAM W. GREEN, Chicago, Ill., assignor of two-thirds to A. H. Casey and CYRUS D. Lane, same place. Filed Feb. 12, 1889. Serial No. 299,644. (No model.)

Claim.—1. In a dumping-wagon, the combination, with the box or bed, of a chambered cylinder arranged vertically underneath said bed and supported in the frame-work of the running-gear, a vertical screw-shaft working in said cylinder, a vertically-moving piston inserted in said cylinder and having a threaded engagement with said screw-shaft, and a hinged connection with the box or bed, the pinion mounted on said screw-shaft, the horizontal shaft passing through the side of said cylinder, and the pinion and hand-crank mounted on the respective ends of said horizontal shaft, whereby the wagon box or bed may be elevated, swung on a pivot, and tilted to discharge the load, substantially as set forth.

2. In a dumping-wagon, the combination, with the framing-bars, of the chambered cylinder provided with holding-flanges, as described and bolted to said bars, the screw-shaft arranged vertically on the inside of said cylinder and journaled therein, means for rotating said shaft, the piston, flanged as described and inserted in said cylinder and having a threaded engagement with said shaft, and the box or bed to which the upper end of said piston is hinged, whereby said box may be raised bodily, tilted, and the load discharged at either side or end of the wagon, substantially as set forth.

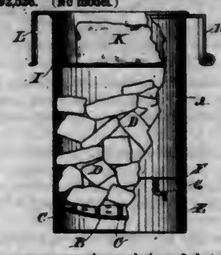
404,352



3. The combination, with the wagon box or bed, of a piston or plunger hinged to the under side of said box, the cylinder in which said piston has a vertical movement, the screw-shaft arranged on the interior of said cylinder and having a threaded engagement with said piston, the pinion mounted on the screw-shaft, the horizontal shaft having a companion pinion mounted on the inner end and a hand-crank on the outer end thereof, whereby a rotary motion is imparted to the screw-shaft and the piston raised or lowered, as may be required, substantially as and for the purpose set forth.

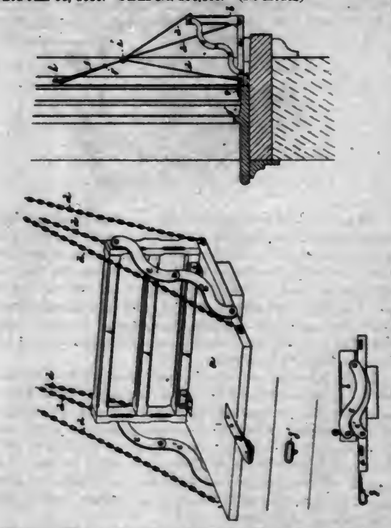
4. In a dumping-wagon, the combination, with the vertically-moving piston provided with a rectangular flange and having lugs extending upwardly from the back edge thereof, as described, of the box or bed provided with corresponding lugs projecting downwardly therefrom, the horizontal rod mounting all of said lugs, whereby a hinged connection is formed between the piston and box, and the transverse cleat secured to the under side of said box, a space being left between said cleat and flange on the piston when the latter is at its lowest position, substantially as and for the purpose set forth.

5. In a dumping-wagon, the combination, with the box or bed and frame-work, of a bolster hinged to the latter and adapted to be turned downwardly out of the way when tilting the box, substantially as set forth.



404,353. STEAM-RADIATOR. TIMOTHY HOLLAND, St. Paul, Minn., assignor to Mary C. Holland, same place. Filed June 30, 1888. Serial No. 278,674. (No model.)

Claim.—1. A radiator composed of separately-formed sections arranged in series, each section having in one piece two vertical branches—an inlet branch and an outlet branch—said branches being connected at their tops to form a passage for the steam, and being formed at their bottoms with a connecting trap-bend, in combination with horizontal connecting pipes or nipples connecting the outlet branch of one section with the inlet branch of the succeeding section, said connecting pipes or nipples being located above the highest point of the trap-bends in said sections, substantially as set forth.

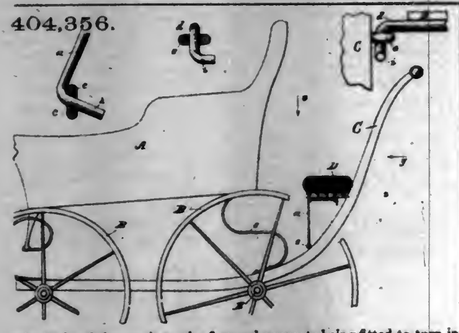


2. A radiator comprising a plurality of rows of radiating-sections, each of said sections having in one piece two vertical branches—an inlet branch and an outlet branch—said branches being connected at their tops to form a passage for the steam, and being formed at their bottoms with a connecting trap-bend, horizontal connecting nipples or pipes connecting the outlet branch of one section of each row with the inlet branch of the succeeding section of the same row, said connecting nipples or pipes being located above the highest point of the trap-bends in said sections, in combination with a single cross steam-inlet section connected with the initial radiating-section of each of the several rows of sections, substantially as set forth.

404,354. SOAP-RECEPTACLE. KATIE HUBER, Milwaukee, Wis., assignor of one-half to Charlotte Powell, same place. Filed Dec. 3, 1888. Serial No. 292,596. (No model.)

Claim.—A soap-receptacle consisting of the receptacle A, having a handle, H, and a perforated false bottom, B, and the thereto removably-secured tight cup-bottom E, in combination with the receptacle I, provided with a handle and a perforated bottom and adapted to fit into the top of the receptacle A, and to serve both as a receptacle and as a cover for the receptacle A, substantially as described.

404,355. WINDOW-CHAIR. BERTHA JACOB, New York, N. Y. Filed Jan. 30, 1889. Serial No. 298,115. (No model.)



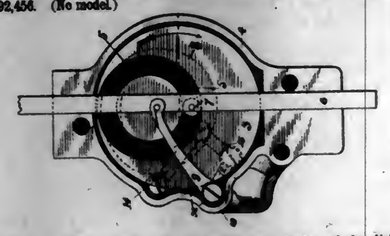
Claim.—The combination of a seat with a pivoted back, sectional arm-rests pivoted to the seat and the back, chains *d*, secured to seat and back and secured at their upper end to ring *e*, chains *f*, secured to said ring and carrying hooks *f'*, and with the snap-hook *g* secured to the seat, the hook *g* and chains *f* being adapted to engage staples secured to the window-frame, substantially as specified.

404,356. SEAT FOR A CHILD'S CARRIAGE. CHARLES V. KLIPFERT, Rochester, N. Y., assignor of one-half to Louis J. Vogt, same place. Filed Apr. 1, 1888. Serial No. 305,590. (No model.)

Claim.—1. In combination with the handle-bars or frame of a child's carriage, a seat back of the body of the carriage, and supports for the seat attached to the latter and entering rests in the handle-bars or frame, substantially as shown.

2. A seat for a child's carriage, having forward and rear supports therefor resting in rests secured to the handle-bars or frame in rear of

404,356.



the body of the carriage, the forward supports being fitted to turn in their bearings in the seat, and the rear supports being fitted to slide longitudinally in their bearings in the seat, substantially as shown and described.

3. A seat for a child's carriage, provided with supports *a a* for its front edge and other supports, *d d*, for its rear edge, said supports *d d* being held to slide longitudinally in their bearings in the seat, and a fastener for said supports *d d*, substantially as and for the purpose specified.

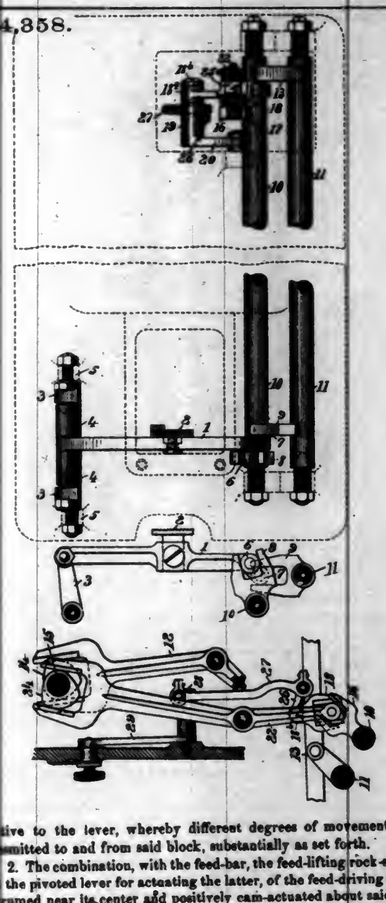
4. A detachable seat for a child's carriage, having movable supports for its forward edge and other movable supports, *d d*, for its rear edge, the supports *d d* being formed with offset bends and parallel parts, substantially as shown, and a fastener to press said parallel parts of the holders, substantially as shown and described.

404,357. TAKE-UP MECHANISM FOR SEWING-MACHINES.

FRANCIS T. LEILICH, Bridgeport, Conn. Filed Dec. 3, 1888. Serial No. 292,456. (No model.)

Claim.—1. The combination, with the main shaft and the disk, mounted upon the end thereof and carried thereby, and provided with a circular groove cut in the face thereof and having a cam-groove at its rear side, of the needle-bar supported in ways in the head and engaged and actuated by the circular groove, the take-up arm at the front of the head, the rock-shaft upon which said take-up is mounted, and the links, arm, and radius-bar operated by the cam at the rear of the disk, whereby the sectoral throw is imparted to the take-up arm, substantially as specified.

2. The combination, with the main shaft, of the disk mounted upon the forward extremity thereof, a circular groove cut in the outer face of said disk and eccentric as to its center with the center of the disk and engaging the needle-bar, a cam-groove cut in the rear side of said disk, the take-up arm extending across the face of the head, the rock-shaft journaled in said head, upon which the take-up arm is mounted, and the rock-arm, radius-bar, links, and roller-stud, the latter engaged by the cam-groove, whereby the proper throw is imparted to the take-up, as set forth.



3. The combination, with the main shaft and the disk upon the end thereof, of the cam-groove cut in the rear side of said disk, the roller-stud 11, engaging said groove, the link 13, the radius-bar 14, and the rock-shaft having a short arm at one end pivotally secured to the link and having at the other end the take-up arm extending across the face of the head, substantially as described.

404,358. FEEDING MECHANISM FOR SEWING-MACHINES.

FRANCIS T. LEILICH, Bridgeport, Conn. Filed Feb. 12, 1889. Serial No. 299,653. (No model.)

Claim.—1. In a feeding mechanism for sewing-machines, the combination, with the main shaft, of the feed-lifting lever fulcrumed near its center, a cam engaging and actuating said lever at its upper end, and the feed-lifting rock-shaft positively operated by said lever, the cam-actuated feeding-lever fulcrumed near its center, the feed-driving rock-shaft and feed-bar, and the vibratory grooved block arranged between the lever and the shaft and movable to different positions

404,358.

relative to the lever, whereby different degrees of movement are transmitted to and from said block, substantially as set forth.

2. The combination, with the feed-bar, the feed-lifting rock-shaft, and the pivoted lever for actuating the latter, of the feed-driving lever fulcrumed near its center and positively cam-actuated about said fulcrum, the feed-driving rock-shaft and its connection to the feed-bar, the pivoted grooved block engaged by the lever and in turn engaging the feed-driving rock-shaft, and means, as described, whereby the shaft to which the block is secured may be turned to different angles of inclination, substantially as set forth.

3. The combination, with the feed-bar and the means, as described, whereby the same is properly raised and lowered, of the main shaft, the cam-actuated fulcrumed lever driven therefrom and provided with a roller at its lower end, the block engaged by said roller and journaled on a cranked shaft, the rock-shaft 10, actuated by said block, and a suitable rod and index, whereby said cranked shaft may be turned to various positions relative to its fulcrum, as set forth.

4. The combination, with the feed-bar and the lever and the rock-shaft, whereby said bar is positively raised and lowered, of the feed-driving lever pivoted near its center, the cam on the main shaft, whereby it is actuated, the stud upon the lower end of said lever, the block engaged by said stud, and the adjustable shaft on which said block is journaled, the rock-shaft actuated by said block through the arm, and the connection between the forward end of said rock-shaft and the feed-bar, substantially as specified.

5. The combination, with the feed-bar and means for imparting to the same the necessary vertical reciprocation, and with the feed-driving lever, the feed-driving rock-shaft, and the connection of the latter with the feed-bar, of a grooved block pivotally secured to a movable shaft, means for moving said shaft to various positions relative to its fulcrum, a connection between the driving-lever and said block, and a connection between said block and the rock-shaft, as specified.

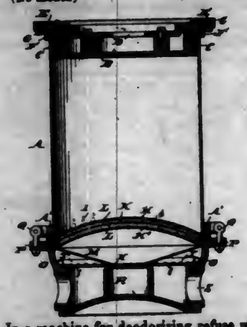
6. The combination, with the feed-bar, of the fulcrumed oscillating link whereon one end of said bar is mounted, the slide-blocks projecting outward from the opposite sides of the other end of the

bar, the two rock-shafts actuated from the other end of the machine, and the two forked arms upon said shafts embracing the slide-blocks, the one lying in a horizontal and the other in a vertical plane and at the same end of the bar, substantially as set forth, whereby the appropriate coinpound movement is imparted to the feed-bar.

7. In a feeding mechanism for sewing-machines, the combination, with the main shaft and the cam mounted thereon and carried thereby, of the vibrating lever fulcrumed at its center and forked at each end, the upper end being operated by the cam, the fulcrumed and grooved adjustable vibratory block operated by the lower end of the lever, the feed-driving rock-shaft operated from said block, and means, as described, for imparting to the feed-bar its proper rising-and-falling movement, as set forth.

404,359. BUSH-HAMMER.

FRANCIS D. LEMON and WILLIAM LEMON, Merrickville, Ontario, Canada. Filed Dec. 6, 1888. Serial No. 292,822. (No model.)



Claim.—1. A bush-hammer comprising a head, A, beveled inwardly at the sides toward both ends, tubular-tooth-holders C and C', sleeved on said head at opposite ends and connected by bolts F F', and rectangular-sided tapering teeth E, supporting one another within the tooth-holders, each tooth having an exposed pyramidical point and removable by disconnection of the tooth-holders from the hammer-head, as set forth.

2. The combination, with the hammer-head A, having the sides beveled inwardly at both ends, of the tubular tooth-holders C and C', sleeved thereon, the tapering teeth E, filling the tooth-holders, and bolts F F', connecting the tooth-holders, whereby the teeth are compressed together and confined against the hammer-head by drawing the tooth-holders closer together by the bolts, as set forth.

404,360. MECHANISM FOR DEODORIZING REFUSE MATTER AND CONVERTING IT INTO FERTILIZERS.

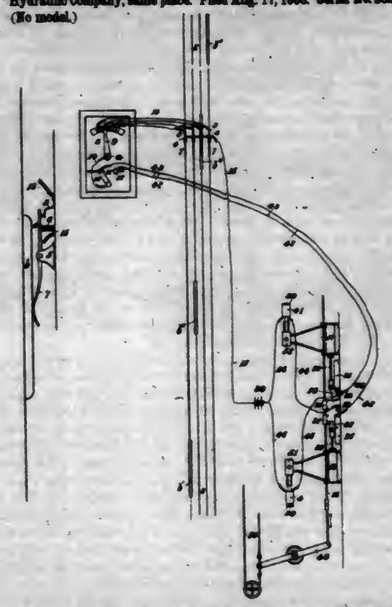
OSCAR D. MCCLELLAN, Philadelphia, Pa., assignor, by direct and mesne assignments, to Jacob Kennedy and Peter Hill Engle, same place. Filed June 5, 1888. Serial No. 276,103. (No model.)

Claim.—1. In a machine for deodorizing refuse matter and converting it into fertilizers, the combination of a vessel having a movable bottom with means, substantially as described, to operate said bottom, and a strainer located within said vessel, through which the liquid is forced from the refuse matter in the vessel by the compression due to said movable bottom, and a pipe located under said strainer, through which aerated water is jetted upon the liquid and mixed with it.

2. In a machine for deodorizing refuse matter and converting it into fertilizers, a vessel having a movable bottom, in combination with means, substantially as described, to operate said bottom, and a strainer located within the vessel, consisting of perforated screens H and H', and provided with projections I, extending upward from it.

3. The combination of a cylindrical vessel, a bottom movable within said vessel but not removable from it, flanges upon the base of the vessel to prevent said bottom being withdrawn, a removable strainer located below said movable bottom when the vessel is inverted, a cover adapted to clamp said strainer to the vessel having a receptacle for the expressed liquid below the strainer, and mechanism, substantially as described, unconnected with said movable bottom to operate it.

4. The combination of a cylindrical vessel, a bottom movable within said vessel but not removable from it, flanges upon the base of the vessel to prevent said bottom being withdrawn, a removable strainer located below said movable bottom when the vessel is inverted, a cover adapted to clamp said strainer to the vessel having a receptacle for the expressed liquid below the strainer, a circular guide between said strainer and receptacle, and mechanism, substantially as described, unconnected with said movable bottom to operate it.



5. A donegan for refuse matter, consisting of a vessel having a movable piston-bottom within it guided upon its sides, and a removable air-tight cover or lid, and means to lock the removable lid tightly upon the open end of the donegan.

6. A donegan in which to collect and strain refuse matters, consisting of a cylindrical vessel of uniform cross-section on the inside and open on both ends, a movable piston-bottom within said vessel supported and guided upon the inside of said vessel, and having a packed periphery to prevent escape of liquid, a support upon the cylindrical vessel to prevent the piston-bottom being pushed out of the vessel at one end, a removable tight cover or cap for the other end of the vessel, and clamping devices to hold the cover or cap tightly to the cylinder to seal the donegan.

7. A donegan in which to collect and strain refuse matters, consisting of a cylindrical vessel of uniform cross-section on the inside and open on both ends, a movable piston-bottom within said vessel supported and guided upon the inside of said vessel, and having a packed periphery to prevent escape of liquid, a support upon the cylindrical vessel to prevent the piston-bottom being pushed out of the vessel at one end, a strainer removably supported to the other end of the vessel, a liquid-receiving chamber arranged below said strainer and detachably connected so as to support the strainer in position, and clamping devices to hold the receiving-chamber and the strainer tightly against the end of the vessel.

404,361. ELECTRICAL APPARATUS FOR CONTROLLING ELEVATORS.

RONALD F. MCFERLY, Pittsburg, Pa., assignor to the Electro-Hydraulic Company, same place. Filed Aug. 17, 1888. Serial No. 282,904. (No model.)

Claim.—1. The combination, with the main motor, its controlling valve, and the valve rod or stem, of independent secondary motors having pistons which move the said valve rod or stem to effect motion of the main motor in contrary directions, mechanism for disconnecting the respective pistons of the secondary motors from the said valve rod or stem at a middle point of the travel of the latter, valves controlling the secondary motors and electro-magnets controlling said valves, and an electric circuit and switch mechanism by which the magnets may be caused to operate either of said secondary-motor valves, substantially as and for the purposes described.

2. The combination, with the main motor of an elevator-car and its controlling-valve, of an electro-magnet for operating said valve, an electric circuit, several branch circuits, switch mechanism on the car by which any of said branch circuits may be included in the main circuit, and circuit breakers or closers on the car, one of the contacts of each being movable, and mechanism adapted to move the same and to break or to close the branch circuits as the car reaches or approaches the several floors of the building, whereby the action of said magnet is effected automatically to cause the stopping of the car, substantially as and for the purposes described.

3. The combination, with the motor of an elevator-car, of separate electro-magnets, one of which effects the motion of the valve to drive the motor in one direction and the other of which effects the motion of the valve to drive the motor in the other direction, an electric circuit, several branch circuits, a switch on the car by which any of the said branch circuits may be included in the main circuit, circuit breakers or closers on the car, one of the contacts of each being movable, and mechanism adapted to move the same and to break or to close the branch circuits as the car reaches or approaches the several floors of the building, whereby the action of said magnets is effected automatically to cause the stopping of the car, and a second switch by which either of the said magnets may be put in circuit, substantially as and for the purposes described.

4. In an electrical apparatus for controlling the valve of an elevator-car motor, wherein there is an electro-magnet and an electric circuit extending through the car, a device for automatically controlling said circuit, which consists in a circuit closer or breaker having a contact, 3, a movable contact-piece adapted to engage therewith, and a projection in the elevator-shaft which engages the movable contact-piece and operates the same as the car passes, substantially as and for the purposes described.

5. In an electrical apparatus for controlling the valve of a motor, the combination of two electro-magnets and their operative circuits adapted to effect the motion of the motor-valve in opposite directions, circuit-closers interposed in the said circuit, and mechanism, substantially as described, which on the exciting of one of the electro-magnets and the consequent operation of the motor-valve in one direction is actuated to break the circuit of the other magnet, substantially as and for the purposes described.

6. In an electrical apparatus for controlling the valve of a motor, the combination, with the main-motor-valve rod or stem, of secondary motors 17 and 18, having piston-rods 20, and provided with engaging devices—such as hooks—which engage projections on said valve stem or rod, whereby motion of one of said secondary motors will effect motion of the main-valve stem in the proper direction, and an electric circuit extending from the elevator-car and controlling the valves of the secondary motor, substantially as and for the purposes described.

7. In an electrical apparatus for controlling the valve of a motor, the combination, with the main-motor-valve rod or stem, of secondary motors 17 and 18, having piston-rods 20, and provided with engaging devices—such as hooks—which engage projections on said valve stem or rod, whereby motion of one of said secondary motors will effect motion of the main-valve stem in the proper direction, and an electric circuit controlling the valves of the secondary motor, said hooks being movable into and out of engagement with the said projections, and devices at the ends of the paths of said piston-rod which move the hooks out of engagement with the projections, substantially as and for the purposes described.

8. In an electrical apparatus for controlling the valve of a motor, the combination, with the main-motor-valve rod or stem, of secondary motors 17 and 18, having piston-rods 20, and provided with engaging devices—such as hooks—which engage projections on said valve stem or rod, whereby motion of one of said secondary motors will effect motion of the main-valve stem in the proper direction, electro-magnets which control the valves of the secondary motors, and circuit-closers arranged in the paths of said piston-rods, so that when the piston-rods are at their normal position they shall close the said circuit-closers, and that when the piston-rods leave said positions the circuit-closers shall be open, each of said rods controlling the circuit-closer of the circuit of the magnet which controls the valve pertaining to the other piston-rod, substantially as and for the purposes described.

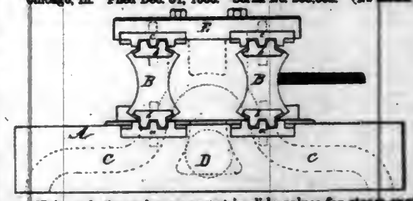
9. In an electrical apparatus for controlling the valve of a motor, the combination of a main-motor-valve rod or stem, of secondary motors 17 and 18, having piston-rods 20 and pivoted hooks at the ends of said rods, which are adapted to engage projections on the said valve stem or rod, supports 25, which guide and support said hooks in their motions, and stops 26, which engage the said hooks and move the same out of the path of said projections when the piston-rods reach the ends of their strokes, and electro-magnets controlling the valves of said secondary motors, substantially as and for the purposes described.

10. In an electrical apparatus for controlling the valve of a motor, the combination of a main-motor-valve rod or stem, of secondary motors 17 and 18, having piston-rods 20 and pivoted hooks at the ends of said rods, which are adapted to engage projections on the said valve stem or rod, supports 25, which guide and support the said hooks in their motions, stops 26, which engage the said hooks and move the same out of the paths of said projections when the piston-rods reach the ends of their strokes, electro-magnets controlling the valves of said secondary motors, and circuit-closers in the circuits of said magnets, said circuit-closers being situated at the ends of the paths of said hooks, substantially as and for the purposes described.

11. In an electrical apparatus for controlling the main valve of a motor, the combination of a secondary motor which operates the said main valve, a valve controlling the secondary motor, a cylinder, 32, and its piston, which is connected with the valve of the secondary motor, a valve, 33, which controls a port leading to the cylinder 32, and an electro-magnet which controls the valve 33, substantially as and for the purposes described.

12. In an electrical apparatus for controlling the main valve of a motor, the combination of a secondary motor which operates the said main valve, a valve controlling the secondary motor, a cylinder, 32, and its piston, which is connected with the valve of the secondary motor, a valve, 33, which controls a port leading to the cylinder 32 on one side of its piston to produce motion thereof in one direction, a spring bearing on the piston to produce motion thereof in the other direction, and an electro-magnet which controls the valve 33, substantially as and for the purposes described.

13. In an apparatus for controlling the valve of an elevator, the combination, with the said valve and its stem or rod, of a mechanical connection—such as a rope—between the elevator-car and the valve-stem, a secondary motor and its controlling electrical circuit, which operates the main-valve stem, and mechanism which automatically detaches the valve stem or rod from the secondary motor when the latter reaches the end of its stroke, whereby the valve may be freely operated by the rope, substantially as and for the purposes described.

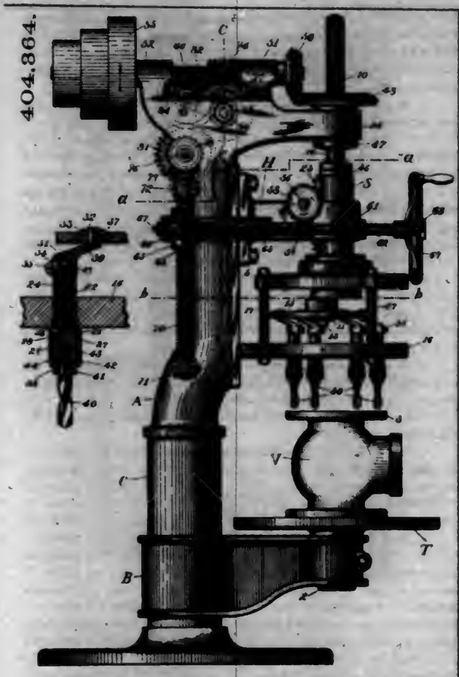


404,862. CONE OR FORMER FOR FELT-HARDENING MACHINES. JOHN PENDERGAST, Boston, and DANIEL PENDERGAST, Merrimac, Mass.; said John Pendergast assignor to William B. Stimpson, Whitinsville, Mass. Filed Dec. 26, 1888. Serial No. 294,618. (No model.)

Claim.—1. A former for shaping a completed wool hat during the hardening process, consisting of a flat body composed entirely of wire-cloth, substantially as set forth.

2. A former for shaping a completed wool hat during the hardening process, consisting of a flat body composed of two sheets of wire-cloth and a metallic binding-strip uniting said sheets at their edges, substantially as set forth.

404,868. ROLLING SUPPORT FOR SLIDE-VALVES. WARREN P. REASER, Fairmont, Nebr., assignor to the Round Valve Company, Chicago, Ill. Filed Dec. 31, 1888. Serial No. 295,092. (No model.)



Claim.—1. As an improvement in slide-valves for steam-engines, the rolling supports for said valves recessed at their ends and provided with wearing-surfaces, and toothed segments *b b*, inserted in said recesses and adapted to be removed and replaced by others when worn, substantially as set forth.

2. As an improvement in slide-valves for steam-engines, the removable rack-plates *a* and *c*, set into recesses formed in the valve-face A and cap E, said plates having plane wearing-surfaces adapted to receive the wear of the rolling supports B, substantially as specified.

3. As an improvement in slide-valves for steam-engines, the rolling supports B, provided with removable segments *b*, in combination with a valve-face, A, the valve and cap E, said face and cap provided with removable toothed plates *a* and *c*, all arranged for joint operation in the manner and for the purpose shown and described.

404,864. DRILLING-MACHINE. FRANCIS H. RICHARDS, Hartford, Conn., assignor to Bickley R. Coxe, Drifton, Pa. Filed Dec. 6, 1888. Serial No. 292,543. (No model.)

404,864.

Claim.—1. In a drilling-machine, the combination of the vertical column having a way for a movable head, a movable head on said way, a spindle-slide working in said head and carrying thereon the drilling-head having the jig-plate carrying the drills, and means, substantially as described, for rotating the drills, said jig-plate being constructed to engage with and be guided by said way, all substantially as described.

2. In a drilling-machine, the combination of a frame-work having a vertical way, the head adjustable on said way and carrying the driving-spindle slide, the horizontal feed-shaft carried in bearings on said head, gearing, substantially as described, connecting said shaft with said slide, and the vertical worm-shaft 70, supported parallel to said way and operating said feed-shaft through a worm-wheel thereon, all substantially as described.

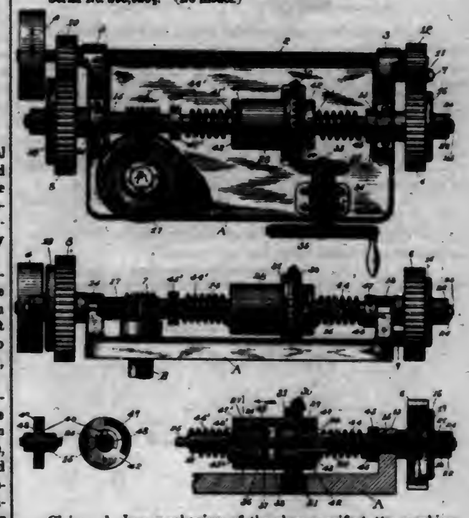
3. In a drilling-machine, the combination of a frame-work having a vertical way, the head adjustable on said way and carrying the driving-spindle slide, the horizontal feed-shaft carried in bearings on said head, gearing operatively connecting said feed-shaft and slide, the vertical worm-shaft 70, parallel to said way and operating said feed-shaft through a wheel thereon, the driving-shaft 60, and a system of connecting-shafts and gearing, substantially as described, actuating said worm-shaft from said shaft 60, said system comprising change-wheels whereby to vary the feed movement of said slide, all substantially as described.

4. In the feed mechanism of a drilling-machine, the combination, with the frame-work carrying the driving-shaft 60 and having the projecting fixed hub 85, of the worm-shaft 70, shaft 76, geared to said worm-shaft, shaft 75, driven by worm-wheel 77 from worm 74 on shaft 60, arm 84, carried on said hub and carrying stud 83, and the change-wheels 80, 81, and 82, connecting said shafts 75 and 76, all substantially as shown and described.

5. In a drilling-machine of the class specified, the combination of the changeable jig-plate bored, substantially as set forth, to receive the drill-sockets, the drill-sockets carried by said plate in said bores and carrying drill-spindles provided with cranks, the driving-spindle having a crank, and the driving-plate carried on said driving-crank and bored to receive the crank-pins of said drill-cranks, said driving-plate being bored larger than said crank-pins, thereby serving as a driver and also as an evener, to accommodate the irregularity and misalignment of the holes in said jig-plate with those of the driver, all substantially as described, and for the purpose specified.

6. In a drilling-machine, the combination of the driving-spindle 10, having a crank, the driving-plate carried on said crank, the jig-plate 16, the drill-sockets 24 set in said jig-plate, the drill-spindles 22, carried in said sockets, cranks 30 on said spindles, and operatively connected to be driven by said driving-plate, the spindle 10 being carried in a slide, and the jig-plate being supported by connections with said slide, substantially as described.

7. In a drilling-machine, the combination of the tubular socket 24, externally enlarged at its lower end and having its bore enlarged within said external enlargement, the spindle 22, fitting said bore and the enlargement thereof, the upper end of said enlargement furnishing a shoulder to resist the pressure of drilling, and the enlarged lower end of the socket furnishing a guide for the spindle against lateral movement, substantially as described.



8. In a drilling-machine, the combination of the socket 24, the drill-spindle having the screw-thread 29, and the crank 30, fitting said thread and bearing on said socket and adapted to be screwed against the end of the spindle, substantially as shown and described.

9. The combination of socket 24, spindle 22, having thread 29, and the crank 30, fitting said spindle and thread, and having slot 34 and clamp-screw 35, substantially as described.

10. The combination of the socket 24, enlarged at its lower end, substantially as described, the spindle 22, having the enlargement 21, and the drill 40, fitting a socket within said enlargement 21, substantially as described, and for the purpose specified.

11. In a drilling-machine, the combination of the vertically-movable spindle-slide provided with connections adapted to carry the jig-plate, the jig-plate carrying the crank-provided drills and supported from said slide, the driving crank-spindle carried in said slide, and the driving-plate carried on said crank between said slide and jig-plate and engaging to drive said drill-cranks, all substantially as described.

404,865. FEED MECHANISM. FRANCIS H. RICHARDS, Hartford, Conn., assignor to Bickley R. Coxe, Drifton, Pa. Filed Jan. 10, 1889. Serial No. 296,220. (No model.)

Claim.—1. In a mechanism of the class specified, the combination, with a driven shaft and reversely-operating driving apparatus, substantially as described, of a sliding collar connected to engage and disengage said apparatus, and a revolving nut carried in a fixed position longitudinally on said shaft, constructed to actuate said collar and adapted to be revolved by hand, all substantially as described.

2. In a mechanism of the class specified, the combination of the shaft 15, driving apparatuses, substantially as described, for reversely revolving said shaft, collar 36, connected to engage and disengage said apparatuses one at a time, the revolving nut, and the hand-wheel connected to revolve said nut independently of and turn the same on said shaft, all substantially as described.

3. In a mechanism of the class specified, the combination, with the shaft 15, provided with a sliding collar, a clutch-rod, and driving apparatuses, substantially as described, of the revolving shell constructed to actuate said collar and adapted to be revolved independently of said shaft, and devices, substantially as described, operating to normally hold said shell in a middle position, as set forth, circumferentially of said shaft, substantially as described.

4. In a mechanism of the class specified, the combination of the shaft 15, having a stop-key, rod 25, collar 36, connected to said rod, the revolving nut actuating said collar and having lug 41, stop-collar 42, engaging said stop-key and lug, and a spring actuating said stop-collar, substantially as described.

5. In a mechanism of the class specified, the combination of shaft 15, collar 36, connected to engage the driving-wheels, substantially as described, the revolving shell actuating said collar, and oppositely-disposed stop-collars actuated, substantially as described, to normally hold said shell in a middle position circumferentially of said shaft, substantially as described.

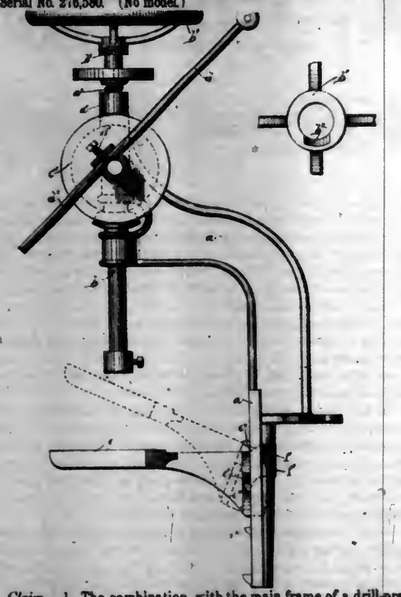
6. In a mechanism of the class specified, the combination, with a frame-work, of the main shaft 15, wheels 6 and 8, clutches 16 and 18, rod 25, collar 36, connected to said rod, and a revolving part, substantially as described, carried on said shaft and adapted to be revolved independently of the shaft to actuate said collar, all substantially as described.

7. In a mechanism of the class specified, the combination, with the shaft 15, having enlargement 26 and slot 37, of the rod 25, key 38, collar 36, and a revolving shell, substantially as described, actuating said collar and taking its bearings on said shaft at either end of said enlargement, substantially as described.

8. In a mechanism of the class specified, the combination, with the shaft 15, having key 40, of the shell having lug 41, and stop-collar 42, having spaces 48 and 49, substantially as described.

404,366. DEVICE FOR TESTING COLOR-BLINDNESS. Lucius T. Stanley, Brooklyn, assignor to David L. Proudfit, New York, N. Y.

Filed Aug. 15, 1888. Serial No. 282,771. (No model.)



Claim.—1. In an apparatus for testing for color-blindness, the combination of two adjustably-attached cards or surfaces, one made up of different color-sections, and the other containing an opening or aperture upon a white surface, the card containing the color-sections being arranged so that the several sections can be brought to pass beneath the opening of the other card.

2. In an apparatus for testing for color-blindness, a card, A, provided with a plain white space, D, and with a white space, C, surrounding an opening, E, in combination with color-sections H, secured to the card and adapted to be passed under the said opening.

3. In combination, the card A, provided with the black spaces B B and with the white spaces C D, one of which has the opening E, and the color-disk F, adjustably secured to the card, so that its color-sections may be passed under the said opening E.

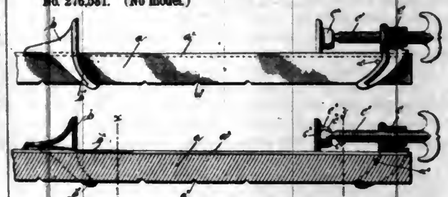
404,367. DRILL-PRESS. Edward C. Stearns, Syracuse, N. Y., assignor to Edward C. Stearns & Co., same place. Filed June 9, 1888.

Serial No. 276,580. (No model.)

Claim.—1. The combination, with the main frame of a drill-press provided with a series of projections on its face, of an adjustable work-supporting table formed with a cross-bar to rest on said projections, and with a pair of arms hooked around the edges of the main frame and having their rear ends beveled, substantially as and for the purpose set forth.

2. In a drill-press, the combination, with the drill-spindle, of a supporting bracket or frame, a shoulder, *a*, provided upon said spindle between its opposite extremities, a wheel or collar, *b'*, secured to the spindle on one side of the shoulder *a*, a loose screw-sleeve, a^3, mounted upon the spindle and interposed between said wheel *b'* and shoulder *a*, a roller, b^2, interposed between said loose screw-sleeve a^3 and the wheel *b'*, locking the screw-sleeve a^3 and wheel *b'* together, with gearing for actuating the spindle, and a hand-hold connected to said gearing and adjustable at different distances to the motor shaft or spindle of the gearing, substantially as and for the purpose set forth.

3. In a drill-press, the combination, with the main frame provided with a stud circumferentially grooved near its end, of a main driving-gear mounted upon said stud, and an adjustable handle passed through the hub of the gear and the groove in the stud, substantially as and for the purpose set forth.



4. In a drill-press, the combination, with the drill-spindle, the screw-feeding sleeve thereon, and the main frame, of a wheel or collar secured upon the top of the spindle, having an inclined recess in its hub, and a small roller placed in said recess, substantially as and for the purpose set forth.

5. In a drill-press, the combination, with a drill-spindle, of a shoulder and loose screw-sleeve mounted on the spindle, means for engaging the screw-sleeve with its spindle, the plain extremity a^3, provided on the screw-sleeve, and a suitable bracket provided with threads engaging the screw-sleeve, substantially as and for the purpose set forth.

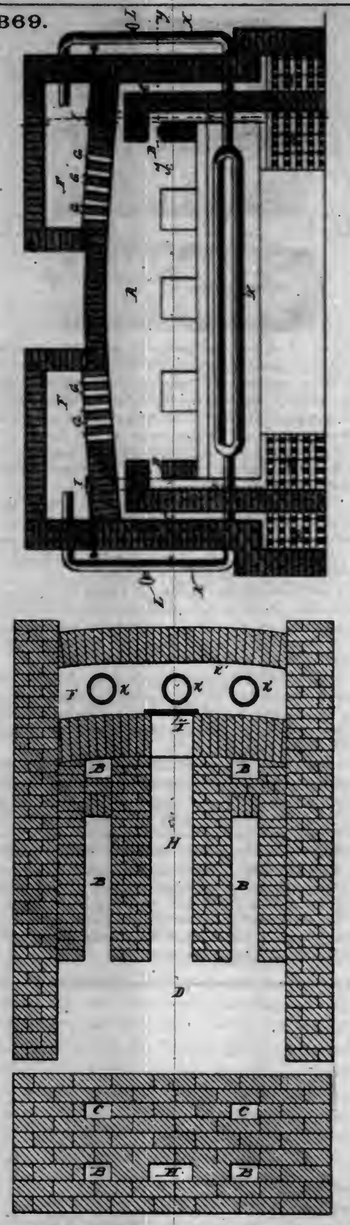
6. In a drill-press, the combination of the frame *a'*, spindle *b*, guided rectilinearly therein, a shoulder, *a*, projecting from said spindle between the opposite extremities thereof, a wheel or collar, *b'*, secured on the upper extremity of the spindle, a loose screw-sleeve mounted on a spindle and interposed between the collar and shoulder, an inclined recess in the hub secured on the spindle, and a roller placed in said recess and bearing upon the upper face of the loose screw-sleeve a^3, binding the opposite face of the screw-sleeve against the shoulder provided on the spindle *b*, substantially as and for the purpose set forth.

404,368. CLAMP. Edward C. Stearns, Syracuse, N. Y., assignor to Edward C. Stearns & Co., same place. Filed June 9, 1888.

Serial No. 276,581. (No model.)

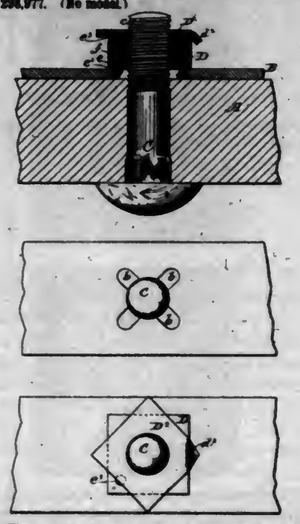
Claim.—1. The combination, with the bar *a*, formed with a longitudinal groove in its upper face and having its lower face formed with a series of transverse notches, of the movable head *b*, having a forwardly-inclined loop rigidly secured thereto for embracing the bar and engaging the notches, the spring b^3, and the stationary head *c*, its screw *c'*, and follower c^3, all constructed and arranged to operate substantially as and for the purpose set forth.

2. The combination, with the bar *a*, having its lower face formed with a series of transverse notches, the movable head *b*, having a forwardly-inclined loop rigidly secured thereto for embracing the bar and engaging the notches, a spring for forcing the loop to engage the transverse notches, the head *c*, having a loop rigidly secured thereto for engaging a transverse slot in the bar *a*, the pin a^3, for the abutment of the head *c*, the screw *c'*, and the follower c^3, substantially as and for the purpose set forth.



404,369. METALLURGICAL FURNACE. William Stubblebine, Bethlehem, assignor to the Stubblebine Patent Company, Philadelphia, Pa. Filed Feb. 16, 1888. Serial No. 264,205. (No model.)

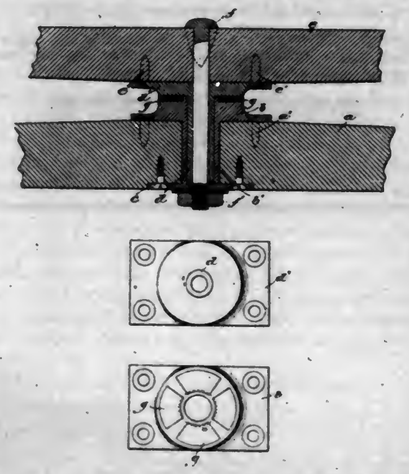
Claim.—1. In a furnace for metallurgical operations and other purposes, the combination, with the combustion-chamber, of a mixing-chamber communicating therewith, an air-regenerator chamber also in communication with the combustion-chamber, a gas-regenerator chamber communicating through suitable flues with the mixing-chamber and with the combustion-chamber at or near the point of communication between the combustion and mixing chambers, and an air-supply pipe, K, communicating with the mixing-chamber for supplying air thereto, substantially as and for the purpose set forth.



2. In a metallurgical or other furnace, the combination, with the combustion-chamber, of a mixing-chamber communicating therewith, an air-supply in communication with the mixing-chamber, an air-regenerator chamber communicating with the combustion-chamber, and a gas-regenerator chamber communicating through suitable flues with the mixing-chamber and with the combustion-chamber, substantially as set forth.

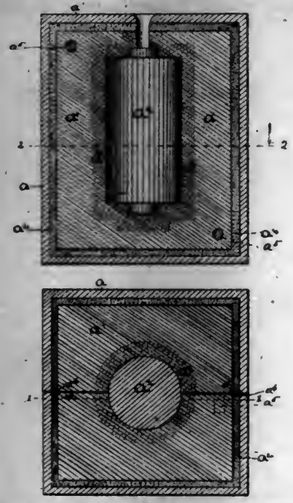
3. In a metallurgical or other furnace, the combination, with the combustion-chamber, of a mixing-chamber at each end, and communications between each of said mixing-chambers and the combustion-chamber, a gas-regenerator chamber at each end of the furnace, each of said regenerator-chambers communicating through flues with one of the mixing-chambers and with the combustion-chamber, an air-supply in communication with each mixing-chamber, and valves for wholly or partially cutting off either of the mixing-chambers at pleasure, substantially as described.

404,369.



404,370. NUT-LOCK. George Van Nest, Raritan, N. J., assignor of one-half to Garret V. Clickener, same place. Filed Feb. 7, 1889. Serial No. 298,977. (No model.)

Claim.—The combination of a plate having perforations therein, a bolt, a nut, D, thereon, a coiled spring, and a pin within said nut, the nut having a countersunk seat for the head of the pin, with an auxiliary nut, D^3, upon the same screw-thread of the bolt as the nut D, whereby the spring-pin is locked, substantially as described.

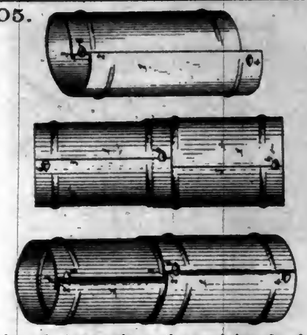


404,371. WHIFFLETREE-CONNECTION. Daniel D. Whitney, Cornwall, N. Y., assignor to the Whitney Coupling Company, Whitinsville, Mass. Filed Jan. 19, 1889. Serial No. 296,960. (No model.)

Claim.—1. In a whiffletree-connection, a bearing or chafer plate, *a'*, adapted to be secured to the whiffletree and having a sleeve extended downwardly into or through the cross-bar, and the retaining-bolt *f* within it, combined with a companion bearing or chafer plate, *b*, secured to the cross-bar and having a bushing, which also extends down into or through the said cross-bar and receives within it the said sleeve, substantially as described.

2. In a whiffletree-connection, the combination, with the protected retaining-bolt *f*, of two bearing or chafer plates located between a cross-bar and whiffletree, one of which plates has an anti-friction bearing-surface, or substantially so, substantially as described.

404,372. MOLD. CHARLES H. WILDER, Natick, assignor, by mesne assignments, to Frederick E. Atteaux, trustee, Boston, Mass. Filed May 4, 1888. Serial No. 273,002. (No model.)



Claim.—1. As a new article of manufacture, a permanent mold formed of coke, graphite, and a coked binder, as described.

2. As a new article of manufacture, a permanent mold provided with an integrally-attached back, the face of the said mold being formed of a mixture of coke, graphite, and coked binder, all substantially as described, and the backing of said mold being formed of coke and a coked binder, the said mold and back being united, substantially as set forth.

REISSUES.

11,005. STOVE-PIPE. WALTER S. SHIPE, Minerva, Ohio, assignor to Oliver S. Garretson, Buffalo, N. Y. Filed Jan. 27, 1888. Serial No. 262,183. Original No. 366,515, dated July 12, 1887.

Claim.—1. A stove-pipe section consisting of a sheet of metal having its longitudinal edges provided with oppositely-turned interlocking flanges and provided near one of its ends with a lip which engages with one of said flanges and prevents the interlocking flanges from being engaged and disengaged in their normal position, but permits the engagement and disengagement of said flanges when displaced lengthwise and the engagement with and disengagement from said lip by a lengthwise movement of the interlocked flanges upon each other, substantially as set forth.

2. A stove-pipe section consisting of a sheet of metal having its longitudinal edges provided with oppositely-turned interlocking flanges and provided near its end with an internally-projecting lip arranged in rear of the inwardly-turned flange and bearing against the outwardly-turned flange, substantially as set forth.

3. A stove-pipe section consisting of a sheet of metal having its longitudinal edges provided with oppositely-turned interlocking flanges and provided near its end with an externally-projecting lip arranged in rear of the outwardly-turned flange and bearing against the inwardly-turned flange, substantially as set forth.

4. A stove-pipe section consisting of a sheet of metal having two of its opposite edges provided with oppositely-turned flanges and having a lip near one end of each of said flanges, said lips being upon opposite ends of the section and extending, respectively, inwardly and outwardly, substantially as set forth.

5. A stove-pipe section consisting of a sheet of metal having two of its opposite edges provided with oppositely-turned flanges and a lip near one end of each of said flanges, said lips extending, respectively, inwardly and outwardly, being upon opposite ends of said sections and struck up from the sheet of metal and projecting over and above their respective flanges, and the flanges being provided with a nick or notch at one end, substantially as set forth.

6. A stove-pipe section consisting of a sheet of metal having two of its opposite edges provided with oppositely-turned flanges and a lip near one end of each of said flanges, said lips being upon opposite ends of said section and one of them being nearer the end of the section than the other, substantially as set forth.

Decided May 13, 1889.

PETERS—DIE FOR MAKING DASH-FRAMES.

Letters Patent No. 281,553, granted July 17, 1883, to George M. Peters, for an improvement in dies for making dash-frames for carriages, *Held* void for want of invention.

APPEAL from the Circuit Court of the United States for the Southern District of Ohio.

Mr. W. H. Fisher for the appellant.
Mr. Arthur Stem for the appellee.

Mr. Justic BLATCHFORD delivered the opinion of the Court.

This is a suit in equity, brought in the Circuit Court of the United States for the Southern District of Ohio, by George M. Peters against The Active Manufacturing Company, a corporation, founded on the alleged infringement of Letters Patent No. 281,553, granted to said Peters, July 17, 1883, on an application filed December 7, 1880, for an "improvement in dies for making dash-frames." A dash-frame is made of metal, and is to be used in constructing a dash-board for a carriage or other vehicle.

The defenses set up in the answer are want of novelty, non-infringement, and also that the devices described and claimed in the patent were, before the alleged invention thereof by Peters, old and well-known in forging, welding, and other metal-working, and that it required no invention to apply or adapt such devices to the old form and construction of dash-frames. Issue was joined, proofs were taken, and the circuit court, in its decree, found that the patent was "void for want of invention," and dismissed the bill. We concur in that conclusion.

The specification of the patent says:

The principal object of my invention is to provide an efficient and useful method of welding the end bars of a metal dash-frame to the bottom rail, and a method by which the bottom rail of the dash is strengthened at the weld and at the portion of said rail to which the dash-foot is to be attached.

Another object of my invention is to provide a means by which a recess is formed in the bottom rail, preparatory to punching said rail, to receive the bolt or other attachment which secures the dash-foot to the bottom rail, the operation of forming the recess being performed at the same time that the end bar is welded to the bottom rail.

The entire operation set forth in the specification, of welding the bars to the rail, of strengthening the bottom rail of the dash, and of forming a recess in the bottom rail at the same time that the welding is done, is described in the specification as effected by one and the same simultaneous action of two opposing dies, an upper die and a lower die, placed face to face. The dies are provided with channels or depressions, one, a, to receive the end bar of the frame, and the other, a', to receive the bottom rail, the channels, $a\ a'$, of one die coinciding with like channels in the other die, when the two dies are placed together. From the bottom of the depressions a' in the two dies rise tongues, a^2, which, like the depressions a, coincide with each other when the two dies are placed together, the tongues preferably not rising quite to the face of the dies, so that, when the dies are placed together, a slight space is left between the two tongues. The specification also states that, preferably, the tongues a^2 are so formed that when the dies are placed together the tongues will approach closer to each other at that portion of themselves which forms that part of the web in the lower bar which is to be punched through to receive the bolt or other device by which the dash-frame is connected to the foot or vehicle, than at any other point; in other words, the face of the tongues is inclined. The object of such a formation of the tongues is stated in the specification to be, to make the web left in the bottom rail thinner in that portion of such rail where perforations are to be made to receive the bolts which secure the dash-foot to the frame, the web being in other portions preferably left of a uniform thickness; and one of the objects of thus making the web thin is to enable it to be more readily punched or otherwise perforated. By means of those dies a recess is formed in either side of the bottom rail, which recess corresponds with the tongues a^2 of the dies.

The four claims of the patent are as follows:

1. The combination, substantially as before set forth, of the two dies having opposing angularly-joined depressions $a\ a'$, and a tongue, a^2, in the depression a' of either or both dies.

2. The combination, substantially as before set forth, of the two dies having opposing angularly-joined depressions $a\ a'$, and a tongue, a^2, in the depression a' of either or both dies, the depressions a' deepening toward their junctions with the depressions a.

3. The combination, substantially as before set forth, of the dies having opposing angularly-joined depressions $a\ a'$, and a tongue, a^2, in either or both of the said depressions, the face of said tongue or tongues being inclined.

4. The combination, substantially as before set forth, of the dies having opposing angularly-joined depressions $a\ a'$, and a tongue, a^2, in either or both of the said depressions, the depressions a' deepening toward their junctions with the depressions a, and the face of the tongue or tongues being inclined.

The whole of this alleged invention is based upon the idea, old and well known, that a metallic die, whether of a cameo or intaglio form, will, when impressed upon a piece of heated or yielding metal, leave

the latter of the converse form of the die, and that, when two dies are brought together over a piece of heated or yielding metal, the latter will take the shape of the space existing between the contours of the two dies. It is an inevitable consequence of the use of two dies in such a way, on two pieces of metal of proper size, heated to a welding heat, that swaging or welding will take place by the impact of the dies; that, when the dies have tongues and depressions in them, the metal acted on by such tongues and depressions will take the shape, in form and thickness, of the space left between the tongues or the depressions; and that a greater or less thickness of metal will be the result as the face of the tongues is more or less inclined. All this was old and common knowledge, and the whole of the operation resulting from such features is nothing but the well-known action of two dies so shaped as to give the desired conformation to the article acted upon by them.

If it was desired to preserve a channel in the bottom rail of the dash-frame, when the bottom rail was made of channeled iron, it was obvious, and not a matter of invention, that the die must be provided with a tongue to fit into the channel, to prevent the filling up of the channel by the forcing into it of metal by the action of the dies in welding the two pieces together. So, too, if it was desirable to make the welded parts thicker, and thus stronger, at the angle formed by the end-bar and the bottom rail, it was obvious that the bottoms of the recesses in the dies must be deepened at such angle. That is all there is of the alleged invention of Peters.

It appears from the testimony that it was not new, at the time of such alleged invention, to use channeled iron in making dash-frames; or new to weld channeled iron to flat or oval bars of iron; or new to use dies for swaging or welding together two pieces of iron. All that remained to be done in the present case, as in other cases, was to adapt the form of the dies to the shape desired in the article to be acted upon by them. Dies which act upon two pieces of metal which are capable of being welded to each other, and which are brought to a welding heat, necessarily will weld them together by the impact and action of the dies. There is no patentable invention in securing such result of welding or swaging, if there be no patentable invention in the construction and use of the dies to produce a given shape in the article acted upon by them.

The decree of the circuit court is affirmed.

U. S. Circuit Court—Southern District of New York.

GRANT *v.* WALTER.

Decided May 4, 1889.

1. GRANT—REELING AND WINDING SILK AND THREAD.
The claims of Letters Patent No. 267,192, granted November 7, 1882, to James M. Grant, for improvements in the art of reeling and winding silk and other thread, are for the skein merely as a product, and are void for want of novelty.

2. INVENTION DESCRIBED BUT NOT CLAIMED.
While the specification makes many references to the use of the skein in the process of dyeing, which process of using might be patentable, it is not covered by the claims, and they rigidly control.

3. DISCLAIMER NO REMEDY IN SUCH CASE.
To disclaim the skein except for use in the process of dyeing would not change the patent into one for the process. The patent for the skein would still be void and the process of using it be still free from the patent.

Mr. William Edgar Simonds for the complainant.
Mr. Henry Grasse for the defendant.

WHEELER, *J.*:

This suit is brought upon Letters Patent No. 267,192, dated November 7, 1882, and granted to the orator for what are called in the patent "improvements in the art of reeling and winding silk and other thread," and which are stated there to relate—

to a novel manner of winding silk or other thread upon the reels in a reeling-machine preparatory to its being dyed—

and to consist—

in winding the silk or other thread upon the reel in the form of a wide band, in which the thread crosses from side to side as it is wound, somewhat in the manner now employed, but so arranged as not to form single skeins by passing one layer over the other. I prefer to have the thread cross in five-sixths of one revolution of the reel, although other proportions will answer. When the required quantity has been wound, I lace the skein or band, before it is removed from the reel, in one or more places, generally on opposite sides of the reel, so as to divide it into a number of parts and hold it in its flat or band-like condition. This lacing constitutes the chief point of my invention, and is what preserves the skein in its shape and prevents its becoming entangled in the process of dyeing. After lacing the skein is removed from the reel and passes into the hands of the dyer. After winding in the manner above described the skein is so laid, one thread crossing the other, that its texture is more open even than the small skeins wound in the ordinary manner, and although much larger, the dye easily penetrates to every part and insures a uniform color. The several threads cannot become matted together, as with the ordinary skein wound in the customary manner.

The utility of the invention is set forth as that by means of it—

a great saving is made in the expense of manufacture, the waste of silk is greatly reduced, and less skill is required in the winding after the dyeing, thereby dispensing with the high-priced skilled operatives now employed upon this work.

There are two claims for—

1. A skein of silk or other thread wound upon a reel diagonally from side to side, in the manner described, and laced back and forth across its width to preserve its form, substantially as set forth.

2. The combination of the lacing B with a wide skein of silk or other thread in which the strands are diagonally crossed, substantially as described.

According to the evidence, silk in the shape in which it is formed by the silk-worm exists in the shape of cocoons which are soaked in a suitable bath, and the filaments of silk are unwound from the cocoons and formed in skeins on reels or swifts. In this shape it forms the raw silk of commerce and is imported into America in large quantities. In manufacture the raw silk is ungummed, dried to a sufficient degree, and then, in skein form, put on swifts from which it is wound onto spools or bobbins; then the silk, according to the use to which it is to be put, is further doubled, in which operation it goes from spool to spool, is twisted, in which operation it goes from spool to spool, and when of sufficient size as to number of threads and of condition as to twisting is reeled from the spool or bobbin into skein form. In this skein form it is dyed.

The term "winding" means the changing of the silk from the skein form to its form on a bobbin or spool, and by "reeling" is meant the putting of the silk into the skein form. Before the orator's invention the skeins for dyeing were made up of several small skeins of threads wound without being crossed. These smaller skeins were difficult to separate and straighten after the operation and skilled operatives were required. The orator's method produces a form of skein in which a larger quantity of silk can be reeled than by the old method. It requires less skill on the part of the operative to reel the silk, and a large part of the waste inseparable from the old method is prevented. There appears to be a saving of about forty per cent. in cost over that by the other method. After the skein has been dyed it can be wound without parting, and thus dispenses with the work of parting that required considerable skill and experience in the other method of manufacture. The evidence also abundantly shows that raw silk was reeled diagonally into broad skeins and laced across for convenience in handling and transportation before the orator's invention, but more closely, and not for the purpose of handling in the operation of dyeing. The great advantage of that form of skein for that purpose does not appear to have been known before.

What the orator invented was the method of dyeing and winding silk by the use of that form of skein in the operation and not the skein itself. That, being known before, was not patentable as such even for a new use. (*Pennsylvania Railroad Co.* v. *Locomotive Truck Co.*, 110 U. S., 490; *Miller* v. *Foree*, 116 U. S., 22.) The process of using it in dyeing and winding was probably patentable. (*Cochrane* v. *Deener*, 94 U. S., 780; *The Telephone Cases*, 126 U. S., 1.) He appears to have a patent for what he did not invent and not to have one for what he did invent. The looseness in winding and difference in size of the skeins made use of in the practice of the orator's invention are somewhat relied upon to uphold the patent for the skein; but they are not mentioned in the claims, and are no more covered by them than the process is, and if they were these differences in degree merely would not seem to be patentable. (*Estey* v. *Burdett*, 109 U. S., 633.)

The specification makes many references to the use of the skein in the process of dyeing, and this has been urged as forcibly as it could be as a ground for upholding the patent for such a skein in use in that process; but the claims are for the skein merely as a product, and they rigidly control. (*Burr* v. *Duryea*, 1 Wall., 531; *James* v. *Campbell*, 104 U. S., 356.) The orator offers to disclaim the skein except for use in the process of dyeing; but that would not change the patent into one for the process. The patent for the skein would still be void and the process of using it be still free from the patent. This is not like Cummings's patent for a set of artificial teeth made in a defined manner, which was held to cover as well the process as the product. (*Smith* v. *Goodyear Dental Vulcanite Co.*, 93 U. S., 486.) The skein of this patent is not the product and is not new. The product is the wound skein of dyed silk. This skein is merely put to a new use in the process of producing that, and when that is produced it is not different from the wound skein of dyed silk produced in the former mode, and would not seem to be patentable. (*McKay* v. *Jackman*, 12 Fed. Rep., 615.)

The invention of the orator is so meritorious and valuable that the conclusion that the patent does not, and cannot be made to, cover it has been reached with reluctance, and only after much consideration of all the grounds urged in favor of an opposite result.

Let there be a decree dismissing the bill of complaint, with costs.

U. S. Circuit Court—Southern District of New York.

H. TIBBE & SON MANUFACTURING COMPANY *v.* HEINEKEN.

Decided February 18, 1889.

1. TIBBE—PIPES.
Letters Patent No. 205,816, granted July 9, 1878, to Henry Tibbe, for an improvement in pipes, *Held*, in view of the state of the art, void for want of patentable novelty.

2. DEFENSE—ESTOPPEL.
A former licensee is not estopped from questioning the validity of a patent after his license has expired in vindication of acts done subsequent to its termination.

3. CONVEYANCE OF PATENT UNDER A POWER OF ATTORNEY.
A conveyance executed by an attorney under a power of attorney to sell for the patentees, for them and in their names, all their right, title, and interest in a patent, is in law their conveyance and not his.

Mr. Paul Bakewell and *Mr. Abram J. Rose* for the complainant.
Mr. Louis C. Raegener for the defendant.

LACOMBE, *J.*:

This is an application for a preliminary injunction to restrain infringement of Letters Patent No. 205,816, of July 9, 1878, granted to Henry and Anton Tibbe, for an improvement in pipes.

There has been no adjudication in support of the patent except a decree, which, being on consent, need not be regarded. Complainant insists that the validity of the patent has been suitably acquiesced in by the public, showing that its sales of articles covered thereby have run up into the millions. The weight of this argument is greatly weakened by the facts shown in defense—viz., that the defendant has been manufacturing the same pipes continuously and to a considerable extent since 1883; that the Tibbes, through their solicitor, threatened to prosecute him for infringement four years ago; that he then retained counsel and insisted that he had a right to manufacture and sell, communicating that fact to their solicitor, and that he has ever since openly continued the manufacture and sale of his pipes undisturbed by complainant or his grantors. In view of the other facts disclosed by the papers this branch of the subject need not be discussed. We may concede that the Letters Patent and proof of exclusive enjoyment make out a *prima facie* case and proceed at once to determine whether defendant's answering affidavits are sufficient to defeat that case.

The claim of the patent is:

As a new article of manufacture, a smoking-pipe made of corn-cob, in which the interstices are filled with plastic self-hardening cement.

In the specification plaster-of-paris is indicated as a suitable plastic cement. Inspection of the specification and drawings indicates that the patentee contemplated securing a patent upon other features of his pipe, such as the shape, stem, &c.; but these were all abandoned before issue, and the only claim retained in the patent is for filling the interstices, as above indicated. When a dry corn-cob is trimmed and hollowed out to a shape suitable for a pipe, it appears from an examination of the exhibits submitted with the papers that there are a great many interstices both on the inside and the outside of the bowl. It appears from defendant's affidavits that more than two years

prior to the application for the patent one Charles F. Willis manufactured corn-cob pipes, known and advertised as "Jackson pipes," which were extensively sold in New York and Philadelphia. The bowls of these pipes were lined with plaster-of-paris or a plastic cement prepared from meerschaum dust. This lining of course filled up the interstices on the inside of the bowl precisely in the same way as does the "plastic self-hardening cement" of the patent. Such being the state of the art, there was no invention in filling the outside interstices in the same way, and the patent is clearly void. The complainant, however, contends that the defendant cannot be heard to deny the validity of the patent in suit.

It appears that in May, 1879, the patentees, Henry and Anton Tibbe, gave to defendant an exclusive license to sell these pipes, agreeing not to appoint any other agents to sell, nor to sell or assign the patent without his consent, he to have 25 per cent. of all sales. This agreement expired by its own limitation May 14, 1885, and there is no authority for the proposition that a former licensee is estopped from questioning the validity of a patent after his license expires in vindication of acts done subsequent to its termination. It is also shown that, the patent standing in the name of Henry Tibbe and Anton Tibbe, copartners, they executed a power of attorney to the defendant (June 13, 1879) to sell for them and in their names all their right, title, and interest in the patent. By some other agreement, not expressed in the power of attorney, he was to receive 25 per cent. of the proceeds of the sale of the patent-right. Acting under this power of attorney and referring to it as his authority, the defendant conveyed the patent-right to one George Winzer. By various mesne conveyances it subsequently returned (November 5, 1882) to the firm of Henry and Anton Tibbe, into which partnership one Kahman had by that time been admitted. These last, with two other persons, subsequently organized the complainant corporation, and conveyed the patent to it February 1, 1887. Under these circumstances the question arises whether the defendant is estopped, either by deed or *in pais*, from denying the validity of the patent. After examination of the documents submitted and of the authorities cited by the complainant I am inclined to the opinion that he is not. The power of attorney was, for all that appears, revocable at pleasure of the Tibbes, and the conveyance executed by defendant to Winzer was in law their conveyance, not his. It is therefore not his own grant that he seeks to derogate from. The circumstances that he shared in the profit obtained from the sale to Winzer, and would thus be estopped, *in pais*, from questioning the character of what was sold, might be availed of by a subsequent grantee who stood in Winzer's shoes; but no authority is cited which would secure the same benefit to the original circulator of an invalid patent, except, perhaps, the English case, (*Chambers* v. *Crichley*, 33 Beav., 374.) On principle there is no more reason why the defendant should be estopped as against the Tibbes from questioning the validity of their patent because he has shared in the proceeds of its sale than there would be because he has shared in the proceeds of the sale of the articles made thereunder. As the point raised, however, is a new one, and a restraining order was granted in the case, the defendants should only be relieved from its operation upon proper terms.

Let the defendant give a bond for $2,000 and file monthly statements of the number of infringing pipes sold, with leave to complainant to move for an increase of security as the facts may warrant. Upon these terms the motion to continue injunction is denied.

U. S. Circuit Court—Northern District of Illinois.

McCORMICK HARVESTING MACHINE COMPANY *v.* DEERING.

Decided May 6, 1889.

1. PRACTICE—CROSS-BILL—SECTION 4915 REVISED STATUTES.

Leave to file cross-bill in proceeding under section 4915 Revised Statutes denied, the object of the cross-bill being to enjoin the complainant from infringing a patent for the same invention already issued to defendant.

2. SAME.

The original bill not necessarily involving the question of infringement of the defendant's patent, such a cross-bill is not germane thereto.

Messrs. Parkinson & Parkinson for the complainant.

Messrs. Banning & Banning & Payson for the defendant.

BLODGETT, *J.*, (orally:)

This is an application on the part of the defendant, William Deering, for leave to file a cross-bill. The original bill of complaint in this cause is filed under the provisions of section 4915 of the Revised Statutes for the purpose of procuring a determination that the complainant is entitled to receive Letters Patent for the invention claimed by him. The defendant is the owner of certain Letters Patent covering substantially, as is claimed, the same invention for which complainant seeks by his bill to obtain a patent. The defendant now asks leave to file his cross-bill charging the complainant with having infringed the patent held by Deering, and the only question for determination, as far as I can see, is whether the subject-matter of the proposed cross-bill is germane to the matter contained in the original bill. I am of opinion that the subject-matter of the original bill does not involve, necessarily, the question of infringement of the Letters Patent claimed by Deering. I do not think, therefore, that the subject-matter of the proposed cross-bill is germane to the bill of complaint, and for this reason the motion for leave to file the cross-bill is denied.

16,662.—NEWSPAPER.—*Jerome A. Hart*, San Francisco, Cal. Application filed April 10, 1889. Used since March 25, 1877.
"The word 'ARGONAUT.'"

16,663.—TEA.—*The P. H. Kelly Mercantile Company*, St. Paul, Minn. Application filed March 19, 1889. Used since March, 1888.
"The conventional representation of a chrysanthemum having a gold disk and petals of alternate crimson and black, associated with the words 'THE ROYAL CHOP.'"

16,664.—PERFUMED ARTICLES, SUCH AS SOAP, SATCHET-POWDERS, AND THE LIKE.—*Ladd & Coffin*, New York, N. Y. Application filed April 19, 1889. Used since March 15, 1889.
"The words 'GOYA LILY.'"

16,665.—OPTICAL GOODS OF ALL KINDS.—*Andrew J. Lloyd*, Boston, Mass. Application filed April 1, 1889. Used since September 8, 1888.
"The representation of a lion issuant."

16,666.—CIGARS.—*Manuel Lopez & Co.*, Havana, Cuba. Application filed April 17, 1889. Used since December 23, 1885.
"The words 'FLOR DE REMATES.'"

16,667.—CIGARS.—*Manuel Lopez & Co.*, Havana, Cuba. Application filed April 17, 1889. Used since January 19, 1885.
"A monogram of the initials 'M L Y CA.'"

16,668.—CIGARS.—*Manuel Lopez & Co.*, Havana, Cuba. Application filed April 17, 1889. Used since December 15, 1884.
"The words 'VICTOR HUGO.'"

16,669.—CIGARS.—*Manuel Lopez & Co.*, Havana, Cuba. Application filed April 17, 1889. Used since November 18, 1884.
"The name 'LA VENCEDORA.'"

16,670.—WHEAT-FLOUR.—*D. & A. Luckenbach*, Bethlehem, Pa. Application filed March 8, 1889. Used since March 1, 1881.
"The representation of an anchor and the word 'ANCHOR.'"

16,671.—PILLS.—*Renealier MacFarland*, Genoa, Ohio. Application filed March 1, 1880. Used since August 10, 1888.
"A pictorial illustration of the globe with a sphere located above the same, and two figures of Indians holding herbs above the globe and pointing toward the sphere, with the words 'COMBINE THE TWO AND YOU HAVE THE BEST' arranged above the sphere and the words 'ON THE' between the sphere and the globe."

16,672.—FACE-WASH.—*James P. McGill*, South Bend, Ind. Application filed April 8, 1889. Used since February 1, 1889.
"The words 'LANGTRY LOTION.'"

16,673.—CIGARS, SMOKING-TOBACCO, AND CIGARETTES.—*Pine Needle Cigar Company*, Freehold, N. J. Application filed April 23, 1889. Used since November, 1888.
"The representation of a pine branch and cone."

16,674.—BITTERS.—*Clara Pickard*, Philadelphia, Pa. Application filed May 1, 1889. Used since April 1, 1889.
"The words 'PICKARD'S' and 'BITTERS' in connection with the picture of Mrs. S. A. PICKARD."

16,675.—GAME-BOARD.—*Sylvester T. F. Sterick*, Washington, D. C. Application filed April 10, 1889. Used since September, 1888.
"The word 'LAWNAQUET.'"

16,676.—CIGARS.—*F. Suarez & Son*, New Orleans, La. Application filed April 2, 1889. Used since July, 1885.
"The words 'MORNING STAR' and the representation of a six-pointed star placed within the circle of the sun, with rays of sun diverging in every direction from the circle."

16,677.—PLUG AND CUT TOBACCOS FOR SMOKING AND CHEWING.—*Thompson, Moore & Co.*, New York, N. Y. Application filed March 26, 1889. Used since March, 1879.
"The words 'HARD A PORT.'"

16,678.—CARBONATED GINGER.—*White Rock Mineral Spring Company*, Waukesha, Wis., and Chicago, Ill. Application filed May 3, 1889. Used since August, 1887.
"The word 'GINGERETTE.'"

16,679.—WATCH-MOVEMENTS.—*American Waltham Watch Company*, Waltham, Mass. Application filed April 12, 1889. Used since January 1, 1888.
"The letters and words 'A. W. W. Co., RIVERSIDE, WALTHAM,' and a circular design or frame-work inclosing them."

16,680.—MINERAL WATERS, GINGER-ALE, LEMONADE, TONIC DRINKS, AND SIMILAR LIQUIDS.—*The Arcadian Mineral Spring Company*, Waukesha, Wis. Application filed May 13, 1889. Used since January, 1885.
"The word 'ARCADIAN.'"

16,681.—REMEDY FOR PILES.—*Carrie E. Ashmead*, Jersey City, N. J. Application filed April 19, 1889. Used since November 15, 1888.
"The letters 'G. S. P. R.'"

16,682.—BUTTER.—*I. H. Ballou & Co.*, Boston, Mass. Application filed April 15, 1889. Used since April 1, 1887.
"The words 'BAY STATE.'"

16,683.—PAPER FOR LEDGERS.—*L. L. Brown Paper Company*, Adams, Mass. Application filed April 29, 1889. Used since January 1, 1876.
"The word 'ADVANCE.'"

16,684.—CIGARS.—*Buckingham, Swope & Co.*, Baltimore, Md. Application filed April 29, 1889. Used since March 3, 1882.
"The picture of a buck bucking a ham suspended from a broken branch, accompanied by the words 'MY NAME.'"

16,685.—MASK-FASTENERS.—*Charles H. Dessart*, New York, N. Y. Application filed April 22, 1889. Used since April 1, 1889.
"The representation of two masks of the human face."

16,686.—SPRING-MATTRESSES AND SPRINGS FOR THE SAME.—*Benj. Fitch & Co.*, New York, N. Y. Application filed April 25, 1889. Used since February 1, 1889.
"The word 'IMPERIAL.'"

16,687.—NEWSPAPER.—*Henri Gerard*, New York, N. Y. Application filed April 24, 1889. Used since January, 1889.
"The words 'MANUFACTURER AND BUILDER.'"

16,688.—BISCUITS, CRACKERS, WAFERS, AND SIMILAR ARTICLES.—*J. D. Gilmor & Co.*, New York, N. Y. Application filed April 15, 1889. Used since March 15, 1889.
"A border or frame having a smooth glassy non-transparent surface like that of a coating of vitreous enamel, and surrounding the display face or front of cans containing biscuit, crackers, and wafers."

16,689.—GLUE.—*Julius Herold*, Monzingen, Prussia, Germany. Application filed April 24, 1889. Used since April 1, 1879.
"The letters 'J. H.'"

16,690.—ELECTRIC BELTS OR BANDS.—*John E. Hetherington*, New York, N. Y. Application filed April 16, 1889. Used since March, 1887.
"The word 'BI-POLAR.'"

16,691.—COFFEE SCOURERS AND POLISHERS.—*Hercules Manufacturing Company*, Cardington, Ohio. Application filed April 25, 1889. Used since February 15, 1880.
"The word 'HERCULES.'"

16,692.—CEMENTS OR COMPOSITIONS FOR ROOFING AND PAVING.—*James B. Hinchman*, Denver, Colo. Application filed April 15, 1889. Used since December 1, 1888.
"The word 'PIONEER.'"

16,693.—COUGH-MIXTURE.—*Francis M. Jaques*, New London, Conn. Application filed April 22, 1889. Used since October, 1888.
"The words 'ROCK POLYPODE' and the representation of three fern-leaves with crossed stems."

16,694.—FEATHER PILLOWS.—*Frank E. Little*, St. Louis, Mo. Application filed April 25, 1889. Used since January, 1887.
"The word 'GLOBE.'"

16,695.—FEATHER PILLOWS.—*Frank E. Little*, St. Louis, Mo. Application filed April 25, 1889. Used since January, 1887.
"The word 'ROYAL.'"

16,696.—FEATHER PILLOWS.—*Frank E. Little*, St. Louis, Mo. Application filed April 25, 1889. Used since November, 1884.
"The word 'STAR' or the symbol of a star."

16,697.—KNITTING-COTTON.—*J. Turner Morehead & Co.*, Leaksville, N. C. Application filed April 22, 1889. Used since 1877.
"The words 'IRVIN RIVER.'"

16,698.—OPTICAL INSTRUMENTS.—*Charles F. Prentice*, New York, N. Y. Application filed April 12, 1889. Used since November 5, 1886.
"The word 'OPTICIST.'"

16,699.—KID GLOVES.—*J. Roeckl*, Munich, Germany. Application filed April 24, 1889. Used since 1889.
"The representation of a draped figure with the human face and the horns and feet of a goat and a scroll with the initials 'J. R.'"

16,700.—INSECT-POWDERS AND LIKE PREPARATIONS.—*William Henry Sayre*, Newark, N. J. Application filed April 24, 1889. Used since March 1, 1889.
"The word 'BUGBANE.'"

16,701.—APPLIANCES FOR TAKING PHOTOGRAPHS.—*Charles Spiro*, New York, N. Y. Application filed April 25, 1889. Used since April 1, 1889.
"The composite word 'ANTI-DARK-ROOM.'"

16,702.—BICYCLES, TRICYCLES, AND KINDRED VEHICLES AND THEIR PARTS AND ATTACHMENTS.—*Starley Brothers*, Coventry, England. Application filed April 1, 1889. Used since March, 1887.
"The word 'PSYCHO.'"

LABELS.

5,926.—Title: "CHASE" (FOR CARRIAGE ROBES, LAP ROBES, &c.).—*L. C. Chase & Co.*, Boston, Mass. Application filed May 13, 1889.

5,927.—Title: "CONGER'S NEWARK TRAY."—*Walter M. Conger, Jr.*, Newark, N. J. Application filed May 9, 1889.

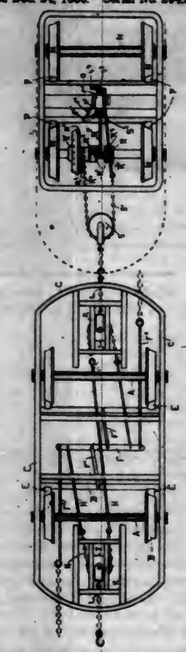
5,928.—Title: "ROCK POLYPODE SYRUP."—*Francis M. Jaques*, New London, Conn. Application filed April 23, 1889.

5,929.—Title: "EAST INDIA PILE REMEDY."—*Samuel J. Ketchum*, Chicago, Ill. Application filed May 9, 1889.

5,930.—Title: "CAKES AND JUMBLES."—*Justin J. Langlés*, New Orleans, La. Application filed May 9, 1889.

5,931.—Title: "GINGER SNAPS."—*Justin J. Langlés*, New Orleans, La. Application filed May 9, 1889.

DISCLAIMERS.



267,192.—*James M. Grant*, Hartford, Conn. ART OF REELING AND WINDING SILK AND OTHER THREAD. Patent dated November 7, 1882. Disclaimer filed May 27, 1889, by the patentee.
Enters his disclaimer—
"To so much of the claims as does or might make such claims apply to a skein which, by reason of being coated with gum, or by reason of the manner of its lacing, or for any other reason, is not in condition for dyeing for ordinary manufacturing purposes."

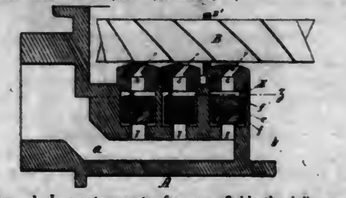
403,560.—*Charles T. Schoen*, Philadelphia, Pa. CENTER BEARING-PLATE FOR RAILWAY-CARS. Patent dated May 21, 1889. Disclaimer filed May 27, 1889.
Enters his disclaimer to the word "annular" in the first line of the first claim of said patent, which word was intended to precede "bearing-pieces" in the third line of said claim, so that the claim would read—
"1. Center bearing-plates of wrought metal, constructed with concentric ribs, combined with interposed *annular* bearing-pieces, substantially as described."

PATENTS

GRANTED JUNE 4, 1889.

404,373. CAR-BRAKE. WILLIAM L. ABBOTT and VIRGIL C. KILLIE, Chicago, Ill. Filed Dec. 24, 1888. Serial No. 294,539. (No model.)

Claim.—1. The combination of two fixed collars with the axle of a car, movable friction-plates between them, toggle-bars connected with such friction-plates, and a brake-chain secured to such friction-plate, so that by operating the toggle-bars the friction-plate is locked against the fixed collar and the chain is wound up to set the brakes.



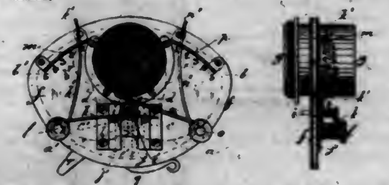
2. The combination of a car with a pivoted brake-lever and connections therefrom to the shoes, pulleys at the opposite ends of the cars supported so as to move along the length of the car, chains therefrom connecting the systems of contiguous cars, and a system of chains and rods extending from one end of such lever over both pulleys to the opposite end of the lever.

3. The combination of a car with a pivoted brake-lever and connections therefrom to the shoes, pulleys and sliding frames therefor on opposite ends of the cars and near the middle of the ends of such car, said frames adapted to slide along the length of the car, chains connecting the pulleys of adjacent cars, and a system of chains and rods extending from one end of such pivoted lever over both pulleys to the opposite end of such lever.

4. The combination of two fixed collars with the axle of a car, a movable friction-plate between them, toggle-bars connected with such friction-plate and to another point along the axle, and a brake-chain secured to such movable friction-plate, said friction-plate shaped so as to serve as a drum, substantially as and for the purpose set forth.

5. The combination of a fixed collar or friction-plate with the axle of a car, a movable collar or friction-plate thereon and formed like a drum, toggle-bars secured at one point to the axle and at another to the movable friction-plate, so that by operating the toggle-bars the movable and fixed friction plates or collars are locked together, and a chain secured to the drum so as to be wound thereon to set the brakes.

404,374. ROTARY METER. PHINEHAS BALL, Worcester, Mass., assignor to the Union Water Meter Company, same place. Filed Jan. 2, 1889. Serial No. 295,155. (No model.)



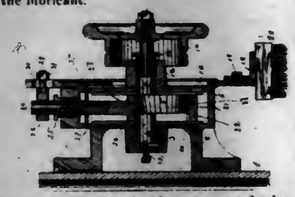
Claim.—1. In a rotary meter for gas or fluids, the delivery-nozzle or mouth-piece having the inclined orifice formed for concentrating and directing the stream of gas or fluid, in combination with a chamber anterior to said mouth-piece, having an inlet-passage surrounded by a valve-seat, and the weighted reacting valve disposed within said chamber between the inlet and nozzle for closing against said seat and stopping said inlet-passage in opposition to the entering flow, substantially as and for the purpose set forth.

2. In a gas or fluid meter, the combination of the rotatable measuring-wheel, the delivery mouth-piece having a concentrating-orifice for directing the gas or fluid against said wheel, the valve-chamber beneath said mouth-piece having an inlet-passage with valve-seats, as described, and a valve-puppet loosely disposed within said chamber between the inlet and delivery passages, whereby said delivery-passage is automatically closed when the pressure or active force of the current increases beyond the normal limit of resistance for which said valve is adjusted, substantially as hereinbefore set forth.

3. In a gas or fluid meter, the combination, with the rotatable wheel, of the series of mouth-pieces D, having passages increasing in size in succession, arranged for directing gas or fluid against said wheel for imparting motion thereto, and the series of resistance-valves F, arranged in chambers beneath said mouth-pieces and respectively controlling the passages, said valves being severally weighted or adjusted to resist different degrees of pressure, substantially as and for the purpose set forth.

4. In a gas or fluid meter, the combination, substantially as described, with the body or casing provided with inlet and outlet channels, and the rotatable measuring-wheel mounted within a chamber in the case, of a series of valve-chambers, a series of mouth-pieces having orifices of different caliber fitted to said valve-chambers and respectively disposed for directing a current of gas or fluid against said wheel, and automatic pressure-resisting valves disposed within said valve-chambers, severally weighted or adjusted for resisting different pressures in their relative order as the size of the orifices which they severally control, for the purpose set forth.

404,375. SHUTTER FOR PHOTOGRAPHIC CAMERAS. ROBERT E. M. BAIN, St. Louis, Mo. Filed Jan. 14, 1889. Serial No. 296,300. (No model.)



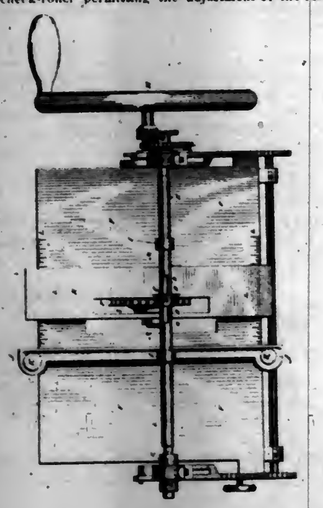
Claim.—1. In apparatus for opening and closing photographic-

camera shutters, the combination of two springs having different tensions and means for altering the respective tensions of said springs, with a pin passing through the shutters and through slots in the shutter-casing, substantially as shown, and for the purpose described.

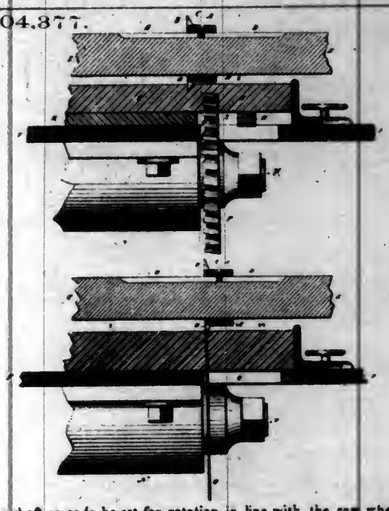
2. In apparatus for opening and closing photographic-camera shutters, the combination of two springs having different tensions, each of said springs passing spirally round a fixed stud and engaging in either one of a series of notches formed in a fixed bar, with the pin passing through the shutters and through vertical slots in the shutter-casing, substantially as shown, and for the purpose described.

404,376. DABBING-BRUSH APPARATUS FOR COMBING-MACHINES. JAMES L. BALLANTYNE, Newton, Mass., assignor to the Nonantum Worsted Company, of Massachusetts. Filed Oct. 19, 1888. Serial No. 288,600. (No model.)

Brief.—On the interior of the box bracket and cover are curved ribs, which serve to prevent the splashing of the lubricant against the stuffing-box in the top of the apparatus and to insure the proper circulation of the lubricant.



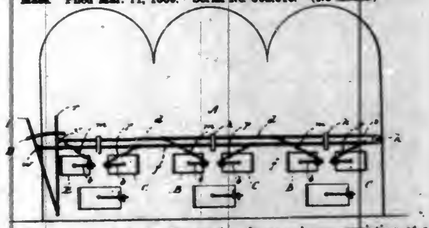
Claim.—1. In a dabbing-brush apparatus, the box 2 and box-cover 6, and the cam-shaft 4, journaled in bearings in said parts and provided with the cam or eccentric 5, the carrier and its sliding brush-carrying plate combined with the ribs 37 38 on the interior of said box and cover, substantially as and for the purpose set forth.



2. In a dabbing-brush apparatus, the box 2, having bearing 3 and regulating-screw 32, and the cover 6, having stuffing-gland 13, combined with the rotary shaft 4, having the cam or eccentric 5, and the carrier 22, having upwardly-projecting spindle 24 guided in the upper part of said box and cover and provided with a stuffing-gland 25, substantially as and for the purpose set forth.

404,377. CONVERTIBLE MACHINE FOR GROOVING AND SAWING WOOD. ELDRIDGE F. BARNES, New Haven, Conn. Filed May 29, 1886. Serial No. 203,594. (No model.)

Claim.—In a convertible machine for grooving and sawing wood, the combination, with a feed-shaft provided with a short longitudinal groove, of a check-roller having teeth at its edge and flat on one side and conical on the other side, and provided with a collar carrying a set-screw entering the groove in the shaft upon which the check-roller is mounted, a table F, a gage J, loose rollers I, mounted upon the shaft, movable bearings for the opposite ends of the shaft, gearing for rotating the shaft, and a tool-shaft located below the table and adapted to interchangeably carry a grooving-plow and a saw, the described grooving of the feed-shaft and the described construction of the check-roller permitting the adjustment of the roller on



404,377.

the shaft so as to be set for rotation in line with the saw when the machine is converted for sawing and for rotation out of line with the plow when the machine is converted for plowing, substantially as set forth.

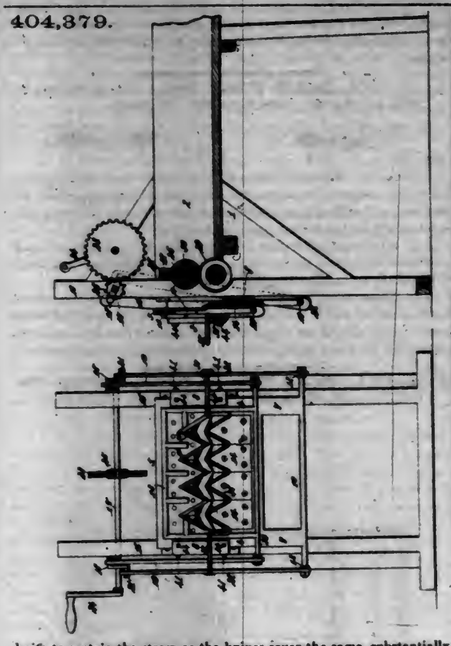
404,378. BOILER-FURNACE. EDWARD BARRETT, Fall River Mass. Filed Mar. 11, 1889. Serial No. 302,818. (No model.)

Claim.—1. A device for opening furnace-doors, consisting of a rod arranged to slide on the furnace-front and connected with said doors by cords or chains, substantially as described.

2. In a device of the character described, the combination of a rod fitted to slide on the furnace-front in the direction the furnace-door swings, with a chain connecting the rod with the door-latch, and a lever for actuating said rod, substantially as described.

3. In a device of the character described, the combination of a furnace, a rod fitted to slide in guide-rolls on the front thereof, a chain connecting the door-latch with said rod at a point opposite the center thereof, and a lever pivoted to said rod and the furnace-front, substantially as and for the purpose set forth.

4. In a device of the character described, the combination of a furnace provided with doors opening in opposite directions, two rods fitted to slide in the furnace-front and having their corresponding ends connected by a chain passing over a fixed pulley, chains connecting the latches of doors opening in like directions with one of said rods, and an actuating-lever for each rod, whereby the doors may be opened or closed as said rods are moved, substantially as described.



5. The furnace A, provided with doors B, having latches *b*, in combination with the rod *d*, fitted to slide between rolls *g* on the furnace-front, the chains *m*, connecting said latches and rod, and the lever *r*, for actuating said rod, substantially as described.

6. The furnace A, provided with doors B C, having latches *b*, in combination with the rods *d f*, fitted to slide between rolls *g* on the furnace-front, the chains *m p*, connecting said latches and rods, the chain *i* and pulley *k*, and the levers *r t*, all being arranged to operate substantially as described.

404,379. STRAW-CUTTER. WILLIAM C. BAYLESS, Mossy Creek, Tenn. Filed July 14, 1888. Serial No. 279,911. (No model.)

Claim.—1. The combination, in a straw-cutter, of two opposing knives, one movable toward the other and each comprising a series of cutting-dentations, with those of one knife alternating with and adapted to pass those of the other, a feed-box, and a bracing-support having a zigzagged portion corresponding substantially to the dentations of one

404,379.

knife to sustain the straw as the knives sever the same, substantially as described.

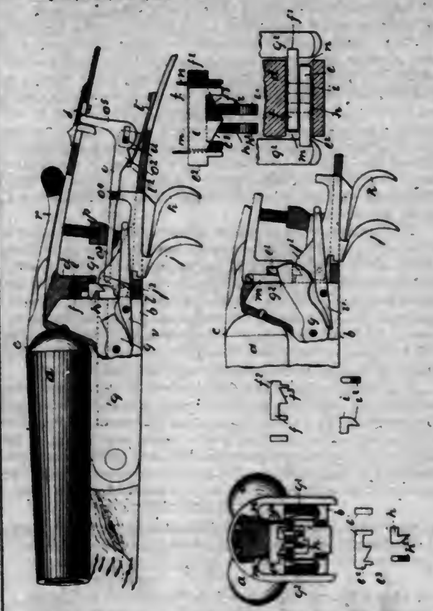
2. The combination, in a straw-cutter, of a feed-box, two opposing knives, one movable toward the other and each comprising a series of cutting-dentations, with those of one knife alternating with and adapted to pass those of the other, a pair of feed-rolls, each having a series of annular depressions, and a bracing-support having a zigzagged portion corresponding substantially to the dentations and depressions of one knife and roller to sustain the straw as the knives sever the same, substantially as described.

3. The combination, in a straw-cutter, of the feed-box for the straw, a pair of knives movable toward each other and each composed of a metallic plate formed with a series of cutting-dentations, with those of one plate alternating with and adapted to pass those of the other, a pair of feed-rollers, each having a series of annular V-shaped bosses and corresponding depressions alternating with each other and conforming substantially to the dentations of the knives, and means for simultaneously moving the knives toward each other, substantially as described.

4. The combination, in a straw-cutter, of the feed-box, the knives movable toward each other and each composed of a metallic plate having a series of cutting-dentations, with those of one plate alternating with those of another, and a zigzagged bar corresponding substantially to the form of the dentated knives and movable toward one knife to support the protruding ends of the straw as the knives act thereupon, substantially as described.

5. In a straw-cutter, the combination, with vertically-reciprocating cutter-frames moving in parallel ways, of shear-setting wedges lying in an angular recess between the vertical arms of said frames and adjusted by set-screws to force said frames apart and setting-plates lying against the outer faces of two parallel arms of one of said frames and having adjusting-screws, substantially as described.

6. In a straw-cutter, the combination, with reciprocating cutters, each having a serrated or angular edge alternating with the serrations of the other cutter, of a pair of distributing feed-rolls having outlines resembling the outline of the cutting-edge and arranged to have a similar alternation, substantially as described.



7. In a straw-cutter, the combination, with a pair of cutters, each having a serrated or angular edge alternating with the serrations or angles of the opposite edge of a brace-bar or board moving with the lower knife-frame, said bar being of a shape conforming to the cutting-edge of the lower cutter and arranged to lie beneath said edge, substantially as described.

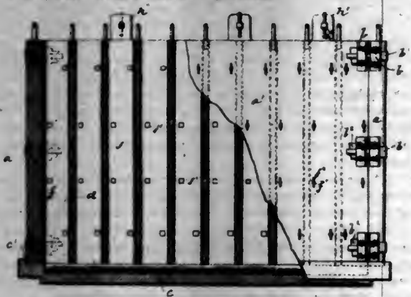
8. In a straw-cutter, the combination, with a pair of cutters having serrated edges, the angles of one alternating with those of the other, of a brace-bar or board mounted on elastic supports carried by the lower cutter, the said bar conforming in shape to the angles of the cutting-edge, whereby it moves with and is drawn toward the lower cutter, beneath or opposite to the edge of which it lies as the knives operate, substantially as described.

9. In a straw-cutter, the combination, with a pair of cutters, each composed of a series of blades having two converging edges, of means, substantially as described, for imparting opposite reciprocation to both cutters, the cutting-edges of the one alternating with those of the other, a pair of distributing feed-rolls having bosses or corrugations which substantially correspond with the serrations of the upper and lower cutters, respectively, and a pawl-carrier reciprocated by a pitman actuated by one of the devices driving the cutters and having pawls meshing with ratchets on the ends of the feed-rolls, the pawl-carrier and pitman being either or both adjustable toward and from the point of support of the devices to which they are connected to shorten and lengthen the feed movement of the rolls, substantially as described.

10. In a straw-cutter, the combination, with the uprights of the cutter-box having parallel casings, of independent cutter-frames having their vertical arms moving in said casings and provided with ribs on their exterior faces and beveled upon their adjacent vertical angles, adjustable wedges lying in the angular space formed by said bevels, adjustable setting-plates bearing upon the outer faces of the vertical arms of one frame, and means for adjusting said wedges and setting-plates relatively to each other, substantially as described.

404,380. BREECH-LOADING FIRE-ARM. CHRISTOPHER G. DOUBLL, Belmont Row, Birmingham, County of Warwick, England. Filed June 29, 1888. Serial No. 278,519. (No model.) Patented in England May 30, 1888, No. 7,823.

Claim.—1. In a concealed-hammer gun, the combination, with the hammers thereof and the intercepting cross-bolts *e f*, arranged, respectively, side by side at the back of the breech-body part, of the pushers *h i*, formed with the inclines h^2 i^2, vertically movable below said bolts, and the triggers *j k*, upon which the pushers rest, substantially as described.



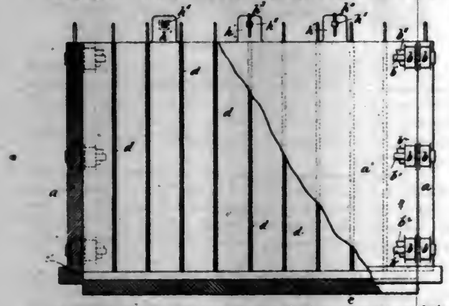
2. In a concealed-hammer gun, the combination, with the hammers and lock mechanism, of the transverse bolts *e f*, arranged side by side at the back of the breech-body and formed with the under side inclines e^2 f^2, engaged by vertically-movable pushers, and the springs *m n*, impinging against the ends of said bolts, substantially as set forth.

3. In a concealed-hammer gun, the combination, with the rear body part *d* and hammers *g g*, of intercepting-bolts *e f*, arranged at the back of the breech-body part, pushers *h i*, engaging with and located below said bolts and above the triggers, and the triggers $j j^2$ k^2, as set forth.

4. In a concealed-hammer gun, the combination, with the hammers *g g*, the cross-bolts *e f*, arranged at the back of the body part

and having inclines e^3 f^3, of the pushers h i, located below said cross-bolts and having inclines h^2 i^2, and the triggers i k, with fore extensions j^2 k^2, bearing on said inclines, substantially as described.

404,381. INGOT-MOLD. EDWARD L. CLARK, Pittsburg, Pa. Filed Nov. 5, 1888. Serial No. 290,027. (No model.)



Claim.—1. An improvement in apparatus for casting simultaneously a series of two or more laterally-separate ingots by bottom casting, which consists in a mold subdivided into two or more compartments for separate ingots by upright removable partitions having openings under their bases, thereby establishing communication between the compartments, and forming at the base of the mold an open runner trough or gutter, substantially as and for the purposes described.

2. An improvement in apparatus for casting simultaneously a series of two or more laterally-separate ingots by bottom casting, which consists in a mold having a bottom piece formed with a concave or gutter-shaped surface, and upright partitions which divide said mold into two or more compartments for separate ingots, the bases of said partitions being elevated above the base of the concave or gutter-shaped surface of the bottom piece, thus establishing communication between the compartments and forming at the base of the mold an open runner trough or gutter, whereby the metal in the runners forms integral and reducible parts of the several ingots, substantially as and for the purposes described.

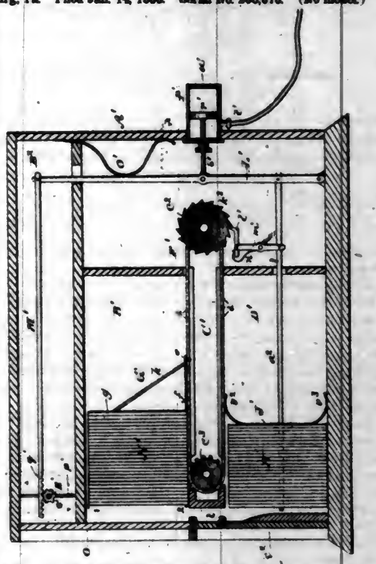
3. An improvement in apparatus for casting simultaneously a series of two or more laterally-separate individual ingots by bottom casting, which consists in a mold having separable ends and sides, partitions movably arranged in grooves in the sides and dividing the mold into a plurality of small molds for individual ingots, separate detachable linings for each of the small molds, and a base having recesses c', into which the sides and ends are detachably fitted, provided with a continuous longitudinal runner common to and communicating with all of the small molds, substantially as described.

4. A mold for casting simultaneously a series of two or more laterally-separate individual ingots, said mold having sides and ends, transverse partitions dividing the inclosed space into a series of smaller molds, a base having a unitary inlet or runner common to all the smaller molds, and an interior sectional lining of refractory material detachably secured in place in each of the smaller molds and co-operating with the partitions, substantially as described.

404,382. ART OF CASTING STEEL INGOTS. EDWARD L. CLARK, Pittsburg, Pa. Filed Nov. 5, 1888. Serial No. 290,028. (No model.)

Claim.—In the manufacture of steel, the improvement consisting in casting by bottom casting a series of two or more steel ingots separated laterally from each other and united laterally at their ends by thin webs or runners, which form integral and reducible parts of the several ingots, separating the ingots so formed by fracture of the webs between the adjacent ingots, and finally rolling each ingot and its integral fractured web or runner portion, thereby incorporating the runner portion with the ingot, substantially as and for the purposes described.

404,383. BALE-TIE BUCKLE. EDWARD L. CLARK, Pittsburg, Pa. Filed Jan. 23, 1889. Serial No. 297,331. (No model.)



Claim.—1. A bale-tie buckle having a slot for receiving the bale-band, lips bent over the edges of the slot to form bearing-surfaces for the band, and supporting-surfaces which hold out and support the lips, substantially as and for the purposes described.

2. A bale-tie buckle consisting of slotted superposed leaves and a reflexed lip forming the bearing-surface of the bale-band in the slot, substantially as and for the purposes described.

3. A bale-tie buckle consisting of two superposed leaves, each of which is slotted and is provided with a lip, the lip of each leaf being bent over the edge of the slot of the other leaf and forming a bearing-surface for the band, substantially as and for the purposes described.

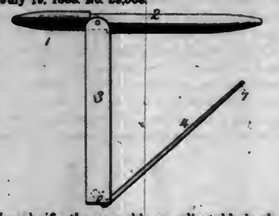
404,384. STATION-INDICATOR. VICTOR L. CUNNINGHAM, Pittsburg, Pa. Filed Jan. 14, 1888. Serial No. 260,673. (No model.)

Claim.—1. In a station-indicator, the combination, with a casing provided with a compartment for containing cards bearing the names of the streets or stations and having an aperture in one end of its bottom, of an endless carrier working in the bottom of the compartment for moving the cards over the aperture therein, and means for operating the endless carrier, substantially as described.

2. In a station-indicator, the combination, with a casing provided with compartments communicating with each other, of a series of cards bearing the names of the streets or stations and arranged in the upper compartment, an endless belt, a projection or bracket carried by the belt and engaging the cards, and means, substantially as described, for imparting motion to the endless belt, substantially as herein shown and described.

3. In a station-indicator, the combination, with a casing provided with compartments communicating with each other, of a series of cards bearing the names of the streets or stations and arranged in the upper compartment, an endless belt provided with a bracket engaging the cards, a ratchet-wheel on the shafts of one of the rollers of the endless belt, a spring-actuated pawl engaging the ratchet-wheel, a pivoted lever, a connection between said lever and pawl, and means for operating the lever, substantially as herein shown and described.

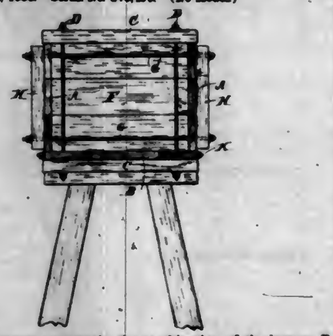
4. In a station-indicator, the combination of a casing provided with compartments communicating with each other, an endless belt working in the bottom of the upper compartment and provided with a bracket, a ratchet-wheel on the shaft of one of the rollers of the endless belt, a pawl engaging the ratchet-wheel, a pivoted lever, a connection between the said lever and pawl, and an air or steam cylinder having its piston-rod connected to the said lever, substantially as specified.



5. In a station-indicator, the combination, with a casing provided with a compartment for containing cards bearing the names of streets or stations and having an aperture in one end of its bottom, a carrier for moving the cards over the aperture in the bottom of the said compartment, and means for operating the carrier, of a rotating plate arranged above the compartment and operated from the card-moving mechanism, substantially as herein shown and described.

6. In a station-indicator, the combination, with a casing provided with compartments communicating with each other, of an endless belt for transferring the cards carrying the names of the streets or stations from one compartment to the other, card-holding arms in the compartment into which the cards drop after being displaced, and means for operating the said belt and arms, substantially as herein shown and described.

7. In a station-indicator, the combination, with a casing divided into compartments communicating with each other, of an endless belt for transferring the cards carrying the names of the streets or stations from one compartment to the other, a ratchet-wheel on one of the rollers of the endless belt, a lever pivoted in the casing, card-holding arms connected to the lever, a second lever pivoted in the casing and to the first-named lever, a spring-pawl carried by the second lever and engaging the ratchet-wheel, and means for operating the first-named lever, substantially as herein shown and described.

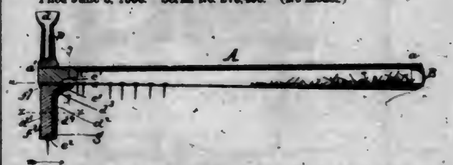


8. In a station-indicator, the combination, with a casing divided into compartments communicating with each other and an endless belt for transferring the cards carrying the names of the streets or stations from one compartment to the other, of a lever pivoted in the casing, card-holding arms in the lower compartment and connected to said lever, a follower in the said lower compartment, a second lever pivoted in the casing and connected to the first-named lever, a spring-pressed pawl on the upper end of the second lever, a ratchet-wheel on one of the rollers of the endless belt, a shaft in the top compartment provided with a plate and a pinion, and a rack engaging the pinion and connected with the first-named lever, substantially as herein shown and described.

404,385. CUTLERY. RICHARD DAINE, Halifax, Nova Scotia, Canada. Filed July 19, 1888. Serial No. 280,452. (No model.) Patented in Canada July 19, 1888, No. 29,506.

Claim.—In a knife, the movable or adjustable back fitted so as to admit of its being opened to allow either end of the double-ended blade aforesaid to pass out of the handle and being then closed to retain the blade in position.

404,386. WATER-RESERVOIR. HERMAN DAUE, Woodland, Wis. Filed June 28, 1888. Serial No. 278,458. (No model.)



Claim.—In a water-reservoir, the combination of the bottom B, formed of separate pieces of plank, bottom-retaining bolts K, passing horizontally through apertures formed in the body of said plank, sides A A and side-retaining bolts J, passing through apertures formed in the plank composing said sides, vertical cross-pieces H, secured to the exterior surface of the respective sides of said tank by the retaining cross-bolts G, retaining cross-bolts G, horizontal cross-pieces C C, respectively located one above and the other beneath the respective sides of the tank and retaining-bolts D, said retaining-bolts D being adapted to draw said side planks A in close contact with each other and the bottom B, and said bolts G G being adapted to retain said side planks in contact with the respective ends of the end planks of said tank, all substantially as and for the purpose specified.

404,387. CLEANSING AND POLISHING COMPOUND. JOSEPH H. DUPAIN, Kansas City, Mo., assignor of one-half to Dwight O. Wallace, same place. Filed Jan. 21, 1889. Serial No. 297,047. (Specimens.)

Claim.—The herein-described cleansing and polishing compound, composed of a hydrocarbon, acetic acid, hydrochloric acid, trichloride of antimony, alcohol, and dragon's blood, (*Sanguis draconis,*) in the proportions substantially as specified.

404,388. HAMMER. ANDREW L. DE VOL, Binghamton, N. Y. Filed June 8, 1888. Serial No. 276,466. (No model.)

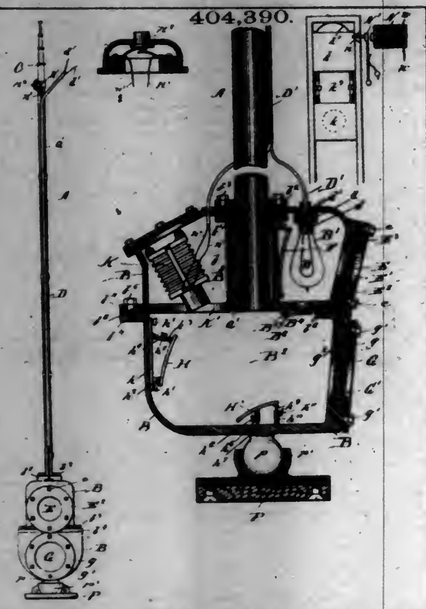
Claim.—1. A hammer having the handle A made hollow and provided with a slot a underneath, the head D, having the driving end d and the peen end d', the latter having a groove d^3 in its rear side connecting with the slot a, said groove being covered by a slotted guide-plate which extends around the extremity of the peen end of the hammer, as set forth.

2. The combination of a hollow handle having the guide-slot a, the head D, having the groove d^3, and the guide-plate F, having the hole f^3, the slot f^2, and the slot f^4, as set forth.

404,389. CRAYON-RACK FOR BLACKBOARDS. ADELBERT J. DOUGLASS, Ilion, N. Y. Filed Dec. 8, 1888. Serial No. 292,099. (No model.)

Claim.—The crayon-rack consisting of the crayon or chalk screen, the dust-trough, and the springs, the screen comprising a series of transverse wires bent down to form a vertical leg for the support of the rear edge of the tray and upward to form a guard at the front edge of the tray, said springs being formed with vertical end portions secured in the bottom of the trough, and with a horizontal portion bowed to project outward to secure the screen in place, substantially as shown and described, and for the purpose set forth.

404,390. SUBMARINE SEARCH-LIGHT. ANDREW L. DUTTON, Racine, Wis., assignor to himself and Walter B. Dutton, same place, and Marshall M. Dutton, Chicago, Ill. Filed Nov. 16, 1888. Serial No. 291,067. (No model.)



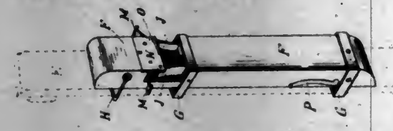
Claim.—1. The combination, with the shell or case B, of an observation-tube A, attached thereto, a lamp contained within said case for illuminating the object, lenses or reflectors, and a camera contained within said case or shell adjacent to said observation-tube, substantially as specified.

2. The combination, with the tube A, of shell or case B, having light-chamber B' and reflector-chamber B^3, electric lamp D, lens or window E, lens or window G, and two reflectors within said chamber B^3, one opposite said lens G and one opposite said observation-tube A, substantially as specified.

3. The combination, with the tube A, of shell or case B, having light-chamber B' and reflector-chamber B^3, electric lamp D, lens or window E, lens or window G, and two reflectors within said chamber B^3, one opposite said lens G and one opposite said observation-tube A, and camera K, contained within said case or shell adjacent to said observation-tubes, substantially as specified.

4. The combination, with the tube A, of shell or case B, having light-chamber B' and reflector-chamber B^3, electric lamp D, lens or window E, lens or window G, and two reflectors within said chamber B^3, one opposite said lens G and one opposite said observation-tube A, camera K, and an electric circuit and magnet for operating the shutter of said camera, substantially as specified.

404,390.



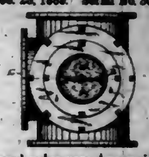
5. The combination, with tube A, of shell or case B, having light-chamber B' and reflector-chamber B^2, electric lamp D, lens or window E, lens or window G, and two reflectors within said chamber B^2, one opposite said lens G and one opposite said observation-tube A, said reflectors being hung adjustably within said chamber, substantially as specified.

6. The combination, with shell or case B, of an observation-tube A, attached thereto, a lamp contained within said case for illuminating the object, and lenses or reflectors, said case being provided with a base P, connected thereto by a ball-and-socket joint, substantially as specified.

7. The combination of observation-tube A, case B, having windows or lenses E G, lamp D, and base-plate P, said shell B, with its tube A, being rotatable on said base-plate, substantially as specified.

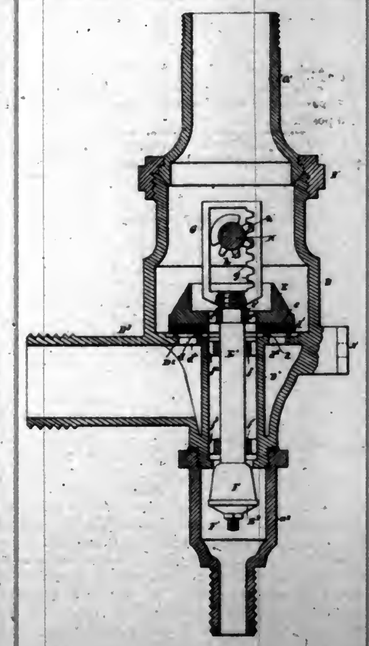
8. The combination, with the tube A, of shell or case B, having light-chamber B' and reflector-chamber B^2, electric lamp D, lens or window E, lens or window G, and two reflectors within said chamber B^2, one opposite said lens G and one opposite said observation-tube A, and a telescope at the upper end of said observation-tube, substantially as specified.

404,391. GATE-LATCH. PHILIP DYER, Mooretown, Ontario, Canada, assignor of one-half to William Abernethy, same place. Filed Nov. 1, 1888. Serial No. 289,779. (No model.)



Claim.—1. The combination, with the latch-post and the vertically-adjustable gate, of a guide-rail secured to said post, a sliding block adjustable on said rail, gravity-latches, and a pivoted binder on said block engaging said rail, substantially as and for the purpose specified.

2. The combination, with the latch-post and a guide-rail secured thereto, of a vertically-adjustable gate, a recessed sliding block carrying the keepers and adjustably secured to said guide-rail by the strape G, and by the binder-H, and the notched plate N, the parts being arranged to operate substantially as and for the purpose described.



3. In combination with a vertically-adjustable farm-gate provided with the latch-pin L, the guide-rail E, secured to the latch-post, the recessed block F, having the notch O, slidingly secured upon the guide-rail E, the bail or binder H, the gravity-latches J, adapted to swing to the inside, the stops K, and the forked bail P, the parts being constructed and arranged to operate substantially in the manner and for the purposes herein set forth.

404,392. VALVE. FREDERIC BOSER and JOHN W. HARRIMAN, St. Louis, Mo. Filed Feb. 23, 1888. Serial No. 300,325. (No model.)

Claim.—The sectional valve-case A, provided with stuffing-box c and inlet and outlet openings, and with a refractory or fire-brick lining having a valve-seat therein, in combination with the water-vessel B, fitting and extending up through the stuffing-box, with its mouth or upper end projecting outside of the valve-case and open to the atmosphere, all constructed and arranged as hereinbefore shown and described.

404,393. WATER-CLOSET. ALBERT ELMENDORF, New London, Conn., assignor of one-half to Stephen A. Gardner and Charles Prentis, both of same place. Filed Mar. 6, 1888. Serial No. 302,107. (No model.)

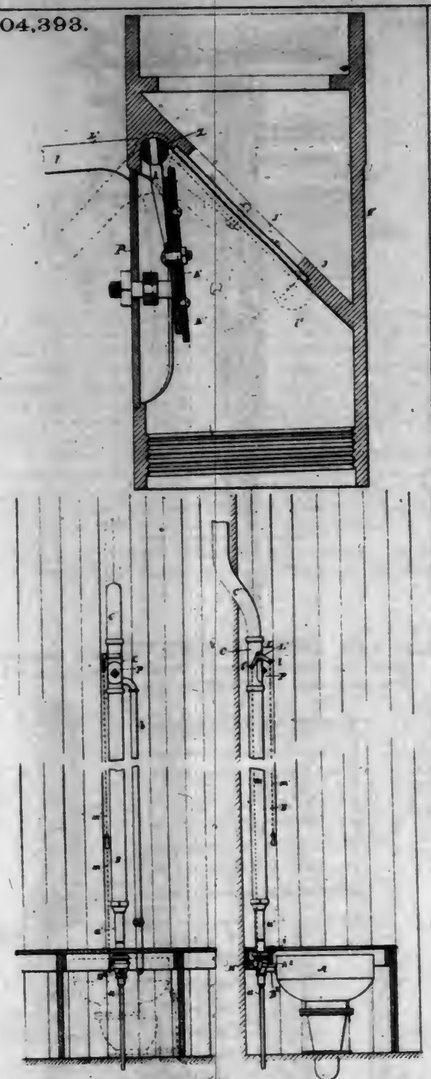
Claim.—1. The combination, with the bowl and its flushing stand-pipe, of the ventilating-extension of said pipe, the ventilating-pipe connecting said bowl and ventilating-extension, the flushing-valve, and the valve in the ventilating-extension connected to the flushing-valve to be operated simultaneously therewith, substantially as described.

2. The combination, with the stand-pipe and bowl and the flushing-valve connecting said pipe and bowl, of the ventilating-extension of said stand-pipe provided with a valve connected to said flushing-valve, and a ventilating-pipe connecting said bowl with the ventilating-extension of said stand-pipe, substantially as described.

3. The combination, with the bowl and stand-pipe, of the interposed valve-chamber having the perforated diaphragm D^3 and inner tube D', and the connected valves E and F, arranged and operating substantially as described.

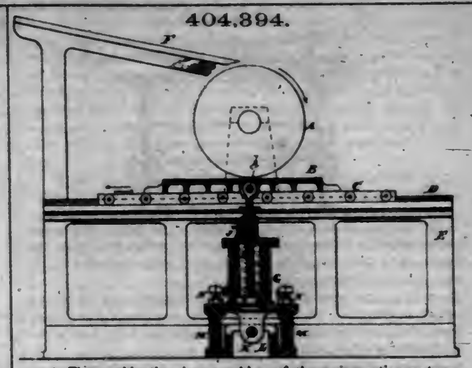
4. The combination, with the bowl A and its flushing stand-pipe B, of the interposed valve-chamber or section of the stand-pipe having the perforated diaphragm and the lateral flushing-pipe D^4 below said diaphragm, the lift-valve E, the water-supply valve F, connected to said lift-valve to operate as described, and the rock-shaft connected to said valves for operating them, substantially as described.

5. The combination, with the bowl in a flushing arrangement for water-closets, of the flushing-valve E, the ventilating extension or pipe C C', provided with a valve K, the ventilating-pipe b', connecting the bowl with the ventilating-extension pipe, and connections, substantially as described, for simultaneously operating the valves E and K, for the purpose specified.



404,394. MECHANISM FOR CUSHIONING TRAVERSING BEDS OF RECIPROCATING MACHINERY. HENRY P. FRISTER, Philadelphia, Pa. Filed July 26, 1888. Serial No. 281,099. (No model.)

Claim.—1. The combination, in a machine, of the reciprocating or traversing bed with a piston connected to and moved with said bed, a cylinder in which said piston reciprocates pivoted or hinged at one end to the frame or foundation plate of the machine.



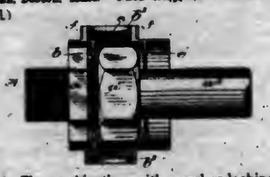
2. The combination, in a machine, of the reciprocating or traversing bed with a piston connected to and moved with said bed, a cylinder having its end closed and provided with a relief-valve, and in which cylinder said piston reciprocates, and in which the said cylinder is pivoted or hinged at one end to the frame or foundation of the machine.

3. The combination, in a machine, of the reciprocating or traversing bed with a piston connected to and moved with said bed, a cylinder in which said piston reciprocates pivoted or hinged at one end to the frame of the machine, and springs to counterbalance and cause said cylinder to normally assume an upright or substantially vertical position.

404,393.

404,894.

4. The combination, in a machine, of the reciprocating or traversing bed with a piston connected to and moved with said bed, a cylinder in which said piston reciprocates pivoted or hinged at one end to the frame or foundation of the machine, springs to cause said cylinder to normally assume an upright or substantially vertical position, and means to adjust the tension of said springs.



5. The combination of the reciprocating or traversing bed, a piston hinged to it on a transverse axis, and a cylinder closed at one end and hinged at or near its other end also on a transverse axis, and in which the piston reciprocates, the said cylinder having an aperture at or near one end for the admission of air above the piston when fully lowered.

6. The combination of the reciprocating or traversing bed, a piston hinged to it on a transverse axis, a cylinder closed at one end and hinged at or near its other end also on a transverse axis in which the piston reciprocates, the said cylinder having an aperture at or near one end for the admission of air above the piston when fully lowered, and a pressure relief-valve at or near its closed end.

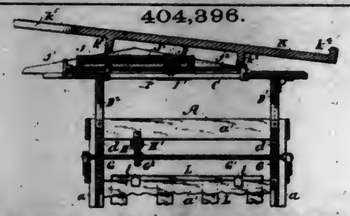
7. A reciprocating or traversing bed, combined with a pivoted cylinder and piston connected to and operated by the movements of the bed to compress air in the cylinder.

8. The combination of a main frame, a reciprocating traversing bed, and a spring continually acting on said traversing bed and always opposing its movement and tending to bring it to a central and fixed position.

404,395. SEALING DEVICE FOR WATER-METERS. GEORGE A. FOLLANSBEE, Boston, Mass. Filed Aug. 6, 1887. Serial No. 246,284. (No model.)

Claim.—1. The combination, with a seal or locking device consisting of two parts $b' b^3$, having flanges $b^3 b^4$ and $b\,e$, the flanges b having holes c, of a fastening device or wire adapted to be inserted through said holes to unite the said parts, substantially as described.

2. The combination, with a seal or locking device consisting of two parts $b' b^3$, having flanges $b^3 b^4$ and $b\,e$, the flanges $b' b^3$ having holes c, of a wire inserted through the said holes, and a key to turn or bend said wire, substantially as and for the purpose specified.



3. A seal or locking device for pipe-couplings, consisting of two parts $b' b^3$, provided with flanges $b^3 b^4$, having lips f and forming a cup or socket b^3, and a flange b, provided with a rabbet to prevent movement of the parts $b' b^3$ independent of each other in one direction, substantially as described.

404,396. CAMERA-STAND. WILLARD H. FULLER, Passaic, N. J., assignor to The Scovill Manufacturing Company, New York, N. Y. Filed Nov. 17, 1888. Serial No. 291,139. (No model.)

Claim.—1. A camera-stand consisting of a base-frame provided with wheels or casters and a vertically-adjustable bed and camera-support, the said support oscillating on its center, substantially as specified.

2. In a camera-stand having a base-frame and a vertically-adjustable bed and centrally-oscillating camera-support, the combination, with the base-frame, of wheels or casters secured to the sides of the base-frame so as to give the latter an extended base, substantially as specified.

404,396.

3. In a camera-stand, the combination of a base-frame, two vertically-adjustable frames combined therewith, springs bearing on said frames, and a bed hinged to one and detachably engaged with the other, substantially as specified.

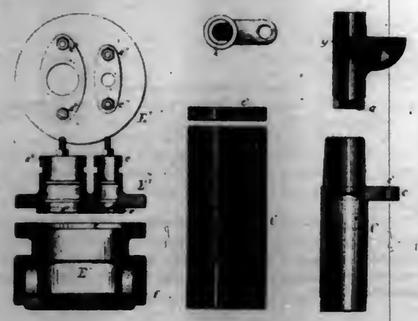
4. In a camera-stand, the combination of a base-frame, a bed adjustably supported by the base-frame and having a central oscillation, a shaft for effecting the adjustment of the said bed, and a hand-wheel upon said shaft, substantially as specified.

5. In a camera-stand, the combination of a base-frame, two upright frames having a sliding connection therewith, racks upon said upright frames, a rotary shaft, gear-wheels upon said shaft engaging with said racks, a worm-wheel upon said shaft, another rotary shaft, and a worm upon the last-mentioned rotary shaft engaging with the said worm-wheel, substantially as specified.

6. In a camera-stand, a bed and a camera-support, both notched at one end, said notches being one above the other, and the arms of the notch in the support forming an extended bearing for the camera, substantially as specified.

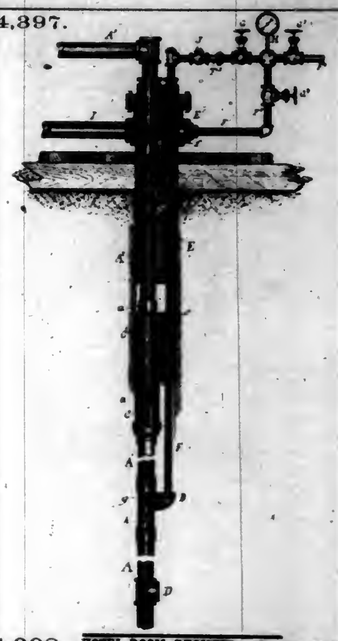
7. In a camera-stand, the combination of a bed, a camera-support pivotally connected between its ends to said bed, a slide arranged between said bed and camera-support, and inclines carried by said slide operating to tilt the camera-support, substantially as specified.

8. In a camera-stand, the combination of a bed notched at one end, a camera-support notched at the corresponding end and pivotally connected between its ends to said bed, a slide arranged between said bed and camera-support, and inclines carried by said slide and arranged laterally beyond the notches of the bed and camera-support and operating to tilt the camera, substantially as specified.



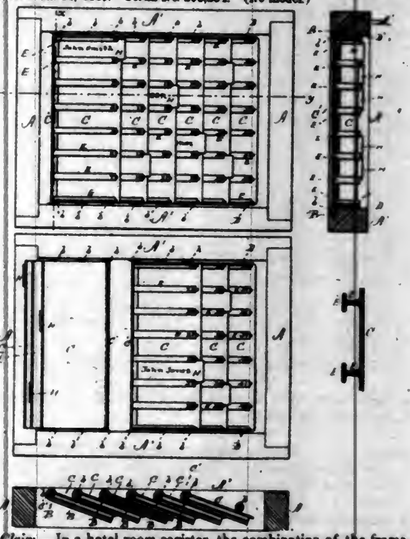
9. In a camera-stand, the combination of a bed, a camera-support pivotally connected between its ends to the bed, a slide between the bed and camera-support, inclines carried by the slide, a rack upon the slide, and a rotary shaft supported by the bed in a position parallel with the rack and operating to transmit longitudinal motion to the slide, substantially as specified.

10. In a camera-stand, the combination of a bed notched at one end, a camera-support notched at the corresponding end and pivotally connected between its ends to the bed, a slide intermediate of the bed and camera-support, inclines carried by the slide arranged laterally beyond the notches of the bed and camera-support and serving to tilt the camera-support, and a rotary shaft serving to impart longitudinal motion to the slide and having its end which is to be actuated by the operator located close to the inner ends of the notches in the bed and camera-support, substantially as specified.



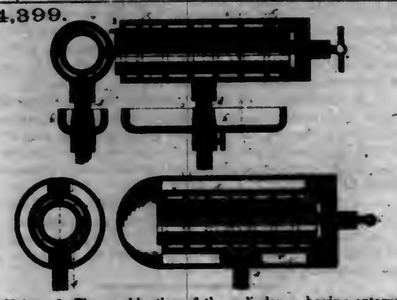
404,397. DEVICE FOR EJECTING OIL FROM OIL-WELLS. WILLIAM GEISER, Salina, Pa. Filed Nov. 1, 1888. Serial No. 289,709. (No model.)

Claim.—1. The combination, substantially as set forth, of the oil-tubing A A' A^2 with the pipe F, located outside of the oil-tubing, the ejector B, and check-valve J.



2. The combination, substantially as set forth, of a pipe F, check-valve J, ejector B, check-valve h, oil-tubing A A' A^2, packer C C' C^2, and casing-head E E^2.

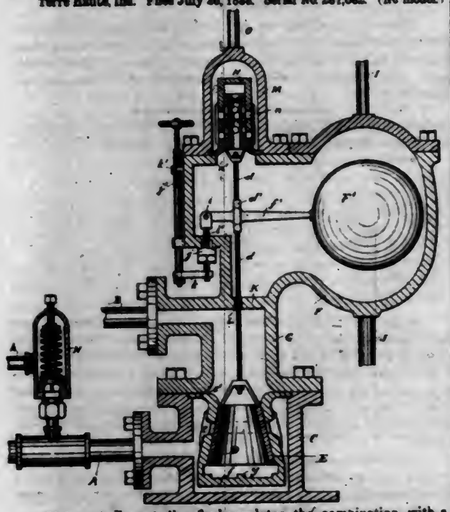
404,397.



404,398. HOTEL ROOM-REGISTER. CHARLES H. GREENLEAF, Boston, Mass., assignor of one-half to William A. Tracy, Nashua, N. H. Filed Jan. 31, 1889. Serial No. 298,254. (No model.)

Claim.—In a hotel room-register, the combination of the frame A, the series of parallel rods or shafts B, whose ends are held in said frame, the series of leaves C, turning or swinging on said rods or shafts, each leaf being integral and swinging bodily and provided with recesses or spaces separated by partitions adapted for the easy insertion, withdrawal, and holding of cards or slips, on which may be written the names, &c., of guests, said partitions being provided near their outer ends with characters indicating the different rooms, and a stop piece or rod D, substantially as and for the purpose set forth.

404,399. APPARATUS FOR BURNING PETROLEUM OR SIMILAR SUBSTANCES. LOUIS P. GUIGNARD, Fluntern, near Zurich, and JAKOB SCHWEIZER, Unterstrass, near Zurich, Switzerland. Filed Aug. 30, 1888. Serial No. 284,174. (No model.) Patented in France May 4, 1888, No. 190,410, and in England July 24, 1888, No. 10,884.



404,399.

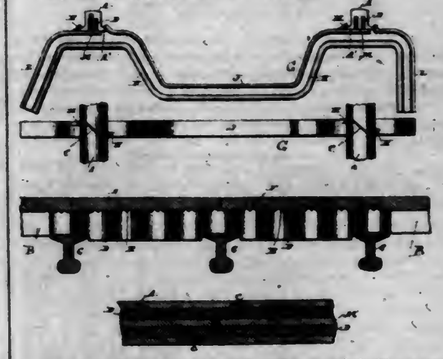
Claim.—1. The combination of the cylinder a, having external annular flanges and provided with recesses a' in each of said flanges, jacket b resting on said flanges, forming chambers or spaces c between the cylinder and jacket, the chambers or spaces c communicating through the recesses a' with each other and with the feed-tube d, leading to one of the chambers or spaces c, and the jet e, leading from one of the chambers or spaces c to the interior of the cylinder a, substantially as described.

2. The combination of the cylinder a and jacket b around said cylinder, forming the chamber or space c between said cylinder and jacket, with the outer apertured jacket f, feed-tube d, leading to the chamber or space c, and jet e, leading from the chamber or space c to the interior of the cylinder a, substantially as described.

404,400. BOILER FEED-REGULATOR. WINFIELD O. GUSCKEL, Terre Haute, Ind. Filed July 26, 1888. Serial No. 281,062. (No model.)

Claim.—1. In a boiler feed-regulator, the combination, with a conical regulating-valve working in a seat provided with orifices for the passage of water, of an outer casing for said valve and its seat, a float operatively connected to said conical valve, a float-casing connected to said valve-casing, inlet and delivery pipes upon opposite sides of the regulating-valve, and a safety-valve secured upon the inlet-pipe, substantially as and for the purpose set forth.

2. In a boiler feed-regulator, the combination, with an open-ended conical regulating-valve, of a valve-seat provided with lateral orifices for the passage of water, and projections on its bottom for the said valve to rest on, of an outer casing for the said valve and its seat, a float operatively connected to said conical valve, a float-casing connected to the said valve-casing, inlet and delivery pipes upon opposite sides of the regulating-valve, and a safety-valve secured upon the inlet-pipe, substantially as and for the purpose set forth.



3. The combination, with the water-regulating valve of a boiler-feeder, of the float provided with a lever and operatively connected to said valve, a fulcrum-stem for the said lever passing through the float-casing, a connecting-piece secured to the end of said stem, and a revolubly screwed spindle engaging with a stationary screw-threaded projection and journaled in the connecting-piece for adjusting the fulcrum of the float, substantially as set forth.

4. In a boiler feed-regulator, the combination, with a water-regulating valve provided with a stem and a float operatively connected to the said stem, of an outer casing for the said valve, water inlet and delivery pipes upon opposite sides of the valve, a casing for the float connected to the steam and water spaces of the boiler, and a partition provided with a hole for the valve-stem and arranged between the water-space under the float and the water-space above the regulating-valve, whereby the float may rest in still water, substantially as set forth.

5. In a boiler feed-regulator, the combination, with a water-regulating valve provided with inlet and outlet pipes, and a safety-valve upon the said inlet-pipe, of a float provided with a pivoted lever and working in a casing above the said water-valve, a balanced steam-supply valve for the pump working in a cylinder on top of the float-casing, both valve and cylinder being provided with orifices for regulating the passage of steam from the float-casing, and a stem connecting the said steam and water valves with the float-lever, substantially as and for the purpose set forth.

6. In a boiler feed-regulator, the combination, with a water-regulating valve provided with inlet and outlet pipes, and a safety-valve on the said inlet-pipe, of a float provided with a pivoted lever, a steam-supply valve for the pump, a stem connecting the said steam and water valves with the float-lever, and casings inclosing the said water-valve and float and having their internal spaces separated by a partition provided with a small hole for the passage of the valve-stem, whereby the float may work in still water and the steam-valve receive dry steam direct from the upper part of the float-casing, substantially as set forth.

404,401. RAILWAY-TRACK. JACOB HAHN, De Kalb, Ill. Filed July 27, 1888. Serial No. 281,170. (No model.)

Claim.—1. The combination of the rail A, provided with recesses B B, and corrugations F, and bars D, provided with notches E, substantially as shown, and for the purpose described.

2. The combination of the tie G, provided with lugs H, formed in diagonal parallel lines thereon, and the rail A, provided with diagonally-formed ends C, substantially as shown, and for the purpose described.

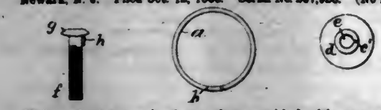
3. The combination of the tie G, provided with lugs H, and rails A, provided with flanges A', and diagonally-formed ends C, substantially as shown, and for the purpose described.

4. The combination of the tie G, provided with lugs H, and central depression J, rails A, provided with recesses B, and central supporting-wall M, and flanges A', and the bars D, substantially as shown, and for the purpose described.

5. The combination of the tie G, provided with central depression J, and lugs H, the rails A, provided with diagonal ends C, wall M, and recesses B, provided with corrugations F therein, and the bars D, provided with notches E therein, substantially as shown, and for the purpose described.

404,402. CART. THOMAS HARDY, Toronto, Ontario, Canada. Filed Sept. 12, 1888. Serial No. 285,193. (No model.)

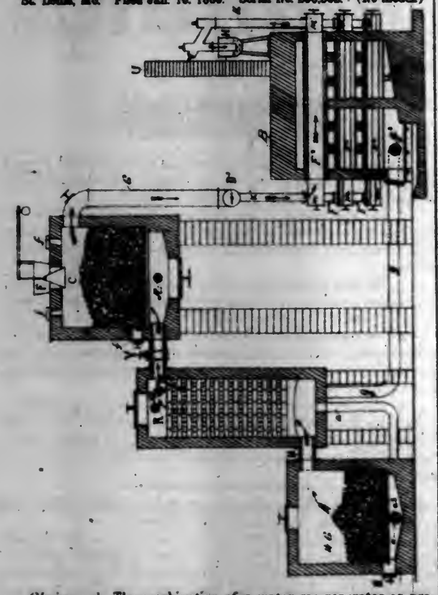
Claim.—1. The combination, with the body A, of the ledges B, secured to the top thereof, the bars C, secured to the sides of said body and extended across the tops of said ledges and across the bottom of the body, and the braces D, all substantially as shown and described, and for the purpose specified.



2. The combination, with the axle having a crank formed in it, as shown, the body, and the ledges secured to the top of said body, of the springs secured at their ends to the under side of said ledges, the T-pieces on the axle, the plate between the T-pieces and the bottom of the spring, and the clips J, passed around said spring and

404,402.

plate and through holes in the T-pieces, substantially as and for the purposes specified.

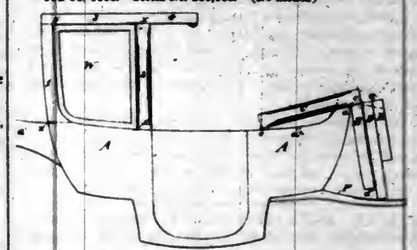


404,403. TERRET WITH SEPARABLE SHANK. EMERY E. HARDY, Newark, N. J. Filed Oct. 12, 1888. Serial No. 287,928. (No model.)

Claim.—1. A terret having a ring provided with an aperture in one side, a collar formed in a separate piece, and a through-bolt inserted through the ring and collar, the several parts of the terret being detachable from one another, substantially as shown and described.

2. A terret having a ring and collar united by a through-bolt provided with a feather to hold the bolt from turning in the side of the ring.

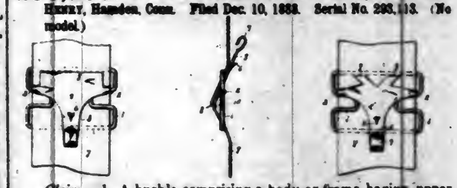
404,404. APPARATUS FOR THE MANUFACTURE OF FUEL AND ILLUMINATING GAS. JOHN W. HARRISON and FREDERIC BOSER, St. Louis, Mo. Filed Jan. 16, 1889. Serial No. 296,562. (No model.)



Claim.—1. The combination of a water-gas generator or producer, a superheater which receives the gases from the generator, a coal-distilling chamber which receives the gases from the superheater, and a bench of retorts to which the gases and vapors from the coal-distilling chamber directly pass, the whole connected and adapted to operate substantially in the manner hereinbefore set forth.

2. The combination, with the water-gas generators or sets of generators W G W' G', the superheaters R R', one for each water-gas generator or set of generators, and the coal-distilling chamber C, common to said superheaters, these elements being constructed, connected together, and adapted to jointly operate substantially in the manner and for the purposes hereinbefore set forth.

3. In combination with the retort-bench and the coal-distilling chamber, the regulator or superheater provided with three valve-controlled outlets, the one leading to the atmosphere, the next to the coal-distilling chamber, and the third to the combustion chamber or furnace of the retort-bench, substantially as and for the purposes hereinbefore set forth.



4. In combination with the superheaters and retort-bench, the intermediate coal-distilling chamber, connected on the one hand with the superheaters and on the other hand with the retorts, and provided with the air and steam inspirator A, substantially as and for the purposes hereinbefore set forth.

404,405. CARRIAGE. MICHAEL HAGERTY, St. Louis, Mo. Filed Oct. 31, 1888. Serial No. 289,063. (No model.)

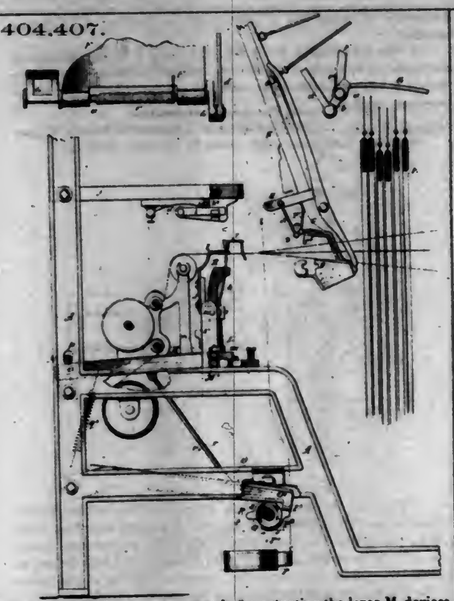
Claim.—In a carriage-top, the jointing and hinging of the back B at a point higher than the front center pillar C, so that the top when open will fold in a vertical position outside of and parallel to the rear panel, all substantially as shown and described, and for the purposes set forth.

404,406. BUCKLE. ROBERT G. HENRY, Waterbury, and RENE L. HENRY, Hamden, Conn. Filed Dec. 10, 1888. Serial No. 293,113. (No model.)

Claim.—1. A buckle comprising a body or frame having upper and lower cross-pieces and bearings between said cross-pieces, a tongue pivotally attached to said bearings, and provided at its lower end with a hook and with a backwardly-extending prong 6 below said bearings, said tongue having its upper end extended above its pivotal bearings to form a clamping part 8, arranged to engage the web and clamp the same against the upper cross-piece of the said body or frame.

2. A buckle comprising a body having bearings and a tongue turning thereon and having a clamping-surface 8, a prong 6, and a prong 10 to engage the web, and a hook to engage an attaching-strap.

404,407. STOP MECHANISM FOR LOOMS. EDUARD HERRIG, West Hoboken, assignor to Rand H. Simon, Union, N. J. Filed Sept. 3, 1888. Serial No. 284,903. (No model.)



Claim.—1. In a loom, the batten B and the movable fly or fork G carried by said batten, and means, substantially as described, for actuating the fork G, combined with the fork J, a pivoted support carrying said fork, lever L, lever M, a cam or eccentric for actuating the lever M, devices intermediate said cam and lever, and a device operated by the lever M to stop the loom, substantially as set forth.

2. In a loom, the batten B, bracket F carried thereby, fly or fork G, carried by the bracket F, and lever H, carried by the batten above the fly G and connected with the fly or fork G, in combination with the stop or tongue I, and support *f*, carrying said tongue, said stop or tongue being above the fly or fork G, substantially as described.

3. In a loom, the batten B, bracket F, shaft *a* on said bracket, fly or fork G and crank *b* on said shaft, lever H, and link *d*, said lever being above the fly or fork G, combined with the tongue I, and support *f*, carrying said tongue, said tongue being above the fly or fork G, substantially as described.

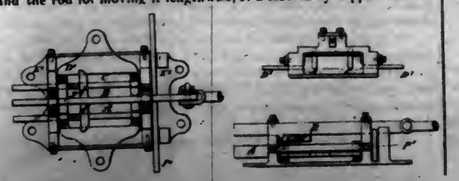
4. In a loom, the batten B, bracket F, shaft *a*, fly or fork G and crank *b* on said shaft, lever H, and link *d*, combined with the tongue I, and support *f*, carrying said tongue, and with the fork J, lever A, levers L and M, a cam or eccentric for actuating the lever M, devices intermediate said cam and lever, and a device operated by the lever M to stop the loom, substantially as described.

404,407.

5. The batten B and the swinging fly or fork G carried thereby, and means, substantially as described, for actuating the fork G, combined with the fork J, lever A, levers L M, stop U, rod N, connected with the driving-gear, rod *r*, lever O, and cam P, all arranged for operation substantially as herein shown and described.

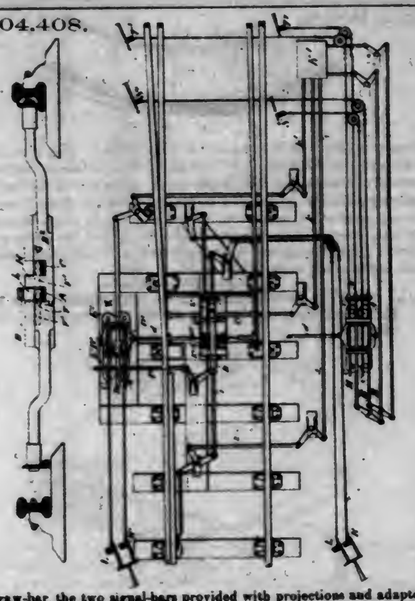
6. In a loom, the batten B, combined with the lever R, having a slight vertical movement, lever M^2, a cam or eccentric for actuating the lever M^2, devices intermediate said cam and lever M^2, and a device operated by the lever M^2 to stop the loom, as specified.

7. In a loom, the batten B, combined with the lever R, having opening *x*, pivot *w*, passing through said opening and carried by the support *v*, support *v*, spring *y*, lever M^2, a cam or eccentric for actuating said lever, devices intermediate said cam and lever M^2, and devices operated by the lever M^2 to stop the loom, as specified.



8. In a loom, the batten B, combined with the lever R, having a slight longitudinal movement, lever M^2, rod N, connected with the driving-gear, rod r^2, lever O^2, and cam P^2, all arranged for operation substantially as herein shown and described.

9. The batten B, bracket F, fork G, and lever H, connected to the fork and carried above the fly or fork G, combined with the tongue I, spring *g*, supporting the free end of said tongue, and support *f*, substantially as described.



404,408. WORKING AND INTERLOCKING RAILWAY SIGNALS AND POINTS. JOSEPH HILL and JOHN P. O'DONNELL, London, County of Middlesex, England. Filed June 21, 1887. Serial No. 242,055. (No model.) Patented in England May 18, 1886, No. 6,061.

Claim.—1. The combination, with the draw-bar provided with long and short projections F' and F, and one rod for moving it lengthwise, of the two signal-bars provided with projections G and arranged one upon each side of the draw-bar and substantially parallel with it, and a second rod coupled to the points for opening and shutting them and simultaneously causing the respective signal-bar to engage with the draw-bar, so that it may subsequently be operated by the first-mentioned rod, substantially as set forth.

2. The combination, with the draw-bar provided with projections, and the rod for moving it lengthwise, of a stationary support for the

404,408.

draw-bar, the two signal-bars provided with projections and adapted to engage with those on the draw-bar and arranged one upon each side of the draw-bar, a support for the said signal-bars adapted to slide crosswise and rigidly connected to the points, and a second rod coupled to the points for opening and shutting them and simultaneously sliding the respective signal-bar into gear with the draw-bar, substantially as and for the purpose set forth.

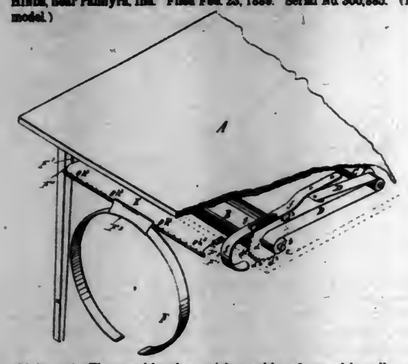
3. The combination, with the longitudinally-movable draw-bar provided with projections F' and F of unequal length, of a stationary support for the draw-bar, the two signal-bars arranged upon opposite sides of the draw-bar and provided with projections which are always in contact with the longer projections F' of the draw-bar, a support for the signal-bars rigidly connected to the points and adapted to slide crosswise with them, thereby causing the projections on the signal-bars to be slid between the said short and long projections on the draw-bar and placing the appropriate signal-bar in gear with the draw-bar according to the direction of the motion of the points, substantially as set forth.

4. The combination, with the longitudinally-movable draw-bar, of the two signal-bars arranged upon opposite sides of the draw-bar and adapted to engage with it, a stationary support for the draw-bar provided with one or more locking-holes for the signal-bars to enter when moved by the said draw-bar, and a support for the signal-bars rigidly connected to the points and adapted to slide crosswise with them and to place the appropriate signal-bar into gear with the draw-bar and in front of the locking-hole, substantially as set forth.

5. The combination, with the points, of the stretcher secured between the points and provided with holes for the signal-bars to slide in, the longitudinally-sliding draw-bar supported above the stretcher and provided with projections, and the two signal-bars provided with projections and adapted to engage with the said projections on the draw-bar, substantially as and for the purpose set forth.

404,409. COLLAR-FASTENER. JOHN HIMMELSTEIN, Milwaukee, Wis. Filed June 7, 1888. Serial No. 276,324. (No model.)

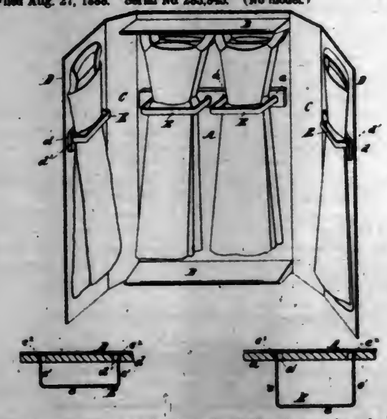
Claim.—The metal collar-fastener constructed in two parts secured to the two ends of the collar, respectively, the face of one part having a T-shaped recess or slot G extending laterally from one edge nearly across the face and the other part having a corresponding T-shaped tongue H nearly across its face laterally, the tongue H being



404,409.

adapted to enter and fit in the recess G, said fastener being also provided with a set of flanges L L on its lower outer surface on the two parts of the fastener at right angles to the longer axis of the slot G and tongue H, and so located as to form a continuous channel when the two parts of the fastener are locked together, in which channel the hame-strap is adapted to fit, whereby the ends of the collar are retained in position against lateral movement with reference to each other, substantially as described.

404,410. NAPKIN-HOLDER TABLE ATTACHMENT. JOHN M. HIBBS, near Palmyra, Ind. Filed Feb. 23, 1889. Serial No. 300,885. (No model.)

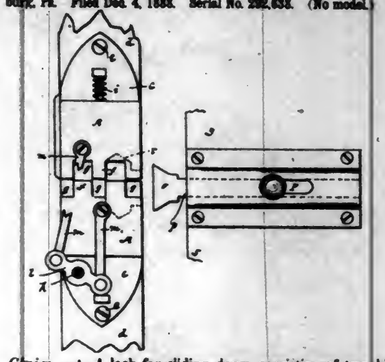


Claim.—1. The combination, with a table, of a napkin-roller applied underneath the top or frame of the table opposite the place where a person sits, upon and off which the napkin rolls, substantially as described.

2. The combination of a napkin-roller applied underneath the top or frame of the table opposite the place where a person sits, a napkin removably attached to it, and a split neckband removably attached to the napkin, substantially as described.

3. In a napkin-holder table attachment applied underneath the top or frame of the table opposite the place where a person sits, in combination, the napkin-roller, napkin, pawl, and ratchet, substantially as described.

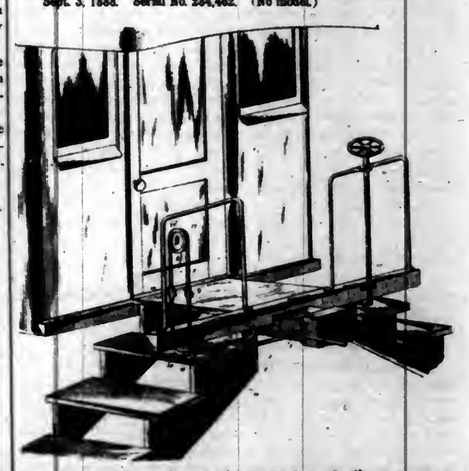
4. The combination of the napkin-roller applied underneath the top or frame of the table opposite the place where a person sits, napkin, ratchet, pawl, and an automatic tension rolling-up device, substantially as described.



404,411. NECKTIE-HOLDER. GEORGE A. HUEWE, Cincinnati, Ohio. Filed Aug. 27, 1888. Serial No. 283,843. (No model.)

Claim.—1. The combination of a folding box, strip *c*, having openings *d'* and attached to the back of the box, and yoke E, having outwardly-springing legs *e'*, substantially as and for the purposes specified.

2. The combination of a folding box, strip *c*, having openings *d'* and attached to the back of the box, and yoke E, having outwardly-springing legs *e'*, provided with teeth *e²*, substantially as and for the purposes specified.

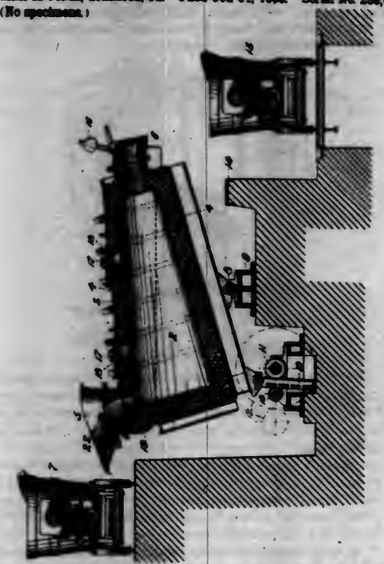


404,412. SLIDING-DOOR LOCK. STEPHEN W. HUSTON, Wilkinsburg, Pa. Filed Dec. 4, 1888. Serial No. 292,638. (No model.)

Claim.—1. A lock for sliding doors, consisting of two blocks limited to vertical movement in opposite directions on a fixed base, and having interlocking fingers formed in their opposing edges, and a recess for the reception of a bolt-head, and a headed bolt limited to endwise movement in a line at right angles to the line of movement of the blocks, substantially as and for the purpose described.

2. A lock for sliding doors, consisting of two sliding blocks limited to vertical movement in opposite directions on a guideway of a base, and having the interlocking fingers, and a recess formed in their opposing edges, an axially-turning shaft connected by intermediate devices with said blocks for adjusting the latter simultaneously in opposite directions, and a headed bolt, substantially as and for the purpose described.

404,413. PIPE-COUPLING. CYRUS F. HURREL, Holton, Kans. Filed Sept. 3, 1888. Serial No. 284,462. (No model.)

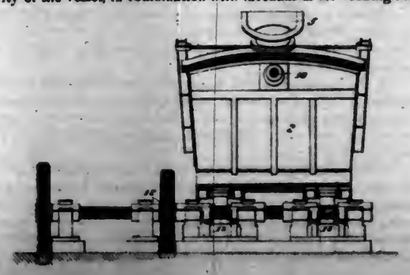


Claim.—1. A coupling for the steam-pipes of railway-cars, comprising a bent metallic pipe having two limbs and provided with one or more coils at the bend, the curvature of the coils being in the same plane with the arms and parallel with the direction of strain, and a connecting device for attaching it to the steam-pipes of abutting cars.

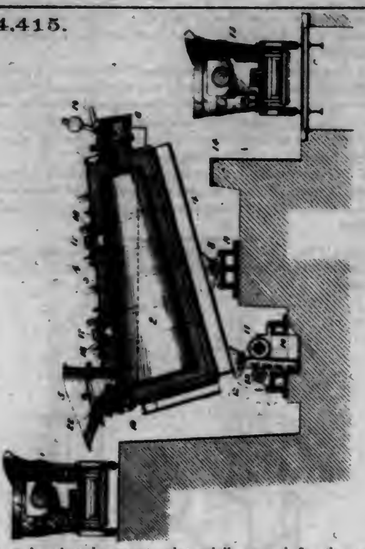
2. A coupling for the steam-pipes of railway-cars, comprising a bent metallic pipe having parallel limbs, both limbs being bent at an intermediate point and provided with one or more coils or turns at each bend to permit a ready yielding in the direction of strain, and a connecting device for attaching the coupling to the steam-pipes of abutting cars.

3. The combination of the pipes 1 and 2, attached to the cars, the coupling connected thereto, said coupling being provided with parallel arms adapted to yield in the direction of strain, a coil connecting the arms, said coils being in the same plane with the arm and parallel with the direction of strain, and springs 13 14, as and for the purpose set forth.

404,414. METHOD OF MIXING MOLTEN PIG METAL. WILLIAM R. JONES, Braddock, Pa. Filed Oct. 31, 1888. Serial No. 289,672. (No specimens.)



Claim.—1. In the art of refining iron directly from the smelting-furnace, the process of equalizing the chemical composition of the crude metal by thoroughly commingling or mixing together the liquid-metal charge and subsequently refining the mixed and equalized charge, substantially as and for the purposes described.



2. In the art of mixing molten metal to secure uniformity of the same in its constituent parts preparatory to further treatment, the process of introducing into a mixing-receptacle successive portions of molten metal nonuniform in their non-metallic constituents, (sulphur, silicon, &c.,) removing portions only of the composite molten contents of the receptacle without entirely draining or emptying the same, and successively replenishing the receptacle with fresh nonuniform additions, substantially as and for the purposes described.

404,415. APPARATUS FOR MIXING MOLTEN PIG METAL. WILLIAM R. JONES, Braddock, Pa. Filed Oct. 31, 1888. Serial No. 289,673. (No model.)

Claim.—1. An apparatus for receiving successive charges of molten metal from a blast-furnace or furnaces and mixing the same previous to further treatment, consisting of an iron vessel having a refractory and heat-retaining lining, and being of substantially rectangular and trapezoidal shape in longitudinal cross-section, covered on top with a removable refractory-lined cover or covers, and furnished with suitable man-hole or man-holes, and having a charging-hopper at or near the top at one end and a discharge-opening at the other end placed above the surface level of the fluid metal when the vessel is in its normal position, said vessel resting on a pivotal support or supports located nearer to the discharge end than the center of gravity of the vessel, in combination with mechanism for rocking the

404,415.

vessel on its pivotal support, substantially as and for the purpose hereinbefore described.

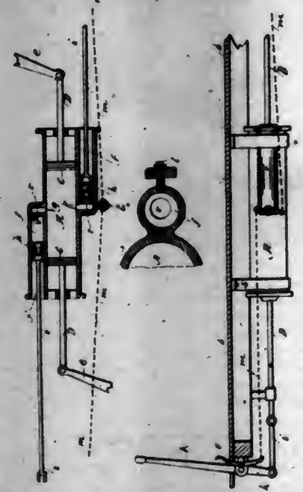
2. A mixing-vessel for molten metal, said vessel having a refractory lining, a heat-retaining cover, a charging-opening, and a discharging opening or spout, and provided with a pivotal support arranged forward of the center of gravity of the vessel, whereby the floor of the said vessel will normally incline downwardly from the discharge opening or spout toward the rear of the vessel, in combination with power mechanism for rocking the vessel on its pivotal support, substantially as and for the purposes described.

404,416. RUBBER BOOT OR SHOE. JOSEPH L. JOYCE, New Haven, Conn. Filed Oct. 22, 1888. Serial No. 288,791. (No model.)

Claim.—The herein-described improvement in india-rubber boots or shoes having solid heels, consisting in a boot having the lower edge of the counter turned over onto the insole, the heel portion of the outsole of an area smaller than the area of the heel portion of the boot, but the said heel portion of the sole joined to the inner edge of the turned-over portion of the counter, so as to leave a margin of the counter upon the heel-surface around the heel portion of the outsole, combined with a heel of hard material, its upper surface of an area corresponding substantially to the area of the heel portion of the boot and larger than the heel portion of the outsole, the heel applied and its outer edge resting directly upon the counter outside the edge of the outsole, and the said heel secured by nails through the heel and through the sole, the points of the nails turned down upon the inside of the sole, substantially as described.

404,417. WIRE MATTING. ISRAEL KINNEY, Windsor, Ontario, Canada. Filed Feb. 28, 1887. Serial No. 228,601. (Model.)

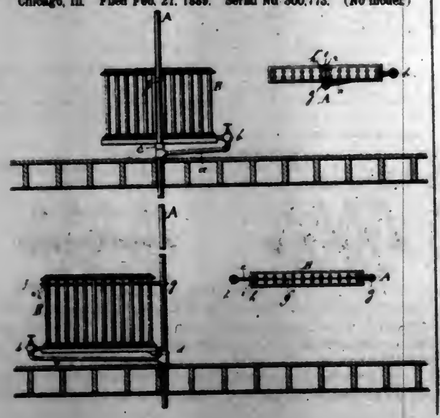
Claim.—1. A wire fabric consisting of flattened spiral coils A, interlocking with each other and lying in the same direction, and intermediate wires B, carried substantially parallel to said spirals and through the alternating coils of the adjacent spirals, substantially as described.



2. A wire fabric consisting of a series of spiral wires, as A, having the spirals interlocked, and wires B, running substantially in the direc-

tion of the spiral wires, each of said wires B passing through or interlocking with the alternate spirals or coils of the adjacent wires A, substantially as described.

3. In a wire fabric, the combination, with spirally-wound wires, of locking-wires engaging therewith and running in substantially the same direction as the spiral coils and crossing each other between the points where they engage with said coils, each locking-wire passing alternately over the wire of one coil and then under the wire of the adjacent coil, substantially as described.

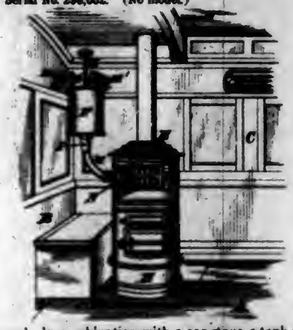


4. The fabric shown, consisting of the spiral coils A, connected by wires B and C, running in substantially the same direction as the coils and each engaging the adjacent coils alternately, substantially as described.

404,418. DEVICE FOR OPERATING CAR-BRAKES. ROBERT A. KNEADDEN, Allegheny, Pa. Filed July 9, 1888. Serial No. 279,456. (No model.)

Claim.—In a device for manually operating car-brakes, the combination, with a main cylinder and two pistons arranged in opposite ends thereof, of two supplementary cylinders *f f*, arranged on opposite sides of said main cylinder and each communicating at one end with said main cylinder at a point between the two pistons therein, and having a check-valve *r*, a valved piston *h*, operating in each of the supplementary cylinders and connected with a hand-lever at the end of a car, a relief-valve *l*, communicating with said main cylinder at a point between the pistons thereof and having an axially-turning body, and a treadle *o*, connected with said relief-valve by an intermediate connection *m*, whereby air may be admitted to the brake-cylinder through the relief-valve and operate the pistons in the main cylinder to release the brake-shoes, substantially as and for the purpose described.

404,419. STEAM-HEATING DEVICE. HERMAN A. KROESCHELL, Chicago, Ill. Filed Feb. 21, 1889. Serial No. 300,773. (No model.)

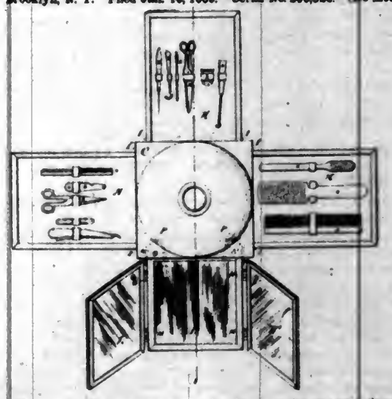


Claim.—1. In combination with a car-stove, a tank suspended by yielding supports, a pipe leading from the discharge-opening of said tank to said stove, a valve controlling said opening, and a stem that connects said valve with the upper part of the car, substantially as herein described.

2. In combination with a car-stove, as K, the tank F, suspended by springs G G', attached to brackets H H', a pipe M, leading from the seat I of said tank to said stove, a valve J, controlling the opening of said seat, and a stem K, that connects said valve with the upper part of the car, as herein described.

3. A flexibly-suspended tank connected by a metallic pipe to a fixed car-stove, the discharging end of said pipe being free to move within the stove-coupling, substantially as herein described, and for the purpose stated.

404,420. AUTOMATIC EXTINGUISHER FOR CAR-STOVES. HERMAN LEVOY and FRANK DAGWELL, Cincinnati, Ohio. Filed Jan. 29, 1889. Serial No. 298,082. (No model.)



Claim.—1. In combination with a car-stove, a tank suspended by yielding supports, a pipe leading from the discharge-opening of said tank to said stove, a valve controlling said opening, and a stem that connects said valve with the upper part of the car, substantially as herein described.

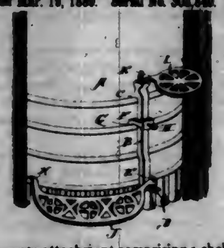
2. In combination with a car-stove, as K, the tank F, suspended by springs G G', attached to brackets H H', a pipe M, leading from the seat I of said tank to said stove, a valve J, controlling the opening of said seat, and a stem K, that connects said valve with the upper part of the car, as herein described.

3. A flexibly-suspended tank connected by a metallic pipe to a fixed car-stove, the discharging end of said pipe being free to move within the stove-coupling, substantially as herein described, and for the purpose stated.

404,421. COMBINED LAMP AND TOILET-CASE. FRANK MAHER, Brooklyn, N. Y. Filed Jan. 16, 1889. Serial No. 296,526. (No model.)

Claim.—1. The combination of a lamp and a support therefor, the sides whereof are hinged, substantially as set forth, and provided internally with toilet or similar utensils, substantially as and for the purposes described.

2. The combination of a lamp and a support therefor, the sides whereof are hinged substantially as set forth, and provided internally with toilet or similar utensils and a base connected with the support for the lamp by a swivel-connection, substantially as and for the purposes described.



3. The combination of a lamp and a support therefor, a part of the sides whereof consist of a folding mirror constructed and arranged substantially as set forth, whereby it may be folded upon itself and swung into place as a part of the support for the lamp and a support for the mirror when unfolded, which is attached to the support for the lamp and rests against the mirror, substantially as set forth.

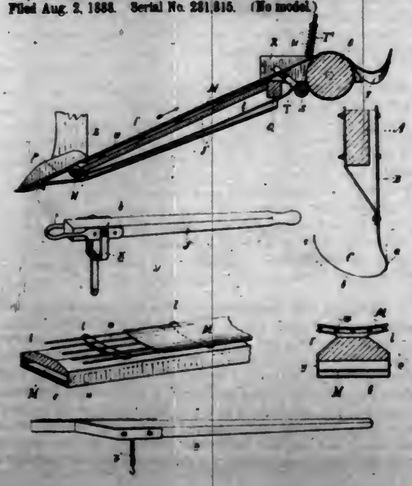
4. A lamp the support whereof is constructed and arranged to receive toilet or equivalent articles, and a door in the side of the support, whereby the said articles may be reached without removing the lamp, substantially as set forth.

404,422. COUGH-SIRUP. WILLIAM A. MAXWELL and OSCAR E. MEDDAUGH, Lakeport, Cal. Filed Mar. 6, 1889. Serial No. 302,123. (No specimens.)

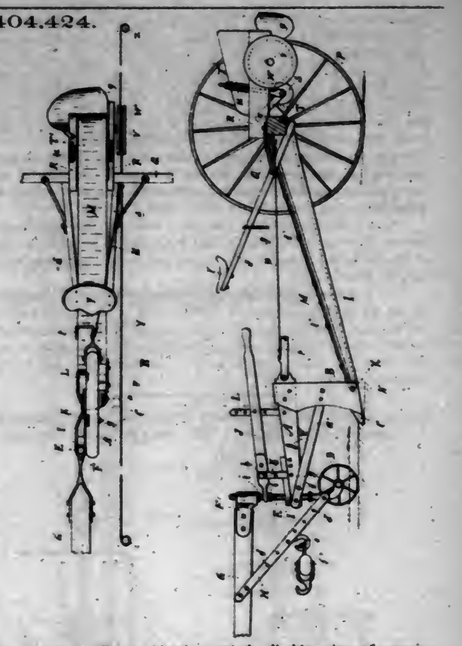
Claim.—The herein-described composition of matter to be used as a medicine, consisting of extract of eriodictyon glutinosum, senega, squills, spirits of chloroform, glycerine, and sirup, in the proportions specified.

404,423. GRATE ATTACHMENT. JOHN J. MITCHELL, Birmingham, Ala. Filed Mar. 19, 1889. Serial No. 303,849. (No model.)

Claim.—1. A grate attachment comprising a shelf-supporting bar provided at its upper end with a hook adapted to engage the grate-bar and at its lower end with a forwardly-projecting lug and the shelves pivotally mounted on said lug and the upper end of the bar, as set forth.



2. The combination of the shelf-supporting bar provided at its upper end with a hook adapted to engage the grate-bars and a pivot-pin projecting vertically from said end and provided at its lower end with a forwardly-projecting lug and a pivot-pin on the upper side of said lug, the shelves mounted on the pivot-pins, and the clamping-bar adapted to pass around the supporting-bar and engage one of the grate-bars and be clamped to the supporting-bar, as set forth.



3. The combination of the shelf-supporting bar provided at its upper end with a hook adapted to engage the grate-bar, the swinging shelf mounted on the said supporting-bar, the clamping-bar passing on opposite sides of the shelf-supporting bar and provided with depending hooks adapted to engage the grate-bar, and the set-screw mounted in said clamping-bar and bearing against the shelf-supporting bar, as set forth.

4. In a grate attachment, the combination of the shelf-supporting bar and the extended shelf pivotally mounted at the lower end of said bar and provided at its free end with a depending hook adapted to engage one of the grate-bars, as set forth.

5. In a grate attachment, the shelf-supporting bar clamped to the grate, the shelf I, pivoted to the upper end of the said bar, and the shelf J, pivoted to the lower end and having the hook K at its outer end to engage one of the grate-bars, as set forth.

404,424. DITCHING-PLOW. RUSSELL H. MOSAR, Dundee, Mich. Filed Aug. 2, 1888. Serial No. 281,815. (No model.)

Claim.—1. The combination, with the ditching-plow, of a carrier mounted on a truck at the rear of the plow and having a hinged connection at its forward end with the scoop or plow, and the adjustable draft-connection with the rear end of the plow-beam, said connection being pivoted at one end to the plow-beam, substantially as described.

2. In a ditching-machine, the combination, with the ditching-plow, of the carrier mounted on the truck at the rear of the plow and having pivotal connection at its forward end therewith, and the adjustable draft-connection between the rear end of the plow and said truck, said draft-connection being pivoted at one end to the plow-beam and under the control of the operator, substantially as described.

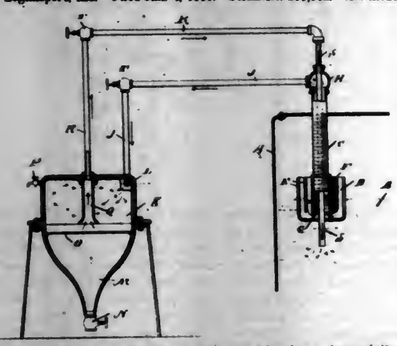
3. In a ditching-machine, the combination, with the ditching-plow, of a carrier pivotally secured at its forward end to the scoop or plow and mounted with its rear end upon the truck, and a draft-connection between said truck and the rear end of the plow in the line of draft, consisting of the foot-lever *l* and the draft-connection *n*, substantially as described.

4. In a ditching-machine, the combination of the following elements: the ground-wheel mounted on a vertical standard, the draft devices applied thereto, the plow-beam provided at its forward end with the vertical bearing engaging with the standard of the ground-wheel, the scoop or plow secured to the rear end of the plow-beam, the raising and lowering device mounted upon the plow-beam, the carrier pivotally secured at its forward end to the plow and mounted at its rear end upon the truck, and the adjustable connection between the rear end of the plow and the truck, said connection consisting of the foot-lever *l* and the draft-connection *n*, substantially as described.

5. The combination, with the plow of a ditching-machine, of the endless carrier pivotally secured at its forward end to the rear end of the plow and mounted at its rear end upon a truck, a carrier-pulley mounted upon the truck and to which motion is applied, and a friction-pulley mounted below such carrier-pulley and pressing the belt against the face of the carrier-pulley, substantially as described.

6. The combination, with the plow of a ditching-machine, of a carrier consisting of the endless belt M, secured at its forward end to the plow and mounted at its rear end upon a truck, the belt-pulley O, mounted in suitable bearings upon the frame of the truck, the adjustable friction-pulley S, mounted in contact with the belt-pulley, the shaft V of the belt-pulley, and the grooved drive-pulley W, substantially as described.

7. The combination, with the ditching-plow, the carrier mounted in the rear thereof and supported upon the truck, the drive-shaft V of the carrier, the grooved pulley W upon said drive-shaft, and the wire rope Y, the parts being arranged to operate substantially as and for the purpose described.



8. In a ditching-machine, the combination of the following elements: the ground-wheel D, the vertical standard E, carrying such

ground-wheel, the draft-bar H, the draft-connection adjustably secured to the draft-bar, the plow-beam provided at the forward end with the bearing l, into which the standard E engages, the raising and lowering lever J, pivotally mounted on top of the plow-beam and engaging by its forward end with the standard E, the adjusting devices of that lever, the scoop U, mounted on the standard B, the endless carrier M, the roller N, mounted in the scoop of the plow, the truck upon which the rear end of the carrier is mounted, the carrier-pulley O, over which the rear end of the carrier-belt passes, the friction-pulley S, the drive-pulley W, and the seat R, mounted on the rear truck in proximity to the rear end of the plow, substantially as described.

9. In a ditching-machine, the plow consisting of the plow-beam, the standard secured thereto, and the scoop secured to the lower end of the standard and having the digging portions *a*, *b*, and *c*, substantially as described.

10. In a ditching-machine, the combination of the ditching-plow, the carrier pivotally secured to the rear end of the ditching-scoop and mounted with its rear end upon the truck, a flexible draft-connection between the plow and the truck, the loop *w*, secured to the plow-beam, the lever *z*, and the hanger *y*, substantially as and for the purpose described.

404,425. BOILER-CLEANING APPARATUS. JOHN T. OBENCHAIN, Logansport, Ind. Filed Jan. 4, 1889. Serial No. 295,362. (No model.)

Claim.—1. In a boiler-cleaner, the combination, substantially as set forth, with a precipitating-chamber, a pipe leading thereto from the boiler, and a pipe leading therefrom to the boiler, of a skimmer within the boiler, having the form of a cup whose peripheral wall is provided with vertical slots having a uniform effective area throughout vertical depth, said first-mentioned pipe projecting downwardly into said cup and communicating with the interior thereof near the floor of the cup.

2. In a boiler-cleaner, the combination, substantially as set forth, with a precipitating-chamber, a pipe leading thereto from the boiler and a pipe leading therefrom to the boiler, of a skimmer within the boiler and attached to said first-mentioned pipe and having the form of a cylindrical cup whose peripheral wall is provided with vertical slots having a uniform effective area throughout the vertical depth, said first-mentioned pipe projecting downwardly into said cup and communicating with the interior thereof near the floor of the cup.

3. In a boiler-cleaner, the combination, substantially as set forth, with a precipitating-chamber, a pipe leading thereto from the boiler, and a pipe leading therefrom to the boiler, of a skimmer having the form of a cup with a vertically-slotted periphery and communicating with said first-mentioned pipe near the bottom of the cup only and below the level of the lower ends of said slots.

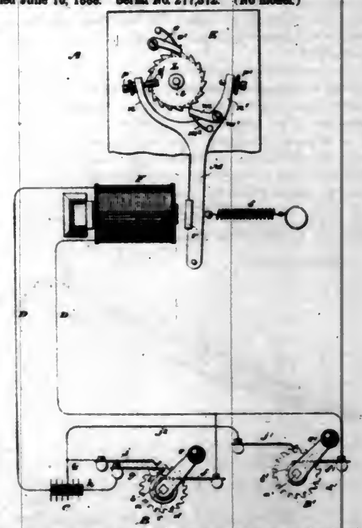
4. In a boiler-cleaner, the combination, substantially as set forth, with a precipitating-chamber, a pipe leading thereto from the boiler, and a pipe leading therefrom to the boiler, of a skimmer having the form of a cup with a vertically-slotted periphery, and having a central hollow hub connected with said first-mentioned pipe, and having apertures leading from the base of the cup to within the base of the hub.

5. In a boiler-cleaner, the combination, substantially as set forth, with a precipitating-chamber, and a pipe leading therefrom to the boiler, of a vertical skimmer-pipe having a threaded portion projecting downwardly into the boiler, a pipe connecting the said skimmer-pipe with the precipitator, and a slotted cup-shaped skimmer screwed upon the lower end of said skimmer-pipe and vertically adjustable thereon.

6. In a boiler-cleaner, the combination, substantially as set forth, of a precipitating-chamber, a skimmer within the boiler, a pipe leading from said skimmer vertically through the boiler-shell and thence to the precipitator, and a pipe leading from the precipitator to said vertical pipe and passing downwardly within the same and through the skimmer and into the boiler-space below the skimmer.

7. In a boiler-cleaner, the combination, substantially as set forth, of a precipitating-chamber, a skimmer within the boiler, a pipe T outside the boiler over the skimmer, a skimmer-pipe connecting the T with the skimmer, a pipe connecting the precipitator with said T and skimmer-pipe, and a pipe passing from below the skimmer upwardly through said skimmer and skimmer-pipe and out of said T, and thence to the precipitator.

8. In a boiler-cleaner, the combination, substantially as set forth, of a skimmer, a precipitating-chamber having a circular inwall, a pipe leading from said chamber to the boiler below the skimmer, and a pipe leading from the skimmer to said chamber and connected with said chamber at an outer point, and arranged to discharge tangentially against and cause the discharge to follow the complete circle of said inwall.



9. In a boiler-cleaner, the combination, substantially as set forth, of a skimmer, a precipitating-chamber, a pipe leading from the skimmer to the outer portion of the precipitating-chamber, and a pipe leading from the boiler-space below the skimmer to a point in the precipitating-chamber below the point of connection with said first-mentioned pipe.

10. In a boiler-cleaner, the combination, substantially as set forth, of a skimmer, a precipitating-chamber, a pipe leading from the skimmer to a tangential inlet at the outer portion of the precipitating-chamber, a centrally-disposed pipe projecting downwardly from the roof of the precipitating-chamber, and a pipe connecting said pipe with the boiler-space below the skimmer.

11. In a boiler-cleaner, the combination, substantially as set forth, of a skimmer, a napiform precipitating-chamber having a completely circular inwall, a clean-out valve at the base of the chamber, a pipe leading from the skimmer to the precipitating-chamber and discharging tangentially against the circular inwall thereof, and a pipe leading from the precipitating-chamber to the boiler-space below the skimmer.

12. In a boiler-cleaner, the combination, substantially as set forth, of a skimmer, a precipitating-chamber, a horizontal perforated septum in the chamber, a clean-out valve at the base of the chamber, a pipe connecting the skimmer with the chamber above the septum, and a pipe leading from the boiler-space below the skimmer to the chamber above the septum.

404,426. UNISON DEVICE. GEORGE F. OEHMEN, New York, N. Y. Filed June 16, 1888. Serial No. 277,372. (No model.)

Claim.—1. The combination of a step-by-step mechanism having a moving part formed with a unison-notch, a unison-stop normally resting in said notch and holding the step-by-step mechanism from movement when resting therein and until removed therefrom by an abnormal amount of power, a battery, a line, and an included magnet controlling said step-by-step mechanism, a unison-transmitter located in said line and connected at an intermediate point of the battery, so as to transmit a diminished amount of energy to said step-by-step mechanism, and a second transmitter located in the line connected with said battery controlling the full amount thereof, whereby the unison-stop will be dislodged from its notch by the full amount of current and the step-and-step mechanism operated by the normal current.

2. The combination of a step-by-step mechanism, a unison therefor holding said step-by-step mechanism from operation under normal currents when held at unison, a battery, a line-wire, and an included electro-magnet controlling said step-by-step mechanism, and a transmitter located in the line and connected to battery at more than two points and itself governing both the full and partial amount of battery thrown on said line.

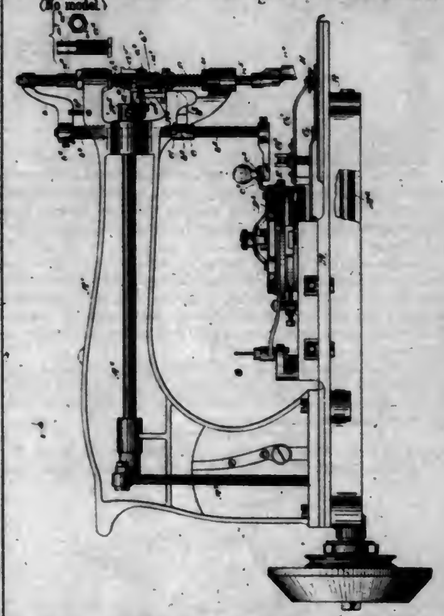
3. In a unison device, the combination of step-by-step mechanism having a moving part provided with a unison-notch, a unison-stop for engaging the notch, an electro-magnet having an armature controlling the movements of the unison stop, a battery, and a line connected therewith and including the said magnet, transmitting apparatus located in the line and controlling at will part or all of the battery-power transmitted to the magnet, the said armature having a range of movement such that when the armature is in full open position to close the unison-stop the diminished amount of current will not induce it but the full amount will, substantially as and for the purpose set forth.

4. In a unison device, the combination of step-by-step mechanism having a moving part provided with a unison-notch, an electro-magnet having a spring-retracted armature provided with a unison-stop for engaging the unison-notch, a battery and a connected line, including the said magnet, two transmitters located in the line, one controlling only a part of the battery and the other controlling both a part and all of the battery, the range of movement of the armature being such that when the armature is in full open position to close the unison-stop and part only of the battery is thrown on the line the armature will be out of inductive proximity to the magnet, substantially as and for the purpose set forth.

5. In a unison device having the armature of the operating-magnet out of inductive proximity thereto when in full open position and the diminished amount of current is thrown on the magnet and operated by the full amount of the current, substantially as described, two transmitters located in the line with the magnet, the one controlling only a part of the battery and the other both a part and all of the battery, substantially as and for the purpose set forth.

6. A combined step-by-step mechanism and unison consisting in an operating-magnet having a pivoted spring-retracted armature with a spring-pawl and a unison-stop, both mounted thereon, a rotary spindle provided with a ratchet-wheel, and a detent for the wheel, said ratchet operated step by step by the engaging-pawl of the armature under the vibrations of the latter, the rotating part of said mechanism provided with a unison-notch engaged by the unison-stop carried by the said armature, substantially as and for the purpose set forth.

7. The combination of the operating-magnet having a pivoted spring-retracted armature provided near one end with an adjustable unison-stop, a spring-pawl mounted on the armature near the end thereof bearing the stop, a ratchet-wheel having a detent and formed with a unison-notch engaged by the stop on the armature.



8. The combination of a ratchet-wheel, an operating-magnet having a pivoted spring-retracted armature provided with a forked end spanning the ratchet-wheel, and having a spring-pawl for engaging the ratchet and rotating it step by step under the vibrations of the armature, a detent for the ratchet, one prong of said forked armature provided with a unison-stop for checking the movement of the ratchet, the other prong thereof provided with an adjusting-screw for regulating the throw of the magnet in its vibrations, substantially as and for the purpose set forth.

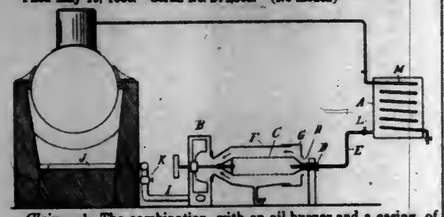
9. The combination of a step-by-step mechanism having a unison-stop for checking its movement, the electro-magnet F, controlling said mechanism and stop, battery C and line D, connected thereto, the transmitter B, consisting in shaft *a*, provided with contact-disk *b* and break-wheels *c* and *d*, the contact-finger *f*, engaging disk *b* and in line D, the contact-finger *e*, engaging the break-wheel *c* and in line D, the contact-finger *j*, connected to an intermediate point of battery C and engaging with break-wheel *d*, the transmitter B', consisting in the shaft *a'*, provided with contact-disk *b'* and break-wheel *d'*, the contact-finger *f'* in line D and engaging disk *b'*, and the contact-finger *j'*, engaging wheel *d'* and connected to an intermediate point of the battery, as at point *k*, substantially as and for the purpose set forth.

10. The combination of the rotating spindle and ratchet-wheel, a detent for holding the parts from backward movement, the electro-magnet F, line D, battery C, and the transmitters B B', one controlling part and the other controlling both part and all of the battery, substantially as described, the pivoted spring-retracted armature M, provided with the unison-stop *p* for taking in a unison-notch formed on the rotating part of the mechanism, and the spring-pawl *m*, mounted on the armature and engaging the ratchet-wheel, substantially as and for the purpose set forth.

11. The combination of the ratchet-wheel L, formed with a notch and provided with a detent to prevent backward movement of the ratchet, the operating-magnet F, having the pivoted spring-retracted armature M, formed with the prongs *n o*, the unison-stop *p*, mounted on the armature and adapted to engage the notch in the ratchet-wheel, and the spring-acted pawl *m*, engaging the teeth of the ratchet and advancing the wheel step by step under the vibrations of the armature, substantially as and for the purpose set forth.

404,427. CUTTING MECHANISM FOR BUTTON-HOLE SEWING-MACHINES. FREELAND W. OSTROM, Bridgeport, and JOHN W. BOOTH, Stratford, assignors to The Wheeler & Wilson Manufacturing Company, Bridgeport, Conn. Filed May 25, 1886. Serial No. 203,207. (No model.)

Claim.—1. In a button-hole sewing-machine, the combination, with the work-clamp and its operating cam or disk, of a cutter-bar, operating mechanism therefor, a cutter carried by said bar, and a tripping device to throw the cutter-bar-operating mechanism into action, said tripping device having two members, one of which members, as arm or projection c^4, is connected to and moved in unison with the said clamp-operating cam or disk, and is thus a traveling member, the other member of the tripping device, as the arm or projection c^3, being normally stationary in the path of movement of a part of the said traveling member, one of the said members being adjustable or movable with relation to the normal path of movement of the said traveling member to enable the latter to pass the said stationary member without engagement therewith when desired.



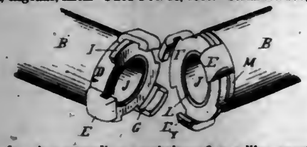
2. In a button-hole-stitching machine, a feeding-clamp, a cutter-bar, its cutter, the attached collar a^4, having a finger, a pin or projection, as b', carried by the cutter-bar, a spring to partially rotate the cutter-bar in one direction, needle-actuating mechanism, and a pin or projection deriving its movement therefrom to strike the said collar a^4 and depress the cutter-bar, combined with a movable beak or arm to co-operate with the said pin or projection of the cutter-bar and retain the cutter with its edge turned aside out of operative position with relation to the material to be cut and tripping mechanism, to operate substantially as described.

3. In a button-hole-stitching machine, a feeding-clamp, the cutter-bar and cutter, means to reciprocate and partially rotate the said bar, the tripping-rod having an arm c^4, the feed-clamp-actuating disk having a projection to act upon the said arm, and a beak to act against a pin or projection of the cutter-bar, combined with a spring to hold the said tripping-rod in its normal position, to operate substantially as described.

4. In a button-hole-stitching machine, a cutter, a cutter-bar having a projection b' and a projection b^2 moved in unison with it, means to reciprocate the cutter-bar, a spring to partially rotate the cutter-bar in one direction, a feed-clamp, and a feed-clamp-actuating disk having an attached tripping arm or projection, and a tripping-rod hav-

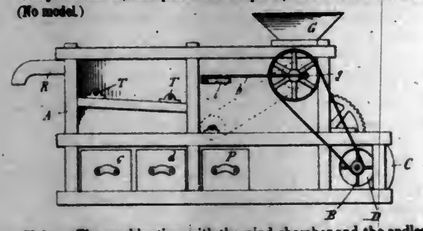
ing two arms or projections, one of which holds the cutter-bar turned aside, while the other arm rests in the line of travel of the tripping-arm made movable with the said disk, combined with an arm b^5, projecting from the tripping mechanism and located in the line of travel of the said projection b^5 of the cutter-bar, whereby the latter in its descent moves the tripping-arm longitudinally, substantially as described.

404,428. OIL-BURNER. GEORGE S. PAINE, Wyandotte, Mich. Filed May 19, 1888. Serial No. 274,302. (No model.)



Claim.—1. The combination, with an oil-burner and a casing, of a fan, a tank, the perforated spraying-drum located within said casing, the supply-pipe from the tank entering the spraying-drum, and the discharge-connections from the fan to the furnace, substantially as described.

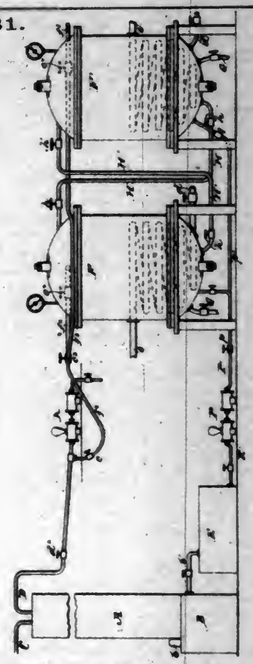
2. The combination, with the casing, a fan, the spraying-drum located within said casing and having a hollow trunnion and secured upon the axis of the fan, the supply-pipe to said drum, the head, means for adjusting the same, the tank, the heating-coil for heating the oil therein, and the discharge-pipes I J into the furnace, substantially as and for the purpose specified.



3. The combination, with an oil-burner, of a fan, a casing, and an oil-spraying device located within said casing, means for revolving the fan and sprayer, and an oil-supply pipe for bringing oil into said spraying device, substantially as described.

404,429. HOSE-COUPLING. SPAIN R. PEARCE and GEORGE W. MERRILL, Algonac, Mich. Filed Feb. 11, 1889. Serial No. 299,484. (No model.)

Claim.—In a hose-coupling consisting of two like members, the combination, with the grooved coupling-hooks E, with the spaces between the hooks formed with the plain part H and segmental flange I, of the stop M, arranged at right angles to the axis of the coupling and adapted to enter between two pairs of coupling-hooks when coupled, the spring O beneath said stop, and the elastic rings set angularly around the mouth of each of the members of the coupling, substantially as shown and described.



404,430. COFFEE-CLEANING MACHINE. CHANCY J. PICKETT, Bay City, Mich., assignor of two-thirds to Willard I. Brotherton and Henry N. Watrous, same place. Filed Sept. 19, 1888. Serial No. 285,788. (No model.)

Claim.—The combination, with the wind-chamber and the endless carrier, of the inclined direction-board U, loosely attached at one end to the frame of the machine and its other end riding loosely upon said carrier, substantially as described.

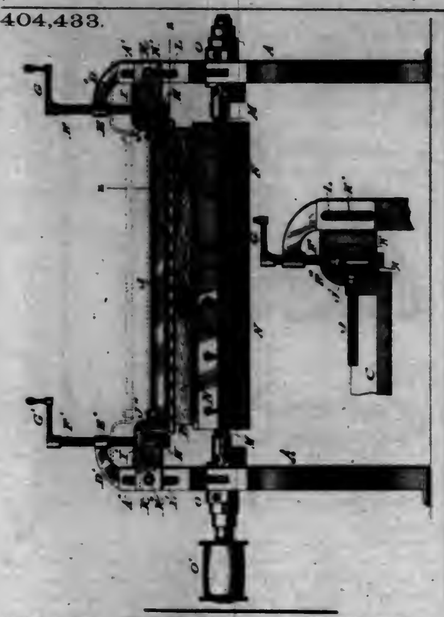
404,431. PROCESS OF DISINTEGRATING FIBROUS MATERIALS. RAOUL P. PICTET, Geneva, assignor of one-half to George L. Bruins, Lausanne, Switzerland. Filed Aug. 19, 1887. Serial No. 247,371. (No model.) Patented in France Apr. 6, 1887, No. 182,606; in Belgium Apr. 7, 1887, No. 77,009; in England Apr. 9, 1887, No. 5,389; in Sweden Apr. 13, 1887, No. 1,262; in Germany Apr. 15, 1887, No. 41,703; in Norway Apr. 20, 1887, No. 553, and in Austria-Hungary Dec. 24, 1887, No. 31,579 and No. 60,881.

404,481.

Claim.—1. The herein-described process in the production of cellulose, which consists in immersing the fibrous material in a solution of sulphurous acid of normal temperature and of a strength of about 1° Baumé, gradually increasing the strength of the solution to sursaturation and gradually increasing the temperature thereof to about 100° centigrade by passing heated sulphurous-acid vapors into said solution, substantially as and for the purposes specified.

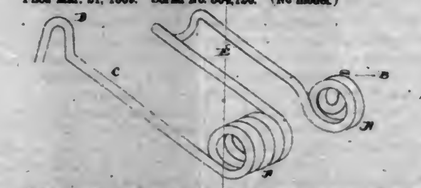
2. The herein-described process in the production of cellulose, which consists in immersing the fibrous material in a solution of sulphurous acid of normal temperature and of a strength of about 1° Baumé, in a partial vacuum, gradually increasing the strength of the solution to sursaturation, and gradually increasing the temperature thereof to about 100° centigrade by passing heated sulphurous-acid vapors into said solution, substantially as and for the purposes specified.

404,432. SLED. LYMAN B. PICKETT, Montrose, Pa. Filed Mar. 29, 1889. Serial No. 305,241. (No model.)



Claim.—The runners A, constructed of metal tubing, and platform C, in combination with the knees B and cross-bar D, having their ends split and spread at right angles and secured to the tubular runners, substantially as and for the purpose herein set forth.

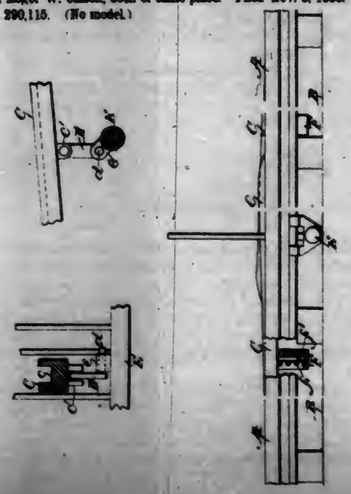
404,433. WOOD-PLANING MACHINE. FRANK J. PLUMMER, Philadelphia, Pa. Filed Dec. 22, 1888. Serial No. 294,637. (No model.)



Claim.—1. In a planing-machine, the combination of the uprights A' A'', arms or projections D D', right and left screw-threaded rods F F', carriages F'' F''', guided by connecting-pieces setting in grooves in the uprights and rigidly attached to a pressure-bar C, shaft J, sustained by said carriages, with the gear-wheels to actuate the shaft, substantially as shown, whereby the said gearing rises and falls with the pressure-bar.

2. In a planing-machine, the combination of the uprights A' A'', arms or projections D D', right and left screw-threaded rods F F', closed boxes F'' F''', forming vertically-moving carriages for shaft J and pressure-bar C, pressure-bar C and shaft J, and the gear-wheels to actuate said shaft and to rise and fall therewith and with the pressure-bar, substantially as described.

404,433.

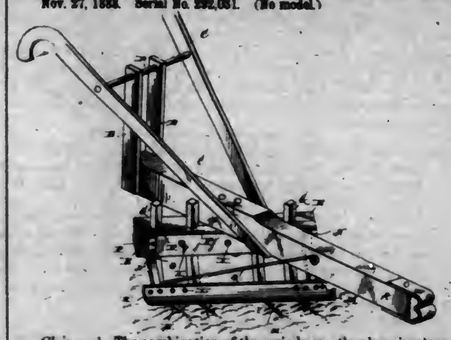


404,434. BUGGY-TOP SPRING. CORTES V. PUGH, Vandalia, Mo. Filed Mar. 21, 1889. Serial No. 304,126. (No model.)

Claim.—The improved spring for buggy-tops herein described and shown, consisting of a central coiled portion having the hook B at one end, the arm C at its other end provided with the hook D, and the intermediate U-shaped rest or supporting-arm E, substantially as specified.

404,435. AUTOMATIC GUARD FOR RAILROADS. JOHN V. REAMS, Midland, Mich., assignor of two-thirds to Frederick L. Beecham and Roger W. Clason, both of same place. Filed Nov. 6, 1888. Serial No. 290,115. (No model.)

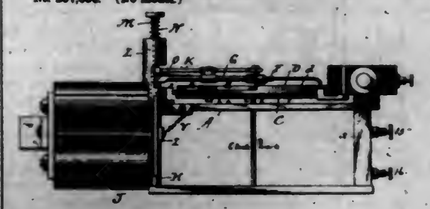
Claim.—In an automatic cattle or other guard for railroads, the combination of the auxiliary rails C, pivoted at one end, forks c', secured thereto, carrying links D, provided with arms d, shafts E, secured in bearings and provided with teeth or pickets, lugs e, secured to the said shafts E, for receiving the arms d, and coil-springs f, seated in cups F and held in position by means of pins f', secured to the auxiliary rails, as and for the purpose described.



404,436. NECKTIE-FASTENER. JOSEPH REDL, Lewiston, Idaho. Filed Dec. 18, 1888. Serial No. 293,994. (No model.)

Claim.—1. The combination, with a necktie which is provided in its rear side with opening G to receive the collar-button, of the spring-actuated slide or catch arranged adjacent to the said opening to close the same, substantially as specified.

2. The combination, with a necktie provided with an opening G for the collar-button and having a brace b below the said opening, of the vertically-movable slide or catch K, having a concaved upper end to close the opening G and provided with an operating-button N, and the S-spring L, connected at its upper end to the slide or catch and bearing at its lower end on the brace b, whereby the slide or catch is normally held in its elevated or engaging position, substantially as specified.



404,437. CULTIVATOR. CHARLES H. RUDDELL, Terrell, Tex. Filed Nov. 27, 1888. Serial No. 292,051. (No model.)

Claim.—1. The combination of the main beam, the clamping-bars secured to the under side of the beam and arranged at an angle thereto, the teeth clamped by and between said bars, the hangers having their upper ends adjustably secured to the ends of the clamping-bars, and the scraper secured to the lower ends of the hangers, as set forth.

2. The combination of the beam, the clamping-bars secured to the under side of the beam and arranged at an angle thereto, the teeth clamped by and between said bars, the hangers having their upper ends provided with a vertical series of openings, the securing-bolts passed through said openings into the ends of the clamping-bars, and the scraper having a horizontal series of openings in each end, and the securing-bolts passed through said openings into the lower ends of the hangers, as set forth.

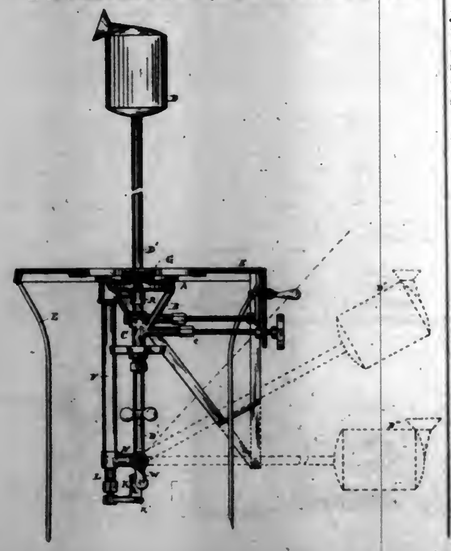
404,438. NON-INTERFERING FIRE-ALARM SIGNAL-BOX. JOHN J. RUDDICK, Richmond, Ind., assignor, by mesne assignments, to the Interstate Fire Alarm Company, Omaha, Nebr. Filed Dec. 14, 1887. Serial No. 257,884. (No model.)

Claim.—1. In a closed-circuit fire-alarm-signal system and electro-magnet in the main circuit, a short circuit around the same, and circuit-controllers in the main and short circuits, in combination with means for keeping the short circuit open whenever the main circuit is being operated by its circuit-controller, such means consisting of an armature for the said electro-magnet operating to hold a lever in position to keep the circuit-controller in the short circuit open, and an annulus provided with notches positioned with relation to the number-groups on the circuit-controller and arranged in the path of the lever, the said lever and the said number-groups forming positive elements of the combination.

2. The combination, with the number-wheel and the rim or flange carried thereby, of notches in the said rim positioned with relation to the number-groups on the wheel, and a spring-pressed arm having a pin that bears against the said rim, both the number-wheel and the arm being adapted to engage with separate circuit-controllers, and the parts being so arranged that the pin always bears against a solid portion of the rim whenever the number-wheel is in a position to operate its circuit-controller, the rim being cut away at other points, so as to afford no obstruction to the pin, as and for the purpose set forth.

3. The combination, with the number-wheel C, having the teeth *c*, of the flanged wheel D and notches *d*, &c., the magnet J, armature-lever I, spring V, post H, arm G, lever K, and pin F, and the detent engaging with the latter, and the circuit-controllers governed, respectively, by the number-wheel and the arm G, as and for the purpose set forth.

4. The combination, with the arm G and its extension G′, and the circuit-controller with which the latter engages, of the pin F and the notched traveling circular detent D′, and the spring *c*, for throwing the arm out so as to break the circuit, as and for the purpose set forth.



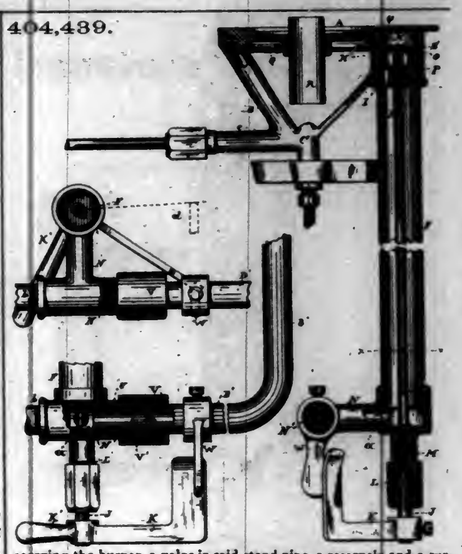
5. The combination, with an electro-magnet in a main circuit, a train controlled thereby, and a short circuit around the magnet and circuit-controllers in both main and short circuits, of a lever connected with the armature of the electro-magnet for holding the short circuit normally open, a distant circuit-controller in the main circuit for releasing the said lever, and a spring acting on the said lever momentarily to break the short circuit, the said spring being attached to a moving part of the train, whereby, on the opening of the circuit at a distant point, the lever will be released and afterward restored by the spring, as set forth.

404,439. SAFETY OIL-CAN ATTACHMENT FOR VAPOR-STOVES.

HENRY RUPPEL, Cleveland, Ohio, assignor to the Dangler Stove and Manufacturing Company, same place. Filed Dec. 24, 1888. Serial No. 294,466. (No model.)

Claim.—1. In combination with a vapor-stove, a stationary stand-pipe F, carrying the burner, a valve in said stand-pipe, a reservoir and a pivoted supply-pipe D′, leading therefrom to the stand-pipe, an arm on the supply-pipe, and an extension, as K, connected to the valve in the stand-pipe and located directly in the path of the arm on the pipe D′, substantially as described.

2. In combination with a vapor-stove, a stationary stand-pipe F,



carrying the burner, a valve in said stand-pipe, a reservoir and a supply-pipe D′, leading therefrom to the stand-pipe, pivotally connected therewith, an adjustable arm W on said pipe, D′, and an extension K, adjustably connected to the valve in the stand-pipe and located in the path of the arm W, substantially as described.

3. In combination with the burner of a vapor-stove, generating-conduits leading thereto from the stand-pipe, a valve for controlling the burner, a second valve between the stand-pipe and the valve of the burner, a reservoir, a pivoted supply-pipe D′, supporting the same, and intermediate operating devices between the pivoted supply-pipe D′ and the stand-pipe valve, substantially as described.

4. In combination with a vapor-stove, a stationary stand-pipe F, a valve within the same for controlling the passage leading to the generating-conduits, an extension K connected to said valve, a reservoir and a pivoted supply-pipe for the same, an arm W on said supply-pipe, adapted to come in contact with the extension K of the valve to automatically operate the same, and a handle connected to said valve for operating the same manually, substantially as described.

404,439.

404,440. PROCESS OF PURIFYING TANNIC EXTRACTS.

LUDWIG SAARBACH, New York, N.Y. Filed Dec. 12, 1888. Serial No. 293,361. (No specimens.)

Claim.—The process herein described of purifying watery tannic juices for making extracts or tannic acid, said mode consisting in first mixing the extracts with acetate of lead without the addition of any acid, separating the precipitate from the juice, and then subjecting the solution to the action of acids, preferably oxalic acid, in about the proportions herein described, thereby obtaining a further precipitate, substantially as described.

404,441. MOTIVE MECHANISM FOR RAILWAY-CARS.

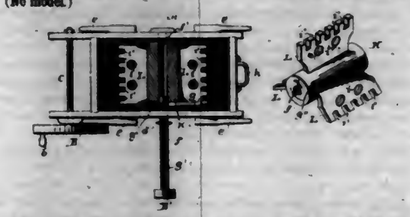
HENRY F. SHAW, Boston, and GEORGE F. SHAW, Dedham, Mass. Filed Jan. 26, 1889. Serial No. 297,633. (No model.)

Claim.—1. The combination of two electric motors, an eccentric on each of the motor-shafts, a rod having bearings for said eccentrics, two car-axles, and two external and two internal gears, two of said gears being fixed to said rod, one of said gears being fixed on each car-axle, and each internal gear being in engagement with the corresponding external gear, substantially as and for the purpose set forth.

2. The combination of two electric motors, an eccentric on each of the motor-shafts, a rod having bearings for said eccentrics, an external gear and an internal gear in engagement with each other, one of said gears being fixed to said rod and the other gear fixed on a car-axle to revolve therewith, substantially as and for the purpose set forth.

3. The combination of two electric motors, two eccentrics on each of the motor-shafts, two rods, each of which is mounted on an eccentric on each of said shafts, two gears fixed to each of said rods, two axles or shafts, each of which has fixed thereon two gears, each gear fixed to a rod being in engagement with a gear on an axle or shaft, one of any two gears in engagement with each other being an external and the other an internal gear, substantially as specified.

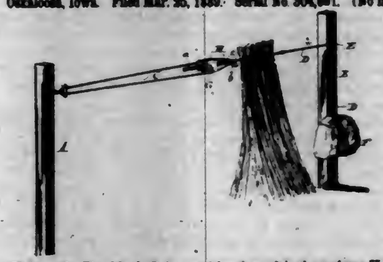
404,442. HYDROCARBON-BURNER.



ANTHONY L. SHORE, Minneapolis, Minn. Filed Feb. 19, 1888. Serial No. 300,470. (No model.)

Claim.—The combination, with the retort-pipe 9, of the burner-pipe 12, extending beneath said retort-pipe, and provided upon its upper surface with the jets 13 and with the jets 15, of the rings or sleeves 16, arranged upon said pipe 12 and adapted to close said jets 15, and provided with the clamping-screws 19, substantially as described.

404,443. CHURN.



HEINRICH SOMMERFELD, Canton, assignor to A. Ehrlich, Lehigh, Kans. Filed Sept. 19, 1888. Serial No. 285,798. (No model.)

Claim.—The improved dasher consisting of the hub K, having the longitudinal perforation *f*″ and transverse perforation *g*″, and the radially-extending paddles L, said paddles having a series of notches *i* formed in their extreme terminal ends and a series of perforations *i* located between the notches and the hub, in combination with the perforated shaft *f* and pin *g*, substantially as shown and described.

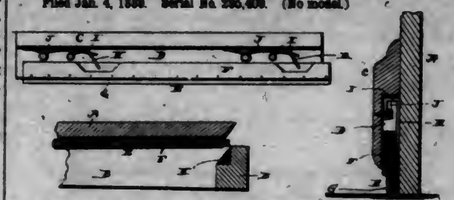
404,444. WIRE-WEAVING APPARATUS.

HENRY STODDON, Jr. Oskaloosa, Iowa. Filed Mar. 26, 1889. Serial No. 304,691. (No model.)

Claim.—1. The block G, in combination with the twister H, movable through the block.

2. The block G, having its edges grooved to receive the wires to be twisted, in combination with the twister H, movable through the block.

3. In combination with block G, having an orifice *e*, twister H, provided with stem *a*, cross-bar *b*, and with grooves *d d* in the cross-bar.



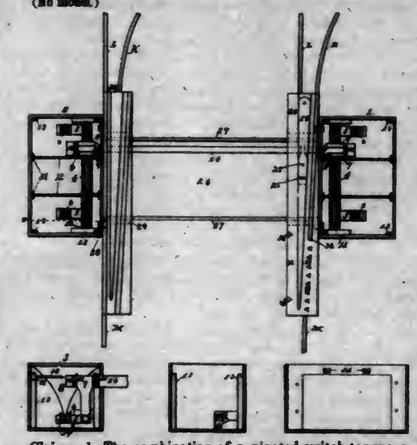
4. In combination with block G, having an orifice *e* and grooved on its edges, as shown, twister H, provided with an angular stem *a* to fit the orifice *e*, all substantially as shown, whereby the twister is permitted to move lengthwise through the block, but not to turn independently thereof.

5. The twister H, provided with a stem *a* and handles *c c*, in combination with a block provided with an orifice *e*, to receive the stem.

6. An apparatus for uniting wires to palings, &c., comprising a post A, having a swivel, a post B, provided with a tension device, a block G, adapted to be inserted between the separated strands, and a T-shaped twister movable lengthwise through the block.

404,445. WEATHER-STRIP.

ANDREW M. STODARD, Eureka, Kans. Filed Jan. 4, 1889. Serial No. 295,409. (No model.)



Claim.—1. The weather-strip comprising the cap-plate, the strip E, arranged between said cap-plate and the door, the hangers having their opposite ends pivoted, respectively, to the cap-plate and the strip E, and the springs secured to the cap-plate and having their free ends bearing on the hangers, as set forth.

2. The weather-strip comprising the cap-plate having a recess in its rear side, the strip arranged in said recess, hangers supporting said strip within the recess and provided with transverse shoulders, and the springs secured within the recess and having their ends bearing against the shoulders of the hangers, as set forth.

404,446. MECHANISM FOR OPERATING SWITCH-POINTS.

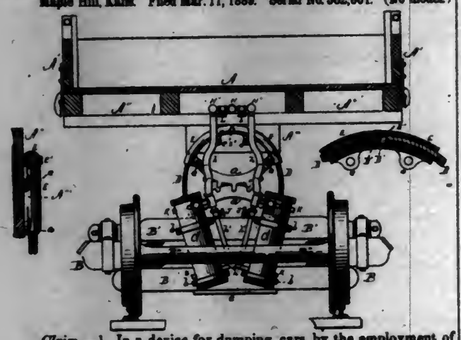
JAMES M. SWEM, Denver, Colo. Filed Oct. 5, 1888. Serial No. 287,301. (No model.)

Claim.—1. The combination of a pivoted switch-tongue, a connecting-bar, a lever connecting such bar with the switch-tongue, and two sets of mechanisms, one at either end of the connecting-bar and each consisting of a rocking lever having an upwardly-projecting arm connected to the connecting-bar, arms projecting outwardly at an angle to such upward arm and each carrying a cup-bearing, and a platform having legs taking in such cup-bearings, substantially as set forth.

2. The combination of the boxes 1 2, each provided with a top 3, having inwardly-projecting arms 8, shaft 4, with arms 7 and 5, the bar 14, connected to the arm 7 of each box, the convex-faced washers 17, the lever 22, and switch-point 19, substantially as set forth.

3. The combination, with the pivoted switch-point, the lever 22, and the bar 14, of the following instrumentalities located at either end of the bar and in suitable boxes thereat, to wit: the rock-shaft 4, with arms 7 and 5, the cup-bearings 6, detachably secured upon the arms 5, and the table or platform 3, having arms 8 taking at their ends in the cup-bearings, substantially as set forth.

4. The combination of a box having lugs 31 secured or formed upon its interior, cross-brace rods 32, seated therein, a vertically-moving platform-top seated in the upper part of the box, and a switch mechanism actuated thereby and located within the box, substantially as set forth.



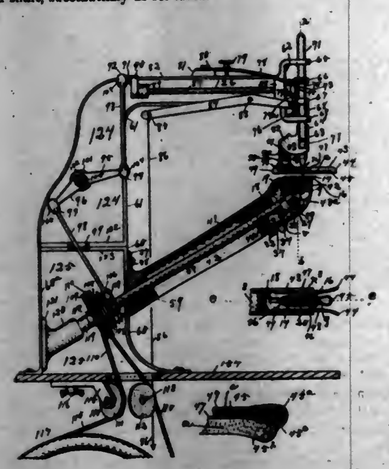
5. The combination of the boxes 1 2, each provided with a top having inwardly-projecting arms 8, shaft 4, with arms 5 and 7, the bar 14, connected to the arm 7 of each box, the lever 22, switch-point 19, pivoted on the frog-plate, having stops or lugs 36 on its inner edge, and the single rail on its outer edge formed with openings or apertures 33 through its body, substantially as set forth.

6. The combination, with the boxes 1 2, of the transverse box 26, having sides 27, formed with the flanges 28 29, substantially as set forth.

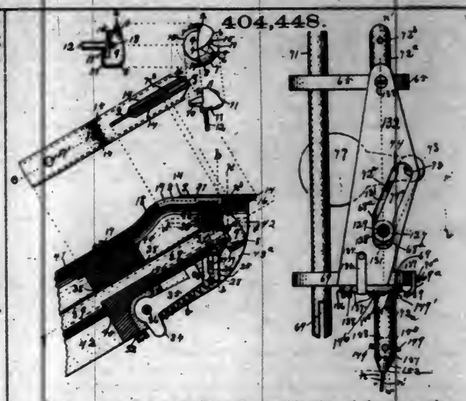
7. The combination of the shaft 4, having arms 5 and 7, the bear-

lugs 6 on the arms 5, the top 3, having arms 8 taking in such bearings, and the bearing-boxes for the shaft 4, each bearing-box having one half 11 formed with the inclosing-box and one half 12 secured thereto, and the inclosing-box, substantially as set forth.

404,447. CAR-DUMPING APPARATUS. ALBERT P. TRAYER, Maple Hill, Kans. Filed Mar. 11, 1889. Serial No. 302,861. (No model.)



Claim.—1. In a device for dumping cars by the employment of steam, compressed air, or analogous power, the combination, with the car-body, truck, cylinders, and pistons, of the flexible piston-rods D, constructed and arranged substantially as above set forth.



2. In a device for dumping cars by the employment of steam, compressed air, or analogous power, the combination of the truck, the pair of cylinders C C, provided with pistons C, the flexible piston-rods D, having their outer ends connected together, as shown, and the car-body and curved tubular frame E, arranged and constructed to operate substantially as described.

3. The combination of the car-truck, the cylinders C, supported thereby, pistons C, flexible piston-rods D, provided with the looped ends D', the tubular frame E, supported by the car, bolt E', pipes or tubes A' H' H, flexible tubes A, cocks and cut-offs J L, and car and rockers, substantially as and for the purpose described.

404,448. SHOE-SEWING MACHINE. JOSEPH L. TERRARE, Cincinnati, Ohio, assignor of two-thirds to Joseph S. Blacker and Gustave Gerstle, both of same place. Filed May 9, 1887. Renewed Apr. 19, 1889. Serial No. 307,886. (No model.)

Claim.—1. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a stitch-forming mechanism operating-shaft extending at an angle to the line of needle motion and backward under the bracket supporting the needle-bar and inclined downward from the stitch-forming point, a reciprocating needle-bar supported and guided by suitable framing, the eccentric 106 107 on the inclined driving-shaft, rod 98, bell-crank 95 96, rod 93, and rock-shaft 87, housed approximately in line with the needle-bar bracket 126 and suitably connected with and operating the needle-bar and needle in conjunction with the stitch mechanism operated by the said inclined shaft, substantially as set forth.

404,448.

2. In a shoe-sewing machine, the combination of the supporting and guiding projecting frame part, horn or post described, upon and over which the work is guided, a presser-foot having a forwardly-extending cord-guiding device with a recess or space in which the button-hole cord is guided, and suitable stitch-forming mechanism having a needle working through the top of the said projecting frame part, substantially as set forth.

3. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a presser-foot having forwardly-extending rigid cord-guides between which the button-hole cord is guided, and suitable stitch-forming mechanism having a needle working through the top of the said projecting frame part, the said guide as being connected in front and having an end gap, as 45^a, in front on the under side, substantially as set forth.

4. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a presser-foot having a forwardly-extending cord-guiding device provided with a recess or space between its sides, a gap at its extremity, as 45^a, for guiding the cord, and adjacent downwardly and outwardly flared or projecting parts, as 45^b, and suitable stitch-forming mechanism having a needle working through the top of the said projecting frame part, substantially as set forth.

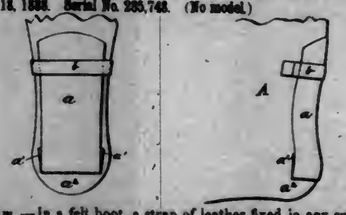
5. In a shoe-sewing machine having a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, and in combination with the needle-plate and stitch-forming mechanism thereof, the presser-foot having the upright central portion 56, and the button-hole-fly guides 43, attached to the upright portion of the presser-foot, one on either side thereof, and having their guiding-surfaces extending near to and parallel with the presser-foot, whereby spaces *i i* are provided between the fly-guides and the upright portion of the presser-foot for the passage of the button-hole flies, substantially as set forth.

6. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a presser-foot having a recessed button-hole-cord guide, detachable button-hole-fly guides having guiding-surfaces extending in proximity to the presser-foot and being attached to the presser-foot part above the space provided for the passage of the button-hole fly, and suitable stitch-forming mechanism having a needle working through the top of the said projecting frame part, substantially as set forth.

7. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a stitch-forming mechanism driving-shaft housed within the said projecting frame part, a cam on the said shaft for lifting the feed device, another cam on the shaft for giving the said device a feed-stroke, a feed device having a slot or opening penetrated by the said shaft and guided by the parts around the said slot or opening and upon the shaft, a spring for replacing the feed device and a presser-foot opposing and acting with the feed device, substantially as set forth.

8. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a stitch-forming mechanism driving-shaft housed within the said projecting frame part, a cam on the said shaft for lifting the feed device, another cam on the shaft for giving the said device a feed-stroke, a feed device having a slot or opening penetrated by the said shaft and guided by its slotted part upon the latter, a spring for replacing the feed device, pivot-bearings for the body of the feed device, providing means for both the upward and backward movement induced by the said cams and spring, and a presser-foot opposing and acting with the feed device, substantially as set forth.

9. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a stitch-forming mechanism driving-shaft housed within the said projecting frame part, a cam on the said shaft for lifting the feed device, another cam on the shaft for giving the said device a feed-stroke, a feed device having a slot or opening penetrated by the said shaft and guided by its slotted part upon the latter, pivot-bearings for the body of the feed device, and a spring connected to the feed device and some stationary part, as the said framing, and acting to turn the feed device about its pivot-bearings, and a presser-foot opposing and acting with the feed device, substantially as set forth.



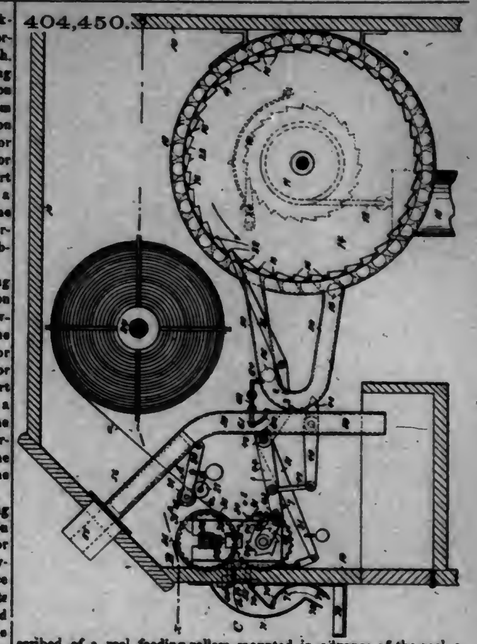
10. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a stitch-forming mechanism driving-shaft housed within the said projecting frame part, a cam on the said shaft for lifting the feed device, another cam on the shaft for giving the said device a feed-stroke, a feed device having a slot or opening penetrated by the said shaft and guided by its slotted part upon the latter, pivot-bearings for the body of the feed device, a spring connected to the feed device and some stationary part, as the said framing, and acting to turn the feed device about its pivot-bearings, a feed-regulator arranged adjustable between its support and the feed-device pivot, and a presser-foot opposing and acting with the feed device, substantially as set forth.

11. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a device, as a presser-foot, for holding the work, a reciprocating needle-bar having a needle-carrying extension pivoted thereto within its vertical axis, and a device operated by the needle-bar and arranged to strike or engage parts of the needle-carrying extension, whereby the extension is vibrated from side to side and caused to enter the fabric at an angle to the said needle-bar, substantially as set forth.

12. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, a device, as a presser-foot, for holding the work, a reciprocating needle-bar having a needle-carrying extension pivoted thereto within its vertical axis, which extension has projecting parts, as pins, and a device operated by the needle-bar and arranged to engage the said projecting parts alternately, whereby the extension is vibrated from side to side and caused to enter the fabric at an angle to the said needle-bar, substantially as set forth.

13. In a shoe-sewing machine, the combination of a supporting and guiding projecting frame part, as a projecting horn or post, upon and over which the work is guided, the sewing-needle bar having a needle-carrying extension pivoted at its end and provided with projecting side parts, the ratchet-wheel 146, through which the needle-bar works, and having a rim 154, provided with raised and depressed portions, as 140 and 145, and suitably retained in place, as described, a pawl operating said wheel and moved by a swinging arm operated by suitable connection with the needle-driving mechanism, the ratchet mechanism being arranged to alternately throw the needle from one side to the other, and the said swing-arm, substantially as set forth.

404,449. FELT BOOT. JOSEPH VAIL, Garden Grove, Iowa. Filed Sept. 18, 1888. Serial No. 285,743. (No model.)

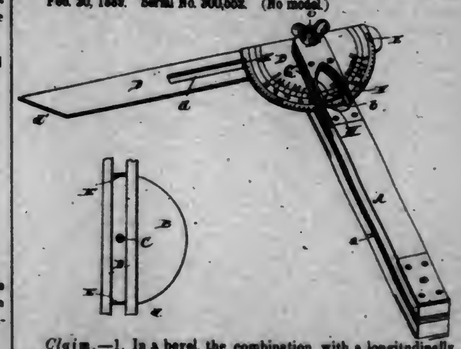


Claim.—In a felt boot, a strap of leather fixed in any suitable manner to the heel of said boot, and at its upper end held in position by a loop formed by a piece of elastic attached to said boot, facilitating the taking on or off of the aforesaid felt boot.

404,450. AUTOMATIC TICKET-SELLING MACHINE. JOHN W. VAUGHN, Jersey City, N. J. Filed July 7, 1888. Serial No. 279,220. (No model.)

Claim.—1. A delivery-chute for automatic selling-machines, consisting, essentially, of a casing and a pivoted trap mounted therein and formed with a forwardly-extending projection 76, as and for the purpose stated.

2. In an automatic selling-machine, the combination, with a weightway and a weight-releasing mechanism, substantially as described, of a reel, feeding-rollers mounted in advance of the reel, a tripping-lever provided with a toe which enters the weightway, and connections, substantially as described, between said lever and one of the feeding-rollers, as and for the purpose stated.

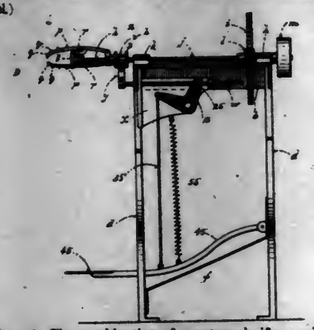


404,450.

3. In an automatic selling-machine, the combination, with a weightway and a weight-releasing mechanism, substantially as described, of a reel, feeding-rollers mounted in connection therewith, web-severing shear-blades, tripping-levers provided with toes which enter the weightway, and connections between one of the levers and one of the feeding-rollers and between the other lever and one of the shear-blades, substantially as described.

4. The combination, with a motor, of a coin-chute, a locking-lever for said motor, which lever can be operated by a coin passing through the coin-chute, a reel, a pair of feed-rollers operated by the motor, and a ticket-severing device, substantially as set forth, and also operated by the motor, substantially as herein shown and described.

404,451. BEVEL. GEORGE H. WAGGONER, Leslie, Mich. Filed Feb. 20, 1889. Serial No. 300,552. (No model.)



Claim.—1. In a bevel, the combination, with a longitudinally slotted stock, of the sector mounted in one end of the slot and the slotted blade sliding on up-struck projections on the sector and adapted to fold within the slot of the stock, substantially as specified.

2. In a bevel, the combination, with a longitudinally-slotted stock provided with a beveled opening and the indices arranged in the said opening, of the sector B, mounted on an adjusting-bolt near one end of the slot of the stock and provided with graduations suitably inscribed, which travel under the said indices, and the slotted blade sliding on projections on the sector, substantially as specified.

3. In a bevel, the combination, with the longitudinally-slotted stock provided with a beveled opening and the indices G and H, arranged in said opening, of the sector B, pivoted in the free end of said slot and provided with two series of graduations, one marking the degrees of a circle and the other marking roof and other timber angles, and the blade D, carried by said sector, substantially as specified.

404,452. MACHINE FOR PARING SQUASHES. FRED L. WEBSTER, Danvers, Mass. Filed Nov. 3, 1888. Serial No. 289,926. (No model.)

Claim.—1. The combination of a rotary knife provided with a pulley and a supporting-rod, an adjustable bracket adapted to be secured to the wall of a room, a tube swiveled in said bracket and adapted to receive said supporting-rod, a main driving-shaft bearing a pulley, and a belt connecting the pulleys on said knife and shaft, substantially as described.

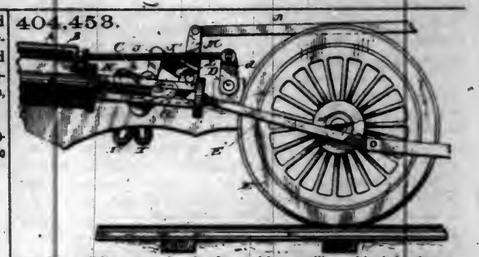
2. The combination of the knife H, provided with the guard 54 and pulley 44, the supporting-rods 74 and 84, the tube 33, swiveled to a stationary object and adapted to receive the rod 84, and adjunctive mechanism for actuating said knife, substantially as set forth.

3. The combination of a body or frame, a rotating shaft journaled in said frame, an expansible holder secured to said shaft and provided with retaining-points, a sliding rod in said frame bearing an arm in engagement with said holder, a bell-crank lever for actuating said rod, a treadle pivoted in said frame and connected by a rod with said lever, and a spring connecting said treadle and frame, whereby said holder may be opened as the treadle is depressed and closed as said treadle is released, substantially as described.

4. The combination of the body A, provided with the shaft *h*, the holder D, secured to said shaft and provided with the sliding sleeve *v*, having flanges *z*, the sliding rod *w*, provided with the forked arm *y*, engaging said sleeve between said flanges, the bell-crank lever 15, for actuating said rod, the treadle 45, connected with said lever by the rod 35, and the spring 55, connecting said treadle and body, substantially as and for the purpose set forth.

5. In a machine of the character described, the combination of a body provided with a rotating shaft, an expansible holder disposed on said shaft, treadle mechanism provided with a spring, whereby said holder may be opened as the treadle is depressed and closed as it is released, a rotary knife provided with a pulley and a supporting-rod, a tube swiveled to a stationary object in which said rod is adjustably secured, and adjunctive mechanism for conjointly actuating said shaft and knife, all being arranged to operate substantially as specified.

6. The rotary knife H, comprising the frame 24, blades 14, and guards 34, secured to a shaft journaled in said frame, the guard 54, and handle 64, in combination with the supporting-rods 74 and 84, the tube 33, adapted to receive the rod 84 and swiveled in the block 23, secured to the adjustable bracket 13, and adjunctive mechanism for actuating said knife, substantially as set forth.

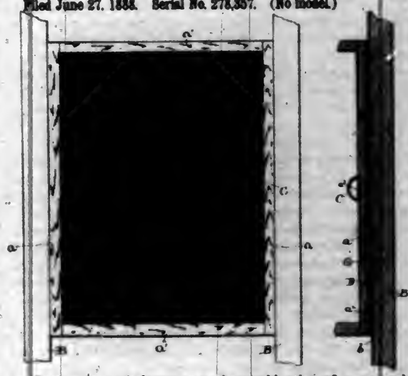


7. In a device of the character described, the combination of the body A, provided with the shafts *h j*, the expansible holder D, secured to the shaft *h* and provided with the sleeve *v*, fitted to slide on said shaft, treadle mechanism in said body for moving said sleeve, whereby the holder may be opened and closed, the rotary knife H, adjustably secured in the swiveled tube 33, and a main driving-shaft belted to said knife and the shaft *j*, whereby said holder and knife may be rotated conjointly, substantially as and for the purpose specified.

404,453. VALVE-GEAR. MICHAEL I. WELSH, Valdosta, assignor of one-half to John Joseph McDonough, Savannah, Ga. Filed Mar. 16, 1889. Serial No. 303,532. (No model.)

Claim.—1. In a valve-gear, the combination, with a projection upon the cross-heads, of a rocking oscillator-block having a groove in which the projection works, and a reverse-link connected at its center to the rock-shaft of the block, as set forth.

2. In a valve-gear, the combination, with a pin or projection carried by a sliding cross-head, of a rocking oscillator-block having a groove of approximately the shape of a figure 8, in which the pin or projection moves, a reverse-link, and a link-pin adjustable on the slot in said link, as set forth.



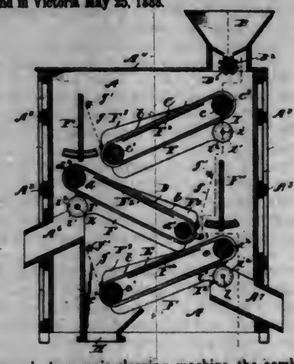
404,453.

3. In a valve-gear, the combination, with a pin or projection upon a sliding cross-head, said pin being vertically adjustable, of a rocking oscillator-block having a groove, as described, in which the pin or projection works, and a link operated by the block, as set forth.

4. In a valve-gear, the combination of the cross-head, a cheek F carried thereby, a vertical slot in said cheek, a pin *f* carried therein, and a set-screw F^a, for adjusting the height of the pin, with a rocking oscillator-block having a groove in which the pin works, and a link carried and operated by the block, as set forth.

404,454. WINDOW-SCREEN. JOHN S. WHITE, Portland, Me. Filed June 27, 1888. Serial No. 278,357. (No model.)

Claim.—In a window-screen, the combination of a grooved side bar, a tongue fitting said groove, a rod or wire having its ends bent at right angles to pass through said side bar and to enter said strip, coiled spring surrounding said ends for forcing said strip outward, said rod having formed in its central portion a loop or handle, whereby said strip may be retracted, substantially as shown.



404,455. METHOD OF LASTING BOOTS AND SHOES. DON F. WILLIS, Lynn, Mass., assignor of one-half to James M. Griffin and John S. Griffin, both of same place. Filed Feb. 8, 1889. Serial No. 298,901. (No model.)

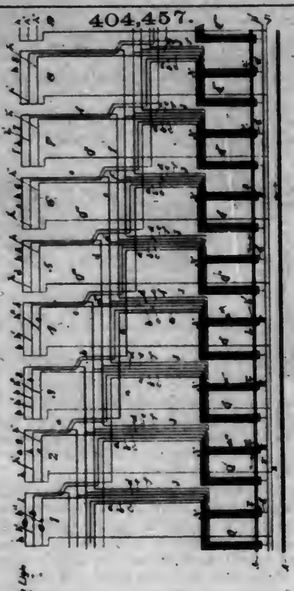
Claim.—1. The method of lasting boots and shoes, which consists in securing the heel portion of the inner sole to the last, placing the last within the upper, securing the fore part of the upper to the instep of the last, turning the edge of the heel portion of the upper over upon and securing it to the inner sole, placing the outer sole upon the turned-over heel portion of the upper, the inner sole, and the last, and securing it thereto, leaving the edge of the fore part of the upper free or unconfined by said sole, and then drawing the unconfined edge of the upper down over the edge of the outer sole and securing it to the outer edge of said sole.

2. The method of lasting boots and shoes which consists in partially straining the upper over the last in the act of assembling the parts preparatory to stitching the sole to the upper, securing the edge of the upper to the edge of the outer sole, and then completing the straining of the upper by the act of stitching the upper to the sole.

404,456. GRAIN-CLEANING MACHINE. JAMES F. WILSON, Orange, assignor to Thomas William Carr, Marrickville, New South Wales. Filed Oct. 13, 1888. Serial No. 288,267. (No model.) Patented in New South Wales Oct. 26, 1886; in South Australia Mar. 28, 1888, and in Victoria May 25, 1888.

Claim.—1. In a grain-cleaning machine, the combination of a plurality of inclined overlapping and upwardly-traveling endless aprons composed of a long-napped fabric and arranged to successively deliver the material from one to the other at a point proximate to the greatest elevation of the aprons, a feeding device adapted to feed the material to the upper apron of the series at the point of greatest elevation thereof, a discharge-chute adapted to deliver the material at the point of least elevation of the last or lowermost of the series of aprons, a beater for each apron arranged below the same in proximity to the point of greatest elevation of the aprons, adjustable diverting-boards F, arranged and operating to arrest rebounding sound grain as it passes down the aprons and to divert the impurities carried over the aprons and beaten therefrom into a separate delivery-chute, substantially as and for the purpose specified.

2. In a grain-cleaning machine, the combination, substantially as herein described, of a plurality of overlapping frames inclined alternately in reverse directions, said frames having side flanges increasing in height from a point near the greatest elevation of the frames to the point of least elevation, a roller-shaft mounted at each end of said frames, the upper shaft constituting the pivot for the frame, an adjustable hanger for the lower roller-shaft, an endless apron composed of a long-napped textile fabric supported from rollers on said shafts, mechanism, such as described, to cause said aprons to move in an upward direction, a whip for each apron arranged below the same in proximity to the point of its greatest elevation, and adjustable diverting-boards F, arranged and operating relatively to the aprons, substantially as and for the purpose specified.



404,457. RAILWAY-SIGNAL. A. JACKSON WHEELER, Philadelphia, Pa. Filed Jan. 24, 1888. Serial No. 261,709. (No model.)

Claim.—1. In a system of electric signals for railroads, the combination, with rail A, of rod C, set parallel with and closely to the inner side of the rail, positive and negative contact-springs D D', connected with wires leading, respectively, to positive and negative mains B B', the wires from the positive main, with signals connected therewith in the line of their traverse, and negative connecting-wires *g*, so arranged that the pressure of the wheel-flanges of the train will depress rod C and effect electrical circuit, substantially as described.

2. In a system of electric signals for railroads, the combination, with rail A, of rod C, set parallel with and closely to the side of the rail, positive and negative contact-springs D D', connected with wires leading, respectively, to positive and negative mains B B', the wires from the positive main, with signals connected therewith in the line of their traverse, and negative connecting-wires *g*, so arranged that the pressure of the wheels of the train will depress rod C and effect electrical circuit, substantially as described.

3. In a system of electric signals for railroads, the combination, with the rail A, of spring-rod C, set parallel with and closely to the side of the rail, positive and negative contact-springs D D', connected with wires leading, respectively, to positive and negative mains B B', or wires from the positive main traversing back along the road, with a signal or signals in its or their traverse, one or more of said wires traversing back along the line of road and one or more of them traversing forward along the line, with signals set upon said wires in the lines of their traverse, and negative wires from contact-springs D',

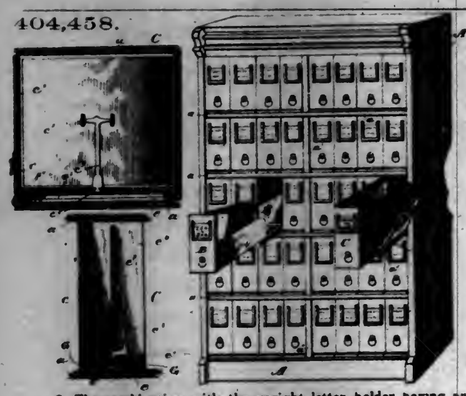
404,457.

all operating, substantially as described, to throw signals simultaneously ahead of and behind the train.

4. In a system of electric signals, the combination, with rail A, of rod C, set parallel with and closely to the side of the rail, and positive and negative contact-springs D D', set at intervals along the line of the rail and connected with wires leading, respectively, to the positive and negative mains B B', the wires from the positive main being provided with signals in the line of their traverse and arranged in blocks, substantially as shown, whereby, as the train progresses and circuit is broken with one block behind, circuit is made or closed with an additional block farther ahead, continuous successive blocks of signals being thus operated as the rear signals cease to operate, substantially as described.

5. In a system of electric signals for railroads, the combination, with rail A, of rod C, set parallel with and closely to the rail, plate C'', with insulator D'', springs C', to sustain rod C, contact-spring D D', connected with wires leading, respectively, to positive and negative mains B B', signal-lamps set on the line of and operated by the positive wires when circuit is closed by the depression of rod C, and negative wire *g*, rod C being adapted to be depressed by the wheels of the train, substantially as described.

6. In a system of electric signals for railroads, the combination, with rail A, of rod C, set parallel with the rail, positive and negative contact-springs D D', connected with wires leading, respectively, to positive and negative mains B B', the wires from one of the mains having signals connected therewith in the line of their traverse, negative connecting-wires *g*, and a wheel or roller attached to one or more of the vehicles of the train to depress said rod and close circuit, substantially as described



7. In a system of electric signals for railroads, the combination, with rail A, of rod C, set parallel with the rail, positive and negative contact-springs D D', connected with wires leading, respectively, to positive and negative mains B B', the wires from the positive main having signals connected therewith in the line of their traverse, negative connecting-wires *g*, and a depressor attached to the train and adapted to bear upon rod C to close circuit, substantially as described

404,458. DOCUMENT OR LETTER FILE. EDMUND W. WOODRUFF, Washington, D. C. Filed Mar. 11, 1889. Serial No. 302,787. (No model.)

Claim.—1. The combination, with the upright letter-holder having an open side, of the lateral file-board or follower operating in planes parallel with the front of the case, substantially as set forth.

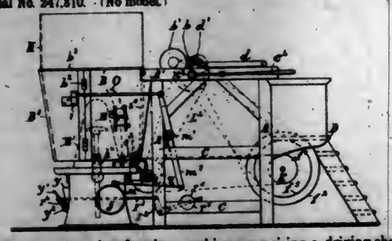
2. The combination, with the upright letter-holder having the open side, of the lateral file-board or follower operating in planes parallel with the front of the case, and a card or leaf index arranged within said holder with its leaves parallel with the sides of the holder and its marked or indicating edge situated at the top of said holder, substantially as set forth.

404,458.

3. The combination, with the upright letter-holder having an open side, of the lateral file-board or follower operating in planes parallel with the front of the case, and a support engaging said follower and adapted to support the same in an inclined position at the side of said holder, substantially as set forth.

4. The combination, with the upright letter-holder having an open side, of the lateral file-board or follower operating in planes parallel with the front of the case, a support engaging said follower and adapted to support the same in an inclined position at the side of said holder, and a slide situated beneath the holder and adapt to sustain the same when drawn out, substantially as set forth.

5. The combination, with the cabinet or case A, of the document and letter holders of uniform appearance, said document-holder being provided with a file-board or follower operating in planes at right angles to the front of the holder, and the upright letter-holder having an open side and a lateral follower operating in planes parallel with the front of the holder, substantially as set forth.



6. As a means for filing papers, the combination, with the cabinet or case A, of the document-holder provided with a file-board or follower operating in planes at right angles to the front of the holder, and the upright letter-holder having an open side and provided with a lateral follower operating in planes parallel with the front of the holder, said holders being interchangeable, substantially as set forth.

7. The combination, with the case or cabinet, of a slide engaging the same and provided with a longitudinal slot or space, and having a lateral recess c^2 at the rear end of the slot or space, whereby it is adapted to receive and sustain, when drawn out, either the document or letter holder, substantially as set forth.

8. The combination, with the case or cabinet having a shelf a and the holders, of the slides E, arranged contiguously to and adapted to keep each other in place on said shelf, and retaining devices which hold said slides to the shelf, but permit their reciprocation, substantially as set forth.

9. The combination, with the shelf a, of the slide E, having a longitudinal space with a lateral recess c^2, retaining devices which hold said slide to the shelf, but permit its reciprocation, and the holder provided with a stop which fits said space, and a lateral arm g, adapted to engage the under side of the slide, substantially as set forth.

404,459. HAT-FORMING MACHINE. GEORGE YULE, Newark, N. J., assignor to Carrie G. Yule, same place. Filed Aug. 25, 1887. Serial No. 247,810. (No model.)

Claim.—1. A hat-forming machine comprising a driving-shaft and a casing inclosing a perforated hat-forming cone, doors upon the said casing, and a cam operated by the driving-shaft and connected to the doors, as and for the purpose set forth.

2. A hat-forming machine comprising a driving-shaft and a casing inclosing a perforated hat-forming cone, a spray-discharger located within the casing adjacent to the cone, a water pipe and cock to supply water to the spray-discharger, a cam operated by the driving-shaft and connected with the cock to open the cock automatically, as and for the purpose set forth.

3. A fur-forming machine having a casing inclosing the perforated cone, a spray-discharger located within the casing adjacent to the cone, a water pipe and cock to supply water to the spray-discharger, an air-inlet in the vacuum-chamber beneath the turn-table, a driving-shaft, and a cam operated by the driving-shaft and connected with the air-inlet, as and for the purpose set forth.

4. A fur-forming machine having a casing inclosing the perforated cone, a spray-discharger located within the casing adjacent to the cone, a water pipe and cock to supply water to the spray-discharger, an air-inlet in the vacuum-chamber beneath the turn-table, an air-check vertically movable within the cone, a driving-shaft, and a cam operated by the driving-shaft and connected with the air-check, as and for the purpose set forth.

5. A fur-forming machine comprising a turn-table, a casing inclosing the same, a feeding-apron, pickers, brush for supplying fur to the cone, and a clutching mechanism connecting the feeding-apron with the driving-shaft and operated to disconnect the apron at intervals corresponding with the feeding of one bat, as and for the purpose set forth.

6. A fur-forming machine comprising the driving shaft, a casing inclosing the perforated cone, a spray-discharger located within the casing adjacent to the cone, a water pipe and cock to supply water to the spray-discharger, and a cam operated by the driving-shaft and connections to the cock and connections to the doors of the casing, the whole arranged and operated substantially as set forth.

7. A fur-forming machine comprising a driving-shaft, a casing inclosing the perforated cone, a spray-discharger located within the casing and adjacent to the cone, a water pipe and cock to supply water to the spray-discharger, an air-inlet in the vacuum-chamber beneath the turn-table, and a cam operated by the driving-shaft and connections to the water-cock of the spray-discharger and to the doors of the casing, the whole arranged and operated substantially as set forth.

8. A fur-forming machine comprising a driving-shaft, a casing inclosing the perforated cone, a spray-discharger located within the casing adjacent to the cone, a water pipe and cock to supply water to the spray-discharger, an air-inlet in the vacuum-chamber beneath the turn-table, an air-check vertically movable within the cone, and a cam operated by the driving-shaft and connections to the water-cock of the spray-discharger, to the air-inlet, to the air-check, and to the doors of the casing, the whole arranged and operated substantially as set forth.

9. A fur-forming machine comprising a driving-shaft, a casing inclosing the perforated cone, a spray-discharger located within the casing adjacent to the cone, a water pipe and cock to supply water to the spray-discharger, an air-inlet in the vacuum-chamber beneath the turn-table, an air-check vertically movable within the cone, a clutching mechanism connecting the feeding-apron with the driving-shaft, and a cam operated by the driving-shaft and connections to the water-cock of the spray-discharger, to the air-inlet, to the air-check, to the said clutching mechanism, and to the doors of the casing, the whole arranged and operated substantially as set forth.

10. A fur-forming machine having a turn-table and a casing inclosing the same, hinged doors in the casing, and a removable annular shield applied to the top of the casing above the doors, as and for the purpose set forth.

11. A fur-forming machine having a turn-table and a casing inclosing the same, hinged doors in the casing, a cam operated by the driving-shaft of the machine, a lever actuated by the cam for moving the doors, and a spring-connection between the lever and the doors for closing the doors elastically, as and for the purpose set forth.

12. A fur-forming machine provided with a rotary turn-table, a casing, and a spray-discharger within the casing, and having sundry movable attachments, (as the hinged doors upon the casing, the air-check, and a pipe and cock for supplying water to the spray-discharger,) and a driving-shaft to actuate the fur-forming cone, cams operated by the driving-shaft, with connections to automatically actuate such attachments, and a clutch for disconnecting the cams from the driving-shaft, as and for the purpose set forth.

13. A fur-forming machine having a turn-table, a casing inclosing the same, and a vertical draft-aperture in the casing provided with two sliding plates adapted to form an opening variable in height from the bottom of the casing, as and for the purpose set forth.

14. A fur-forming machine having a turn-table, a vacuum-chamber sustaining the same and provided with an air-inlet in the side above the bottom of the chamber, and a suction-blower at the side of the vacuum-chamber and connected with such inlet, as and for the purpose set forth.

15. A fur-forming machine having a turn-table, a vacuum-chamber sustaining the same and provided with an air-inlet in the side above the bottom and a water-pan in the bottom of the chamber, a spray-discharger adjacent to the turn-table, and a suction-blower at the side of the vacuum-chamber, as and for the purpose set forth.

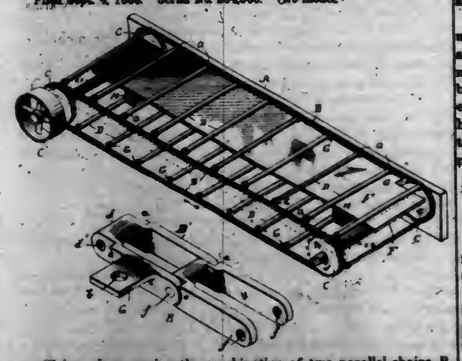
16. In a fur-forming machine, the combination, with the turn-table and a vacuum-chamber sustaining the same, of a spray-discharger sustained adjacent to the turn-table and a water-trough beneath the margin of the turn-table, as and for the purpose set forth.

17. In a fur-forming machine, the combination, with the turn-table and a vacuum-chamber sustaining the same, of a casing inclosing the turn-table, a spray-discharger within the casing, and a water-trough beneath the margin of the turn-table, as and for the purpose set forth.

18. A fur-forming machine comprising a turn-table and a vacuum-chamber sustaining the same, a spray-discharger sustained adjacent to the turn-table, a water pipe and cock to supply water to the spray-discharger, and a cam operated by the driving-shaft of the machine and connections to the water-cock, as and for the purpose set forth.

19. In a fur-forming machine, the combination, with the turn-table, of a vacuum-chamber having a circular seat upon its top, a collar upon the turn-table fitted to such seat, an annular water-trough fitted to such top beneath the rim of the turn-table, and a casing inclosing the turn-table and sustained by the water-trough, as and for the purpose set forth.

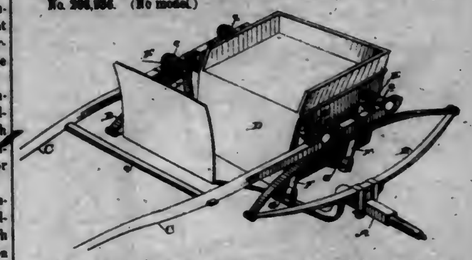
20. In a fur-forming machine, the combination, with the turn-table, of a vacuum-chamber having a circular seat upon its top, a collar upon the turn-table fitted to such seat, an annular water-trough fitted to such top beneath the rim of the turn-table, and anti-friction wheels pivoted to the vacuum-chamber and fitted to the collar between the trough and the seat, as and for the purpose set forth.



21. In a fur-forming machine, the combination, with the turn-table, of a vacuum-chamber having a circular seat upon its top, a collar upon the turn-table fitted to such seat, an annular gear formed upon the turn-table outside such collar between the water-trough and the seat, and anti-friction wheels and a rotating pinion fitted to the said collar and annular gear between the annular trough and the seat, as and for the purpose set forth.

22. A fur-forming machine comprising a turn-table, a vacuum-chamber of circular form, a water-pan fitted within the bottom and curved upwardly at its center and periphery, guides sustained upon the center of the pan, and a movable spindle fitted to the guides and provided at the top with the air-check p, as and for the purpose set forth.

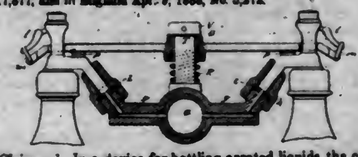
23. A fur-forming machine comprising a turn-table, a vacuum-chamber of circular form, a water-pan fitted within the bottom and curved upwardly at its center and periphery, a circular seat upon the top of the vacuum-chamber, a collar upon the turn-table fitted to such seat, a bead projected from the seat below the collar, and a water-trough arranged beneath the periphery of the turn-table and having a circular support fitted to the seat and resting upon the bead, as and for the purpose set forth.



24. A fur-forming machine comprising a turn-table and a vacuum-chamber sustaining the same, a spray-discharger adjacent to the turn-table, a water pipe and cock to supply water to the spray-discharger, an air-inlet in the vacuum-chamber beneath the turn-table, and a cam operated by the driving-shaft of the machine and connected with the air-inlet, as and for the purpose set forth.

404,460. STRAW-CARRIER. GEORGE AKERSON, Weston, Mo. Filed Sept. 4, 1888. Serial No. 284,580. (No model.)

Claim.—In a carrier, the combination of two parallel chains B, made up of a series of connected U-shaped links B', the butt-end d of said links being cut away and provided with recesses e at its opposite sides for reception of the opposite end of the next link, said butt-end being provided with transverse perforation d', and the opposite end of the next link being provided with perforation f', registering with the perforation in the butt-end of the first-mentioned link, pins f, which are passed through the perforation in the butt of one link and perforation in the end of the next link, transverse lugs G, having perforations b and formed integral with and projecting at right angles from one side of a number of links upon the inner sides of both chains, transverse slats D, mounted upon lugs G, and bolts a, passed through perforations b in said lugs and corresponding perforations in said transverse slats, substantially as set forth.



404,461. VEHICLE. HERMAN ARENBERG, Edgewood, Cal., assignor of one-half to George J. Clark, same place. Filed Jan. 19, 1889. Serial No. 296,956. (No model.)

Claim.—1. In a vehicle, and in combination with its running-gear and the body, the means for suspending the body from the running-gear, consisting of pivoted or rock bars on the body, pivoted or rock bolts on the running-gear, and intervening links or hangers pivoted to both bolts and bars, substantially as described.

2. In a vehicle, and in combination with its axle, springs, shafts, and body, the means for connecting the body, consisting of the pivot or rock bolts E on top of the shafts, the pivot or rock bars G under the body, and the intervening hangers or links F, pivoted at their upper ends to the rock-bolts and at their lower ends to the rock-bars, substantially as described.

404,462. MANUFACTURING AND BOTTLING AERATED WATER. OCTAVE AVERDE, Louvain, Belgium. Filed June 13, 1888. Serial No. 276,999. (No model.) Patented in Belgium Dec. 6, 1887, No. 79,822; in France Dec. 23, 1887, No. 187,787; in Germany Dec. 31, 1887, No. 47,677, and in England Apr. 9, 1888, No. 5,572.

Claim.—1. In a device for bottling aerated liquids, the combination of a main supply-pipe connected with a source of water, and also of gas, and provided with means by which one or both of them may be admitted to it, as desired, nozzles connected with said pipe by an invertible connection, and a yoke pivoted to the invertible connection, each end of which is adapted to engage the neck of a siphon-bottle, and hold it against a nozzle, substantially as described.

2. In a device for bottling aerated liquids, the combination of a main supply-pipe connected with a source of water, and also of gas, and provided with means by which one or both of them may be admitted to it, as desired, nozzles connected with said pipe by an invertible connection, and a yoke pivoted to the invertible connection, each end of which is adapted to engage the neck of a siphon-bottle and hold it against a nozzle, and provided with a ring or hook adapted to engage the valve-lever of the bottle and maintain it in an open position while the bottle is being filled, substantially as described.

404,463. FILAMENT FOR INCANDESCENT ELECTRIC LAMPS. TURNER D. BOTTOM, New York, N. Y. Filed Sept. 20, 1888. Serial No. 286,773. (No specimens.)

Claim.—1. The process of manufacturing filaments, consisting of forming a deposit of molybdenum compound in or upon a suitable filamentary body.

2. The process of manufacturing filaments, consisting in submitting a suitable filamentary body to a bath of a molybdenum compound, then changing such compound to molybdic sulphide, substantially as described.

3. The process of manufacturing filaments, consisting in incorporating a suitable filamentary body with oxide of molybdenum and then heating the same in the vapor of a sulphur compound, whereby the oxide is transformed into sulphide.

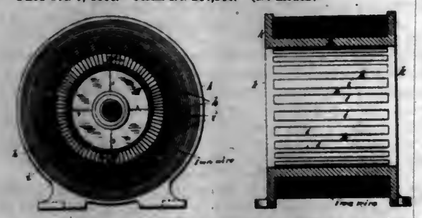
4. The process of manufacturing filaments, consisting in incorpo-

rating a suitable filamentary body with oxide of molybdenum and then electrically heating the same in the vapor of a sulphur compound, substantially as described.

5. The process of manufacturing filaments, consisting in incorporating a suitable filamentary body with oxide of molybdenum and then electrically heating the same in a rarefied vapor of a sulphur compound.

6. The process of manufacturing filaments, consisting in incorporating a suitable filamentary body with oxide of molybdenum and then electrically heating the same in the vapor of a compound of sulphur and hydrogen.

404,464. WAGON-BODY RAISER. WILLIAM S. BOURNE, Afton, Iowa. Filed Mar. 6, 1889. Serial No. 302,192. (No model.)



Claim.—1. The hoisting apparatus comprising the sills, the parallel guide-bars connecting the same, the cleats or stops E, arranged transversely under said guide-bars, the standards rising from the sills, the windlass-shaft journaled in bearings on the standards, said shaft having the crank and the ratchet-wheel, the pawl to engage the latter, the hoisting-frame pivoted between the standards, the ropes connecting one end of the hoisting-frame to the windlass, and the frames suspended from the inner side of the hoisting-frame and adapted to engage the wagon-bed, substantially as described.

2. The combination of the standards, the lifting-frame pivoted thereto and having the cross-bar I, the frames N, loosely hung on said cross-bar, and the rope arranged between the said frames, whereby they may be shifted along the said bar I, as set forth.

3. The combination of the standards, the lifting-frame pivoted thereto and having the cross-bar I, the rings F' on the said cross-bar, the frames N, loosely hung on the cross-bar I, the bails P, extending inward from said frames, and the rope secured to said bails and passing through the rings F', as set forth.

4. The combination of the standards, the lifting-frame pivoted thereto, having the cross-bar I, the rings M on said cross-bar, the bails L, hung from said rings, the frames N, depending from said bails, the bails P, extending inward from the frames N, and the rope between the bails P, as set forth.

404,465. ELECTRIC MOTOR. CHARLES S. BRADLEY, Yonkers, N.Y. Filed Oct. 5, 1888. Serial No. 287,319. (No model.)

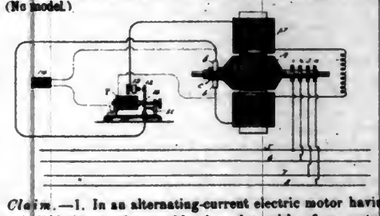
Claim.—1. An electric motor comprising a field-magnet adapted to be energized by the eddying currents due to the rotation of the poles of the armature, in combination with an armature having magnetic poles rotating independently of its motion.

2. An electric motor comprising a field-magnet adapted to be energized by the eddying currents due to the rotation of the poles of the armature, in combination with an armature having magnetic poles automatically rotating independently of its motion.

3. An electric motor having an armature with insulated winding thereon and connections for the external circuit or circuits, in combination with a field-magnet disconnected from the armature and external circuits, and wherein the effective poles depend for existence on eddying currents circulating in its body.

4. In an electric motor, an armature constructed with no dependently-rotating magnetic poles, in combination with a mass composed partly of a magnetic metal and partly of a low-resistance metal placed in continuous inductive proximity to the armature and constituting its field-magnet.

5. In an electric motor, a rotary armature having independently-rotating magnetic poles, in combination with a surrounding compound annulus, partly iron or steel and partly of a low-resistance metal, the latter arranged in bars or sections parallel with the winding on the armature.



6. A compound annular field-magnet having its surface adjacent to the armature composed of alternate bars of iron or steel and a low-resistance metal—such as copper or bronze—substantially as described, whereby said low-resistance bars form paths for currents.

7. A compound annular field-magnet having its surface adjacent to the armature composed of alternate bars of iron or steel and a low-resistance metal—such as copper or bronze—and having the ends of said low-resistance bars connected to low-resistance heads or cross-bars, substantially as described.

8. A field-magnet composed of alternate bars of magnetic metal and low-resistance metal laid together to form a cylinder and bound externally with magnetic metal, which serves to retain the structure in form and complete the magnetic circuit.

9. A field-magnet composed of alternate bars of magnetic metal and low resistance metal laid together to form a cylinder and wound externally with iron or steel wire.

404,466. ALTERNATING-CURRENT ELECTRIC MOTOR. CHARLES S. BRADLEY, Yonkers, N. Y. Filed Feb. 18, 1889. Serial No. 300,270. (No model.)

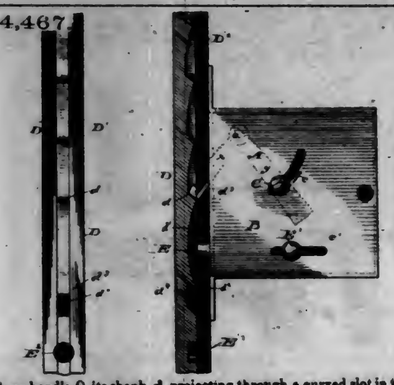
Claim.—1. In an alternating-current electric motor having an induced field-circuit, the combination therewith of an automatic switch adapted to close said field-circuit on arrival of the armature at its normal speed.

2. In an alternating-current electric motor having an induced field-circuit, the combination therewith of an automatic switch adapted to close said field-circuit and means for closing said switch on arrival of the armature at its normal speed.

3. In an alternating-current electric motor having an induced field-circuit, the combination therewith of a switch adapted to close the field-circuit, means for holding said switch open till the armature arrives at its normal speed, and means for thereupon closing said switch automatically.

4. In an alternating-current electric motor having a rotary armature and its field-magnet provided with an energizing-circuit, the combination therewith of a switch in said field-circuit and means for automatically closing said circuit, dependent for operation upon the armature attaining its normal speed.

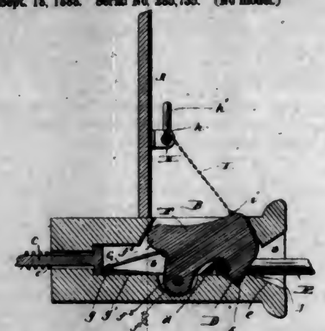
5. In an alternating-current differential-phase electric motor having a rotary armature and its field-magnet provided with an energizing-circuit, the combination therewith of a switch in said field-circuit and means for automatically closing said circuit, dependent for operation upon the armature attaining its normal speed.



6. In an alternating-current electric motor comprising a stationary and a movable member, one of which has polar rotation set up in it by direct action of the operating-current and the other member has an energizing-circuit, the combination, with the said energizing-circuit, of a switch for opening and closing the same, and means for automatically closing said switch controlled by the speed of said movable member of the motor.

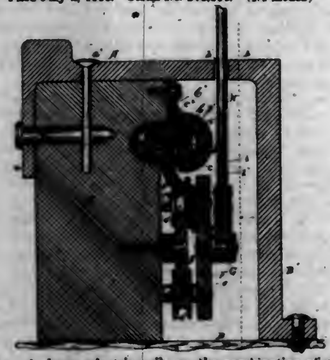
404,467. SASH-FASTENER. ROBERT J. BUCHANAN, Pittsburg, Pa. Filed Feb. 21, 1889. Serial No. 300,751. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the lock frame or casing, the bell-crank lever pivoted thereto, and having an outwardly-projecting arm x formed with an outer end curved from the axis of the lever as a center, a rack-plate having teeth curved to correspond with the curved end of the arm x, and a handle C, secured to the inwardly-projecting arm of the bell-crank lever and working in a curved slot in the lock frame or casing.



2. The combination, substantially as hereinbefore set forth, of the lock frame or casing, the bell-crank lever pivoted thereto and having an outwardly-projecting arm x and an inwardly-projecting arm y, the

404,467.



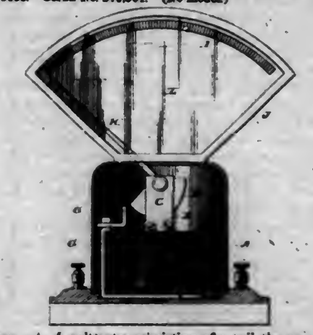
knob or handle C, its shank c^3, projecting through a curved slot in the lock-casing and through the arm y of the bell-crank lever and adapted to turn therein, a spring interposed between the inner end of the shank and the bell-crank lever, and the teeth c^4 on the shank, which engage with notches c' formed in the curved slot of the lock-casing, for the purpose specified.

404,468. CAR-COUPLING. JAMES E. BULL, Tracy City, Tenn. Filed Sept. 18, 1888. Serial No. 285,735. (No model.)

Claim.—The combination, with the draw-head B, longitudinally recessed, as at b, and having a vertically-communicating recess, and having the bottom recesses D and f^2, of the hook F, having the end f fitting in the recess D and the depending portion f' pivoted in the recess f^2 and extended to form the rearwardly-projecting shoulder f^3, and of the transverse shaft g, mounted in the rear end of the longitudinal recess b, and the V-shaped spring G, having its angle bent to form a shaft-embracing eye, and one terminal bearing against the bottom of the recess b and the other against the under surface of the shoulder f^3 of the hook, substantially as specified.

404,469. ELECTRIC RAILWAY. WILLIAM CAMPBELL, Cleveland, Ohio. Filed July 2, 1888. Serial No. 278,806. (No model.)

Claim.—1. In an electric railway, the combination of a trough provided with a longitudinal slot, a conduit and a rail located within said trough, an insulated conductor secured within said conduit, a current-collector engaging with the conductor, a carriage having bearing on said rail and located out of vertical line with the slot of said trough, and a flexible connection connecting said conductor and operating-vehicle, substantially as set forth.

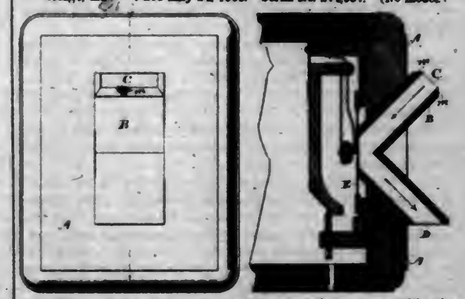


2. In an electric railway, the combination of a sleeper provided with a longitudinal groove, a conduit carrying a conductor secured partially within said groove, said conduit open on its lower face only, and a rail projecting over and protecting said conduit, substantially as set forth.

3. In an electric railway, the combination of a sleeper, a conduit C, secured thereto, and a rail that projects beyond the face of said sleeper, said rail provided with a downwardly-projecting flange, a bolt securing said rail to said sleeper, said bolt provided with an opening, and a cotter fitting in said opening, substantially as set forth.

4. In an electric railway, the combination of a trough provided with a slot, a non-conducting conduit located therein, an insulated conductor secured within the latter, a current-collector engaging with said conductor, and a coupling connected, respectively, with said cable and the operating-vehicle, said coupling being flexible where it passes through said slot, substantially as set forth.

5. In an electric railway, the combination of a trough provided with a longitudinal slot, a conduit and a rail located within said trough, an insulated conductor secured within said conduit, a current-collector engaging with the conductor, a carriage having bearing on said rail and located entirely within said trough, and a coupling engaging with said carriage and the operating-vehicle and flexible its entire length, substantially as set forth.



404,470. VOLTMETER. LEO DAFT, Plainfield, N. J. Filed July 10, 1888. Serial No. 279,501. (No model.)

Claim.—1. A voltmeter consisting of a coil, the core of which is provided with a slotted extension supporting a cam-shaped armature within the slot, and having a pointer connected to the armature, whereby the cam-shaped armature is normally maintained in a uniform field of force, and is operated by repulsion in accordance with the variations of the current passing through the coil, substantially as described.

2. In a voltmeter, the combination of the coil, the slotted core-extension, the cam-shaped armature supported therein, and a slotted adjustable polar extension G', substantially as described.

404,471. TELEPHONE-TRANSMITTER. EDWIN S. DRAKE, Cambridge, Mass. Filed May 24, 1888. Serial No. 274,937. (No model.)

Claim.—1. A telephone-transmitter embodying the combination of a diaphragm E with a supporting case or front A, provided with separate but connecting inlet and outlet air conduits or passages, so

respectively arranged relatively to the diaphragm that the vocalized impulses directed to the diaphragm through the inlet-passage will be reflected directly therefrom through the outlet-passage, as and for the purposes specified.

2. The combination of diaphragm E with a door or front A, provided with air-passages C and D, leading obliquely to and from the diaphragm at equal angles thereto, coinciding with the angles of incidence and reflection of the sound-waves conducted thereto and therefrom through said passages, as specified.

404,472. STEERING APPARATUS. ARBROSE C. DUNN, New York, N. Y., assignor to the Pneumatic Steering Gear and Manufacturing Company, same place. Filed July 27, 1887. Renewed Apr. 26, 1888. Again renewed Nov. 7, 1888. Serial No. 290,256. (No model.)

Claim.—1. The combination, with the rudder of a vessel and located on the deck or elsewhere, of a steering-cylinder provided with a perforated partition, and with pistons which connect with the rudder, and which has supply and exhaust ports at its ends, and a valve-chest containing a valve connected with and operated from the pilot-house first to open a supply-port at one end and an exhaust-port at the other, and then close the ports at both ends, substantially as described.

2. The cylinder provided with a central partition dividing it into two separate chambers communicating with each other by means of an opening in said partition, each chamber having an independent piston, and there being a liquid interposed between the pistons, whereby motion of either piston is at once communicated to the opposite piston, substantially as and for the purpose set forth.

3. The cylinder divided into two equal communicating chambers, each provided with an independent piston, and there being a liquid interposed between the pistons, whereby motion of either piston is at once communicated to the other piston, the cylinder having a separate chamber communicating with the space between the piston-heads, which chamber serves as a reservoir for an additional supply of interposed liquid to prevent leakage and insure a full supply at all times, substantially as described.

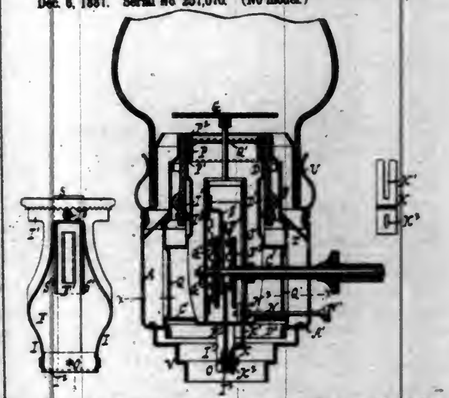
4. The combination, with a cylinder provided with a perforated partition and having an inlet and an exhaust port at each end, the inlet-port being beyond the exhaust-port at or near the end of the cylinder, of pistons arranged as described, and at the end of the outward stroke covering an exhaust-port, thus compressing the confined fluid, cushioning and preventing the rudder from going too far over, substantially as set forth.

5. The combination, with the steering-wheel, of cylinders having pistons and containing liquid against which the pistons bear, pipes containing liquid—further, cylinders having pistons and containing liquid which bears against them—and a rod which actuates a wheel or lever connected with the valve-stem, substantially as and for the purpose described.

6. The combination, with the rudder of a vessel having a yoke upon its post, of steering-cylinders the pistons of which connect directly with the yoke on the rudder-post and operate in opposite directions, the cylinders having supply and exhaust ports at their ends, and valve-chests containing valves connected with and operated from the pilot-house, and controlled first to open supply-ports at opposite ends of each cylinder and exhaust-ports at these ends and then close the ports at both ends, substantially as described.

7. The combination, with a steering-cylinder having a perforated partition, and the rudder having a quadrant, yoke, or tiller, of devices interposed between the same and the valve at the ports of the cylinder, the devices being operated from a moving part—such as the rudder—automatically to close the ports immediately after a movement of the rudder, whereby aeriform fluid will be confined in the cylinder on both sides of its piston or pistons and the rudder will be held elastically, substantially as specified.

8. The combination, with a steering-cylinder having a piston rod or rods and provided with a valve-chest containing a valve provided with a stem, of two cylinders containing pistons, a pipe connected with both cylinders, the cylinders and pipes containing a liquid, and a rod or rods connected to the piston rod or rods of the steering-cylinder or other part moved thereby, the rod or rods being fixed to the piston in the one cylinder and operating to push the piston and force the liquid in its cylinder through a pipe against the piston in the other cylinder, the piston-rod of which connects with the valve-stem of the steering-cylinder and causes the valve to close the ports, as set forth.



404,473. PROCESS OF REDUCING IRON DIRECT FROM ITS ORES. CHARLES J. KAMM, New York, N. Y. Filed Jan. 19, 1889. Serial No. 296,638. (No model.)

Claim.—1. The process herein described of reducing iron ore in reverberatory furnaces, which consists in subjecting a stratum composed entirely of an admixture of granulated iron ore and granulated coke-breeze or anthracite coal and devoid of flux, said stratum arranged on a coke-hearth, to the reverberatory action of a neutral flame or neutral gas-flame in a low state of combustion and under sufficient pressure to prevent the entrance of air into the furnace, substantially as and for the purposes specified.

2. The process herein described for reducing iron ore in reverberatory furnaces, which consists in subjecting a stratum of admixed granulated iron ore and granulated coke-breeze or anthracite coal and devoid of flux, said stratum being arranged on a coke-hearth and covered by a thin layer of coke-breeze, to the action of a neutral gas-flame under such pressure as will prevent the entrance of air into the furnace, substantially as and for the purposes specified.

404,474. ARGAND LAMP-BURNER. PETER J. FOULON, New York, assignor of one-half to George B. Constantine, Brooklyn, N. Y. Filed Dec. 6, 1887. Serial No. 257,070. (No model.)

Claim.—1. In an Argand burner, the combination of the stop-arm having two vertical slots, the screw-rod fitted into one of said slots for adjustably connecting the stop-arm to a fixed portion of the burner, and the wick-carrier having a stop-pin fitted into the other of said slots for regulating the motion of said carrier, substantially as and for the purpose described.

2. In an Argand burner, the combination, with the wick-tube, of a ring fitted thereon with an air space or chamber between said tube and the ring, substantially as and for the purpose described.

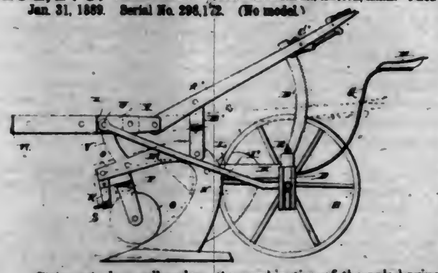
3. In an Argand burner, the combination, with a wick-tube having a flange on the upper end and a shoulder below said end, of a ring fitted loosely on said tube between said flange and shoulder, substantially as and for the purpose described.

4. In an Argand burner, the combination, with the open perforated shell, the inner and outer tubes, and the transverse tubes connecting the same, of the air-distributers fitted into or on said transverse tubes, substantially as and for the purpose described.

5. In an Argand burner, the combination, with a wick-carrier having an attached rack, which is left free on the upper end, as shown, of a spreader and extinguisher, also having an attached rack, and an arm secured to said spreader-rack to form a guide or support for the wick-rack, substantially as described.

404,475. SHIRT. BERTHOLD GALLAND, Scranton, Pa. Filed May 28, 1887. Serial No. 239,662. (No model.)

Claim.—1. A shirt having collar-band and wrist-band linings provided each with lateral integral extensions at its ends, adapted to form also facings for the edges of the adjacent openings, substantially as herein set forth.



2. A shirt having its collar-band provided with a button-hole reenforce C, formed of a piece of cloth or other material inserted between the plies of the band at the place where the button-hole is cut, the ends of the said piece being doubled over across and outside of the ends of the button-hole, whereby the shirt is strengthened opposite to the ends of the button-hole, as herein set forth.

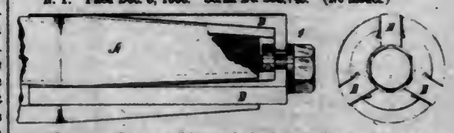
3. A shirt having a stay at the lower end of the opening or placket in the front or back of the same, the said stay consisting of a series of overcast loop-stitches, forming a continuous ridge of closely-laid threads transverse to the length of the opening and composing a bar across the width of the facing, substantially as herein set forth.

4. A shirt having gusset projections G G formed integrally on the adjoining edges of the cloth at the lower terminations of the side seams, the adjacent projections overlapping each other and adjacent portions of the cloth and being united to the cloth by a continuous row or rows of stitches near their edges and around the entire circuit thereof, substantially as and for the purpose herein set forth.

5. A shirt having gusset projections G G formed integrally on the adjoining edges of the cloth at the lower terminations of the side seams, the adjacent projections overlapping each other and adjacent portions of the cloth and being united to the cloth by a row or rows of stitches near their edges and the lower hem or hems of the shirt being continued along the lower edges of the projections and secured by stitching to the cloth, substantially as and for the purpose herein set forth.

404,476. SULKY-PLOW. JOSEPH A. GARBER, Hatton, Kans. Filed Jan. 31, 1889. Serial No. 298,172. (No model.)

Claim.—1. In a sulky-plow, the combination of the axle having a vertically-slotted plate, the slide moving in said slot and having a forwardly-extending arm, the plow-standard attached to the front end of said arm and carrying the plow, and the forwardly-extending beam having upwardly-extending bracket, the tongue connected pivotally with said bracket, an adjusting-lever pivoted to the rear end of the tongue, and a link connecting said lever with the plow-beam, substantially as set forth.

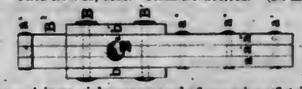


2. The combination of the axle having forwardly-extending converging arms, the plow, the beam of which is provided with an upwardly-extending bracket mounted upon a bolt connecting the front ends of said arms, the tongue having a rearwardly-extending arm mounted pivotally upon said bolt, an adjusting-lever pivoted at the rear end of the arm extending rearwardly from the tongue and connected by a pivoted link with the rear end of the plow-beam, a spring-latch at the rear end of the adjusting-lever engaging a segmental rack, and an arm connecting the plow-standard with a vertically-movable slide, substantially as set forth.

3. In a sulky-plow, the combination of the sulky-truck, the vertically-adjustable plow, the tongue having a laterally-extending bracket provided with a rearwardly-extending arms, whereby it is mounted detachably and reversibly between a pair of arms extending forwardly from the axle, the adjusting-lever pivoted to the rear end of the rearwardly-extending arm of the tongue and connected with the rear end of the plow-beam by a pivoted link, and an arm extending upwardly from the plow-beam and mounted pivotally between the converging ends of the forwardly-extending arms of the axle, substantially as set forth.

4. In a sulky-plow, the herein-described reversible tongue provided at its rear end with a laterally-extending bracket terminating in a rearwardly-extending arm, the same being formed by a pair of plates secured to the sides of the tongue, bent in proper direction parallel to each other and bolted together, suitable spacing-plates being interposed, substantially as set forth.

5. The combination of the sulky-truck, the plow adjustable vertically with relation thereto, and having a beam terminating in rear of the plow-point, and provided at its front end with a downwardly-extending arm having a clevis, a pair of converging arms extending forwardly from the axle and connected at their front ends by a bolt passing through an arm extending upwardly from the plow-beam, the reversible tongue having at its rear end a laterally-extending bracket terminating in a rearwardly-extending arm mounted upon the bolt which connects the forwardly-extending arms of the axle, the adjusting-lever pivoted to the rear end of the arm, extending rearwardly from the tongue and connected with the rear end of the plow-beam with a pivoted link, and means for retaining said lever in any position to which it may be adjusted, substantially as set forth.



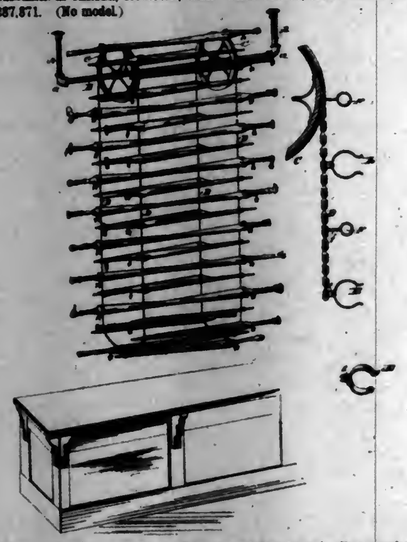
404,477. EXPANSIBLE MANDREL. PATRICK H. GRIFFIN, Buffalo, N. Y. Filed Dec. 5, 1888. Serial No. 292,745. (No model.)

Claim.—1. In expansible mandrels, the combination, with a tapering arbor A, provided with an internally-screw-threaded central aperture and with parallel dovetail longitudinal grooves at the periphery of the wedge-shaped jaws D, having parallel toes *g* at their heads, and the spindle B, having the head C and circular nut *c*, the whole being constructed to operate substantially as and for the purpose stated.

2. In expansible mandrels, the combination, with a tapering arbor having dovetailed longitudinal grooves at its periphery, of taper jaws having toes at their heads, a revolving screw-threaded spindle engaging said arbor, provided with a head having a circular base, and a removable nut upon said spindle, said toes engaging the neck *f* in said spindle, substantially as and for the object stated.

404,478. LOOM-PICKER. EUGENE S. GRINNELL, Waltham, Mass., assignor of two-thirds to Eben W. Blake and Robert Burgess, same place. Filed Nov. 12, 1888. Serial No. 290,652. (No model.)

Claim.—A loom-picker composed of a number of strips of leather secured together near the opposite ends thereof, having the striking face on the edge of said strips, and the re-enforcing strips on opposite sides secured to the body of the picker by rivets passing through the body at points above and below the striking-point, whereby provision is made for the lateral expansion of the body by separation of the strips when the picker comes in contact with a loom-shuttle.



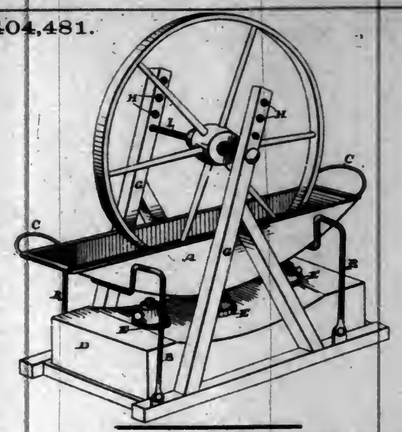
404,479. GRAIN-BINDING MACHINE. FRANK HARPER, Auburn, assignor to the D. M. Osborne & Company, of New York. Filed June 16, 1888. Serial No. 277,292. (No model.)

Claim.—1. In a grain-binder, the combination, substantially as described and shown, of a rotary tying-bill, the rotary cord-holding disk provided with a series of peripheral cord-receiving notches mounted on a stationary axis to turn freely under the stress of the cord and in position to receive the cord at the side farthest from the tyer, the cord-clamping shoe embracing the edge of the disk and adapted to confine the two ends of the applied cord in successive notches of the disk, and mounted, substantially as described, to rise from the disk at either end independently of the other, the spring acting to urge the clamp toward the disk, and the needle or binder arm arranged to lay the cord across the tyer to the distant edge of the disk, whereby the disk is enabled to receive and hold both ends of the cord and to turn under the stress of the cord, so as to yield the latter to the tyer during the formation of the knot.

2. In a grain-binder, the combination of the rotary tying-bill, the rotary cord-holding disk provided with peripheral notches and mounted to turn freely on an axis fixed in relation to the tyer and in position to receive the cord at the side farthest from the tyer, the shoe or clamp embracing the edge of the disk and provided at the delivery end with the cord-retaining shoulder adapted to confine the cord in successive notches thereof and free to rise from the disk at either end independently of the other, the pressure-spring acting upon the shoe midway of its length, and the cord-carrying arm or needle arranged to lay the cord across the tyer and thence to the distant edge of the disk, whereby the one clamp is enabled to hold the two ends of the applied band and to slacken the cord to the tyer during the formation of the knot without the assistance of mechanism to turn or to retard the disk.

404,480. **UMBRELLA-EXHIBITOR.** FREDERIC HARRINGTON and BENJAMIN L. CARTER, Cleveland, Ohio. Filed Oct. 11, 1888. Serial No. 287,871. (No model.)

Claim.—1. An umbrella-exhibitor consisting in an endless carrier or carriers, and a wheel or wheels on which said carrier or carriers are supported, with holders for the umbrellas on the carrier or carriers, substantially as set forth.



2. In an umbrella-exhibitor, endless chains, one of which has a spring-grip and the other a staple, with an eye for holding the umbrellas and wheels on which said chains are hung, substantially as set forth.
